KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.
ȧ " " senate, chaotic.
â " " glare, care, and as *e* in there.
ă " " am, at.
ä " " arm, father.
à " " ant, and final *a* in America, armada, etc.
a " " final, regal, pleasant.
a̱ " " all, fall.
ē " " eve.
ė " " elate, evade.
ĕ " " end, pet.
ẽ " " fern, her, and as *i* in sir, etc.
e " " agency, judgment.
ī " " ice, quiet.
i̇ " " quiescent.
ĭ " " ill, fit.
ō " " old, sober.
ȯ " " obey, sobriety.
ô " " orb, nor.
ŏ " " odd, forest, not.
o " " atom, carol.
oi " " oil, boil.
o͞o " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
u̇ " " unite.
ŭ " " cut, but.
u̯ " " full, put, or as *oo* in foot, book.
û " " urn, burn.
y " " yet, yield.
ʙ " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
D " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
g " " go, get.
G " " German Landtag = *ch* in Ger. ach, etc.
H " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
hw " *wh* in which.
K " *ch* in German ich, Albrecht = *g* in German Arensberg, Mecklenburg, etc
n̲ " in sinker, longer.
ng " " sing, long.
N " " French bon, Bourbon, and *m* in the French Étampes; here it indicates nasalizing of the preceding vowel.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh " *z* in azure, and *s* in pleasure.

An apostrophe ['] is sometimes used as in tā'b'l (table), kăz"m (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

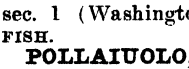
RICHMOND (Va.).
Mr. John Hart.

* Deceased.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

POLK, pōk, FRANK LYON (1871–). An American lawyer, son of William Mecklenburg Polk and grandson of Leonidas Polk. He was born in New York City, graduated from Yale in 1894 and from Columbia Law School in 1897, and served as captain during the Spanish-American War. He then practiced law in New York and was a member of the Board of Education and of the Municipal Civil Service Commission under Mayor McClellan. In 1914 he was appointed corporation counsel by Mayor Mitchel and in the following year became counselor to the State Department at Washington, after Mr. Robert Lansing had been promoted from the counselorship to the post of Secretary of State.



POLK, JAMES KNOX (1795–1849). The eleventh President of the United States, born in Mecklenburg Co., N. C., Nov. 2, 1795. His ancestors, who bore the name of Pollock, emigrated from the north of Ireland early in the eighteenth century. Polk graduated at the University of North Carolina in 1818, then studied law with Felix Grundy (q.v.) at Nashville, Tenn., and was admitted to the bar in 1820. Three years later he was elected a member of the State House of Representatives and soon afterward (1825) was sent to Congress by the Democratic party, serving as Speaker in the Twenty-fourth and Twenty-fifth Congresses. In Congress he won distinction by his industrious habits and readiness in debate. He was one of the chief supporters of President Jackson's administration and gave the same loyal support to Jackson's successor, Martin Van Buren. As Speaker it devolved upon him to preside over the deliberations of the Representatives at a time when party feelings were bitter, and his rulings were frequently appealed from, although usually sustained by the House. After 14 years in Congress he was elected Governor of Tennessee in 1839 and was nominated for the office again in 1841 and 1843, but was each time defeated by the Whig candidate. Nevertheless, his standing among his party associates was not impaired, and when the vigorous opposition to Van Buren made impossible the latter's nomination for the presidency in 1844, especially under the rule which required a majority of two-thirds of all the delegates to the national convention to nominate, Polk was introduced as a compromise candidate and was unanimously nominated on the ninth ballot. The Whig candidate, Henry Clay, had compromised himself in some parts of the country by his attitude in regard to the annexation of Texas, whereas the Democratic platform was moderately acceptable to both North and South through its advocacy of the "reoccupation of Oregon and the reannexation of Texas." Polk received 170 electoral votes, as against 105 for Clay. George M. Dallas was elected Vice President. During his term the Oregon boundary dispute was settled with England, the United States accepting the parallel of 49° as the northern limit, though the party cry that helped to elect Polk was a claim for the entire territory to lat. 54° 40′ N. A dispute regarding the boundary of Texas led, in 1846, to a war with Mexico, which resulted in the acquisition, through the Treaty of Guadalupe Hidalgo (q.v.), of California and New Mexico. The chief event of President Polk's administration relating to internal affairs was the enactment of the tariff law of 1846, which was based on the principles of tariff for revenue only, and the establishment of the independent treasury system. The President set himself against the internal-improvement mania by vetoing a river and harbor bill which appropriated a large sum for improvement purposes. Regarding the slavery question, the debate over the Wilmot Proviso (q.v.) and over the bill to organize the Territory of Oregon were the most notable events. In private life President Polk was unostentatious, frank, and courteous. His habits were extremely simple, and his character exemplary. He died at Nashville, Tenn., June 15, 1849. Consult: J. S. Jenkins, *Life of James K. Polk* (Auburn, N. Y., 1850); G. P. Garrison, *Westward Extension* (New York, 1906); *Diary of James K. Polk*, edited by M. M. Quaife (4 vols., Chicago, 1910); G. L. Rives, *The United States and Mexico* (2 vols., ib., 1913); George Bancroft, "James K. Polk," in J. G. Wilson, *Presidents of the United States* (ib., 1914). See UNITED STATES.

POLK, LEONIDAS (1806–64). An American soldier and first Protestant Episcopal Bishop of Louisiana. He was born at Raleigh, N. C., educated at the University of North Carolina and at West Point Military Academy. While at West Point he came under the influence of Dr. McIlvaine, afterward Bishop of Ohio, and was converted. After graduation he resigned from military service and prepared for the ministry at the theological seminary at Alexandria, Va.,

being ordained at Richmond in 1830. After a year of Church work he traveled in Europe to benefit his health. Upon his return to the United States he removed to Tennessee, and in 1838 the General Convention appointed him Missionary Bishop of the Southwest—a field embracing Arkansas, Indian Territory, Mississippi, Louisiana, and Alabama. He retained this post until elected Bishop of Louisiana in 1841. He formulated a scheme for higher education in the South which finally resulted in the establishment of Sewanee University, a charter for which was granted by the State of Tennessee in 1858. At the outbreak of the Civil War his sympathies were wholly with the Southern cause. His travels in pursuance of episcopal duties made him thoroughly familiar with the Lower Mississippi States, and he urged upon the President of the Confederacy the necessity of their defense. In response he was urged to take a commission, and with the approval of his clerical friends he became a major general in June, 1861, and accepted the command of Department No. 2, which involved the duty of defense of both sides of the Mississippi from the mouth of the Red River to Cairo, with headquarters at Memphis. He commanded the Southern forces in the battle of Belmont, participated in the engagements of Shiloh and in the operations that led up to the evacuation of Corinth, took part in Bragg's invasion of Kentucky as commander of the Army of the Mississippi, and fought in the battle of Perryville. In October, 1862, he was made lieutenant general and fought at Murfreesboro and Chickamauga. In the last-named engagement it was charged by General Bragg that Polk's delay in making attack lost the victory. As a consequence he was temporarily suspended from his command; but the charges were dismissed by President Davis, who offered to reinstate the deposed general. Declining this offer, Polk assumed the charge of paroled prisoners at Enterprise, Miss., and when Gen. Joseph E. Johnston was assigned to the command of the Army of the Tennessee, followed that general in charge of the Department of Alabama, Mississippi, and East Louisiana. He was killed by a cannon shot while reconnoitring the field of Marietta near Pine Mountain. Consult W. M. Polk, *Leonidas Polk, Bishop and General* (New York, 1893; new ed., 2 vols., ib., 1915).

POLK, William Mecklenburg (1844–). An American physician, son of Leonidas Polk, born at Ashwood, Maury Co., Tenn., and served in the Confederate army during the Civil War, advancing from the rank of cadet to captain. After graduating from the College of Physicians and Surgeons, New York, in 1869, he settled in the same city, serving as professor of therapeutics and clinical medicine at Bellevue Hospital Medical College (1875–79), of obstetrics and gynæcology at the University of the City of New York (1879–98), and subsequently as dean and professor of gynæcology at Cornell University Medical College. He also became connected with many hospitals and dispensaries, was president of the New York Academy of Medicine in 1910–14, and is author of *Leonidas Polk, Bishop and General* (1893; new ed., 2 vols., 1915) and of numerous contributions to medical journals, later reprinted.

POLKA, pōl'kȧ (from Boh. *pulka*, half; so called from the half step characteristic of the dance). A round dance supposed to have originated in Bohemia about 1830. The music is in ¼ time and has the rhythmical peculiarity of being accented on the third quaver of the measure:

It was introduced as a fashionable dance into western Europe about 1841 and soon became extremely popular; in France in particular it created a furore. Its movement is lively, though not so rapid as that of the galop.

POLLACK, pŏl'ak (from Gael. *pollag*, whiting, Ir. *pullog*, pollack), or Pollock. A codfish (*Pollachius virens*), common on both coasts of the North Atlantic and more commonly known in the United States as coalfish. It is dark greenish brown above, sides and below being somewhat silvery. It attains a weight of about 30 pounds and is of value as a food fish. Its habits differ from those of the cod or haddock, for it is to a great extent a surface-swimming fish and congregates in large schools, which swim about in search of young fishes as food; but they also feed at the bottom like cod. They seem to spawn while swimming about, and their eggs float and hatch in five or six days. Their flesh is highly esteemed, especially about the Gulf of Newfoundland, and their liver yields an excellent oil in large quantities.

The Alaskan pollack (*Nieragra chalcogramma*) is a very similar fish, abundant in the North Pacific, and especially in Bering Sea, where it furnishes the larger part of the food of the fur seal and is of great value to the natives of both coasts. It is uniformly dark olive and reaches a length of 3 feet. Another more sooty species, the wall-eyed pollack (*Nieragra fucensis*), is numerous in Puget Sound and on the California coast.

Consult G. B. Goode, in *Fishery Industries*, sec. 1 (Washington, 1884). See Plate of Codfish.

POLLAIUOLO, pōl'lī-wō'lō, Antonio (1429–98) and Piero (1443–96). Florentine artists of the early Renaissance. Antonio stood at the head of the most popular bottega (workshop) in Florence, in which labored many assistants and pupils. Its product consisted of goldsmith's work, sculptures (especially bronzes), paintings, niello (q.v.), enamels, and all manner of decorative work. In engraving he was associated with the well-known Finiguerra (q.v.). He was patronized by the Medici and the Signory of Florence and wrought especially for the cathedral, in the museum of which his imposing silver relief, "The Beheading of St. John Baptist," and sumptuous embroideries after his designs still survive. In 1484, following the summons of Pope Innocent VIII, he removed with Piero to Rome. There he modeled his two most important surviving works, the fine bronze tombs of Pope Sixtus IV (1493) and Innocent VIII (1498) in St. Peter's, and died in 1498, two years after his brother. Antonio was, after Verrocchio, the chief bronze sculptor of the later fifteenth century. His work is executed with a goldsmith's fineness and love for detail; it lacks breadth and inspiration, but it is unsurpassed in the rendition of movement, both in sculpture and in painting—for in this regard Antonio made greater progress than any other artist of the century. He was also the first to study anatomy systematically, in the modern sense. He appears to greatest advantage in studies taken direct from nature, probably intended as models for his pupils—like the small

bronze "Hercules Strangling Antæus," the very quintessence of movement, his pictures of the same subject and of "Hercules Slaying the Hydra," and his engraving of "Ten Fighting Nudes," all in the Uffizi Gallery. The same collection possesses a bust of a "Young Warrior," probably by him.

In his paintings he was often assisted by his brother Piero, who, generally speaking, worked after Antonio's designs. A pupil of Baldovinetti, Piero lacked force and originality, being entirely under Antonio's influence. The best of Antonio's paintings are the frescoes of dancing figures in the Torre del Gallo, Florence; "David," in the Berlin Museum, and "Apollo and Daphne," in the National Gallery, London. Of the "Five Virtues" in the Uffizi, two are entirely by Piero. The recently uncovered frescoes at Staggia, near Siena, and the well-known "Tobias and the Angel," at Turin, are probably joint work. Among portraits assigned to one or the other are "Galeazzo Sforza," in the Uffizi, and "The Profile of a Lady," in the Gardner collection, Boston. Berenson attributes to Antonio "Hercules and Nessus," in the Jarves collection, Yale University, and a large fresco of "St. Christopher Bearing the Infant Christ," in the Metropolitan Museum, New York; but the latter is probably a "school" picture. The only signed picture by Piero is his "Coronation of the Virgin," in the collegiate church of San Gemigniano. Consult: Giorgio Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects*, vol. ii (Eng. trans. by Blashfield and Hopkins, New York, 1896); Maud Crutwell, *Antonio Pollaiuolo* (London, 1907); Kenyon Cox, in *Painters and Sculptors* (New York, 1907); Bernhard Berenson, *Florentine Painters of the Renaissance* (ib., 1909).

POLLAIUOLO, SIMONE DEL (1457–1508). An Italian architect. He was born in Florence and spent a number of years in Rome devoted to the study of the monuments of antiquity. He was a keen observer, and from his habit, after his return to Florence, of describing with great minuteness the sights of the Eternal City, the nickname Il Cronaca (the chronicler) was bestowed upon him by his fellow artists. In 1495 he was appointed chief architect of the Duomo. After the death of Benedetto da Majano he became the architect of the Palazzo Strozzi, to the façade of which he added the splendid cornice, his inimitable masterpiece. He built also the Palazzo Guadagni (now Palazzo Dufour-Berte), a handsome structure in the early Renaissance style, and the church of San Francesco or San Salvatore al Monte, an edifice imposing in its very simplicity and chaste proportions, which was greatly admired and praised by Michelangelo. Among the few other works that may be ascribed to him with certainty are portions of the sacristy of San Spirito, the court of the Palazzo Strozzi, and the great hall in the Palazzo Vecchio. Consult Anderson, *The Architecture of the Renaissance in Italy* (London, 1896), and Geymüller-Stegmann, *Die Architektur der Renaissance in Toscana* (Florence, 1885–96).

POL'LANARRU'A. A ruined city of Ceylon, in the Province of Tamankadme, about 60 miles northeast of Kandy; now called Toparé. It was the capital of the island in 769–1235. Its golden age was in the reign of Prakrama Bahoo I (1153–86), who fortified it, built a royal palace, a monastery and residence for the priesthood, the superb Rankot Dagoba, and many other public buildings. When the Malabars took it, about 1204, they demolished it and reduced it to its present condition. The most remarkable building is the Jaitawanarama Temple. Opposite the entrance is an image of Gautama Buddha 50 feet high. The Sat Mahal Prasada is a handsome pyramidal building. The palace of Prakrama Bahoo I is on the borders of the Toopawewa, an artificial lake.

POL'LARD, ALBERT FREDERICK (1869–). An English historian, born at Ryde, Isle of Wight. Educated at Jesus College, Oxford, he became fellow of All Souls. From 1893 to 1901 he was assistant editor of the *Dictionary of National Biography*. He was professor of English history in the University of London and in 1913 was the first Goldwin Smith lecturer at Cornell University. His special field was Tudor England. Pollard wrote (besides many articles for the *Dictionary of National Biography*, the *Cambridge Modern History*, the *Encyclopædia Britannica*, and vol. vi, 1547–1603, of Hunt and Poole's *Political History of England*): *The Jesuits in Poland* (1892); *Thomas Cranmer and the English Reformation* (1898); *England under Protector Somerset* (1900); *Henry VIII* (1902; rev. ed., 1905, 1913); *Factors in Modern History* (1907); a short *History of England* (1912); *The Reign of Henry VII, from Contemporary Sources* (3 vols., 1913–14); *The War: Its History and its Morals* (1915).

POLLARD, CHARLES LOUIS (1872–). An American botanist, born in New York City. He was educated at Columbia (A.B., 1893; A.M., 1894), served as an assistant curator in the United States Department of Agriculture (1894–95) and in the United States National Museum (1895–1903), and in 1907 became curator in chief of the Public Museum of Staten Island, N. Y. After 1897 Pollard served also as editor of the *Plant World*. He contributed to *Webster's International Dictionary* in 1900 and to the *Century Dictionary* in 1903 and was editor for botany and horticulture of *Webster's New International Dictionary*.

POLLARD, EDWARD ALBERT (1828–72). An American journalist, born in Nelson Co., Va. He graduated at the University of Virginia in 1849, studied law, went to California and engaged in journalism until 1855, and then traveled extensively in Europe and in the Orient. At the beginning of the Civil War he was preparing for the Episcopal ministry. From 1861 until its suppression by the military authorities in 1865 he was an editor of the Richmond *Examiner*, but, nevertheless, a merciless critic of President Davis. Near the close of the war, while attempting to run the blockade on his way to England, he was captured and imprisoned for eight months in Fort Warren and Fortress Monroe. His books include: *Black Diamonds Gathered in Darky Homes of the South* (1859), an attempt to show the bright side of slavery; *Letters of a Southern Spy in Washington and Elsewhere* (1861); *Southern History of the War* (1862–66); *The Lost Cause* (1866), a shorter history of the war; *Lee and his Lieutenants* (1867); *Life of Jefferson Davis, with Secret History of the Southern Confederacy* (1869). His books show considerable literary ability, but his violent prejudices prevented any sort of fairness to the objects of his dislike.

POL'LARDING (from *pollard*, from *poll*, head). The process very commonly practiced in

Europe of cutting off the crown of a tree to make it throw out numerous water sprouts from the top of the remaining trunk. Trees so treated, called pollards, are not beautiful, but are useful in districts where fuel is scarce, since the branches are cut every third or fourth year. The practice is not common in the United States. Trees of rapid growth, such as willows, poplars, alders, elms, and limes, are most frequently pollarded. While the operation apparently injures the tree, it should be noted that many of the oldest trees in Europe, and the largest in diameter, have been continuously pollarded. See Plate of WILLOWS.

POLLED DURHAM. See CATTLE.

POL'LEN (Lat., fine flour, fine dust). A name applied to the microspores of seed plants and popularly regarded as the "fertilizing dust" produced by flowers. See SPORE.

POLLEN, JOHN HUNGERFORD (1820–1902). An English artist and writer, born in London. He graduated M.A. at Christ Church, Oxford, in 1844 and was fellow of Merton College in 1842–52. In 1855–57 he served as professor of fine arts at the Catholic University of Ireland, Dublin. Pollen was among the first to reintroduce fresco decoration into England and after 1860 had many commissions for that kind of work. In 1863–76 he was connected with the art and industrial department of South Kensington (now Victoria and Albert) Museum. His publications include: *Universal Catalogue of Books on Art* (3 vols., 1870–77); *Ancient and Modern Furniture and Woodwork* (1873; 3d ed., rev. by T. A. Lehfeldt, 1908); *Ancient and Modern Gold and Silversmith's Work* (1876).

POLLEN'TIA. An ancient place in north Italy, on the Tanarus, represented by the modern little town of Pollenzo, 33 miles south of Turin, near Bra. The ruins of an aqueduct, an amphitheatre, a theatre, and a temple mark the site of the ancient city, where Alaric and Stilicho fought in 402 or 403 A.D.

POLLENZO, pŏl-lĕn'tsō. See POLLENTIA.

POLL-EVIL. A painful swelling on the head or the neck of horses, which if not attended to may become a troublesome and serious ulcer. It may be caused by striking the head against a beam, straining against the halter, or by the use of an excessively tight rein when driving. If the swelling continues to increase and pus forms it must be lanced. Drainage must be promoted — a seton sometimes being used for this purpose — to prevent bone involvement. This is all the treatment required, except fomentations of tepid water to insure cleanliness, if the disease be taken in its early stages.

POLLICEM PREMERE. See POLLICE VERSO.

POLLICE VERSO, pŏl'lĭ-sē vĕr'sō (Lat., with thumb turned). The sign by which the spectators at the Roman gladiatorial combats expressed their wish that the vanquished gladiator should be put to death. (Consult Juvenal, iii, 36.) The exact nature of this sign is unknown; for a careful discussion of various views concerning it, consult E. Post, "Pollice Verso," in the *American Journal of Philology*, xiii, 214–225 (Baltimore, 1893). Post himself, holding that the thumb symbolized the short Roman sword, suggested that the gesture which meant the death of the vanquished gladiator was given by turning the hand over, into an unnatural position, with the thumb (sword) pointing at the defeated man. The gesture which called for the release of the defeated man (expressed in Latin by the phrase *pollicem premere*) Post thought to consist in hiding the thumb entirely (i.e., sheathing the sword). The famous painting, "Pollice Verso," by Gérôme, shows the victor standing over his prostrate rival and looking up to the benches for the verdict of the spectators, who are represented with thumbs turned down.

POL'LINA'TION. Transference of the pollen (q.v.) from the stamen of a flower to the stigma of the same flower (self or close pollination) or to that of another flower (cross-pollination). Several terms associated with these processes may be here defined: *autogamy*, self-pollination of flowers; *allogamy*, cross-pollination; *geitonogamy*, cross-pollination between two flowers upon one plant; *xenogamy*, between flowers of different plants. Flowers containing both stamens and pistils are called *monoclinous*, or *hermaphroditic;* if stamens are in one flower and pistils in another, but both kinds are on the same plant, the plants are said to be *diclinous* and *monœcious* (Fig. 1); if on different plants, *dicœcious* (Fig. 2). *Anthesis* is the period during which pollination is possible; flowers that remain closed during this period exhibit *cleistogamy* (q.v.), those that open all or part of the time exhibit *chasmogamy*. Flowers the stamens or pistils or both of which are of unequal lengths are said to show *heteromorphism;* if two lengths occur, *dimorphism* (Fig. 3); if three are present, *trimorphism*. In *homogamous* flowers the stigmas mature when the pollen grains are shed; in *dichogamous*, these two periods differ. If the stigmas mature first, the flower exhibits *protogyny* or

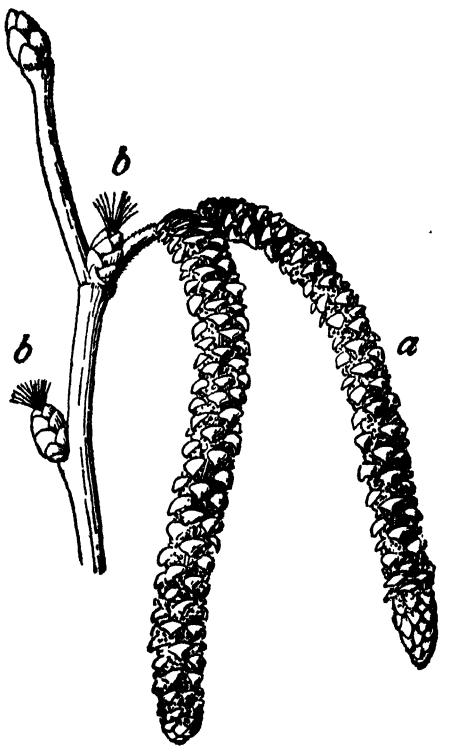


FIG. 1. MONŒCISM.

proterogyny; if the pollen grains are shed first, *protandry* or *proterandry* (Fig. 4).

In general, cross-pollination seems to be somewhat advantageous to plants because it is sup-

FIG. 2. DIŒCISM.

Catkins of the crack willow (*Salix fragilis*), the lower staminate, the upper pistillate. These catkins are borne on separate plants, thus insuring cross-pollination.

posed to prevent close inbreeding, which in both plants and animals appears to result in degeneracy. The reason for this is not known.

There are various devices by which cross-pollination is obtained. The most perfect device is

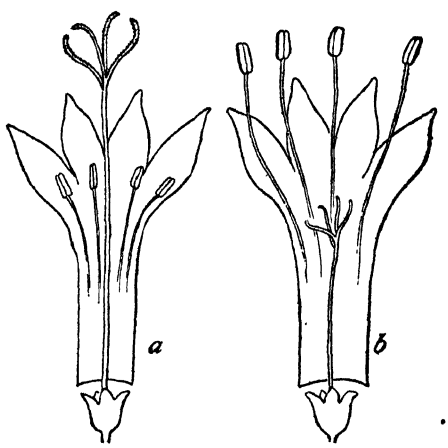

FIG. 3. DIMORPHISM.

Flowers of the *Houstonia*, illustrating a means for facilitating cross-pollination. In *a* the styles are long and the stamen filaments short; while in *b* the reverse is true. Pollen obtained from anthers on long stamens is likely to be brushed off upon the stigmas of the long styles; while pollen from the short stamens will be brushed off upon the stigmatic surface of the short styles.

the so-called diœcious habit illustrated by the willows (Fig. 2). In the so-called monœcious habit (Fig. 1) cross-pollination is less certain, though it is often facilitated by the pistillate flowers being uppermost on the tree. In the case of insect-pollinated flowers cross-pollination is sometimes secured by protandry (Fig. 4) or protogyny. In many cases the stigma when mature

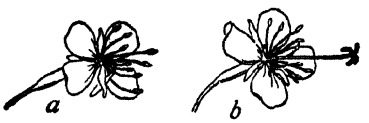

FIG. 4. PROTANDRY.

Flowers of a fireweed, showing a young condition (*a*), in which the stamens, but not the stigmas, are mature, and an older condition (*b*), in which the pollen has gone, while the stigmas are mature. Cross-pollination is thus effected.

is higher than the stamens, and hence self-pollination is difficult. Perhaps the most effective device to insure cross-pollination is the impotence of the pollen upon the stigma of the same flower and even of other flowers on the same plant. It must be remembered that in some plants self-pollination is not only possible but even common. It is invariably the case in cleistogamous flowers. (See CLEISTOGAMY.) In the subterranean flower of the violet self-pollination is necessary, and the rich development of seeds shows that it is effective.

Pollination is effected in various ways in plants, among which the most important are the following: 1. Insect pollination. In a vast

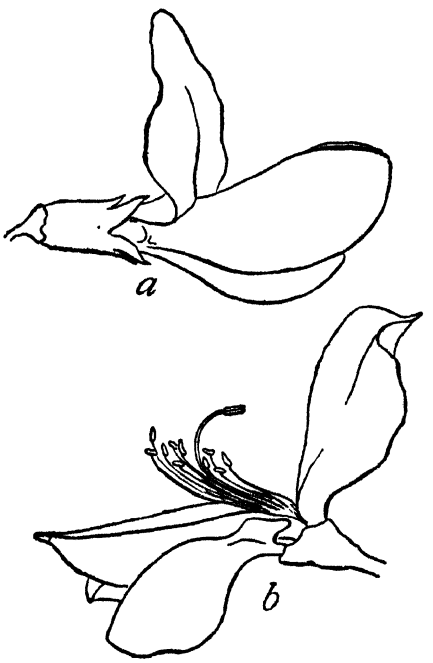

FIG. 5. INSECT POLLINATION.

The flower of a legume, showing the normal condition (*a*) and the condition which appears when an insect alights on the flower (*b*). It is obvious that insect pollination can be readily effected here.

number, perhaps even the majority of plants, pollen is transferred by insects. The structure of the insect-pollinated flowers is commonly more or less complicated and differs somewhat widely from that of flowers pollinated in other ways (Fig. 5). For example, the corollas are commonly prominent and highly colored, and it is

believed that insects are more likely to visit flowers if their corollas are colored. Some experiments, however, appear to show that color may not serve conspicuously as an attraction. Many flowers are attractive to insects because of their fragrance, which is a device to secure cross-pollination. The pollen of insect-pollinated flowers is often comparatively sticky and heavy. A large number of structures are found in these flowers which appear to favor certain insects and oppose others. Among the more striking of these devices is a long corolla tube which favors insects with a long proboscis. In general, insect-pollinated flowers are rich in nectar, which is often the lure for the visit of insects. Other flowers are visited for their pollen, of which many insects are fond. 2. Bird pollination. A comparatively small and in North America unimportant number of flowers are pollinated by birds, especially humming birds. 3. Wind pollination is common with a large number of plants, especially trees, grasses, and sedges, in which the flowers differ from insect-pollinated flowers in the relative absence of showiness, nectar, odor, etc. These flowers are also comparatively small. The pollen is usually light, easily carried by the wind, and is also produced in very large quantities. Pine

pollen is particularly interesting in that it is winged (Fig. 6, *a*). It is so abundant that it sometimes forms the so-called sulphur showers. 4. Water-pollinated flowers. A small number of aquatic plants are pollinated by means of water currents. In some cases, as in *Vallisneria*, a somewhat complex mechanism is present.

POL'LIO, GAIUS ASINIUS (70 B.C.–4 A.D.). A Roman orator, politician, soldier, and author of considerable merit. He was born in Rome, but belonged to a family of Marrusinian descent. When civil war broke out between Cæsar and Pompeius, Pollio sided with the former, was present at the crossing of the Rubicon, and took part in the battle of Pharsalus (48 B.C.). At the time of Cæsar's assassination Pollio was Governor of Further Spain and was carrying on the war against Sextus Pompeius. In the subsequent struggles he sided with the triumvirate against the oligarchic senate and, on the triumph of the former, was appointed administrator of Gallia Transpadana, in which capacity he helped to save the property of the poet Vergil, near Mantua, from confiscation. After Antonius and Octavianus had quarreled, Pollio effected their temporary reconciliation at Brundusium (40 B.C.); in the next year he conducted a successful campaign against the Parthini, a people of Illyria, and in consequence obtained a triumph. After this event, however, he withdrew from political life. Besides having a reputation for oratory, Pollio was celebrated as a historian, poet, and critic. (Consult Horace, *Odes*, ii, 1.) His literary and political criticism of his contemporaries, in particular, appears to have been valuable. He deserves remembrance also as a distinguished patron of Catullus, Horace, Vergil, and other men of letters and as the founder of the first public library at Rome. Of the writings of Pollio we possess only three letters to Cicero (published among Cicero's correspondence *Ad Familiares*, v, 31–33), and a few fragments of his *History of the Civil Wars*, collected by Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1883). Wölfflin would attribute to Pollio the *Bellum Africanum* (published with Cæsar's works by Dinter, Leipzig, 1890), but this theory is not generally accepted. Consult: Landgraf, *Untersuchungen zu Cæsar und seinen Fortsetzern* (Erlangen, 1888); Wölfflin and Miadoriski, *Pollionis de Bello Africo Commentarius* (Leipzig, 1889); Schmalz, *Ueber den Sprachgebrauch des Asinius Pollio* (Munich, 1890); Kornemann, *Die historische Schriftstellerei des Asinius Pollio* (Leipzig, 1896); V. Gardthausen, *Augustus und seine Zeit*, vol. i (1896–1904); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part i (3d ed., Munich, 1911). In "A Witticism of Asinius Pollio," in the *American Journal of Philology*, xxxvi (Baltimore, 1915), G. L. Hendrickson discusses anew Pollio's charge that the writings of the historian Livy (q.v.) were marked by *patavinitas*.

POLLIO, VITRUVIUS. See VITRUVIUS POLLIO.

PÖLLNITZ, pĕl'nĭts, KARL LUDWIG, BARON VON (1692–1775). A German memoirist. He was remarkable for his talents, but his extravagant and vagabond habits often reduced him to the greatest poverty. After wandering all over Europe, taking service in the Church in Austria and in the army in Spain, he finally attracted the favorable notice of Frederick the Great, who appointed him his reader and made him director of the theatre at Berlin. After changing twice from Catholicism to Calvinism, shortly before his death he proclaimed himself a member of the Church of Rome. Among his works, marked by keen observation and wit, are *Lettres et mémoires* (1734) and *Etat abrégé de la cour de Saxe, etc.* (1734). He was probably also the author of *Histoire secrète de la duchesse d'Hanovre, etc.* (1732) and *La Saxe galante* (1734).

POL'LOCK. See POLLACK.

POLLOCK, SIR FREDERICK (1845–). An English jurist and author, nephew of Field Marshal Sir George Pollock, brother of Walter Herries Pollock, and father of John Pollock. He was born in London, Dec. 10, 1845, and was educated at Eton and at Trinity College, Cambridge, of which he was made fellow in 1868. Called to the bar at Lincoln's Inn (1871), he served as examiner in law at Cambridge (1879–81); as professor of jurisprudence at University College, London (1882–83), Corpus professor of jurisprudence at Oxford (1883–1903), and professor of common law in the Inns of Court (1884–90); as a member of the Royal Labor Commission (1891–94) and as chairman of the Royal Commission on Public Records (1910). In 1914 he was ap-

pointed Judge of the Admiralty Court of the Cinque Ports. Pollock became a fellow of the British Academy in 1902, honorary fellow of Corpus Christi, Oxford, in 1906, and Privy Councilor in 1911. In 1888 he succeeded his father as third Baronet of the name. From 1895 he edited the British Law Reports. His works pertaining to the legal profession comprise mainly: *Principles of Contract* (1876; 8th ed., 1911); *Digest of the Law of Partnership* (1877; 10th ed., 1915); *The Land Laws* (1882; 3d ed., 1895); *The Law of Torts* (1887; 9th ed., 1912); *Law of Fraud* (1894); *History of English Law* (1895; 2d ed., 1898), with Frederick William Maitland (q.v.); *A First Book of Jurisprudence* (1896; 3d ed., 1911); *The Expansion of the Common Law* (1904); *The Genius of the Common Law* (1912), lectures at Columbia University. In the same field are his valuable introduction and notes to Maine's *Ancient Law* (1906; 2d ed., 1908). Better known to the general reader is *Spinoza: His Life and Philosophy* (1880; enlarged ed., 1912). Further versatility is shown by his *Introduction to the History of the Science of Politics* (1890; rev. ed., 1911) and by many brilliant political articles contributed to the *Pall Mall Gazette* and the *Saturday Review*. Pollock also wrote verse parodies of typical law cases: *Leading Cases Done into English* (1877), popular from the first, and reissued, enlarged (*with Other Diversions*), in 1892; and in 1899, with Ella Fuller Maitland, he published *The Etchingham Letters*, a clever novel in epistolary form. Consult his *Personal Reminiscences* (London, 1887).

POLLOCK, Sir George (1786–1872). A British soldier. He studied at the Royal Military Academy at Woolwich until 1803 and then entered the East India Company's service as a lieutenant of artillery. He arrived in India towards the end of the Mahratta wars, at once went to the front, and participated in the sieges of Deeg (Nov. 12–Dec. 25, 1804) and Bhurtpore (Jan. 4–April 2, 1805). During the First Burmese War he took an important part in the military operations and at its close was invalided home. In 1838 he was promoted major general and in 1842 was assigned to command the British forces in the war against the Afghans. He forced the Khyber Pass and captured Kabul. For these services he received a pension of £1000 from the East India Company and many honors from the Indian and British governments. In 1870 he was commissioned field marshal in the British army, a year later was made constable of the Tower of London, and in 1872 was created Baronet. He was the uncle of Sir Frederick and Walter Herries Pollock. Consult C. R. Low, *Life of Field-Marshal Sir George Pollock* (London, 1873), and Sir J. W. Kaye, *History of the War in Afghanistan in 1838 to 1842*.

POLLOCK, John (1878–). An English playwright and historical writer, son of Sir Frederick Pollock. He was educated first at Eton, graduated M.A. at Trinity College, Cambridge, in 1903, studied at the University of Vienna in 1901 and at Harvard Law School in 1903–04. In 1906 he was called to the bar, but soon turned his attention to writing for the stage. Among his plays are: *The Invention of Dr. Metzler* (1905); *Rosamond* (1910); *The Love of Mrs. Pleasance* (1911); *Madame Diana* (1913); *Anna Karénina* (1913), from Tolstoy's novel. Pollock also translated Ibsen's *A Doll's House* and *Hedda Gabler* (1911); Tolstoy's *The Man who was Dead* (1912); Brieux's *Damaged Goods* (1914). In another field he published *The Popish Plot* (1903) and contributed to the *Cambridge Modern History*.

POLLOCK, Walter Herries (1850–). An English author, nephew of Sir George Pollock and brother of Sir Frederick Pollock, third Baronet. He was born in London and was educated at Eton and at Trinity College, Cambridge, where he graduated with classical honors in 1871. Though called to the bar at Lincoln's Inn (1874), he early began to give most of his time to journalism and literature. From 1883 to 1894 he was editor of the *Saturday Review*. His work includes, among other writing, much graceful and humorous verse: *Lectures on French Poets* (1879); *The Poet and the Muse* (1880), a metrical translation from Alfred de Musset's *Nuits; Songs and Rhymes, English and French* (1882); *The Picture's Secret* (1883), a novel; *The Paradox of Acting* (1883), translated from Diderot; *Verse of Two Tongues* (1884); *Old and New* (1890), verse; *A Nine Men's Morrice* (1889) and *King Zub* (1892), two volumes of fantastic tales; *Mémoires inédits du Marquis de* ——— (French, 1894); *The Charm, and Other Drawing-Room Plays* (1896), with Sir Walter Besant; *Jane Austen: Her Contemporaries and Herself* (1899); *Impressions of Henry Irving* (1908); *The Art of the Hon. John Collier* (1914).

POL'LOK, Robert (1798–1827). A Scottish poet, son of a poor farmer. He was born at North Moorhouse, Renfrewshire; was educated at the University of Glasgow (M.A., 1822) and for the ministry at the United Secession Hall (1822–27), was licensed to preach (1827), and died of tuberculosis after setting out to visit Italy for his health. Pollok's *The Course of Time* (1827), a long essay in blank verse treating of the destiny of man, was popular on both sides of the Atlantic. He had written earlier *Tales of the Covenanters*. Consult the *Life* by his brother, David Pollok (Edinburgh, 1843).

POL'LOKSHAWS. A municipal borough and manufacturing town in Renfrewshire, Scotland, on the White Cart, 3 miles southwest of Glasgow of which it is virtually a suburban extension, connected by electric street railroads, etc. Many working people employed in Glasgow live here. Cotton spinning, calico printing, silk weaving, bleaching, iron founding, and fancy dyeing are extensively carried on. Pop., 1901, 11,183; 1911, 12,932.

POLL TAX. See Capitation; Tax.

POLLU'TION OF WATERCOURSES (Lat. *pollutio*, from *polluere*, to defile, from *por-*, forth + *luere*, to wash). By the common law owners of real property adjoining running streams are entitled to make such a use of their waters as will not inflict material damage or an unreasonable degree of discomfort upon owners above and below them on the stream. In some of the United States the common-law rule has been modified so as to permit riparian proprietors to make any use of the stream which, under all the circumstances and taking into account the needs of all other riparian proprietors affected by such use, will be deemed a reasonable one. This modified doctrine has generally come to prevail with respect to mill streams in the New England States. As this doctrine of "reasonable user" is applied, no absolute and definite rule can be framed as to what extent the waters of a stream can be polluted or contaminated by an adjoining owner. As streams are natural means of drainage of land, it has been held that a city

cannot be restrained from causing its sewage to flow into a stream, unless an unusual or unreasonable quantity is discharged therein. Mills and other industries along a stream naturally impair the quality of the water somewhat, but as a general rule the courts will "not interfere if they are adapted to the stream and do not cause it to give off odors which are injurious to health." The discharge of dye materials, poisonous chemicals, unusual quantities of sawdust, and other waste into a stream, has been restrained in various jurisdictions.

The remedies of a riparian owner who is injured by pollution of a stream are to seek an injunction and damages in a court of equity, or sue for damages alone, in a court of law. Consult: Angell, *The Law of Watercourses* (7th ed., Boston, 1877); Haworth, *River Pollution* (1897); Gould, *Treatise on the Law of Waters* (3d ed., Chicago, 1900). See NUISANCE; RIPARIAN RIGHTS.

POLLUX. See CASTOR AND POLLUX.

POLLUX, JULIUS (Gk. Ἰούλιος Πολυδεύκης, *Ioulios Polydeukēs*). A Greek lexicographer who was born at Naucratis in Egypt and flourished in the reign of the Emperor Commodus (180–192 A.D.). After a preparatory training under his father he studied under the Sophists and became a learned critic of grammar. He opened a school of rhetoric at Athens and won such fame that he became preceptor of the Emperor Commodus. He prepared for the use of the Emperor an *Onomasticon*, a Greek vocabulary divided into 10 books, designed to facilitate the learning of the Greek language by the young prince. It contains a variety of synonymous words and phrases, is useful in the study of Greek literature and art and of the Greek theatre, and is valuable also because in the first part it treats of the gods and their worship. Pollux was the author of several other works, of which Suidas has preserved the titles. The *Onomasticon* was published with Latin translation and commentary by Dindorf (5 vols., Leipzig, 1825), by Bekker (Berlin, 1846); the text was edited by E. Bethe (Leipzig, 1900). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., Cambridge, 1906); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

POLNISCH-OSTRAU, pōl'nĭsh-ōs'trou. A town in the Crownland of Silesia, Austria, on the Ostrawitza, opposite Mährisch-Ostrau, 60 miles west-southwest of Cracow. Its importance is owing to the extensive coal deposits of the neighborhood, which form the southwestern part of the great Upper Silesia coal belt. The town produces malt and liquors. Pop., 1900, 18,800; 1910, 23,151, chiefly Czechs.

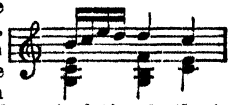
POLO (from Tib. *pulu*, ball). A game played on horseback and closely resembling hockey (q.v.). While polo is the most ancient of all games of stick and ball, its introduction into England and thence into America is of relatively recent date. Having its origin in Persia, where certain odes thought to antedate the Christian era celebrate the glories of the game, it spread to Byzantium, Turkestan, and other Eastern centres until it came, by way of Tibet, to Hindustan. Little exact information can be gleaned about polo in India during its early days there. Several varieties, such as Gilgit and Manipur polo, still exist, but it was not until the later sixties that officers of English cavalry, lancers and hussars mainly, took to the game, promulgated rules, and systematized the play. Introduced in England, the sport at once sprang into favor, and the Hurlingham Club Polo Committee, established in 1875, is still the governing body of the game for Great Britain and her colonies. It may be said to be the headquarters of army polo, while the Ranelagh Club of Barnes occupies a like position in county polo. There are 41 clubs affiliated to the English County Polo Association. It is essentially an army game, and there are few regiments in the British service without one or more polo teams. In the United States the game is growing in popularity, particularly on the Pacific coast. Introduced in 1876 by James Gordon Bennett and fostered by H. L. Herbert, chairman of the American Polo Association, it gains every year in number of players. It is gratifying to Americans to remember that they have improved the game and instituted certain changes that were later adopted by English players. These changes were largely the outcome of the series of international matches for the American International Challenge Cup presented by the Westchester Polo Club, of Newport, R. I. Under the conditions the Hurlingham Club was to select the English team and (since 1901) the Polo Association of America the American team. The first match was played at Newport, R. I., in 1886, England winning both matches. In 1900, at Hurlingham, England again won. In 1902 England retained possession of the cup by winning two of the three matches. In 1909 the United States regained the cup after 23 years, winning two straight matches. The United States team, known sometimes as the "big four," consisted of H. P. Whitney, J. M. and L. Waterbury, and Devereux Milburn. In 1911, at Meadow Brook, L. I., this team defeated Hurlingham in two straight matches. Two years later the invading team met like defeat. In 1914 England regained the cup after five years, winning two straight matches. Harry Payne Whitney did not play, the new member being René La Montagne.

It was owing probably to the three successive defeats by the American team that England lost confidence in the polo tactics hitherto accepted, and adopted in a measure those of her successful adversaries. In a word, she discarded the close combination and short pass for the faster-riding and longer-hitting game of Whitney's men. Where the English team had been content with a scientific passing and relatively slow game, they found themselves opposed to a different and more successful type of play calling for harder and more accurate hitting than that to which they had accustomed themselves. That the adoption of this change aided their victory of 1914 is hardly open to doubt. The off-side rule, which has no place in the American game and has been modified in England, was another cause of the faster pace in America. So much faster has the game become of recent years that the time of the periods, or chukkers, has been reduced. Where formerly these periods were four 15-minute periods of play with seven minutes' rest between them, they are now, in a match game between teams of four, eight periods of seven and a half minutes each with three-minute intervals between all periods for change of ponies except after the fourth period, when a seven-minute interval is allowed. When polo was first brought from India the height of the ponies was lower than 14 hands. Later the Hurlingham authorities raised it to 14 hands and 2 inches. American

players have not rigorously conformed to this standard, as has been seen in recent international matches. On March 17, 1915, the executive committee of the Polo Association meeting at the Whitehall Club changed the rule calling for ponies of 14 hands and 2 inches and permitted players to ride horses of 15 hands and 1 inch. The word "ponies" was changed to "mounts." As mounts of this height have been used constantly, this will hardly affect the pace of polo.

Polo is played on a field which should be 900 feet long by 450 feet wide. The goal posts are 24 feet apart, at least 10 feet high, and light enough to break if collided with. The balls are of wood (bamboo root, English willow, or basswood) having no covering but white paint, 3⅛ inches in diameter and not more than 5 ounces in weight. The mallets, from 50 to 56 inches long, are of malacca cane or rattan, with heads of maple, sycamore, bamboo, or ash. The game can be played by teams of two, three, or four players, but in discussing polo the match team of four players is invariably meant. A team is made up of players designated as numbers one, two, three, and back; one and two are forward, three is a half-back, and back protects the goal as the last line of defense. Number one usually rides off the opposing forward to give number two a chance to shoot for goal. A goal counts as one point, a safety minus one-quarter, and a foul minus one-half. A safety is when a player, to save his goal, hits the ball behind the goal line. This method of scoring penalties had its origin in the United States and modifies the fortunes of the game considerably. For instance, in the second international match of 1914, which England won, both teams scored five goals, but the American team lost two and a quarter points by penalties and the English team only one. Fouls may be claimed for foul riding or dangerous horsemanship.

In order that players of varying degrees of skill may contend together on some sort of equal basis, a system of handicapping has been arranged. This does not apply to open or championship games. Teams whose handicaps aggregate less than those of their competitors are allowed the number of goals between their own handicap and that of their competitors. In tournament events the handicap of any player is not less than one goal. The highest handicap assigned in the United States is nine. Consult: T. F. Dale, *Polo, Past and Present* (New York, 1905); T. B. Drybrough, *Polo* (ib., 1906); E. D. Miller, *Modern Polo* (3d ed., ib., 1911).



POLO, pō'lō, GASPAR GIL (c.1530–91). A Spanish poet, born at Valencia. Philip II appointed him, in 1572, coadjutor to the president of the upper financial chamber of the Kingdom of Valencia and in 1580 sent him to superintend the royal patrimony at Barcelona, where he died. Besides his *Canto de Turia* in praise of his native city, he wrote a notable continuation of Montemayor's *Diana*, under the title *Diana enamorada* (Valencia, 1564). A convenient edition is that of Francisco Cerdá y Rica (Madrid, 1778; new ed., 1802; consult also the edition in the *Biblioteca clásica española*, Barcelona, 1886). Polo's *Diana* was translated into English by Bartholomew Young (London, 1583–92).

POLO, MARCO (c.1254–1324). The most celebrated traveler of the Middle Ages. He belonged to a noble Venetian family. His father, Nicolò Polo, and his uncle, Maffeo Polo, went about 1249 to the Crimea and from there journeyed to Cathay or China. Here they were received by the famous Kublai Khan (q.v.), returning home in 1269. When they set out again for the East, in 1271, Marco Polo, who had been born during his father's absence, went with them. The three travelers crossed western Asia and Tartary and reached China and the Great Khan in 1275. They were received with great honors, and young Marco received various high offices; at one time he administered a whole province for three years. The three Europeans finally became restless in this distant land, and, though the Khan was unwilling to allow them to depart, they at last obtained permission to accompany an embassy to Persia. From there they journeyed to Venice, reaching their native city in 1295. Marco Polo commanded a vessel in a war against Genoa in 1298, was taken prisoner, and was not released until the following year. Meanwhile he dictated in French an account of his journey to Rustichello of Pisa, who entitled the work *The Book of Marco Polo*. It was translated almost immediately from the French text of Rustichello into many other languages. For centuries it comprised all the knowledge Europe possessed of the extreme East, and though Marco Polo was at one time accused of exaggeration in many particulars, subsequent travels have proved the accuracy of his observations. Little is known of Polo's history after he left the Genoese prison, beyond the fact that a wife and three daughters survived him. Consult: C. R. Beazley, *Dawn of Modern Geography*, vol. iii (Oxford, 1906); the best edition of his work is that of Sir Henry Yule, *The Book of Sir Marco Polo* (3d ed., 2 vols., New York, 1903). Among the many other editions in English may be mentioned the one in the Bohn Library, edited by Thomas Wright (London, 1904). An edition called *Travels of Marco Polo*, translated by William Marsden, is to be had in the Everyman's Library (New York, 1908).

POLOCK. An ancient city of Russia. See POLOTSK.

POLO DE MEDINA, pō'lō dā mā-dē'nä, SALVADOR JACINTO (c.1607–c.60). A Spanish poet, born in Murcia. He took orders early in life, and when about 30 years old became secretary to the Bishop of Lugo. He wrote much satirical verse in his youth in the manner of Cervantes and Quevedo. His *Academias del jardin, Buen humor de las musas Apolo y Dafne*, and *Pan y Siringa* were all printed in 1630. His *Hospital de incurables, viaje de este mundo al otro* (1636), an imitation of Quevedo's *Sueños*, is in prose. He wrote also the elegant treatise *A Lelio, gobierno moral* (1657), which had great influence on the literature of his time. His *Obras en prosa y versa* were first published in 1664. His verse is printed in Rivadeneyra's *Biblioteca de autores españoles*, vol. xlii (Madrid, 1857).

POLONAISE, pō'lō-nāz' (Fr., Polish), or POLACCA. A Polish national dance of slow movement, in ¾ time. It always begins and terminates with a full bar, and a peculiar effect is produced by the position of its cadence, the dominant seventh in the second quarter of the bar preceding the triad on the third quarter. The characteristic rhythmic figure of the accompaniment is  . At present the polonaise is more a promenade than a dance, taking the place of the older

cntrée. Grove asserts that this dance was not originally a popular dance, but originated at the coronation of Henry of Anjou at Cracow (1574). This statement seems to be confirmed by the fact that the oldest polonaises were not dance songs, but purely instrumental pieces.

POLO'NIUM (Neo-Lat., from Lat. *Polonia*, Pol. *Polska*, Poland). A metallic element discovered in 1898 by Madame Sklodowska Curie. While studying the radioactivity of various minerals Madame Curie found that specimens of uraninite or pitchblende from certain localities showed more active radiation than metallic uranium, the principal metallic ingredient of uraninite. She thus became convinced that those minerals must contain some radioactive substance hitherto unknown, and further examination led her to the discovery of a new radioactive metal, resembling bismuth, for which she proposed the name "polonium." At first the elementary nature of polonium was questioned and it was said to be a mixture of bismuth and some unknown substance. The researches of Marckwald of Berlin and Debierne of Paris appeared to demonstrate the elementary nature of polonium and its identity with the radiotellurium found by Marckwald in substances containing tellurium. On the other hand, the substance called Radium F, produced in the gradual disintegration of radium, has been shown to be identical with polonium. The properties of polonium are similar to those of bismuth, although the metal resembles nickel in color. The special peculiarity of polonium is its wonderful radioactivity, which is said to be about three hundred times greater than that of uranium. Madame Curie and Debierne have shown that the radioactivity of polonium is accompanied by the evolution of helium (q.v.). Marckwald has shown that polonium intercepts a strong current of electricity passing through the air from a generator to the receiver, the air ceasing to be a conductor for the flashes, and that in the dark pieces of barium, platinum, and zinc sulphide, if placed near polonium, glow with a bright greenish light. The atomic weight of polonium is about 210. See RADIOACTIVITY.

POLO'NIUS. The chamberlain to the King of Denmark, and father of Ophelia and Laertes, in Shakespeare's *Hamlet*. Hidden behind the arras to overhear Hamlet and the Queen, he is killed by the former, who thinks it is his uncle attempting concealment.

POLON'SKY, YAKOV PETROVITCH (1819–98). A Russian lyric poet. He was born at Riazan, studied at Moscow University (1840–44), and traveled extensively in Russia and abroad. On settling in St. Petersburg he edited the periodical *Ryeskoé Slovo* (1859–60) and then joined the Board of Foreign Censorship, with which he was connected till his death. In 1896 he became a member also of the chief government bureau of printing. His long literary career began in 1844 with a collection of verse entitled *Gamuts*. His prose includes the novels *Sleepy Hills, A Cheap Town*, and *Sergei Tchalygin's Confession* (all 1888). Of his poetry 13 collections were published, the latest in five volumes (St. Petersburg, 1896). An edition of all his works to date appeared in 1885–86 (10 vols., St. Petersburg). Polonsky is essentially a household poet. His lyrics, many of them set to music, are widely popular.

POLOTSK, pō'lŏtsk, or POLOCK. An ancient city of the Government of Vitebsk, Russia, situated on the Düna, 63 miles northwest of Vitebsk (Map: Russia, C 3). Its two ancient castles are now in ruins and a new church stands on the site of the church of St. Sophia, originally founded in the twelfth century. There is a seminary for teachers. The chief manufactures are leather, pottery, tobacco, soap, and candles. Pop., 1910, 31,111, about 50 per cent Jewish. Polotsk was the capital of a mediæval principality, which was absorbed by Lithuania. In the sixteenth century it was a prosperous and splendid city, but was subsequently ruined by war and plague. It was taken by Russia in the first partition of Poland in 1772. It was the scene of severe conflicts between the Russians and the French during the Napoleonic invasion of Russia in 1812.

POLTAVA, pōl-tä'vȧ, or **PULTOVA,** pul'-tȧ-vȧ. A government of Little Russia, bounded by the Government of Tchernigov on the north, Kharkov on the east, Ekaterinoslav and Kherson on the south, and Kiev on the west (Map: Russia, D 5). Area, about 19,265 square miles. The surface is undulating, slightly elevated in the north and with a general incline towards the valley of the Dnieper in the southwest. It belongs to the basin of the Dnieper, by which river it is skirted on the southwest. The climate is moderate and steady, the annual temperature at Poltava, the capital, averaging about 46°. Poltava belongs to the black-soil region of European Russia and is one of the chief grain-producing districts of the Empire. Agriculture is the principal occupation and is carried on on very primitive lines, modern machinery and fertilizers being confined principally to large estates. The leading products are rye, oats, and wheat, which are raised in quantities far above the domestic demand. The sunflower and flaxseed are cultivated for the production of oil, and tobacco raising is important. The vegetables of Poltava, especially the melons, are famous all over Russia. Stock raising, especially the breeding of horned cattle, is of great importance, since oxen are used chiefly as draft animals and for agricultural purposes. The government has few manufacturing industries, and these are connected with agriculture or gardening. The principal manufactures are flour, oil, tobacco, sugar, etc. Pop., 1913, 3,716,400, more than 95 per cent Little Russians, Jews, Poles, and Germans. Capital, Poltava. The Russians began to settle in the region in the tenth century, but their settlements were destroyed during the Mongol invasion and the territory was taken possession of by Lithuania in the fourteenth century. Later it passed to Poland. By the Andrusovo Treaty (1667) it fell to Russia. The present government was formed in 1802.

POLTAVA, or **PULTOVA.** The capital of the government of the same name, Little Russia, on the Vorskla River, about 70 miles southwest of Kharkov (Map: Russia, D 5). Outside of the town is situated a monastery dating from 1650. Near it is the monument known as the Swedish Tomb, commemorating the victory of the Russians over the Swedes. The educational institutions of the town comprise two Gymnasia, a Realschule, a cadet corps, an institute for daughters of noblemen, a seminary for priests, and a number of Jewish schools. Industrially the town is of considerable importance, carrying on an important trade in horses, cattle, and grain, though its fairs have virtually lost their former significance. Pop.,

1911, 83,841, including a considerable number of Jews. Poltava is famous as the scene of the signal victory of the Russians under Peter the Great over the Swedes under Charles XII, on July 8, 1709.

POLYÆ'NUS (Lat., from Gk. Πολύαινος, *Polyainos*) (c.85–c.170). A Greek rhetorician. He was born in Macedonia, lived in Rome, and about 163 wrote in Greek a work entitled *Strategica* or *Strategemata*, rated highly by the Roman emperors. Of its eight books parts of two (vi, vii) are lost. The sources also are mostly gone, so that the work contains much historical information for which there is no other authority. It was edited by Casaubon (1589) and by Wölfflin (1887). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

POLY'ANDRY (from Gk. πολυανδρία, *polyandria*, populousness, from πολύανδρος, *polyandros*, having many men, from πολύς, *polys*, much, many + ἀνήρ, *anēr*, man). That form of marriage and the family in which a woman has more than one husband at a time. There are two well-marked types of polyandry, in one of which, called Nair polyandry, the husbands are usually not related to one another, and the Tibetan, or fraternal polyandry, in which the husbands are brothers. Either of these forms may shade into a relationship which would have to be described as a combination of polyandry and polygyny, each husband having more than one wife, as each wife has more than one husband. A family scheme similar to this existed in the Hawaiian Islands when they first became known to Europeans, and was there known as the Punaluan family, and this name has been adopted into ethnology. In one or another form polyandry has been widely distributed. It has only lately disappeared from Ceylon, New Zealand, New Caledonia, and elsewhere in the Pacific islands. It is still found among the Koryaks north of the Okhotsk and among the Zaporogian Cossacks. In Africa it is found among the Hottentots, among the Damaras, and among mountain tribes of the Bantu race, and traces of it remain among the Hovas of Madagascar. Cæsar notes its existence in his day among the Picts and the Irish, and many evidences of its former occasional existence in other Aryan stocks and throughout the Semitic and the Hamitic races have been brought together by McLennan, Spencer, and W. Robertson Smith. See MARRIAGE.

POLYAN'THUS (Neo-Lat., from Gk. πολύανθος, having many flowers). A hardy perennial plant, much prized, and cultivated in gardens. It has been developed from *Primula variabilis*, which itself is a hybrid between the common primrose (*Primula vulgaris*) and the English cowslip (*Primula officinalis*). The numerous flowers are borne above the foliage in an umbel supported on a common leafless flower stem, or scape. It exhibits a variety of delicate and beautiful colors. If a particular color is to be preserved the plants are propagated by divisions. A rich soil, shade, and moisture are most suitable for its growth.

POLY'BASITE. A sulphantimonite of silver, occurring in monoclinic crystals, and found with other silver ores in Mexico, Chile, Nevada, Colorado, and Arizona.

POLYBIUS (Lat., from Gk. Πολύβιος, *Polybios*) (c.205–c.120 B.C.). The chief Greek historian of the Hellenistic period, born at Megalopolis in Arcadia. He was the son of Lycortas, a general of the Achæan League (see ACHÆA), and an intimate friend of Philopœmen (q.v.). His birth and great talent early secured him important political positions in his native city. In 181 B.C. he was chosen as member of the embassy which was to visit Alexandria, but which was afterward given up; in 169 he held the office of hipparch in the Achæan League. After the conquest of Macedonia in 168 he was one of the thousand noble and influential Achæans who were taken to Rome as hostages. There he remained 17 years. Through some good fortune he soon gained the friendship of Æmilius Paulus (q.v.) and his sons, with whom he resided during a large portion of his exile. The younger Scipio Africanus became strongly attached to him and took him as companion on his journeys in northern Italy and also in his military expeditions against the Celtiberians in Spain. In 150, together with his fellow exiles, he was allowed to return to his home, but during the Third Punic War he rejoined Scipio, accompanied him on his African campaign, and was present at the destruction of Carthage in 146. The outbreak of war between the Achæans and the Romans called him again to Greece, where he was of the greatest service, through his influence with the Romans, in procuring favorable terms for the vanquished. So grateful were his countrymen for his services in their behalf that Megalopolis, Mantinea, and many other towns erected statues in his honor. It is said that he met his death by a fall from a horse.

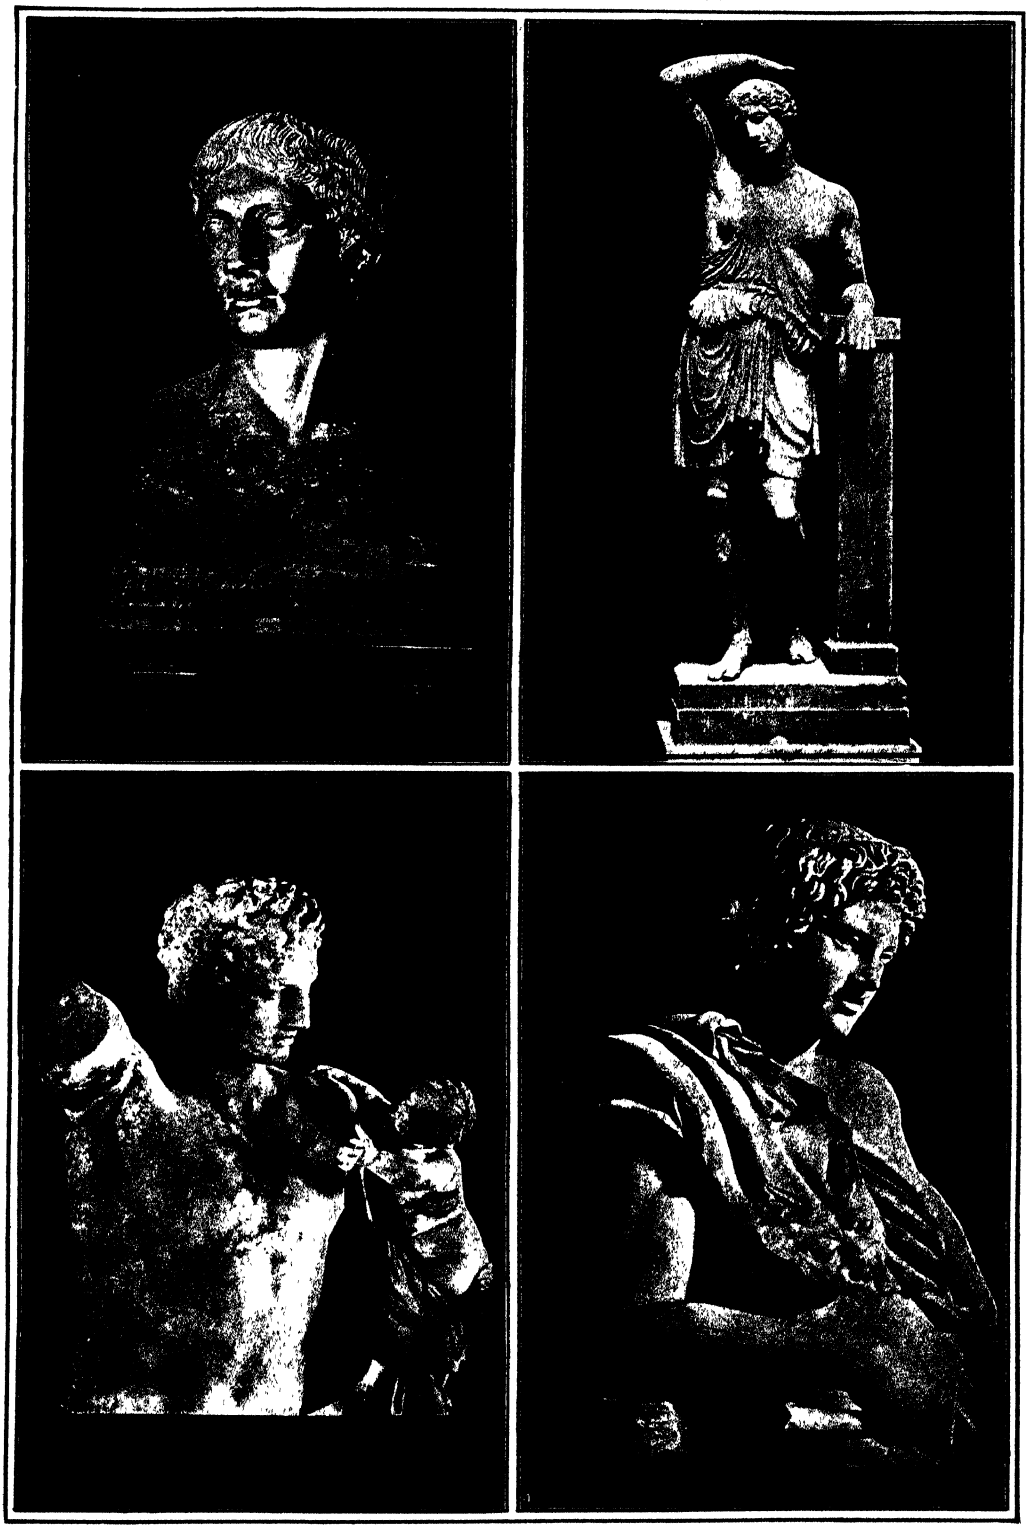
Polybius' chief work is his *Histories*, in 40 books, of which the first five have come down to us complete; we also have considerable portions of the first 18 books, preserved in a codex of Urbino and also the important excerpts of Constantinus Porphyrogenitus. The purpose of this history was to explain how, in less than 60 years (220–168 B.C.), all the known regions of the civilized world had come under the sway of Rome. Polybius devoted the first two books of his work to an introductory sketch of Rome and Carthage from 266 to 221. From this point it is a general history of the times, including the important events in Greece, Asia, and Libya, as well as in the West. The history to 168 B.C. occupied books iii–xxx, while the last 10 books brought the narrative down to the year 146. Polybius seems to have begun his work as early as 150, and the composition of it apparently extended over about 25 years.

Polybius is the first great example of a writer of history on the pragmatic method. He endeavored not simply to present facts, but also to ascertain the causes of these facts, and to draw from them lessons valuable for the future. On the other hand, his tone is too didactic in general, and the continuity of his narrative is too often interrupted by digressions. His style is clear, but without grace or charm; he incurred the censure of later Greek critics for carelessness in the choice of words and in the structure of sentences. His work, however, marked an epoch in the history of Greek literary style, for with it begins the period of the so-called common dialect, a slightly modified Attic. The best annotated edition is by Schweighäuser (8 vols., Leipzig, 1789–95); there are critical editions by Bekker (Berlin, 1844), Dindorf (last ed., Leipzig, 1882–89), Büttner-Wobst (5 vols., Leipzig, 1882–1904), and also by

Hultsch (2d ed., ib., 1888; Eng. trans. by Shuckburgh, London, 1889). Consult: R. von Scala, *Die Studien des Polybius* (Leipzig, 1890); O. Cuntz, *Polybius und sein Werk* (ib., 1902); J. B. Bury, *Ancient Greek Historians* (New York, 1909); J. L. Strachan-Davidson, in an annotated edition of *Selections from Polybius* (Oxford, 1888); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911).

POL'YBO'TES (Lat., from Gk. Πολυβώτης). A giant pursued by Poseidon after the struggle of the giants (q.v.) with the gods, and who was buried under a portion of the island of Cos, which Poseidon in wrath tore away and hurled upon him.

POL'YBUS (Lat., from Gk. Πόλυβος, *Polybos*). A king of Corinth, foster father of Œdipus (q.v.).



POL'YCARP (Lat. *Polycarpus*, from Gk. Πολύκαρπος, *Polykarpos*) (c.69–155). Bishop of Smyrna and one of the most celebrated early Christian martyrs. Such meagre information as we have about his life is drawn chiefly from Irenæus, Eusebius, and the anonymous *Martyrdom of Polycarp*. As a youth he came in contact with the Apostle John, and thus he constitutes an important link between him and Irenæus (q.v.). When Ignatius passed through Asia Minor on his way to death in Rome early in the second century, he visited Polycarp, then already Bishop of Smyrna, and to him he afterward addressed a letter. (See IGNATIUS OF ANTIOCH.) So far as we know, most of Polycarp's life was passed in the peaceful administration of his see. One of his last acts was to visit Anicetus, Bishop of Rome, to confer with him respecting the time of celebrating Easter (q.v.). Soon after his return to Smyrna Polycarp was arrested by the officers of the Roman government, tried on the charge of being a Christian, and condemned to death by burning. He suffered martyrdom on Feb. 23, 155 (not 166, as was formerly supposed), at the advanced age of 86 years, and perhaps older. Such was the sanctity of his life and such his heroism in martyrdom that his memory and his relics were always held in the deepest veneration. Polycarp is said to have written several letters, only one of which, however, that to the Philippians, has come down to us. Its authenticity has been doubted, but on insufficient grounds. The epistle is extant partly in the original Greek, and as a whole in a loose Latin translation. The *Martyrdom of Polycarp* is an early document giving a probably authentic account of his trial and death, with slight traces of legendary development. Both these works are included among the Apostolic Fathers, and may be read, in English translation, in Harmer's one-volume edition of Lightfoot's *Apostolic Fathers* (London, 1898), and in the Loeb Library (New York, 1912–13). Consult: J. B. Lightfoot, *The Apostolic Fathers*, part ii, *Ignatius and Polycarp* (2d ed., London, 1889); Adolf Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897); C. T. Cruttwell, *Literary History of Early Christianity* (2 vols., New York, 1899); F. X. Funk, *Patres Apostolici* (Tübingen, 1901).

POL'YCHROME BIBLE (from Gk. πολύχρωμος, *polychrōmos*, many-colored, from πολύς, *polys*, much, many + χρῶμα, *chrōma*, color). An edition of the books of the Old Testament printed in different colors, sometimes called the rainbow Bible, to show the various literary sources represented, according to the view of modern scholars. The series has been issued in both Hebrew and English under the editorship of Prof. Paul Haupt of Johns Hopkins University, with the help of some of the foremost scholars of Europe and America. The first numbers were issued in 1894, but the great expense of the undertaking caused its intermission for a time.

POLYCHROMY, pŏl'ĭ-krō'mĭ (from Fr. *polychromie*, Gk. πολύχρωμος, *poluchrōmos*, from πολύς, polus, many + χρῶμα, *chrōma*, color). The use of colors in decoration, especially in architecture and sculpture. Variegated color appears to be the most important resource of primitive decorators, and all the works of the earlier styles both of architecture and of sculpture were adorned with color. Egyptian and early Greek statues were painted, the exposed parts of the figure with a tint somewhat suggesting conventional flesh color, the draperies with patterns like those of actual fabrics. Both the interiors and large portions of the exteriors of Egyptian temples were covered with pictures, symbols, and hieroglyphs, incised or carved in low relief and richly painted, or sometimes, as at Abydos, painted flat on a coating of thin stucco. Chaldæan and Assyrian buildings were adorned with bands and friezes of encaustic tiles, or with facings of enameled bricks, in black and rich shades of blue, yellow, and green. Greek architecture employed red, blue, green, and yellow freely; the triglyphs were blue and the metopes red; the moldings were enriched with painted ornament; the ceiling panels were blue, with gold ornaments; it is possible that both walls and columns were tinted. See illustration of model of Parthenon under ARCHITECTURE.

The Romans employed mural painting and mosaic in their interiors (see INTERIOR DECORATION), and added to this the splendid resource of richly colored building materials—marbles, granites, and porphyry—which they used for column shafts and, in large slabs, for wall incrustation, besides the decoration of floors with various forms of mosaic (q.v.). It is possible that this use of natural polychromy was derived from late Greek or Greco-Egyptian prototypes, but it was developed by Rome into a splendid system which was perpetuated by the Byzantines, who added to it the further splendor of glass mosaic on a golden background (see BYZANTINE ART), though they employed mural painting in fresco and distemper also. The mediæval artists outside of Italy abandoned mosaic, but painted certain parts of their church interiors, especially the vaults and the choir or chapels, and all their decorative sculpture as well as parts of the woodwork. Even when broad color was not employed, moldings and capitals were picked out in red, green, blue, and gold. But their supreme achievement in color was in the superb stained glass (q.v.) of their great windows. In Italy was developed a marvelous art of external natural polychromy, by the use of colored marble in shafts, bands, and inlaid patterns, and even of glass mosaic. The façades of the cathedrals of Orvieto and Siena, and both the interior and exterior of St. Mark's at Venice are the most splendid examples of this art.

Except in the field of interior decoration the Renaissance artists of Europe generally abandoned the use of strong external color, natural

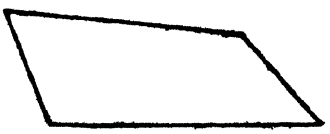
4. UPPER PORTION OF THE FAUN OF PRAXITELES, Copy in Marble, Capitoline Museum, Rome.

or applied. But all the Oriental schools and styles of art have continued to employ rich polychromy both externally and internally. The marble inlays of Cairo, the brilliantly colored relief patterns in stucco of Moorish Spain, the superb tiles of Turkey and Persia, the lacquered woodwork of Japan, the inlays of India and her tombs and palaces of red sandstone and white marble, are in their own field unequaled. In modern art polychromy has been sadly neglected, but there are signs of a new and increasing interest in its use. Consult: Hitorff, *L'Architecture polychrome* (Paris, 1851); Owen Jones, *Grammar of Ornament* (London, 1910); Racinet, *L'Ornement polychrome* (Paris, 1869–87); Ward, *Colour Decoration in Architecture* (London, 1914); and the bibliographies under the different styles and under INTERIOR DECORATION.



POL'YCHRON'ICON (Neo-Lat., from Gk. πολύς, *polys*, much, many + χρονικός, *chronikos*, relating to time, from χρόνος, *chronos*, time). A history of the world from the creation down to the year 1342 by Ranulf Higden, a Benedictine monk, who died about 1363.

POL'YCLI'TUS (Lat., from Gk. Πολύκλειτος, *Polykleitos*). 1. A Greek sculptor in bronze. He is called by Plato and other ancient writers an Argive, and was certainly the representative of that school in Greek art. The only authority for his birth at Sicyon is Pliny, who seems to have drawn on a history by a Sicyonian, who claimed for his native city the honor of being the birthplace of the greatest Argive artist. His chryselephantine Hera at Argos probably dates shortly after 433 B.C., for it was in the new temple built immediately to replace the old sanctuary that was destroyed by fire at that date. It is possible that the statue of Zeus Meilichios at Argos was a later work than this. That Polyclitus may well have been a pupil of Ageladas is shown by an Oxyrhynchus papyrus, wherein his earlier statues of Olympic victors are dated in 452 and 460 B.C. The earliest work of his of which we have record is the statue of Cyniscus, who won the boxing match for boys in the neighborhood of 460. At Olympia the bases of other athlete statues bearing Polyclitus' name have been found. Two are in honor of Pythocles and Aristion, who were winners in 452. All this evidence shows that Polyclitus was working virtually at the same time as Phidias (q.v.). In technical skill, delicacy of finish, and beauty of line he ranked with the greatest artists of his time, but ancient critics missed in his works the sublimity that marked the statues of Phidias. He followed in the lines already characteristic of the Peloponnesian school. His figures are marked by a powerful muscular frame, while the face is square rather than oval, with broad brow, straight nose, and small chin, with the lines sharply defined, presenting a somewhat striking contrast to the fine oval which is characteristic of the Attic school. A careful student of proportions, Polyclitus embodied his theories not only in writing (if this is the meaning of the canon attributed to him), but in his statues, and especially in the Doryphorus (see ATHLETE, THE), of which the best marble copy is in Naples, while the head is represented in a bronze bust from Pompeii. Of the same character, but softer in its lines, is the Diadumenos (q.v.), or youth binding a fillet round his brow, which is preserved in several marble replicas, of which the best was found in a private house on the island of Delos. His statue of an Amazon is almost certainly reproduced in a marble at Berlin, and his strongly marked characteristics in form and pose render it possible to attribute to him or his school the originals of a number of other works. 2. A younger Polyclitus, possibly a nephew of the great sculptor, flourished in the next century, and enjoyed a high reputation not only as a sculptor, but likewise as an architect. He built the theatre in the sanctuary of Asclepius at Epidaurus, greatly and justly famed for the beauty of its proportions, and the Tholos, or circular building, of which the use is uncertain, at the same place. See GREEK ART.

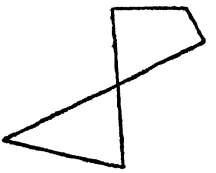
POLYC'RATES (Lat., from Gk. Πολυκράτης, *Polykratēs*). A tyrant of Samos (q.v.), born in the earlier half of the sixth century B.C. Nothing is known of him until about 535 B.C., when, with the assistance of his brothers, Pantagnotus and Syloson, and a small band of conspirators, he seized the government of the island. After a short time Polycrates made himself sole despot, conquered several islands of the Ægean archipelago and even some towns on the Asiatic mainland, waged war successfully against the inhabitants of Miletus, and defeated their allies, the Lesbians, in a great sea fight. His fleet, which was probably the most powerful in all Greece, amounted to 100 armed ships, and he had a force of 1000 mercenary bowmen. He was in intimate alliance with Amasis, King of Egypt, but this was ultimately broken off, according to Herodotus, by Amasis, who became alarmed at the uninterrupted good fortune of Polycrates. It was said that Amasis wrote a letter to Polycrates, earnestly advising him to throw away the possession that he deemed most valuable and thereby avert the displeasure of the envious gods. Polycrates, in compliance with this advice, cast a signet ring of marvelously beautiful workmanship into the sea; but when a fisherman presented the tyrant with an unusually big fish that he had caught, in its belly was found this same ring. It was quite clear now to Amasis that Polycrates was a doomed man, and he immediately broke off their alliance. Grote suggests that Polycrates, with characteristic perfidy, abandoned the Egyptian for a Persian alliance when he found the latter likely to be of more value to him in his ambitious designs. When Cambyses (q.v.) invaded Egypt (525 B.C.) Polycrates sent him a contingent of 40 ships, in which he placed all the Samians disaffected towards his tyranny, telling the Persian King not to let them come back. In some way or other they escaped the fate that Polycrates had designed for them, returned to Samos, and made war against the tyrant, but without success. Thereupon they went to Sparta and succeeded in securing the help of both the Spartans and the Corinthians. A force of Samians, Spartans, and Corinthians embarked for Samos and attacked the capital. After vainly besieging it for 40 days they sailed away, and Polycrates now became more powerful than ever. But a certain Orœtes, a Persian



broken line its *perimeter*. The vertices of the angles made by the various segments of the perimeter are called the *vertices* of the polygon, and the segments themselves the *sides* of the

CONVEX.

CONCAVE.

CROSS.

polygon. The perimeter of a polygon divides the plane into two parts—one finite (the part inclosed), the other infinite. The finite part is called the surface of the polygon, or for brevity

FIG. 1.

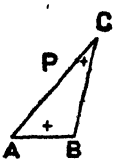


FIG. 2.

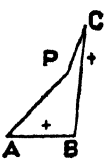

FIG. 3.

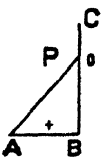

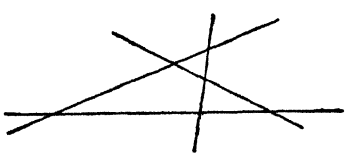

FIG. 4.

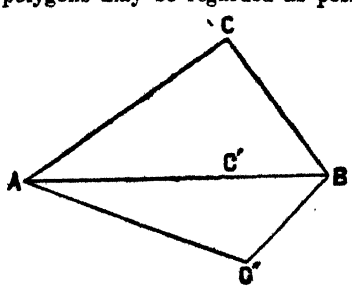
FIG. 5.

simply the polygon. A polygon is said to be *convex* when no side produced cuts the surface of the polygon, *concave* when a side produced cuts the surface of the polygon, and *cross* when

A GENERAL POLYGON (QUADRILATERAL).

the perimeter crosses itself. The word "polygon," in elementary geometry, is understood to refer to a polygon that is not cross unless the contrary is stated. If all of the sides of a polygon are indefinitely produced, the figure is called a *general* polygon. If a polygon is both equiangular and equilateral, it is said to be *regular*. A polygon is called a triangle, quadrilateral, pentagon, hexagon, heptagon, octagon, nonagon, decagon . . . . dodecagon . . . . pentedecagon . . . . *n*-gon, according as it has 3, 4, 5, 6, 7, 8, 9, 10 . . . . 12 . . . . 15 . . . . *n* sides.



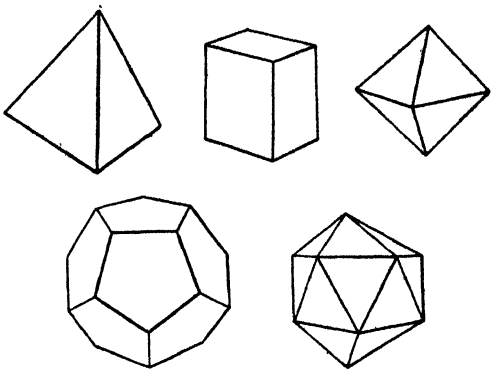
REGULAR CONVEX POLYGON.

REGULAR CROSS POLYGON.

According to the principle of continuity (q.v.) polygons may be regarded as positive or

as negative. For example, consider the triangle *ABC*, which is, in general, regarded as positive. If *C* moves down to rest on *AB*, then $\triangle ABC'$ becomes zero; and as *C* passes through *AB* $\triangle ABC$ passes through zero and is considered as having changed its sign and become negative; i.e., considered as generated in this manner, $\triangle AC''B$ is negative. In the case of polygons in general the law of signs will readily be understood from the annexed figures. In Figs. 1, 2, 3, both the upper and lower parts of the polygon are considered as positive; in Fig. 4, *P* has reached *BC*, and the upper part of the polygon has become zero; in Fig. 5, *P* has passed through *BC*, and the upper part of the figure has passed through zero and become negative.

The sum of the interior angles of a polygon equals $(n-2)$ straight angles. The sum of the exterior angles equals a perigon, or 360°. In concave polygons certain exterior angles lie inside the polygon and are taken as negative according to the principle of continuity. The number of diagonals of a simple convex polygon is $\frac{n(n-3)}{2}$, n being the number of sides. If a polygon of an even number of sides is circumscribed about a circle, the sums of its even and odd sides are equal; and if a polygon of an even number of sides is inscribed in a circle, the sums of its even and odd angles are equal. The inscription and circumscription of regular polygons depend upon the partition of the perigon. Thus, to inscribe an equilateral triangle in a circle depends upon trisecting the circumference and hence upon trisecting the perigon at the centre. It was known as early as Euclid's time that the perigon could be divided into 2^n, 3.2^n, 5.2^n, 15.2^n equal angles, and no other partitions were deemed possible by the use of the straight edge and compasses. But in 1796 Gauss found, and published the fact in 1801, that a perigon could also be divided into 17.2^n equal angles; furthermore, that it could be divided into $2^m + 1$ equal angles if $2^m + 1$ represents a prime number; and, in general, that it could be divided into a number of equal angles represented by the product of different prime numbers of the form $2^m + 1$. Hence it follows that a perigon can be divided into a number of equal angles represented by the product 2^m and one or more different prime numbers of the form $2^m + 1$. It is shown in the theory of numbers that if $2^m + 1$ is prime, m must equal 2^p; hence the general form for the prime numbers mentioned is $2^{2^p} + 1$. Elementary geometry is thus limited to the inscription and circumscription of the regular polygons mentioned. Con-



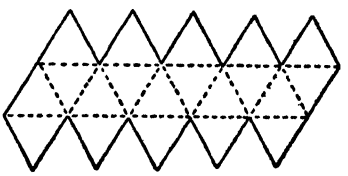
sult *Klein's Famous Problems of Elementary Geometry* (Amer. ed., Boston, 1897).

POLYGONA'CEÆ (Neo-Lat. nom. pl., from Lat. *polygonum*, from Gk. πολύγονον, knot grass, polygony, neut. sing. of πολύγονος, *polygonos*, prolific, from πολύς, *polys*, much, many + γόνος, *gonos*, seed), THE BUCKWHEAT FAMILY. A dicotyledonous family of herbs, vines, shrubs, and trees, comprising about 800 species in 40 genera and widely distributed, especially in northern temperate regions. It is a peculiar family, among its associates, in its conspicuously sheathed joints and in its strong tendency to produce three-parted flowers. Representative and familiar genera are as follows. The largest genus is *Eriogonum*, with about 200 species, all of them natives of America and most of them belonging to the western United States. The species of *Rumex*, about 140 in number, are mostly called docks, but one of them (*R. acetosella*) is the sheep sorrel. *Persicaria* (formerly included in *Polygonum*) contains 125 species, called in general smartweeds, but one of them (*P. orientalis*) is the prince's feather, cultivated as an ornamental plant. *Polygonum*, the genus which gives name to the family, contains about 100 species, which are known in general as knotweeds. *Tinaria* (formerly included in *Polygonum*) includes eight species of twiners, known as bindweeds. *Fagopyrum*, with six species, natives of Europe and Asia, is distinguished as including the buckwheat (*F. fagopyrum*); while *Rheum* includes the rhubarb or pieplant (*R. rhaponticum*), a native of the Old World. See Plate of BALSAM, ETC.

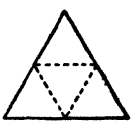
POLYGO'NAL NUMBERS. See NUMBER.

POL'YHE'DRON (from Gk. πολύεδρος, *polyedros*, having many bases, from πολύς, *polys*, much, many + ἕδρα, *hedra*, base). A solid whose bounding surface consists entirely of planes. The polygons that bound it are called its *faces;* the sides of those polygons, its *edges;* and the points where the edges meet, its *vertices*. If a polyhedron is such that no straight line can be drawn to cut its surface more than twice, it is said to be *convex;* otherwise it is said to be *concave*. Unless the contrary is stated, the word "polyhedron" means "convex polyhedron." If the faces of a polyhedron are congruent and regular polygons and the polyhedral angles are all congruent, the polyhedron is said to be *regular*. A polyhedron that has for bases any two polygons in parallel planes and for lateral faces triangles or trapezoids that have one side in common with one base and the opposite vertex or side in common with the other base, is called a *prismatoid*. (See MENSURATION.) In accordance with the definition, all prisms and pyramids (q.v.) are also included among the prismatoids. Among the general relations of polyhedrons the following are the most remarkable: If a convex polyhedron has e edges, v vertices, and f faces, then $e + 2 = f + v$ (a theorem known to Descartes, but bearing Euler's name); e.g., in a regular octahedron, a solid having 8 faces, 6 vertices, and 12 edges, the equation becomes $12 + 2 = 8 + 6$. For every polyhedron there is another which, with the same number of edges, has as many faces as the first has vertices and as many vertices as the first has faces. There cannot be more than five regular convex polyhedrons. These solids are represented by the figures here shown, and are sometimes known as the Platonic bodies, from the attention they received among Platonists.

For these five polyhedrons, if s is the number of sides in each face, n the number of plane angles at each vertex, then, following the other

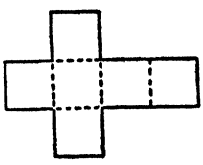


POLYHEDRA.

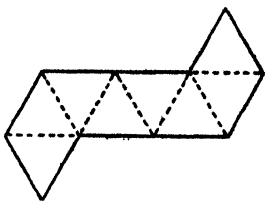


notation above given, $sf = n.v = 2e$. Also the sum of all the plane angles in each figure is $2\pi(v - 2)$. These formulas may easily be verified from the following table of elements:

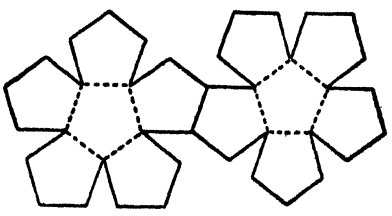
NAME OF SOLID	s	n	f	v	e
Tetrahedron	3	3	4	4	6
Hexahedron	4	3	6	8	12
Octahedron	3	4	8	6	12
Dodecahedron	5	3	12	20	30
Icosahedron	3	5	20	12	30



The five regular polyhedrons can be constructed from cardboard by marking out the following, cutting through the heavy lines and half through the dotted ones, bringing the edges together.



ICOSAHEDRON.



TETRAHEDRON.

HEXAHEDRON.

OCTAHEDRON.

DODECAHEDRON.

the Royal Society, vol. clii (London, 1862); Zeising, "Die regulären Polyeder," in the *Deutsche Vierteljahrsschrift* (Stuttgart, 1869); Eberhard, *Zur Morphologie der Polyeder* (Leipzig, 1891); Rouché and De Comberousse, *Traité de géométrie* (7th ed., Paris, 1901).

POLYHISTOR, ALEXANDER. See ALEXANDER POLYHISTOR.

POL'YHYM'NIA, or **POLYMNIA** (Lat., from Gk. Πολύμνια or Πολύμνια). One of the nine Muses (q.v.). When in late times the functions of the Muses were specialized, she became the Muse of the pantomime and was represented without special attribute, but closely wrapped in her mantle and sometimes with her hand upon her mouth.

POL'YMAS'TODON (Neo-Lat., from Gk. πολύς, *polys*, much, many + μαστός, *mastos*, breast, + ὀδούς, *odous*, tooth). A fossil multituberculate animal of the size of a beaver, of which fragmentary remains have been found in the basal Eocene or Puerco beds of New Mexico. The jaws and dentition have some resemblances to those of rodents.

POLYMESTOR. See ILIONA.

POL'YMOR'PHISM (from Gk. πολύς, *polys*, much, many + μορφή, *morphē*, form). The differentiation either of one animal into two or more incomplete undetached individuals (pseudo-individuals) or zoöids, as in the Siphonophores or *Physalia;* or that of the animal into two separate sexes, or of the latter into castes, as in the termites and ants. Instead of the functions of the whole animal or plant being equally distributed to the individual organs, some of the organs or parts of the animal are set apart for this or that function. In the hydra the individual is monomorphic, not divided into male and female individuals, but in *Hydractinia*, a fixed, vegetative form, sexual or reproductive zoöids arise, some female and other male, and also hydra-like or nutritive zoöids or incomplete individuals. In the Portuguese man-of-war (q.v.) we have a still better example of incomplete polymorphism. Thus, as Hertwig states, division of labor leads to greater centralization, "the more polymorphic an animal colony becomes, the more unified it is, the more it gives the impression of being a single animal instead of an aggregation of single animals."

In the hydroids alternation of generations (q.v.) has arisen from a division of labor or polymorphism of individuals originally of equivalent value, in which some individuals (the sexual ones) have separated and acquired a peculiar structure. Moreover, while alternation of generations has arisen from polymorphism, it can again produce it. Hertwig illustrates this by the case of certain medusæ, which, instead of separating, remain permanently attached to the colony. They then degenerate into sporosacs, in which a mouth, tentacles, and a velum are wanting.

A second kind of polymorphism is that seen in the males and the females of most animals. This is sexual dimorphism, which may pass into sexual polymorphism. This is complete polymorphism. Reproduction by budding involves the differentiation of the animal form into three kinds of individuals, i.e., males, females, and neuters, as among insects. Among the cœlenterates and worms the forms reproducing by parthenogenesis (q.v.) are usually larval or immature, as if they were prematurely hurried into existence and their reproductive organs had been elaborated in advance of other systems or organs for the sudden production, so to speak, of large numbers of individuals like themselves.

Among insects dimorphism is intimately connected with organic reproduction. Thus, the summer wingless asexual aphis and the perfect-winged autumnal aphis may be called dimorphic forms. The perfect female may assume two forms, so as to be mistaken for two distinct species.

Dimorphism in Birds. Besides ordinary sexual dimorphism, depending on sex and comprised under the head of secondary sexual characters (see SEX; SEXUAL SELECTION), a few special cases are known, due probably to climate or local causes. Thus, in some species of skua a parti-colored bird may frequently be found mated with a unicolorous form, either male or female. In the guillemots, at nearly every breeding station about 1 in 20 may be marked with a white circle around the eye and a white line extending backward from it, these ringed or bridled guillemots being of either sex and apparently paired with birds of normal plumage, no intermediate forms being known. (See DICHROMATISM IN BIRDS.) A striking example of dimorphism in respect to the beak is furnished by the huia (q.v.).

Dimorphism and Polymorphism in Insects. Although sexual dimorphism is very prevalent in insects, there are many instances of dimorphism, resulting from local causes, as temperature. (See TEMPERATURE VARIETIES, especially as relating to seasonal dimorphism, wet and dry forms.) Certain species of grasshoppers are dimorphic. In the honey ant (*Myrmecocystus mexicanus*), besides the usual workers, individuals occur with enormous spherical abdomens filled with honey. Here the cause is evidently connected with the food.

The chief initial or determining causes of dimorphism and polymorphism, besides sexual selection (q.v.), are changes in temperature, of light, and of other physical agents. See EVOLUTION.

POL'YMOR'PHOUS, IN MINERALOGY. See ISOMORPHISM.

POL'YNE'SIA (Neo-Lat., from Gk. πολύς, *polys*, much, many + νῆσος, *nēsos*, island). Dumont d'Urville in 1832 established this designation for so much of the oceanic area of the Pacific as is inhabited by a nearly primitive brown race of obscure Asiatic origin. Based upon a collation of the migration within the area, Polynesia is now divided into the following provinces: Nuclear Polynesia: Samoa, Tonga, Fiji, Niuē, Uvea (Wallis Islands), Futuna (Horne Islands), Tokelau, and Ellice Islands. Central Polynesia: Cook group, Phœnix group, Tubuai group, Rokahanga, Tongarewa, Manahiki. Southeast Polynesia: Society group, Marquesas, Tuamotu, Gambier group, Easter Island, Pitcairn Island, Henderson, Elizabeth, and Ducie islands. Northern Polynesia: Hawaiian Islands, Laysan, Midway, Ocean Island. Southern Polynesia: New Zealand, Chatham Islands; for political convenience this division is attached to Australasia. The Polynesian Verge: certain islands geographically pertinent to Melanesia but ethnically Polynesian—Ticopia, Sikaiana, Liueniua (Ongtong Java), Nukumanu, Tauu, Nuguria, Nukuoro (in Micronesia). In general, the islands of Polynesia are high and volcanic: low islands and atolls are the rule in Central Polynesia, in the southern group of Tonga, and

in the Tuamotu. (See individual titles of islands.) Consult: Domeny de Rienzi, *Océanie* (Paris, 1836–55); Mager, *Le monde polynésien* (ib., 1902): general bibliography in *American Geographical Society, Bulletin No. 41* (New York, 1900). See POLYNESIANS.

POLYNE'SIANS. The race of mankind discovered in possession of the islands of Polynesia is among the stateliest of humanity, the men in particular ranking among the tallest, the women being considerably shorter. Their body proportions are comparable to nothing less than the works of the best Greek statuary. Their faces have a distinctly Caucasian cast, a resemblance which would be more complete if it were not for the common practice of flattening the nostrils in children to conform to a local standard of beauty. The skin coloration is of a light olive brown, with a range of pigmentation closely approximating that observed among the Mediterranean peoples of Europe; among the younger women, those who seek shade for cosmetic purposes are several degrees lighter than they become when exposed to the sun in later life; albinism is not infrequent. The hair is long, black, subelliptical in section, and wavy; it was formerly worn at full length by men, cropped to from 2 to 4 inches by women, and clipped in fanciful patterns on young children; since contact with European culture it is cropped short by men and women; it is made brittle and colored red by the frequent application of coral lime, but despite this harsh treatment baldness is rare.

The Polynesians are not indigenous to Polynesia. The study of the early history of the race was hindered by Bopp's erection of a Malayo-Polynesian family (q.v.). It is now possible to trace the race from Polynesia backward through Melanesia into Indonesia and there as far as its western limit at Sumatra, where in the Mentawei Islands is preserved an interesting survival of Polynesians among Malayan people. Earlier than the appearance of the Polynesians in Indonesia it has been found impossible to trace the source of the race with any certainty. Attempts have been made to connect them through the Mon-Khmer with the Indo-Chinese and the Turanian family, with the Caucasian race through the pre-Gangetic Aryans, with the Semitic race of Arabia and the adjacent African highlands. Up to the present their strongly marked anthropometric curves have not been satisfactorily identified among other peoples. The most remote point in their history which may be regarded as definitely established is that the people now Polynesians were established in the Malay Archipelago at the time when the earliest Malayan people advanced from Asia upon those islands, a time which is sufficiently established at about the second century before the beginning of the Christian era.

The advancing Malayans were in possession of metal; the early Polynesians were neolithic and could oppose no successful resistance with stones against bronze and iron. Therefore they took to flight before the wave of Malay culture, were forced eastward through Indonesia and eventually to the Pacific. It has been possible to identify two waves of Polynesian migration within the Pacific—the Proto-Samoan about the Christian era, effecting a lodgment in Nuclear Polynesia, theretofore uninhabited, and the Tongafiti about eight or ten centuries later, with a more advanced culture. It is impossible to identify with any certainty the movement of Tongafiti migration between eastern Indonesia (probably Philippines) and Nuclear Polynesia. Though much earlier, the courses of Proto-Samoan migration have been somewhat exhaustively studied. In examination of the Polynesian Verge and the Polynesian inclusions in Melanesian speech, it has been possible to trace a double track out of Indonesia. One made its exit from Indonesia by way of Torres Strait to the New Hebrides and thence to Fiji. The other passed to the north of New Guinea and into the Pacific by way of the Dampier-Vitiaz passage at the west of New Britain or through St. George's Channel at the east of that island, thence through the Solomon Islands to Samoa. From Nuclear Polynesia the earliest migration eastward was that of Proto-Samoans who fled from the encroachment of the fiercer Tongafiti of their own race. A greater migration movement followed upon the expulsion of the oppressors from Samoa, apparently about the tenth century. The last great migration was that from Central Polynesia to the colonization of New Zealand, in 1350. The distinctly eastward direction of all Polynesian migration is directly due to the fact that it took place in the belt of the southeast trade wind and that the best sailing point of the double canoe is to windward.

The character of the Polynesian measures very high when referred to the standards that represent the sum of the needs of his race; the individual almost always attains to the standard of his race morality. In a juvenile race it is not to be expected that character will stand the test of the higher culture of an older race.

The religion of the Polynesian is partly historical, partly practical. The Proto-Samoans remember the supreme god Tangaloa, maker of heaven and earth, but pay him no act of worship. The Tongafiti have a group of four great gods, Tu, Tane, Lono, and Tangaloa, to whom on occasions of great moment were offered human sacrifices. The common affairs of life were under the charge of family and town gods, ghosts of ancestors and deified animals of a somewhat totemic importance. The chief, as family head, officiated as priest. The practice of religion as a moral code was largely conditioned by the system of the taboo (q.v.).

In the arts the Polynesians remained upon a neolithic plane. They polished stones for utensils and for decorative purposes, the highest pitch being reached by the Maori of New Zealand in the carving of the greenstone, a jadelike nephrite, in the making of axes, lance points, and images of the lesser gods. Wood carving in intricate geometrical figures became an art in the Hervey Islands and the Marquesas. With the sole exception of the Mangarevans they were skilled canoe builders and able navigators. From the bast of trees they manufactured cloth for clothing, from the leaf of the screw pine they plaited mats of wonderful fineness, from the fibre of the hibiscus they made nets, and from the coir of the coconut husk they made ropes of sennit. To pottery, the loom, and the use of the bow they had not attained.

Society was well organized on the base of the family, with an active head chosen by the elders in a system of mixed heredity and adoption. In the historic period the family was patriarchal and polygamous, but there are abundant survivals of matriarchal customs. The system of

government is unsurpassed for the hamlet; it breaks down when several hamlets become a district government. With the exception of the *Areoi* of Tahiti there was nothing resembling the secret fraternities of Melanesia, there was no initiation period of boys, and the performance of incision (a modified circumcision) at puberty was not made a ceremony.

The speech of the Polynesians, in which 14 languages exist, as distinct as are the languages of the Romance family, is isolating; it abounds in duplication forms of various structural types, is highly vocalic, and admits of no closed syllables. Though isolating, the words are frequently polysyllabic, the result of the freedom with which unalterable stems may be put together by compaction. The roots are uniformly monosyllabic, either a vowel or a consonant followed by a vowel; in the latter class considerable progress has been made in the reduction of the root to the comprehension of the basic vowel value and the coefficient value of the modulant consonant. These studies occupy an important part in the evolution of human speech from the animal cry. The parts of speech are of the most elemental type and are three in number. The demonstrative expresses position in place or time and carries the germ of the pronoun and the adverbs of place and time. The paradeictic expresses transition, the existence and character of a relation between two concepts; possibly it includes the germ of the substantive verb; it corresponds to the prepositions and conjunctions of the more highly developed categories of grammar. The attributive expresses all names of objects, concepts, states, and acts, therefore embraces the noun, verb, adjective, and adverb, and forms the great mass of the vocabulary. The art of writing had not been discovered, except in the doubtful case of the hyloglyphs of Easter Island (q.v.). Nevertheless a considerable mass of myth and song was preserved in memory, of which a small part has been reduced to writing and preserved for study.

POLYNESIAN SUBREGION. A subregion of the Australian region in zoögeography, embracing all the islands of the Pacific Ocean from Guam on the west to the Marquesas on the east. It is characterized mainly by the absence of indigenous mammals, the great scarcity of reptiles, and the comparative uniformity of its birds. The central and most characteristic fauna seems to be in the New Hebrides. The Hawaiian Islands, although included in the subregion, have so many distinctive peculiarities that some naturalists regard them as a separate subregion.

POLYNICES, pŏl'ĭ-nī'sēz (Lat., from Gk. Πολυνείκης, *Polyneikēs*). A son of Œdipus and brother of Eteocles. See ETEOCLES AND POLYNICES.

POLYNOMIAL (from Gk. πολύς, *polys*, much, many + Lat. *nomen*, name, thing). A general name for algebraic expressions of more than one term. See ALGEBRA; FUNCTION.

POLYOLBION, pŏl'ĭ-ōl'bĭ-an. A long descriptive poem by Michael Drayton in 30 parts or songs, published in 1613 and 1622. It is a kind of poetical gazetteer, a description of the rivers, mountains, and forests of England, with histories, traditions, and genealogies, generally so accurate that it was used as an authority by later writers.

POLYP (Fr. *polype*, from Lat. *polypus*, from Gk. πολύπους, *polypous*, polyp, polypus in the nose, many-footed, from πολύς, *polys*, much, many + πούς, *pous*, foot). A name once given to any of those minute, attached, usually colonial animals having tentacles around the mouth, now recognized either as a special form of cœlenterates (usually some hydroid) or as Polyzoa. The name was given by Réaumur on account of their external resemblance to the many-armed cuttlefishes, which were so denominated by Aristotle; and our knowledge of these organisms as members of the animal kingdom hardly dates from much more than a century ago. Most of them live in colonies, sometimes of great extent, supported on a common stock, to which the term "polypidom" (polyp home) is sometimes given, and which may be horny, gelatinous, or calcareous. The polyps are either embedded in cavities in the substance of the calcareous polypidom or are inclosed in minute cups or tubes in the horny polypidoms, from which the body can be protruded and into which it can be retracted at pleasure. The solitary species often attain a considerable size (as, e.g., many of the sea anemones), but the social polyps are always minute, although the combined power of some of the species in modifying the earth's crust is neither slight nor limited in extent, as is shown by the dimensions and geographical importance of coral. See CORAL; CORAL ISLANDS AND CORAL REEFS.

POLYPEPTIDES, pŏl'ĭ-pĕp'tīdz, or **POLYPEPTIDS,** -tīdz (from Gk. πολύς, *polys*, many + πεπτόν, *pepton*, neut. of πεπτός, *peptos*, cooked). A class of synthetic organic substances resembling the proteins (q.v.). By the action of acidified water upon proteins Emil Fischer succeeded in breaking up these exceedingly complex bodies into simple amino acids, i.e., substances that are at the same time acids and amines (see AMINES), such as aminoacetic acid or glycocoll, $CH_2(NH_2)COOH$. The assumption thus suggested itself that the proteins, whose chemical constitution had long remained an impenetrable mystery, are formed by the combination of a number of simple amino acids, with the elimination of the elements of water. Fischer then proceeded to devise a series of methods for causing amino acids to combine under laboratory conditions, and as the amino acids them-

selves are mostly synthesizable from the elements, the possibility arose of thus artificially reproducing the proteins, which are so intimately bound up with the phenomena of life in animals and plants. While the simplest natural protein has a molecular weight of about 10,000, the most complex polypeptide yet produced has a molecular weight of only 1213, so that much work must be done before we can achieve the synthesis of a true protein. But already the more complex polypeptides produced show unmistakable resemblance to the natural proteins in their chief chemical and physical properties.

POL'YPET'ALY (from Gk. *πολύς, polys*, many + *πέταλον, petalon*, leaf). A condition in flowers in which the petals are distinct from one another. See FLOWER.

POL'YPHE'MUS (Lat., from Gk. *Πολυφήμος, Polyphēmos*). In the *Odyssey*, the son of Poseidon and Thoösa, the most celebrated of the fabulous Cyclopes (q.v.), who inhabited the coast of Thrinakia. He was of enormous size and had only one eye. On his return from Troy Odysseus (see ULYSSES) landed in this region, visited the cave of the Cyclops in his absence, and awaited his return. The monster penned the Greeks in his cave and ate two at once. Next morning he devoured two more, but that night, after his evening meal, Odysseus presented him with some strong wine, and, when he had fallen into a drunken sleep, bored out his eye with a blazing ship's mast. They then escaped by clinging beneath the bellies of the sheep that he had penned within the cave (*Odyssey*, ix). It was in answer to the prayer of Polyphemus for vengeance that Poseidon visited Odysseus with so many troubles by sea. The later Alexandrian poetry took up the story of Polyphemus as the giant shepherd and depicted his love for the coy nymph Galatea (q.v.), and the same subject was a favorite with artists of the Roman period. Consult: W. Grimm, *Die Sage von Polyphem* (1857); G. R. Holland, in *Leipziger Studien*, vol. vii (Leipzig, 1884); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

POLYPHEMUS MOTH. One of the large American silk moths (*Telea polyphemus*), expanding 5 or 6 inches. It is yellowish or brownish, with a window-like spot in each wing, divided by a vein and encircled by yellow and black rings; a dusky band margined with pink lies near the outer margin of both pairs of wings. The caterpillar is light green, with an oblique yellow line on each side of each segment, except the first and the last; it feeds on tree foliage. The cocoon is dense, oval, and is usually inclosed in a leaf. Sometimes it is suspended from a twig, but ordinarily it falls to the ground in the autumn.

POLYPH'ONY (from Gk. *πολυφωνία, polyphōnia*, variety of sounds, from *πολύφωνος, polyphōnos*, having many sounds, from *πολύς, polys*, much, many + *φωνή, phōnē*, sound, voice). In musical composition, the combination in harmonious progressions of two or more parts, each of which has an independent melody of its own. Polyphony is opposed to homophony (q.v.), which consists of a principal part with a leading idea and accessory parts furnishing the harmony. The construction of polyphonic phrases is called counterpoint (q.v.). About the ninth century the beginnings of modern polyphony in organum or diaphony are found; this was the progression of parts in parallel fifths or fourths. In these first attempts at polyphony there are many dissonances which seem to us intolerable; but in the course of time composers learned the secret of obviating the harsh effects by using the intervals in proper succession, and the next step was the combining of two voices into a real harmonic structure. Instead of the melody being only in one voice, as in the following example from Guido d'Arezzo (q.v.),

while the second voice intoned an organ point (q.v.), we have a distinct melody in each voice, as in the following example from the fourteenth century:

When polyphony developed still further, and three and four voices were employed, the additional voices were also given separate melodies as far as possible. Still polyphony as we now understand it had not really begun, for, though the voices were combined in an harmonic whole, they did not all assist in the development of a single idea. Composition had musical but not structural unity. With the rise of the great Flemish school (see MUSIC, HISTORY OF, III) and the appearance of Dufay, Okeghem, Josquin Deprès, Willaert, and their contemporaries, polyphony proper came into existence. Virtually every form of composition was based on a canon (q.v.) or a fugue (q.v.), and the technical dexterity, the mathematical complexity of these early compositions never has been excelled. The reaction was inevitable. With the death of Palestrina (q.v.) in 1594 the decline began. The triumph of monody (q.v.) was swift and widespread, and though it in its turn was supplanted by more complex harmonic forms (see HARMONY), the era of the polyphonic school never has returned. Consult: Humphreys, *The Evolution of Church Music* (London, 1896); R. C. Hope, *Mediæval Music* (ib., 1899); "The Polyphonic Period," in *Oxford Dictionary of Music*, vol. i, edited by W. H. Hadow (Oxford, 1901).

POLYPO'DIUM (Lat., from Gk. *πολυπόδιον*, sort of fern, from *πολύπους, polypous*, many-footed; so called from the branching rootstock). One of the largest and most widely distributed genera of ferns, containing several hundred species, mainly of tropical and subtropical regions. They are mainly shade species of various habit, and are very commonly epiphytes in the moist tropics. The sori are usually round, without indusium, and are borne variously on the under surface of the leaf, sometimes being terminal on the free veins. As now usually restricted, the genus includes only the forms with free veins, i.e., veins ending freely in the margin of the leaf. *Polypodium vulgare* (polypody), whose fronds grow from 2 to 6 inches or more in length, is one of the most common and widespread species of America and Europe. There are a number of varieties of this species, some

of which are extensively grown as ornamentals. The rootstocks of a number of species were formerly employed in medicine, but are now believed to be nearly inert. See Colored Plate of FERNS.

POLYP'ORUS. A fungus attacking old trees and timber. See AMADOU; DRY ROT.

POLYPS. See POLYP.

POLYP'TERUS (Neo-Lat., from Gk. *πολύπτερος, polypteros*, many-winged, from Gk. *πολύς, polys*, much, many + *πτερόν, pteron*, feather, wing). A genus of ganoid fishes of African rivers. See BICHIR; REED FISH.

POL'YPUS (Lat., from Gk. *πολύπους, polypous*, polypus in the nose, polyp, many-footed). In surgery, a term employed to signify any sort of pedunculated tumor attached to a surface to which it was supposed to adhere like a many-footed animal, as its name indicates. The common seat of polypi is the mucous membrane; hence we have polypi of the nose, ear, bladder, rectum, and uterus. The only satisfactory mode of treatment consists in their removal, which is effected in various ways, as by the forceps, the écraseur, the wire snare, or the ligature.

POLYSARCIA, pŏl'ĭ-sär'shĭ-ȧ. See OBESITY.

POL'YSPERB'MY. See EMBRYOLOGY.

POL'YTECH'NIC INSTITUTE (from Gk. *πολύτεχνος, polytechnos*, skilled in many arts, from *πολύς, polys*, much, many + *τέχνη, technē*, art). A school of science and liberal arts in Brooklyn, N. Y., established in 1854. It granted its first degrees in arts and sciences in 1871 by special authority of the regents of the State University, and in 1890 was reorganized and received a broad college charter. It now confers the degrees of bachelor of science, master of science, civil, electrical, mechanical engineer, and chemical engineer. During the early years of its history the Polytechnic was known as a successful preparatory school, and it still maintains a preparatory department, as a separate institution, which in 1914–15 had 500 students, while the institute had an attendance of 725, with 85 instructors in all departments. The library contained 15,000 volumes. The president in 1915 was F. W. Atkinson, Ph.D.

POLYTECHNIC SCHOOLS. See TECHNICAL EDUCATION.

POLYTECHNIQUE, pō'lē'tĕk'nēk' (*Ecole Polytechnique*). One of the most famous military preparatory institutions of Europe. It was established at Paris by the National Convention as the Ecole Centrale des Travaux Publics in 1794, and in 1795 its name was changed to Ecole Polytechnique. Although intended originally as a preparatory school for all branches of the public service, it was particularly devoted to the training of civil and military engineers. Under the famous mathematicians Lagrangè and Monge the institution developed rapidly, especially in mathematics and physical sciences, with a view to their application to technical training. In 1804 Napoleon reorganized it on military lines, and under his régime it became a training school for artillerists and engineers. The Ecole Polytechnique is under the supervision of the Minister of War and is devoted mainly to the preparation of students for the several branches of military and civil engineering. Students must hold the bachelor's degree in order to become eligible for the competitive entrance examination. The course of study covers two years, at the end of which period the names of those who successfully pass the final examination are placed on a list in the order of merit, and candidates are allowed to choose what branch of the service they wish to take up. Soldiers who have been in the service at least six months may be admitted without fulfilling all the ordinary entrance requirements. The branches of the service which rely on the Polytechnique for candidates are the corps of land and naval artillery, military and naval engineers, the marine, the corps of hydrographic, road, bridge, and mining engineers, and the telegraph and gunpowder superintendencies.

POL'YTHE'ISM (from Gk. *πολύθεος, polytheos*, relating to many gods, from *πολύς, polys*, much, many + *θεός, theos*, god). The belief in a multiplicity of deities. (For special phases of polytheism see ANIMISM, FETISHISM, NATURE WORSHIP, TOTEMISM, as well as articles on GREEK RELIGION; ROMAN RELIGION; ETC.) The evolution of deities has proceeded from the indifferentiated animism or dynamism of primitive man to the highly complex cosmogonies of the civilized peoples of the ancient world.

In early conditions the development of deities proceeded along the two lines of a specialization and a multiplication of functions of originally but vaguely personal spirits. Thus arose tribal and national deities, who absorbed the powers and functions of minor religious agents, and specialized local deities, who became separated from higher deities of wider power through restriction of functions. As evolution proceeded the personalities of deities tended to become more definite and they assumed distinctly anthropomorphic characteristics. The functions of deities may be derived from three sources: (1) the powers of nature: thus arise gods of the sun and moon, of the stars and the firmament, the dawn, the thunder and lightning, the winds, floods, storms, rivers, and mountains; (2) human attributes: gods are supplied with human qualities, passions, virtues, vices, and desires; (3) human desires: gods are conceived as superhuman, as having that which man lacks—infinite wisdom and foresight, eternal life, colossal strength, transcendent virtue, and exalted capacity for enjoyment.

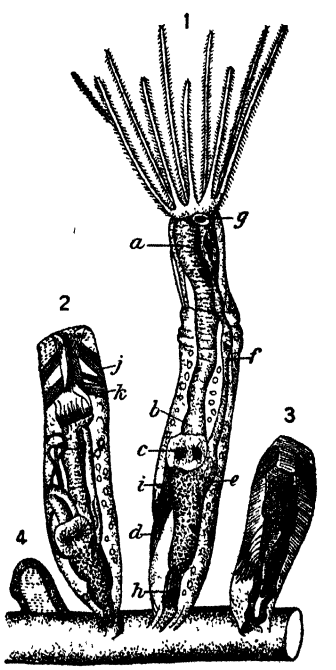
Even in some of the lower religions the tendency is observable for one deity to assume an exceptional position which ranks above those of the other deities of a given tribe or people. We may assume, although it has never been satisfactorily demonstrated, that out of such multiplicity of deities with one supreme god monotheism has gradually developed through a process of syncretism, the functions and ultimately the very personalities of the inferior deities becoming absorbed in that of the superior god. As against this theory it is held by some students that from the earliest times the superior deity outranked the other deities associated with it to such an extent as to constitute what might be called a limited monotheism.

While the divinities of the Greeks and Romans and of some of the other peoples of antiquity are relatively well known, such is not the case with the lower polytheisms of some of the more advanced among primitive peoples. The animal Olympus of the Zuñi Indians is fairly complex: we learn of divine animals presiding over the various directions, others who control the source of events, still others who hold in their power the success of the hunter. The Koriak believe in a Supreme Being, who is variously known as the Universe, or the Supervisor, or Existence,

or The-One-on-High, or Dawn, or Sun. The wife of the Supreme Being is Supervisor Woman, also known as Sea Woman. The children of the couple are Cloud Man, or Cloud Maker, and Cloud Woman. While the Supreme Being and his family are beneficent deities, man is constantly threatened by the machinations of a host of malevolent beings, the Kalan. According to Koriak ideas the Kalan live in families, like human beings, with an old man at the head of the family, his children, their wives, etc. Big Raven, one of the beneficent deities, and his children wage a constant war against the Kalan. The Haida of the Queen Charlotte Islands believe that their country rests on a great supernatural being called Sacred-One-Standing-and-Moving. The highest of Haida deities, however, is Power-of-the-Shining-Heavens, which seems to be associated with the sky. A house suspended in the air is the abode of Faxet, to whom go all who die a violent death. Another suspended house is occupied by the Above-People, who are not longer than one's hand and wrist. The sea and rivers swarm with supernatural beings. All animals, whether of land or sea, have their spiritual prototypes, who are powerful divinities. Such are the Black-Whale-People, the Herring-People, the Killer-Whales, the Salmon-People, etc. The most important of land beings are the Creek Women, otherwise called Daughters-of-the-River. The land animals also have their divine spiritual guardians, the Grisly-Bear-People, Black-Bear-People, Land-Otter-People, Eagle-People, etc. Among the deities associated with economic life and the industries, prominent place is occupied by Property Woman, Master Carpenter, and Master Canoe Builder.

It will thus be seen that polytheism, comprising a multiplicity of more or less differentiated personal deities, is by no means peculiar to the higher stages of religion. It occurs, on the contrary, among peoples of relatively low culture, in association with a general animism, fetishism, totemism, and other forms of belief.

For bibliography, consult special articles referred to above.



POL'YTRICHID'IUM. A bryophyte (q.v.). See Plate of MUSCI.

POL'YU'RIA. An excessive secretion of urine, temporary or permanent. The urine is increased after excessive drinking of fluids, exposure to cold, the suppression of perspiration, the taking of certain drugs called diuretics (q.v.), and as a sequel of hysterical attacks. An increase in the amount of urine is a favorable sign during defervescence in acute febrile diseases, and attends certain organic diseases of the nervous system, e.g., cerebellar, bulbar, and spinal tumors, locomotor ataxia, and meningitis. Permanent polyuria is characteristic of diabetes mellitus and diabetes insipidus, of chronic interstitial nephritis, and of amyloid disease of the kidneys. See DIABETES.

POLYX'ENA (Lat., from Gk. Πολυξένη). The daughter of Priam and Hecuba. She was betrothed to Achilles (q.v.), who, according to one story, was killed by Paris (q.v.) while celebrating his nuptials with her in a temple of Apollo. At the demand of his shade Polyxena was sacrificed in expiation on his funeral pyre. Her death forms the subject of the first part of Euripides' *Hecuba*.

POL'YZO'A (Neo-Lat. nom. pl., from Gk. πολύς, *polys*, much, many + ζῷον, *zôon*, animal), or MOSS ANIMALS. Minute marine animals usually forming mosslike or coral-like calcareous or chitinous masses called corms, each cell containing a polyp-like animal with the digestive tract flexed, the anus situated near the mouth. The body is usually drawn in and out of the cell by the action of retractor and adductor muscles. The mouth is surrounded by a crown of long tentacles. No heart or vascular system exists, and the nervous system consists of a single or double ganglion situated between the mouth and the vent, with nerves proceeding from it. The Polyzoa are hermaphroditic, multiplying by budding or eggs. The embryo passes through a blastula, gastrula, and trochosphere stage, the corm being formed by the budding of numerous cells from a primitive one. The group was formerly called Bryozoa.

Fossil Polyzoa are common in nearly all geological formations from the Ordovician upward. Because of the difficulties attendant upon their identification, very few of them have served as horizon markers or index fossils. The one prominent exception to this rule is the genus *Archimedes*, with its screw-shaped axis, which is very abundant in some parts of the Carboniferous rocks. In North America the Trenton, Cincinnati, and Hamilton groups are especially prolific sources of supply. The European Mesozoic and Tertiary deposits abound in them, one author, D'Orbigny, having described about 850 species

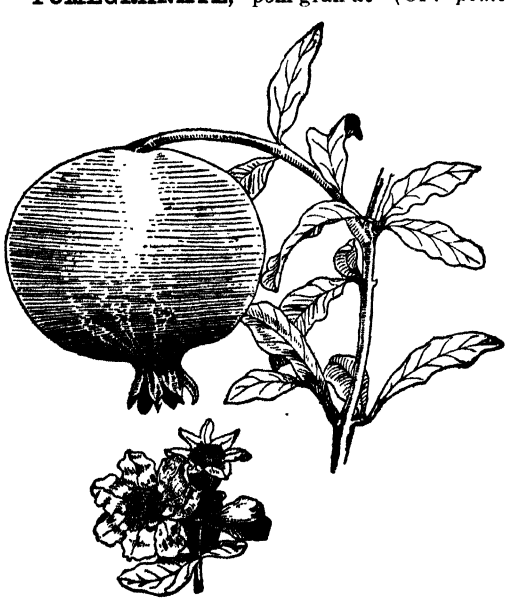
A TYPICAL POLYZOAN.

1, animal of *Bowerbankia densa* fully expanded: *a*, pharynx; *b*, cardia; *c*, gizzard; *d*, stomach; *e*, pylorus; *f*, intestine; *g*, anus; *h*, muscles. 2, the same animal when completely retracted: *j*, *k*, opercular retractor muscles. 3, an immature animal. 4, a bud in its earliest state.

from the Upper Cretaceous beds alone, while the rocks of these ages in North America are comparatively lacking in them. The North American Paleozoic has afforded about 1325 species, distributed under 170 genera. Consult: Von Zittel and Eastman, *Textbook of Paleon-*

tology, vol. i (New York, 1900); Nickles and Bassler, "Synopsis of American Fossil Bryozoa, Including Bibliography and Synonymy," in *United States Geological Survey, Bulletin No. 173* (Washington, 1900); S. F. Harmer, "Polyzoa," in *Cambridge Natural History*, vol. ii (New York, 1901).

POMACE (pŭm'ăs) **FLY** (ML. *pomacium*, cider, from Lat. *pomum*, apple, pome). One of the small yellowish flies of the genus *Drosophila*, very common about the refuse of cider mills and fermenting vats of grape pomace; also in houses, about overripe or decaying fruit, in which they lay their eggs. The larvæ breed occasionally in decaying animal matter also, and in excrementitious matter, and these flies are undoubtedly instrumental in spreading disease by frequenting the dining rooms of unscreened houses.



POMARE, pō-mä'rā. The name of four sovereigns of the Society Islands, of whom Pomare IV, Queen of Tahiti (1813–77), is best known. During her reign France seized the islands in 1842, established a protectorate, and in 1880 annexed them. A revolution in 1852 forced Queen Pomare to abdicate in favor of her children. See SOCIETY ISLANDS; TAHITI.

POMBAL, pōn'bȧl', SEBASTIÃO JOSÉ DE CARVALHO E MELLO, MARQUIS OF (1699–1782). A Portuguese diplomat and statesman, known to his countrymen as the Great Marquis. He was born May 13, 1699, at the castle of Soure, near Pomba. After studying law at Coimbra and serving a short time in the army, Pombal received an appointment in the service of the Portuguese government. In 1739 he was appointed Envoy Extraordinary to the Court of London through the influence of his uncle, Paulo Carvalho, and held the appointment six years, after which he was sent to Vienna in a similar capacity. He there married Countess Daun, and on returning to Lisbon, in 1750, he became popular with the Austrian party in the Portuguese court and was appointed Minister of Foreign Affairs by King Joseph. His activity was not confined to the external concerns of the realm. His first acts were to limit the power of the Inquisition and also to reattach to the crown a great number of domains that had been unjustly alienated. Then followed the reorganization of the army, the introduction of fresh colonists in the Portuguese settlements, and the establishment of an East India company and a Brazilian company. He introduced into Brazil the cultivation of coffee, sugar, cotton, rice, indigo, and cacao, and freed the Indians from slavery. When the great earthquake of 1755 laid Lisbon waste, Pombal displayed surpassing courage and energy in bringing about the rebuilding of a greater and more beautiful capital. The King raised him to the rank of Count D'Oeyras, and in the following year appointed him Prime Minister. He crushed an alleged conspiracy instigated, so he asserted, by the great nobles and the Jesuits, the latter of whom he expelled from court and in 1757 confined to their colleges. An attempt upon the life of the King, to which the Jesuits were accused of being a party, but which some historians assert was a complot of Pombal himself to serve his own political ends, placed his enemies completely in his power. The leaders were severely punished by command of the Minister. Pombal made up his mind that the presence of the Jesuits in Portugal was incompatible with the security of the government and the welfare of the nation, and by a royal decree of Sept. 3, 1759, they were banished from the Kingdom as rebels and enemies to the King. Pombal had them seized and carried on board ships and transported to the states of the Church. The Pope, Clement XIII, protested vehemently, whereupon Pombal caused the Papal Nuncio to be shown across the frontier. He also expelled the Jesuits from the famous missions in Paraguay, which resulted in their complete destruction. All this time Pombal was laboring energetically to improve agriculture in Portugal and also the system of primary education. In 1770 he was created Marquis of Pombal, and from this period to the death of the King in 1777 he was at the very height of his power. The accession of Joseph's daughter, Maria I, brought about his downfall. He was deprived of his office; the numerous alleged conspirators whom he kept in prison were released; many of his measures were abrogated, and Maria ordered him to retire to his castle of Pombal. He died there May 8, 1782.

POME (OF. *pome, pomme*, Fr. *pomme*, apple, from Lat. *pomum*, fruit). A fruit in which the flesh is developed from the cuplike structure upon which the sepals, petals, and stamens have stood in the flower. Apples, pears, and quinces are illustrations. The core, with its contained seeds, is the transformed ovary, which is closely invested by the fleshy covering. See FRUIT.

POMEGRANATE, pom-grăn'ăt (OF. *pome granate*, from ML. *pomum granatum*, apple with seeds, from Lat. *pomum*, apple pome, and *grana-*

POMEGRANATE FRUIT AND FLOWER.

tus, having seeds, from *granum*, seed, grain), *Punica granatum*. A thorny shrub or small tree of the family Punicaceæ, native of southwest Asia, naturalized in southern Europe, and widely cultivated during historic time. The cultivated varieties, which are scarcely thorny, have coral-red, waxlike terminal flowers, leathery-skinned fruits as large as oranges, yellow, with a rosy cheek. Each of the many seeds is enveloped in a sweet or subacid separate pulp inclosed by a thin membrane. This pulp is often used for the preparation of cooling drinks. A kind of pomegranate without seeds is cultivated and much prized in India and in Persia. There are ornamental varieties with double flowers. The finest morocco leather is said to be tanned with the rind of the fruit. In the United States the cultivation of the pomegranate is confined to the southern part of Florida and the warmer parts of California and Texas, since the tree is tender, being injured by a temperature of 8° to 10° below freezing. In some portions of the South the plant is used for hedges, in which form it grows through a much wider latitude. It is propagated by cuttings of both green and ripe wood, by layers, and by grafting.

POMEGRANATE. See MUSKMELON.

POM'ELO. See GRAPEFRUIT.

PO'MERA'NIA (Ger. **POMMERN**, pŏm'-mĕrn). A province of Prussia, bounded by the Baltic Sea on the north, West Prussia on the east; Brandenburg and West Prussia on the south, and Mecklenburg-Schwerin on the west; it also touches Mecklenburg-Strelitz (Map: Germany, F 2). Its area is 11,634 square miles. The surface is mostly flat, with isolated hills in the eastern part and a general inclination towards the Baltic. The coast is low and is very deeply indented, forming numerous inlets, among which the Stettiner Haff is the most prominent. The only river of importance is the Oder. There are numerous lakes both along the coasts and in the interior. The climate, especially in the east, is somewhat raw. Pomerania is chiefly an agricultural country, although its soil with a few exceptions is rather inferior and in some parts is unfit for farming. Rye, oats, wheat, barley, potatoes, tobacco, and several kinds of beets are raised. In 1913 there were under rye 466,808 hectares; oats, 310,279; potatoes, 219,572; wheat, 60,394; barley, 56,348. The number of horses in 1913 was about 242,500; cattle, 858,200; sheep, 711,200; goats, 87,300; swine, 1,326,700. Some of these products are exported. Smoked fish is one of the famous products of Pomerania. The manufacturing industries are of less importance. They are centred chiefly in the cities and are confined for the most part to shipbuilding and the manufacture of machinery. There are also some glassworks, sugar refineries, tobacco factories, woolen mills, breweries, and distilleries. Owing to its numerous harbors Pomerania has a well-developed sea trade, of which Stettin, the capital, is the centre. The province is divided into the three districts of Stettin, Köslin, and Stralsund, and sends 26 Deputies to the Lower and 25 to the Upper House of the Prussian Landtag. The increase in population has been much below the average for the Empire. In 1871 the inhabitants numbered 1,431,633; in 1880, 1,540,034; in 1890, 1,520,889; in 1900, 1,634,832; in 1910, 1,716,921. The Poles and other Slavs number about 15,000. The only large city is Stettin (pop., 237,419).

History. The Vandals, who occupied the country at the beginning of historic times, were succeeded in the fifth and sixth centuries by the Slavic Wends, who before the end of the twelfth century had been converted to Christianity. Under the Wends the country was divided into several principalities. Two of the princes assumed the ducal title in 1170. In 1181 they were recognized as dukes of the Empire by Frederick Barbarossa, and soon after the Margrave of Brandenburg received the feudal suzerainty over Pomerania. In 1308 the district between the Persante and the Vistula, known as Pomerellen, was ceded to the Teutonic Order, but territorial gains were made on the west. Subsequently the Elector of Brandenburg received the right of succession to the Pomeranian lands upon the extinction of the ruling house in the male line. In 1541 the duchies of Stettin and Wolgast were erected, to which were frequently given the names of Hither Pomerania and Farther Pomerania respectively. The line of Slavic dukes died out in 1637, but in the Treaty of Westphalia, in 1648, Brandenburg had to content herself with the greater part of Farther Pomerania, Hither Pomerania and some districts of Farther Pomerania going to Sweden. The Prussian possessions in Pomerania were rounded out by the Treaty of Stockholm in 1720, when Sweden relinquished part of Hither Pomerania, and in 1815 Prussia acquired the rest of Swedish Pomerania.

POMERANIAN DOG. See SHEEP DOG.

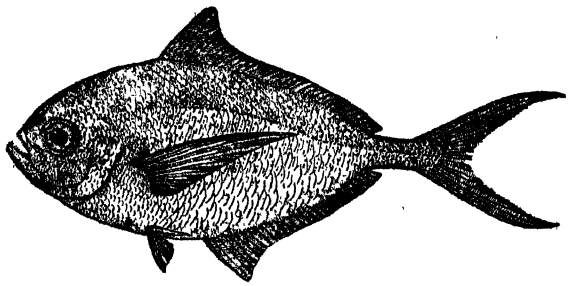
POMERANUS, pŏm'ĕr-ā'nŭs *or* pō'mĕ-rā'nus. See BUGENHAGEN, JOHANN.

POMERENE, ATLEE (1863–). An American legislator. He was born at Berlin, Holmes Co., Ohio, graduated from Princeton in 1884 and from the Cincinnati Law School in 1886, and thereafter practiced law at Canton, Ohio, where he was city solicitor in 1887–91. He served as prosecuting attorney of Stark Co., Ohio, from 1897 to 1900, was appointed a member of the Honorary Tax Commission of Ohio in 1906, and became Lieutenant Governor of Ohio in 1910. In the latter year Pomerene presided over the Democratic State Convention and was elected United States Senator for the term 1911–17.

POMERIUM. See POMŒRIUM.

POMEROY, pŏm'e-roi. A village and the county seat of Meigs Co., Ohio, 125 miles by rail southeast of Columbus, on the Ohio River and on the Hocking Valley and the Kanawha and Michigan railroads (Map: Ohio, F 7). It is in a region possessing valuable deposits of salt and bituminous coal and is of commercial and industrial importance. It is particularly noted for the production of calcium and bromine. The salt works are extensive. There are, besides, foundries and machine shops, flour and lumber mills, etc. A Carnegie library is maintained by the village. The government is administered by a mayor, elected biennially, and a unicameral council. Pomeroy was settled in 1816 and was first incorporated in 1840. Pop., 1900, 4639; 1910, 4023.

POMEROY, FREDERICK WILLIAM (?–). A British sculptor. He studied at the Lambeth art schools, at the Royal Academy schools, and in Paris. He did much to popularize decorative sculpture. Pomeroy did the carvings and metal work for Welbeck Abbey and the stone panels and frieze for the Sheffield town hall and is noted for his statues: Robert Burns (Paisley and Sydney, New South Wales), Gladstone



(Houses of Parliament), Duke of Westminster (Chester Cathedral), Archbishop Temple (Canterbury Cathedral), and Lord Dufferin (Belfast). Productions of another type include "Dionysos" and "The Nymph of Loch Awe" (Tate Gallery), "Giotto," and "Perseus." Pomeroy's work shows careful technique, imagination, and strength. He was elected an associate of the Royal Academy in 1906.

POMEROY, JOHN NORTON (1828–85). An American lawyer and legal writer, born in Rochester, N. Y. He graduated at Hamilton College in 1847 and was admitted to the State bar in 1851. He then practiced law in Rochester until 1864 and from 1864 to 1868 was professor of law and political science and dean of the law faculty of the University of New York. From 1869 until 1878 he again practiced law in Rochester and from 1878 until 1885 was professor of municipal law in the University of California. He edited Sedgwick's *Statutory and Constitutional Law* (1874) and Archbold's *Criminal Law* (1876), and wrote *An Introduction to Municipal Law* (1865); *An Introduction to the Constitutional Law of the United States* (1868; 9th ed., 1886); *Remedies and Remedial Rights According to the Reformed American Procedure* (1876); *A Treatise on Riparian Rights* (1884); *A Treatise on Equity Jurisprudence* (3d ed., 4 vols., 1905).

POMEROY, SETH (1706–77). An American soldier, born in Northampton, Mass. He early became a blacksmith and accumulated property, but was interested chiefly in military affairs. He was major of the Fourth Massachusetts Regiment in the successful attack upon Louisburg in 1745 and the next year was engaged against the Indians on the frontier. In the French and Indian War he was lieutenant colonel in the expedition against Crown Point. When Col. Ephraim Williams was killed at Lake George, Sept. 8, 1755, Pomeroy took command of the regiment and captured the French commander, Baron Dieskau. Promoted colonel in 1757, he marched to the relief of Fort William Henry, and in 1760 he commanded the frontier forts. He was elected to the first New York Provincial Congress in 1774 and was one of the three men put in charge of the military forces of the Colony by that body. In 1775 he was again a member of the Provincial Congress, drilled the militia, and is said to have planned the capture of Fort Ticonderoga. In the battle of Bunker Hill Pomeroy fought at first as a private, but during a part of the day commanded a battalion. On June 22 he was nominated to be one of the first eight brigadiers named by Congress, but on account of his advanced age declined to accept larger responsibility. In the latter part of 1776, at Washington's personal solicitation, he joined General McDougal at Peekskill, but died of pleurisy, Feb. 17, 1777, before seeing any active service. His journal, published in J. R. Trumbull's *History of Northampton* (2 vols., Northampton, 1902), contains much interesting matter concerning the colonial wars.

POM'FRET. A town in England. See PONTEFRACT.

POMFRET (probably corrupted from Portug. *pombo, pampo,* pomfret). The name in Bermuda of a fish (*Brama raii*) allied to the moonfish and the harvest fish, but representing a singular family whose three or four species are of almost cosmopolitan distribution. West Indian local names are castagnole and rondanin. They are large dun-colored pelagic fishes, which roam widely, descend to great depths, and are edible.

THE POMFRET (*Brama raii*).

The young differ decidedly from the adults. Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898).

POMFRET, JOHN (1667–1702). An English poet, born at Luton, Bedfordshire; was educated at Queens' College, Cambridge, and was rector of Maulden and then of Millbrook, both in Bedfordshire. His poem *The Choice* (1700), written in the heroic couplet, was admired by Dr. Johnson; his *Miscellany Poems* appeared in 1702. Consult Samuel Johnson, *Lives of the British Poets,* vol. i (London, 1779; new ed., Oxford, 1905).

POM'MER, DR. See BUGENHAGEN, JOHANN.

POMMERN, pôm'ĕrn. See POMERANIA.

PO'MO (probably, earth people, indigenes). A group of small tribes constituting a distinct linguistic stock known as the Kulanapan, formerly dwelling in northwestern California. When first described by Gibbs, in 1853, they were very numerous, with villages along every stream, but they are now nearly extinct. They were described in 1876 by Powers, in his *Tribes of California,* as a peaceful, good-tempered, and easy-going people, rather below the intellectual standard of their more warlike neighbors. They built conical dwellings of poles and bark for their winter residence, with brush shelters in the summer. They had a system of dual chieftainship, with rather elaborate marriage ceremonies, and usually burned their dead. A secret society of the Pomo had branches in nearly every village; its members, in horrible disguise, at frequent intervals made the rounds of the dwellings to terrorize the women by their uncouth appearance and antics, the belief being that for the time being the performers were incarnations of the tribal demons. Like most of the northern California tribes, they had a thanksgiving dance after an abundant acorn crop. Their fame rests chiefly upon the baskets woven by their women. Almost all their household utensils were of basketwork, and the art survives in almost its old-time perfection, now highly prized by collectors and museums. (See BASKET.) The following tribes survive: Clear Lake, Gynomehro, Little Lake, Lower Lake, and Pomo. Consult: O. T. Mason, *Aboriginal Indian Basketry* (Washington, 1904); S. A. Barrett, *Pomo Indian Basketry* (Berkeley, Cal., 1908); id., *Ethnogeography of Pomo and Neighboring Indians* (ib., 1908).

POMŒ'RIUM, or **POME'RIUM** (Lat., commonly explained as the space behind the wall,

from *post*, after, behind + *murus*, *mœrus*, wall; but R. G. Kent, "The Etymological Meaning of Pomerium," in *Transactions of the American Philological Association*, xliv, Boston, 1914, explains it rather as corrupted from *proimoiriom*, from *pro*, before, i.e., outside, and *mœrus*, wall). A space about (or outside) the walls of ancient Rome, marked off by cippi (or boundary stones) and kept vacant as sacred ground. The pomœrium marked the limits of the city. It was advanced by Sulla, and later by several of the emperors, when the bounds of the Empire were enlarged. Consult the references in the footnotes of Kent's article, referred to above, and the article "Pomerium," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

POMOL'OGY (from Lat. *pomum*, apple, pome + Gk. *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The study or cultivation of fruits, particularly those belonging to the apple family. This restricted meaning is not now adhered to, and the term is often used synonymously with fruit culture in general and is made to include all fruits. See FRUIT, CULTIVATED; HORTICULTURE.

POMO'NA (Lat.; connected with *pomum*, apple, pome). An ancient Latin or Italian goddess of fruit, especially of gardens. Her early prominence is shown by the existence of a *flamen Pomonalis*, at the foot of the list of *flamines* (see FLAMENS), and the presence of a sacred grove, the Pomonal, near the road to Ostia. It is, however, still doubtful whether these indications speak for a Pomona or a Pomonus, as a god of that name is found among the Umbrians, or possibly for a pair of divinities, such as is not uncommon in the early Roman religion. In the later Roman poets, especially Ovid, Pomona appears in various legends. Thus she is the wife of the mythical King and prophet, Picus (q.v.), who was changed by the jealous Circe to a woodpecker. More famous is Ovid's tale (*Metamorphoses*, xiv, 623 ff.) of the fair but cold nymph Pomona, who, absorbed in the care of her trees, disdained all other love, till Vertumnus, the "transformer" who ripens the fruits, after vainly wooing her in many forms, finally approached her as an old woman, who won her favor and told her many stories of the fate of those who had despised love. Even then she remained indifferent to the suit of Vertumnus till the god assumed the form of a youth of perfect beauty, when she yielded, and from that time the lovers were inseparable. Consult Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

POMONA, or MAINLAND. The largest of the Orkney Islands (q.v.).

POMONA. A city in Los Angeles Co., Cal., 33 miles by rail east of Los Angeles, on the Southern Pacific and the San Pedro, Los Angeles, and Salt Lake railroads (Map: California, H 8). It is a beautiful town, situated in the San Gabriel valley, attractive as a place of residence and as a health resort, and noted also as the centre of extensive fruit-growing interests, especially the culture of oranges. At Claremont, in the vicinity, is Pomona College (Congregational), opened in 1888. Ganesha Park commands a magnificent view of the country and also of the sea, about 50 miles distant. There is a public library. Pomona was settled in 1875 and incorporated in 1887. Pop., 1900, 5526; 1910, 10,207; 1914 (U. S. est.), 12,202.

POMONA COLLEGE. A coeducational institution for higher education at Claremont, Cal., founded in 1887 under Congregational auspices, but free from ecclesiastical control. The campus comprises more than 100 acres. A plan for the development of the campus and buildings has been carefully worked out by competent landscape architects, and all growth is in accordance with this harmonious plan. The total enrollment in all departments in 1915 was 541; of these all but 21 were in four college classes. The freshman class is limited to 100 men and 100 women. The instructors numbered 45. All courses given in the college lead to the degree of B.A. The college has an endowment of approximately $1,000,000. The value of the grounds and buildings is about $580,000, and the annual income $125,000. In 1915 the Mabel Shaw Bridges Hall of Music, one of the finest music halls on the coast, was completed. The library contains about 22,000 volumes. The president in 1915 was James Arnold Blaisdell, D.D.

POMO'NUS. See POMONA.

POMPADOUR, pôN'pȧ'dōōr', JEANNE ANTOINETTE POISSON, MARQUISE DE (1721–64). A mistress of Louis XV of France. She was born in Paris, Dec. 29, 1721, of obscure parents, bearing the name of Poisson. Lenormant de Tournehem, a rich farmer-general, was supposed to be her father, however, and he saw that she was well educated and well provided for. She excelled in music, elocution, and drawing; but what charmed the brilliant society that frequented the salons of the rich financier was the perfect grace and beauty of her figure and the exquisite art with which she was dressed. A crowd of suitors sought her in marriage, but in 1741 she became the wife of De Tournehem's nephew, Lenormant d'Etioles. In 1745 Madam d'Etioles, who had attracted the favorable notice of the King, was installed in the palace of Versailles. Soon after this time she was ennobled by the title of Marquise de Pompadour and long ruled the King, first as mistress and afterward as an indispensable purveyor of diversions. The King believed her extremely clever, and after he had lost his first passion for her as his mistress was glad to avail himself of her services as his chief political adviser. In fact, for nearly 20 years her influence was predominant in all important affairs of state. The choice of ministers, of ambassadors, of generals, depended on "la Pompadour" and her favorite minions. The Austrian Prime Minister, Kaunitz, even induced Maria Theresa to sacrifice her pride to the exigencies of her position, and the Empress wrote the royal mistress a letter in which she addressed her as *ma cousine*. Largely through the influence of the Marquise de Pompadour was that diplomatic revolution effected which in the Seven Years' War ranged France on the side of her hereditary enemy, Austria. (See KAUNITZ.) She made and unmade ministers, and Choiseul-Amboise (q.v.) owed his influence to her support. She was a bitter enemy of the Jesuits and was responsible to a great degree for their expulsion from France. She was noted also for her patronage of artists and literary men. She was in receipt of an income of 1,500,000 francs a year and had apartments at Paris, Versailles, and Fontainebleau. She died at Versailles, April 15, 1764.

Pompadour (ib., 1888); Dietrick, *Les maîtresses de Louis XV* (Vienna, 1881); Sainte-Beuve, *Causeries du lundi*, vol. xi; Fleury, *Louis XV intime* (Paris, 1899); De Caraman, *La famille de la marquise de Pompadour* (ib., 1900); also her *Correspondance*, edited by Malassis (ib., 1878). Two volumes of alleged *Mémoires* of the Marquise de Pompadour are without value. Consult, however, the *Mémoires de Madame du Hausset, femme de chambre de Madame de Pompadour* (Paris, 1846); Capefigue, *Madame de Pompadour* (ib., 1858); Campardon, *Madame de Pompadour et la cour de Louis XV* (ib., 1897); N. Williams, *Madame de Pompadour* (London, 1902); De Nolhac, *Louis XV et Madame de Pompadour* (Paris, 1903).

POM'PANO (Sp. *pampano*, young vine tendril), or PALOMETA. A fish of southern waters, representing a section of the great horse-mackerel family Carangidæ, and of admirable edible quality. The "common" pompano (*Trachynotus carolinus*) dwells along the South Atlantic and Gulf shores of the United States and southward and is occasionally seen on the Pacific coast. It has the characteristic ovate form of the group (see Plate of HORSE MACKERELS AND ALLIES), is bluish and silvery in colors, and is about 18 inches long. This pompano is found all the year round at the Florida Keys and south of that, but northward enters the bays in large schools in the spring. These disperse to the feeding and spawning grounds in shallow inlets and gather again in the autumn for migration. This fish is caught in seines and otherwise both in spring and autumn, but is fattest and best in the latter season.

Several other species exist, some of which are valuable. The largest, the "great" pompano or "permit" (*Trachynotus goodei*) of the West Indian region, reaches a length of 3 feet; it is closely allied to a well-known African one. Another noticeable species is the "round" pompano (*Trachynotus falcatus*), which may be identical with an East Indian form; it has a more circular outline than the others and ranges northward to Vineyard Sound. It is not so good as the common pompano; and several other of the numerous species are almost worthless as food, though some, like the "banner" or "gaff-topsail" pompano of the Carolina and Gulf coasts (*Trachynotus glaucus*), are exceedingly handsome in form and color. The so-called pompano (*Rhombus simillimus*), so highly prized in southern California, is a somewhat different fish, being one of the true harvest fishes. See HARVEST FISH.

POMPEII, pŏm-pā'yē. An ancient city of Campania, built at the mouth of the river Sarnus (Sarno), looking out on the Bay of Naples. It stood only a few miles south of Mount Vesuvius, between Herculaneum and Stabiæ. It was founded as early as the sixth century B.C. by Oscans, who were later conquered by Samnites. The city fell under the power of Rome during the Samnite wars (342–290 B.C.), but retained autonomy in a measure. Under Sulla (80 B.C.) it became a Roman colony and later a favorite resort for wealthy Romans, many of whom, including Cicero and the Emperor Claudius, had villas in the suburbs. It was also a place of considerable trade and was the port town of Nola and other inland cities which studded the fertile valley of the Sarnus. Its population must have been about 20,000. The city was much damaged by an earthquake which occurred on Feb. 5, 63 A.D. In 79 occurred that terrific eruption of Vesuvius which in one day overwhelmed the towns of Pompeii, Herculaneum, and Stabiæ. (Consult Pliny the Younger, *Epistles*, vi, 16 and 20.) In course of time a small village rose at or near the spot; but the memory of Pompeii faded gradually, and for centuries its very site was unknown. The difficulty of discovering its true position was increased in consequence of the changes produced by the fearful convulsion of 79, which had hurled back the Sarnus from its ancient course and raised the sea beach to a considerable height, so that the rediscovered city to which merchantmen resorted of old is now a mile from the coast and a considerable distance from the stream that in ancient times ran near its walls. For more than 1500 years Pompeii lay undisturbed beneath heaps of ashes and cinders. In 1594–1600 an aqueduct for Torre Annunziata was tunneled under the ruins, but no particular notice was taken of them. It was not till 1748 that excavations were made in modern times. These operations, begun by the Neapolitan government, have been continued till the present time (and since 1860 with increased energy and in accordance with a well-considered plan; see FIORELLI) and have been exceedingly productive of objects that interest not only the antiquarian and the classical scholar, but the student of human life and social conditions in general. The remains found are in a remarkably good state of preservation, owing to the fact that the city was destroyed, not by lava, but by showers of wet ashes and cinders (lapilli), forming a light covering, which found their way into every nook and, when they dried, hermetically sealed up the town. Only about 2000 of the inhabitants perished. Around the bodies of some of these the ashes (mixed with rain) settled into a compactness that preserved the character of the mold after the bodies themselves had turned to dust. Into some of these molds liquid plaster has been poured by the excavators, and thus the forms of the bodies have been preserved (some of these bodies are to be seen in the small but valuable museum erected at Pompeii, near the Porta Marina). Not only did most of the inhabitants succeed in escaping during the eruption and in carrying with them their movable valuables, but they returned after the eruption had ceased, tunneled down into and around the houses and public buildings (the upper stories rose above the fallen ashes), and carried off almost everything of value, even to the extent of stripping movable slabs from the buildings (e.g., the larger theatre). This explains why so few objects of great value have been discovered.

What has been found affords us a remarkably realistic and complete picture of life in a small provincial city of Italy in the first century after Christ. Most of the movable objects discovered, and a large number of the best-executed wall paintings (e.g., see Colored Plate accompanying article on DECORATIVE ART) and floor mosaics, have been removed to the Royal Museum (Museo Nazionale) at Naples. Lately, however, one house of a family of wealth (the house of the Vettii) has been left, with all its equipments, as found; some parts of it, too, notably the peristyle (q.v.), have been reconstructed. About one-half of the city has already been excavated, and the circuit of the walls (about 2 miles) determined. Many years must elapse before the entire city can be laid bare. The most interest-

POMPEII

PRIVATE HOUSE, WITH MOUNT VESUVIUS IN THE DISTANCE

The view shows the atrium in the foreground, the peristylum in the rear, and the tablinum between these two.

ing discoveries recently have been those of the (unfinished) temple of Venus Pompeiana and of the remains of a number of fugitives carrying much jewelry and other valuables, whose attempted flight in the direction of Stabiæ was blocked by the ruin of the bridge over the Sarnus or by the lack of boats. They took refuge in a wayside inn and there perished. In 1912, in a street which connects the Via dell' Abbondanzia with the amphitheatre, seven houses were found, each with a balcony on the second story; the balconies are 20 feet long by 5 deep. (Consult the *Classical Weekly*, v, 190–191, New York, 1912, and *Notizie degli Scavi*, 1912.) The entire countryside around Pompeii abounded in residences of the wealthy, and rich returns doubtless await the excavators there. A beginning has been made near Boscoreale (q.v.), and the finding of a very valuable table service of silver at the bottom of a well in a villa is an indication of what may be expected elsewhere. The owner had thrown it there for safety when he fled and was unable to rescue it later.

Bibliography. The best books on Pompeii are: Mau, *Pompeii: Its Life and Art*, translated by Kelsey (2d ed., New York, 1902), with elaborate bibliography, and A. Mau, *Pompeii in Leben und Kunst* (Leipzig, 1908). For the current excavations, consult *Notizie degli Scavi*. Very valuable, too, is the account of Pompeii in K. Baedeker, *Southern Italy and Sicily* (16th Eng. ed., Leipzig, 1912). Other recent works of merit are: Overbeck-Mau, *Pompeii, in seinen Gebäuden, Alterthümern und Kunstwerken* (4th ed., Leipzig, 1884); Gusman, *Pompéi*, translated by Simonds and Jourdain (London, 1900); Weichardt, *Pompei vor der Zerstörung: Reconstructionen der Tempel und ihrer Umgebung* (Leipzig, 1897). Popular but useful works are: Fr. von Duhn, *Pompeji: Eine hellenistische Stadt in Italien* (ib., 1906); E. Thomas, *Roman Life under the Cæsars*, chap. i, on the *Graffiti* (q.v.; Eng. trans., New York, 1899); and G. Boissier, *Rome and Pompeii* (Eng. trans. by D. H. Fisher, New York, 1896; pp. 370–419, on the frescoes at Pompeii, are particularly good). On the frescoes found near Pompeii, consult Mau-Kelsey (referred to above), and A. P. Laurie, *Greek and Roman Methods of Painting* (Cambridge, 1910; see GREEK ART). Consult also Duhn and Jacobi, *Der griechische Tempel in Pompeji* (Heidelberg, 1890). For the discoveries near Boscoreale, consult Heron de Villefosse, "Le trésor de Boscoreale," in *Monuments Piot*, vol. v (Paris, 1899); Barnabei, *La villa Pompeiana di P. Fannio Sinistore scoperta presso Boscoreale* (Rome, 1801). The older works are in general not very trustworthy; among the most important for their illustrations are Mazois, *Les ruines de Pompéi* (Paris, 1824–38); Roux and Barre, *Herculaneum et Pompéi* (8 vols., ib., 1841); Nicolini, *Le case ed i monumenti di Pompei* (Naples, 1854–96); *Real Museo Borbonico* (16 vols., ib., 1824–57). On the paintings, consult: Zahn, *Die schönsten Ornamente und merkwürdigsten Gemälde aus Pompei* (Berlin, 1828–59); Rochette, *Choix de peintures de Pompéi* (Paris, 1844–53); D'Amélio, *Pompei: dipinti murali* (Naples, 1898 et seq.); and especially Helbig, *Untersuchungen über die campanische Wandmalerei* (Leipzig, 1873); id., *Wandgemälde der vom Vesuv verschütteten Städte Campaniens* (ib., 1868); Mau, *Geschichte der decorativen Wandmalerei in Pompei* (Berlin, 1882); Sogliano, "La casa dei Vetii in Pompeii," in *Monumenti antichi*, vol. viii (Milan, 1898). Important discussions are contained in Nissen, *Pompejanische Studien* (Leipzig, 1877), and Mau, *Pompejanische Beiträge* (Berlin, 1879). A full bibliography is given in Furchheim, *Bibliografia de Pompei, Ercolano e Stabia* (2d ed., Naples, 1891).

POMPE'IUS, GNÆUS MAGNUS, commonly known as POMPEY, or POMPEY THE GREAT (106–48 B.C.). A famous Roman general and statesman. He was a son of Gnæus Pompeius Strabo. At the early age of 17 he began to learn the military art under his father by service in the field against the Italians in the Social War (q.v.). Though so young, he gave proof of extraordinary valor and of remarkable energy of character. On the death of his father, in 87 B.C., Pompeius, then only 19 years of age, was left without a protector, and during the temporary triumph of the Marian party he was for some time in considerable danger. When Sulla (q.v.), to whose side he was attached, returned from Greece to Italy to oppose Marius (q.v.), Pompey hastened into Picenum, where he had considerable estates and influence, and there raised an army of three legions, with which he successfully opposed the forces of the Marian party, compelling them to quit the district and effecting a junction with Sulla. During the rest of the war he conducted himself with great prudence and valor and with such remarkable success that, on the restoration of peace in Italy, the conduct of the war against the remains of the Marian faction in Africa and Sicily was intrusted to him. He speedily performed this commission and on his return to Rome was honored with the name of Magnus (i.e., the great) and with a triumph which, for one who had not yet held any public office and was merely an *equcs*, was an unprecedented distinction. His next exploits were the reduction of the followers of Lepidus, whom he drove out of Italy, and the extinction of the Marian party in Spain, led by the brave Sertorius (q.v.). This latter work was one of no small difficulty. Pompey suffered some severe defeats at the hands of Sertorius, and it was only after Sertorius had been assassinated that Pompey was able to put an end to the war. In returning to Italy he fell in with and defeated the remnants of the army of Spartacus (q.v.) and thus claimed the credit of concluding the Servile War.

He was now the idol of the people and, though legally ineligible to the consulship, was elected to that important office for the year 70, the Senate preferring to relieve him of his disabilities rather than provoke him to extreme action. Hitherto Pompey had belonged to the aristocratic party; but as he had of late years been looked upon with suspicion by some of the leading men of the Optimates (q.v.), he now publicly espoused the people's cause. He carried a law restoring the tribunician power to the people and aided largely in the passage of the bill of Aurelius Cotta (*lex Aurelia*), directing that the *judices* should for the future be taken from the Senate, the *equites*, and the *tribuni ararii*, instead of from the Senate alone. In 67–66 B.C. Pompey performed a noble service for the Republic in clearing the Mediterranean of the Cilician pirates who had infested it in vast numbers (see CILICIA; GABINIUS, AULUS), and during the next three years (65–63) he conquered Mithridates, King of Pontus, and Tigranes, King of Armenia, annexed Syria to the

Roman dominions, took Jerusalem, and made Judæa tributary to Rome. On his return to Italy he disbanded his army and entered Rome in triumph for the third time, in 61. After his return he was desirous that his acts in Asia should be ratified by the Senate and that certain lands should be apportioned among his veteran soldiers. But the Senate declined to accede to his wish, and he therefore formed a close intimacy and mutual alliance with Cæsar. Crassus, who possessed enormous wealth, and who exercised a wide influence at Rome, was induced to forego his grudge against Pompey, and thus these three men formed among themselves that coalition which is commonly called "the first triumvirate" and which for a time frustrated all the efforts of the aristocratic party. This small oligarchy carried all before it.

Cæsar's daughter, Julia, was given in marriage to Pompey, and private relationship was thus made to bind tighter the tie of political interest. And now, for some years following, Cæsar was reaping laurels in Gaul and rising higher in popular esteem as a warrior and a statesman, while Pompey was idly wasting his time and his energies at Rome. But Pompey could not bear a rival. Jealousies sprang up; Julia died in 54. Pompey returned to his former friends, the aristocracy, whose great desire was to check Cæsar and to strip him of his command. Cæsar was ordered to lay down his office and return to Rome, which he consented to do, provided Pompey, who had an army near Rome, would do the same. The Senate insisted on an unconditional resignation and ordered him to disband his army by a certain day; otherwise, the Senate threatened, he would be declared a public enemy. To this resolution two of the tribunes in vain objected; they therefore left the city and cast themselves on Cæsar for protection. It was on this memorable occasion that Cæsar crossed the Rubicon and thus defied the Senate and its armies, which were under Pompey's command. The events of the civil war which followed have been recorded in the life of Cæsar. It remains only to mention that, after being finally defeated at Pharsalus in 48, Pompey escaped to Egypt, where, according to the order of the King's ministers, he was treacherously murdered by a former centurion of his own, as he was landing from the boat. His head was cut off and afterward presented to Cæsar on his arrival in Egypt. But Cæsar was too magnanimous to delight in such a sight and ordered that the murderer be put to death. Pompey's body lay on the beach for some time, but was at length buried by a freedman, Philippus, who had accompanied his master to the shore. See bibliography under CÆSAR and CICERO. Consult the *Life of Pompey* by Plutarch; Cæsar, *De Bello Civili;* Lucan, *Pharsalia;* and the article "Pompeius, 18," in Friedrich Lübker, *Realleæikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914); also C. W. C. Oman, *Seven Roman Statesmen of the Late Republic* (New York, 1902).

POMPEIUS TROGUS. See TROGUS POMPEIUS.

POMPELMOUS. See SHADDOCK.

POM'PEY THE GREAT. See POMPEIUS, GNÆUS MAGNUS.

POMPEY THE YOUNGER (SEXTUS POMPEIUS) (75–35 B.C.). The second son of Pompey the Great, celebrated in Roman history for his resistance to Antonius and Octavianus. Hearing of the death of his father, he fled to Spain, finally escaping to the borders of the Lacetani and rallying in the mountain fastnesses a gang of banditti. He applied to the Roman Senate for the restitution of his father's property, which had been confiscated. He received a large sum of money from the public treasury and the title of commander of the seas. Marching southward, he crushed all opposition, took possession of Bætica, and assumed the state and authority of a sovereign. When he learned (43 B.C.) that a second triumvirate had been formed, and that he was among the proscribed, he resorted to piracy; his mariners boarded merchantmen, and Corsica, Sardinia, and Sicily fell into his power. Rome was reduced to the point of starvation by his interception of the grain ships; the people compelled Antonius and Octavianus to negotiate a peace, and a treaty was concluded advantageous to Sextus. Sicily, Sardinia, Corsica, and Achaia were given to him, and the consulship for the following year was promised to him. But hostilities were soon resumed, and in 36 a Roman squadron under Agrippa destroyed his fleet off Naulochus. Pompey fled, but after a few months was overtaken by M. Titius, carried to Miletus, and put to death. Consult the article "Pompeius, 20," in Friedrich Lübker, *Realleæikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

POMPEY'S PILLAR. The name of a celebrated column standing on a slight elevation in the southwest portion of ancient Alexandria, a short distance outside the Arabian walls. It is a monolith of red granite, of the Corinthian order, raised upon a pedestal. Its total height is 98 feet, 9 inches; shaft, 73 feet; circumference, 29 feet, 8 inches. The present name is a mere invention of travelers. The inscription on the base shows that it was erected by Publius, eparch of Egypt, in honor of the Emperor Diocletian, in the year 302 A.D., to commemorate his remission of part of the grain tribute. It stood in the centre of the court of the Serapeum (q.v.), or great sanctuary of Serapis, and survived its transformations into a church and a fortification.

POMPEY'S THEATRE. A theatre erected in Rome by Pompey, opened in 55 B.C., but not completed till 52. It was the first theatre built of stone, and, in deference to the popular prejudice against such construction for a place of amusement, the stone seats and steps were made to form the approach to a temple of Venus Victrix, built on top of the cavea. The interior was of marble and seated, according to Pliny the Elder, 40,000 spectators (modern authorities, however, give the capacity as 17,500 or even as low as 10,000). It was destroyed by fire on several occasions and was restored, continuing in use to the sixth century. Considerable remains exist, particularly under the Palazzo Pio. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911), and Charles Knapp, "The Roman Theatre," in *Art and Archæology*, vol. i (Baltimore, 1915).

POM'PHOLYX. See PEMPHIGUS.

POMPILIUS, NUMA. See NUMA POMPILIUS.

POM-POM. An automatic gun (see MACHINE GUN), extensively used in the Boer-British War of 1900, first by the Boers and afterward by the British. The name is often applied to that class of rapid-fire automatic gun whose calibre is greater than that of the shoulder rifle

and less than that of the field gun. Its peculiar noise when being fired rapidly caused the British troops to speak of it as a pom-pom. It is very accurate and effective under favorable conditions and proved to be a formidable weapon.

POMPONAZZI, pôm'pô-nät'sê, PIETRO (1462–1525). An Italian philosopher, born at Mantua. He studied in his native city and at Padua, where he became a doctor of medicine in 1487, professor of philosophy (1488), and professor of natural philosophy (c.1495). He held a professorship at Ferrara from 1509 until 1512, when he went to Bologna. At the latter place he brought out his great work, *De immortalitate animi* (1516), in which he attacked the doctrines of Thomas Aquinas, thereby provoking a great controversy. Some of the orthodox Thomists were for taking his life. Consult A. H. Douglas, *Philosophy and Psychology of Pietro Pomponazzi* (New York, 1910).

POMPO'NIUS, LUCIUS. A Latin writer of Bologna (Bononia), who lived about 90 B.C. He was among the first to transform the hitherto improvised popular plays called *Atellanæ* (q.v.) into a regular branch of comic literature, by the introduction of written composition in the metrical forms and according to the technical rules of the Greeks. About 70 titles and plays by him are mentioned. The extant fragments, which are printed in Ribbeck's *Comicorum Romanorum Fragmenta* (3d ed., Leipzig, 1898), show that the author usually chose his subjects from low life. Consult J. W. Duff, *A Literary History of Rome* (London, 1909), and Martin Schanz, *Geschichte der römischen Litteratur*, vol. i, part i (3d ed., Munich, 1907).

POMPONIUS LÆTUS, JULIUS (or POMPONIO LETO) (1428–98). An Italian humanist and a leader in the revival of learning. He was a natural son of one of the Sanseverini, a pupil of Lorenzo Valla, and an earnest student of Latin literature. He is most famed for his effort to pattern after the manners and morals of the ancients. He took Cato for his model and lived in the country, like the ideal farmer of Varro. He was persecuted by Paul II and imprisoned for a time, but was released although forbidden to renew the meetings of his academy. Consult Sabellicus, *Vita Pomponii Læti* (Strassburg, 1510), and J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

POMPONIUS ME'LA. See MELA.

POM'ROY, REBECCA ROSIGNOL (1817–84). An American nurse, born in Boston, Mass., the daughter of Samuel Holliday. In 1836 she was married to Daniel F. Pomroy. Sickness in her own family having brought her experience as a nurse, she offered her services at the outbreak of the Civil War. She was on duty at Georgetown Hospital, at West Hospital, Baltimore, and at the Hospital of Columbian University, Washington. In 1862 and again in 1864 she attended President Lincoln's family. At the close of the war Mrs. Pomroy was stricken with typhoid fever and was an invalid for several years. Later she became matron of a reformatory home for girls at Newton Centre, Mass., and then of the Newton Home for Orphans, now known as the Rebecca Pomroy Home.

POMUK, JOHN OF. See JOHN OF NEPOMUK.

PONCA, pŏn'kȧ, or PONKA. A tribe of Siouan stock (q.v.), formerly claiming the territory upon the waters of Niobrara River, about the Nebraska-Dakota boundary. They speak a dialect of the same language spoken by the Omaha, Osage, Quapaw, and Kaw. The Ponca were living about the mouth of the Niobrara when visited by Lewis and Clark in 1804 and remained there, in spite of the inroads of the Sioux, until 1877, when, in consequence of their territory being included in a cession by the Sioux, the main body of the tribe was forcibly removed to what is now Oklahoma. During the march and after arrival they died off at so rapid a rate that the tribe was threatened with extinction, when the matter was brought to public attention, with the result that in 1880 a commission reported in favor of returning them to the north. Accordingly a portion of them returned and are now attached to the Santee agency, northeastern Nebraska. The majority, however, still remain in Oklahoma. Consult G. A. Dorsey, *Ponca Sun Dance* (Chicago, 1905), and A. C. Fletcher, *The Omaha* (Bureau of Ethnology Reports).

PONCA (pŏn'kȧ) **CITY.** A city in Kay Co., Okla., 64 miles north of Guthrie, on the Arkansas River and the Atchison, Topeka, and Santa Fe and the Hutchinson and Southern railroads and on the Arkansas River (Map: Oklahoma, D 2). It is the centre of a rich wheat district and carries on an important trade with Ponca and Osage Indians. There are flour mills, a tent-making factory, two oil refineries, a glass plant, and grain elevators. Natural gas is abundant. The city contains a Carnegie library. Pop., 1900, 2528; 1910, 2521.

PONCE, pôn'sȧ. The capital of the Department of Ponce, Porto Rico, and the second largest city of the island (Map: Porto Rico, C 3). It is situated on a plain bordered by hills 3 miles from the south coast and is well built, with clean macadamized streets, and houses chiefly of stuccoed brick or stone. The principal squares are the Plaza Principal and the Plaza de las Delicias, separated by the church of Our Lady of Guadalupe, and both containing gardens. Among other buildings are a Protestant church built of iron, several asylums and hospitals, and two theatres, the Teatro de la Perla being the best on the island. The city had in 1911, 61 graded schools, a kindergarten, the largest high school in the island, and five private schools. The city has a good water supply brought by an aqueduct more than 3 miles long. The chief industries are the manufacture of cigars, cigarettes, rum, carriages, hats, and lace. The city is a terminus of the American Railway and is connected with San Juan, Arecibo, and Mayaguez by good highways. An electric street railroad leads to the harbor of Playa de Ponce, a spacious bay accessible to vessels drawing 25 feet and provided with wharves. Here are the customhouse and the chief commercial houses. Ponce is one of the principal commercial ports of the island and is the chief centre of the export trade in coffee and sugar. Other exports are molasses, rum, and tobacco. Pop. (municipality), 1889, 55,477; 1910, 63,444; (urban) 1910, 35,027; Ponce was occupied by United States troops on July 27, 1898.

PONCEAUX, pôn'sō'. See COAL-TAR COLORS.

PONCE DE LEÓN, pôn'thȧ dȧ lȧ-ōn', FRAY LUIS. See LEÓN, FRAY LUIS DE.

PONCE DE LEÓN, JUAN (c.1460–1521). A Spanish governor of Porto Rico and discoverer of Florida. He was born at San Servas in the Kingdom of Leon. After serving as page to a

tutor of the royal family, Juan Ponce in 1493 went to America on the second voyage of Columbus. In 1508 he went to Porto Rico and in 1510 was empowered to conquer the island, of which he became Governor. He rapidly acquired a considerable fortune there, so that when Diego Columbus appointed a successor to him, Ponce was able to fit out three ships, with which he started, March 3, 1513, to investigate some stories of a marvelous island named Bimini which the Indians said contained a spring which had wonderful curative properties. There is little in the original narratives to substantiate the legend that this was a Fountain of Perpetual Youth that Ponce was in search of. On March 27 land was sighted. He landed not far from the mouth of St. John's River, and on April 8, on Easter Sunday (Span. *Pascua Florida*), took possession of the country. A month later, May 8, having explored the coast carefully and having had two unsuccessful encounters with the natives, he doubled the point of the peninsula and started up the western coast. Proceeding to the neighborhood of Pensacola Bay, he then returned to the Florida Keys and crossed to Cuba. Thence he sailed to the Bahamas, where he was on July 25, and after two months more of cruising about the Bahamas he reached home Sept. 21, 1513. Ponce immediately took ship for Spain, where he secured permission to conquer and colonize the island (as he supposed it to be) of Florida. Returning in 1515, he was delayed by the necessity of conquering the Caribs from Guadeloupe who were overrunning Porto Rico and who inflicted several severe defeats upon the Spaniards. It was not until 1521 that he was again ready to set out for Florida. With two ships, carrying 200 men, he proceeded to a harbor, probably Charlotte Harbor or thereabouts, where he landed and prepared to build a settlement. The natives, however, attacked the white men so fiercely that they were soon compelled to reembark. A storm separated the vessels, one of which made its way to Vera Cruz, where it arrived just in season to assist Cortés at a critical period in his conquest. Ponce, who had been dangerously wounded in the knee by the Indians, turned back to Porto Rico in the other vessel, but died before arriving there. Consult Justin Winsor, *Narrative and Critical History of America*, vol. ii (New York, 1886), and Henry Harrisse, *Discovery of North America* (London, 1892).

PONCELET, pôns'lâ', JEAN VICTOR (1788–1867). A French engineer and mathematician, born in Metz. From 1807 to 1810 he attended the Ecole Polytechnique, where he studied under Monge. In 1812 he entered the army as lieutenant of engineers and was made prisoner on the retreat of the French from Moscow. He was taken to Saratov, on the Volga, where, away from all scientific assistance, he laid the foundations of projective geometry. On his return to Metz (1814) he continued his investigations. He found, however, no recognition in the Paris Academy and therefore published his contributions in *Crelle's Journal*. In 1829 he collected these essays in the *Traité des propriétés projectives des figures* (1822; 2d ed., 2 vols., 1865–66). He then turned his attention to applied mechanics and published several works on the subject. In 1835 he became professor of applied mechanics at Paris, and in 1848 he was raised to the rank of general. In 1851 he went to London as president of a commission to the International Exhibition and later published a report on his mission, *Machines et outils appropriés aux arts textiles* (3 vols., 1854–62), in the *Collection des travaux de la commission française*, which is of great importance in the history of technical science. He published in more complete form the work which he began at Saratov in the *Applications d'analyse et de géométrie* (1862–64). Poncelet is the real founder of modern geometry and had a very strong influence on German geometry, although at first he found little recognition in France. Some of his other works are: *Sur les roues hydrauliques verticales* (1826); *Théorie des effets mécaniques de la turbine Fourneyron* (1838); *Expériences hydrauliques* (1832), jointly with Lebros; *Introduction à la mécanique industrielle, physique ou expérimentale* (1829; 3d ed., 1870; Ger. trans., 1841–45); *Cours de mécanique appliquée aux machines* (1845; 3d ed., 1874–76; Ger. trans., 1845–49). Consult Didion, *Notice sur la vie et les ouvrages du général Poncelet* (Paris, 1869), and Bertrand, "Eloge historique de Poncelet," in the *Mémoires de l'Académie des Sciences* (ib., 1879).

PONCHIELLI, pôn'kê-ĕl'lê, AMILCARE (1834–86). An Italian composer, born at Paderno Fasolaro, near Cremona. He was one of the most important Italian composers of the nineteenth century and, although little known to the world at large, was regarded by his countrymen as second only to Verdi. He was educated at the Conservatory of Milan and made his début as a composer with *I promessi sposi* (1856). Other operas were: *La savojarda* (1861); *Roderica* (1864); *La stella del monte* (1867); *Le due gemelle* (1873); *I Lituani* (1874); *La Gioconda* (1876); *Il figliuol prodigo* (1880); *Marion Delorme* (1885). He wrote the famous *Garibaldi Hymn* of 1882. Popular as he was in Italy, *Gioconda* was the only work of his that found favor abroad. He wrote many ballets and orchestral suites, and during the time he was maestro of the Piacenza Cathedral (1881–86) wrote considerable sacred music.

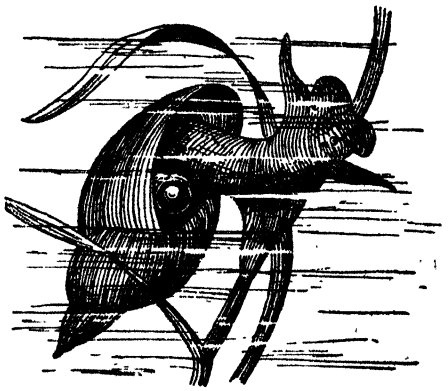
POND, JAMES BURTON (1838–1903). An American lecture manager, born in Cuba, Allegany Co., N. Y., and brought up in Illinois and Wisconsin. He was a journeyman printer in 1856 and for a time lived with John Brown in Kansas and was typesetter on the *Herald of Freedom*. In 1859 he joined the first settlers of Denver, Colo. Then for two years he edited the Markesan *Journal*, a Wisconsin weekly, and in 1861 volunteered in the Third Wisconsin Cavalry, with which he did border duty in Kansas and Missouri. Captain Pond was one of the 17 survivors out of 118 treacherously surprised and shot by Quantrell at Baxter Springs in 1863 and at the close of the war received the rank of major. From 1865 to 1873 he was in business in the West and then settled in Boston, where he bought the Redpath Lyceum Bureau. In 1879 he removed to New York City and established the American Lecture Bureau. Major Pond managed the tours of many noted lecturers, Henry Ward Beecher, Ralph Waldo Emerson, Charles Sumner, Wendell Phillips, John B. Gough, Thomas DeWitt Talmage, Thomas Nast, Mrs. Livermore, George Kennan, Mark Twain, and, among Englishmen, Canon Kingsley, H. M. Stanley, Matthew Arnold, Ian Maclaren, Anthony Hope, and Conan Doyle. Pond wrote *A Summer in England with Henry*

Ward Beecher (1886) and *Eccentricities of Genius* (1900).

POND, JOHN (1767–1836). An English astronomer, born in London. At 16 he entered Trinity College, Cambridge, but was compelled to leave on account of impaired health and spent several years abroad. At his return he settled at Westbury, near Bristol, and erected there an altazimuth 2½ feet in diameter. His observations with this instrument, submitted to the Royal Society in a paper "On the Declinations of Some of the Principal Fixed Stars" (1806), showed that the Greenwich quadrant had changed its form and that a reëquipment of the Royal Observatory was necessary. In 1811 he was appointed Astronomer Royal. In this capacity he effected a reform of the national observatory and procured for it modern instruments. With the 6-foot mural circle mounted in 1812 he catalogued the north-polar distances of 84 stars. He introduced the use of the mercury horizon as a substitute for the plumb line and spirit level, and the method of observing the same object alternately by direct and reflected vision. Pond was also the inventor of the method of observing in groups and the multiplication method. He also showed the unreality of the parallaxes of certain stars observed by Brinkley. He received the Lalande prize in 1817 and the Copley medal in 1823. He was a member of the Board of Longitude and superintended the issuing of the *Nautical Almanac* (1832–33). In 1833 he completed a standard catalogue of 1113 stars. His scientific contributions appeared in the *Transactions* of the Royal Astronomical Society and the Royal Society. He also translated Laplace, *Système du monde* (1809).

PONDICHERRY, pŏn'dĭ-shĕr'rē, or **PONDICHERRI** (Fr. **PONDICHÉRY,** pôN'dē'shā'rē'). The chief of the French Establishments in India, the capital of which, a town of the same name, is the headquarters of their Governor. Area, 112 square miles, which is surrounded by the British district of South Arcot, in the Madras Presidency. The town is situated on the Coromandel Coast, in lat. 11° 56′ N. and long. 79° 49′ E., 122 miles by rail south of Madras (Map: India, D 7). The territory of Pondicherry is divided into four communes and comprises a large number of villages. Pop., 1901, 174,456; 1913, 172,043. The town of Pondicherry had, in 1901, 27,448 inhabitants; in 1913, 47,426. The town stands on a sandy plain and is divided by a canal into a European and a native town. Around a handsome square are grouped the Governor's residence, the Roman Catholic cathedral, the hôtel de ville, and the bazar. There is a wide promenade facing the sea. The town has a European college and an Indian school. The open roadstead is defended by a citadel and possesses a lighthouse. There is an iron pier over 450 feet long, and near its entrance are interesting monuments, including a statue of Dupleix (q.v.). An active import and export trade is carried on, the principal exports being groundnut kernels and oil, cotton fabrics, coconut oil, and rice. The spinning and weaving of cotton is the chief industry. Pondicherry is visited by French steamers sailing monthly between Colombo and Calcutta.

History. In 1683 François Martin collected about 60 Frenchmen and settled them in Pondicherry, which in 1674 he had purchased, with the surrounding territory, from a lieutenant of Sivaji, the great Mahratta conqueror. The Dutch took the town in 1693, but by the Treaty of Ryswick it was restored to the French in 1697. Dupleix (q.v.) was Governor of Pondicherry when war broke out between France and England in India. In 1748 Admiral Boscawen besieged Pondicherry, but two months later was compelled to raise the siege. In 1758 Lally became Governor-General of the French possessions in India and attacked the English settlement of Fort St. David, which surrendered and was totally destroyed. In 1761 Eyre Coote took Pondicherry. By the Peace of Paris (1763) Pondicherry was restored to the French with reduced territory. Pondicherry was again taken by the English under Sir Hector Monro in 1778 and restored in 1783. In 1793 the English repossessed themselves of it, but the Treaty of Amiens in 1802 again restored it to the French, though only till the following year. From this time it was held by the English till, by the treaties of 1814 and 1815, it was again restored to France, to whom it still belongs. Consult Quennefer, *Souvenirs de Pondichéry* (Lyons, 1882). See INDIA.



PONDICHERRY VULTURE. A small black-eared vulture (*Otogyps calvus*) of India, Burma, and Siam, which is especially characterized by the nakedness of the inside of the thighs. It is nowhere numerous and is called by the Hindus "king vulture," on account of its domineering manners. It nests in trees, adding year after year to the old structure until an enormous mass results.

POND LILY. See WATER LILY.

PON'DOLAND. A mountainous and fertile district of Cape of Good Hope Province, situated on the southeast coast and covering an area of 3906 square miles. It was acquired by Great Britain in 1884, being the last remaining portion of independent Kaffraria, and was annexed to Cape Colony in 1894. Pop., 1911, 234,637 (1383 whites).

POND SCUMS. See ALGÆ; CHLOROPHYCEÆ

POND SNAIL. A snail of the pulmonate family Limnæidæ, which inhabit the fresh waters of temperate regions. All are vegetable eaters and seek their food beneath the water. They lay their eggs in clusters surrounded by a clear gelatin-like substance and attached to

A POND SNAIL (*Limnæa*).

plants and other objects beneath the water. The typical pond snails are those of the genus *Limnæa*, which have thin horny shells forming a slender spiral with a large aperture, not pro-

tected by an operculum. When the ponds are frozen or dry up, they bury themselves in the mud and become dormant until released. The largest species (*Limnæa stagnalis*) is scattered abundantly over most of the Northern Hemisphere and may become 2 inches in length. Many other species are known in North America, most of them less than an inch long. A smaller, less-drawn-out shell, differing from *Limnæa* primarily in the fact that it is sinistral, while the shells of *Limnæa* follow the ordinary method of turning from left to right, is that of the genus *Physa*. It is more southerly in its distribution than *Limnæa*, but several species are found throughout the United States, one of which (*Physa heterostropha*) is exceedingly abundant. (See PHYSA.) Another prominent genus, with a large number of familiar species, is *Planorbis*, so called because its shell is coiled in a flat spiral like a roll of tape; none exceed ¾ of an inch in diameter. Among other genera may be mentioned *Ancylus* and *Gundlachia*, which are shaped nearly like limpets and have similar habits, although they inhabit fresh water alone and are not larger than grains of rice. All the pond snails are infested with parasites, and certain of them regularly form the hosts of the liver flukes of the genus *Distoma* during one stage of their development. Pond snails are not only interesting objects in an aquarium, but are of much utility in keeping the glass free from confervoid growths, upon which they constantly feed. Consult: W. G. Binney, *Land and Fresh-Water Shells of North America*, part ii (Washington, 1865); Cooke, "Shells," in *Cambridge Natural History*, vol. iii (London, 1895); Pelseneer, "Mollusca," in E. R. Lankester, *Treatise on Zoölogy*, vol. v (London, 1906). See PHYSA; PULMONATA; SNAIL.

PONEVEZH, pô'nâ-vyĕzh'. A town in the Government of Kovno, Russia, situated 47 miles north-northeast of Kovno (Map: Russia, B 3). It has a Realschule and extensive manufactures of yeast, flour, and tobacco. Its trade in flax and flaxseed is also important. Pop., 1911, 13,750, mostly Jewish.

PONGIDÆ. A family name proposed by Elliot to take the place of Simiidæ, and including the orang-utans (*Pongo*), gorillas (*Gorilla*), and chimpanzees (*Pan*).

PONIATOWSKI, pô'nyà-tôf'skê. The name of a Polish family of Italian origin, descended from the family of the Torelli. A member of this family settled in Poland and assumed the name of Poniatowski from his wife's estate of Poniatow. The most notable members of the family were: PRINCE STANISLAS PONIATOWSKI (1676–1762), who joined Charles XII of Sweden in supporting Stanislas Leszczynski. He fought at Poltava (1709) and as the representative of Charles XII at Constantinople induced the Porte to declare war against Russia. He subsequently held high places at the court of Augustus III of Poland. His son Stanislas ascended the throne of Poland. (See STANISLAS II.) Another son, Andreas, became the father of the most distinguished member of the family, JOSEPH ANTONY, PRINCE PONIATOWSKI, the celebrated Polish commander in the army of Napoleon. The latter was born at Warsaw, May 7, 1762, and at the age of 16 entered the Austrian army, with which he made the Turkish campaign of 1787. In 1792 he returned to Poland and was named commander in chief of the army of the south. In 1792 he defeated superior Russian forces, but Poniatowski's uncle, King Stanislas, by joining the confederation of Targovitza, put an end to the contest in 1793. The Prince then resigned his command and went into voluntary exile, but returned in the following year to aid Kosciuszko, now Dictator, in his fruitless opposition to the third partition of Poland. On the proposal of Napoleon to reconstitute the Kingdom of Poland, Poniatowski joined the French (1800) at the head of a Polish force and did good service against the Russians. After the erection of the Duchy of Warsaw (1807) Poniatowski was appointed Minister of War, and in 1809, when the war between France and Austria was resumed, he drove the Austrians out of Polish territory and overran a considerable part of Galicia. In 1812 he joined the French army destined to invade Russia, with a Polish force of 100,000 men. The greater part of his army was broken up into detachments, which were incorporated with the various French legions, and Poniatowski was left with not more than 30,000 men under his direct command. At the head of this division he distinguished himself in the campaign, but was so severely injured at Smolensk during the retreat that he was obliged to return to Warsaw in December, 1812. He rejoined the French army in the autumn of 1813 and fought with such remarkable valor during the first day of the battle of Leipzig (see LEIPZIG, BATTLES OF) as to gain the title of Marshal of France. When the French abandoned Leipzig, on October 19, Poniatowski was left with the remnant of his Polish division to protect the retreat. The only bridge across the Elster being wrecked through a mistaken order, he attempted to swim his horse across the river and had reached the farther bank when he fell back exhausted into the flood. His body was recovered six days later and was embalmed and carried to Warsaw, whence it was afterward removed to Cracow and placed beside the ashes of Sobieski and Kosciuszko.—PRINCE JOSEPH PONIATOWSKI, a second cousin of the preceding, musical composer, author of *Don Desiderio* and other operas and several masses, was born in Rome, Feb. 21, 1816, and died in London, July 4, 1873. Consult Boguslawsky: *Biographie des Fürsten Jos. Ant. von Poniatowsky* (Cracow, 1831).

PONS, pôNs, JEAN LOUIS (1761–1831). A French astronomer, who was called the "hunter of comets" (*le chasseur de comètes*). He was born at Peyres, Hautes-Alpes; was employed in 1789 at the Marseilles Observatory, where he became associate director; and was director of the observatory near Lucca in 1819–25 and at Florence thereafter. Pons discovered 37 comets between 1801 and 1827.

PONS ÆLII. The name of a Roman camp in Britain out of which sprang Newcastle-upon-Tyne (q.v.).

PONSAN, EDOUARD BERNARD. See DEBAT-PONSAN, E. B.

PONSARD, pôN'sär', FRANÇOIS (1814–67). A French dramatist, leader of the School of Good Sense in a reaction from the dramatic vagaries of romanticism. He was born June 1, 1814, at Vienna. He studied law, but soon gave it up for letters, at first as a follower of Hugo, in which capacity he translated Byron's *Manfred* (1837). His reaction from romanticism was heralded by the tragedy *Lucrèce* (1843), which, aided by the genius of Rachel, achieved in 1853 great popularity. He followed

this by *Agnès de Méranie* (1846), *Charlotte Corday* (1850), *Horace et Lydie* (1850), *Ulysse* (1852), *L'Honneur et l'argent* (1853), his best comedy, *La bourse* (1856), *Le lion amoureux* (1866), and *Galilée* (1867), but from 1853 onward his reformed classicism was superseded by the modern social drama inaugurated by Dumas the Younger and his own former pupil Augier. The Academy elected him a member in 1855. He died in Paris, July 13, 1867. *L'Honneur et l'argent* still holds the stage. His characterization in general is shallow, and his situations are sentimental and romanesque, but his verse is sonorous and his style clear. Ponsard's works were collected in 3 volumes (1876).

PONS AS'INO'RUM (Lat., asses' bridge). The name properly given, from its supposed difficulty to beginners, to the fifth proposition of the first book of Euclid, that the angles at the base of an isosceles triangle are equal to each other.

PONS SUBLI'CIUS (Lat., bridge of piles, from *pons*, bridge, + *sublica*, stake, pile). The earliest bridge over the Tiber, said to have been built by Ancus Marcius (q.v.). See ROME, *Ancient*, end of first paragraph; PONTIFEX; PORSENA.

PONS VARO'LII. See NERVOUS SYSTEM AND BRAIN.

PONTA DELGADA, pôn'tȧ dĕl-gä'dȧ. The principal city of the Azores, situated on the south coast of the island of St. Michael's (São Miguel) (Map: Spain, B 5). It has a roadstead protected by a breakwater, 2800 feet long, and an extensive commerce and shipping. The chief exports are oranges, lemons, and other fruits, most of which are shipped to England. Pop., 1900, 17,675; 1911, 16,179.

PONT-À-MOUSSON, pôN'tȧ-mōō'sôN'. A town in the Department of Meurthe-et-Moselle, France, 17 miles northwest of Nancy by rail (Map: France, N., L 4). The Moselle flows through the town, which is situated in a fruitful valley. The principal buildings are the fine Gothic church of St. Martin, the sixteenth-century late Gothic church of St. Laurent, the hôtel de ville, and a handsomely ornamented Renaissance house, the last two on the triangular and arcaded Place Duroc. The town is dominated on the east by a hill 1010 feet high, crowned by a ruined castle and the village of Mousson. There are manufactures of pottery, woolens, plush, velvet, beet sugar, and extensive iron foundries. In the early part of the European War which broke out in 1914 Pont-à-Mousson was captured by the German army which invaded France. Several unsuccessful attempts were made by the French to regain the town. See WAR IN EUROPE. Pop., 1901, 12,847; 1911, 14,009.

PONTANO, pôn-tä'nō, GIOVANNI GIOVIANO, or **PONTA'NUS**, JOVIANUS (1426–1503). An Italian poet and scholar, born at Cerreto in Umbria. Civil feuds compelled him to leave his birthplace, and after 1448 he lived in Naples. There he was honored by the Aragonese dynasty and subsequently served as Prime Minister for 10 years. When Charles VIII of France entered Naples in 1495, he was welcomed by Pontano, an act punished by disgrace upon the return of the Aragonese. When at least 65 years of age, Pontano took as his second wife a beautiful girl of Ferrara. It was in her honor that he wrote the elegies known as *Eridanus*. His *Urania* and *De Hortis Hesperidum* are didactic poems in Latin. The Aldi at Venice published his verse (2 vols., 1505–08) and his prose, rhetorical in style (3 vols., 1518–19). Pontano founded the Neapolitan Academy of his day.

PONTARLIER, pôN'tȧr'lyȧ'. The capital of an arrondissement in the Department of Doubs, France, situated near the Swiss boundary, 26 miles southeast of Besançon (Map: France, N., M 6). It is fortified and occupies a very important strategic position at the entrance to the Défilé de la Cluse, one of the principal passes over the Jura. In 1871 the town was captured by the Prussians, and the French Army of the East was forced to retreat into Swiss territory. Pop., 1901, 7963; 1911, 8776.

PONTASSIEVE, pôn'tȧs-syā'vȧ. A town in the Province of Florence, Italy, situated at the junction of the Sieve with the Arno, 9 miles by rail east of Florence (Map: Italy, C 3). It is a walled town with well-kept streets, a fine square, and an old castle. The inhabitants are engaged chiefly in agricultural pursuits. Annual fairs are held, and there are manufactures of railway supplies, agricultural implements, and glass. Pop. (commune), 1901, 13,405; 1911, 15,561, (town) 4900.

PONTCHARTRAIN, pŏn'chȧr-trān', LAKE. A large salt-water lake in the southeastern part of Louisiana (Map: Louisiana, J 6). It is about 36 miles long and about 22 miles in maximum width, and communicates eastward with Lake Borgne and Mississippi Sound by the Rigolets Pass, through which the tidewater flows, while on the west it is connected by Pass Manchac with the smaller Lake Maurepas. Its general depth is from 10 to 16 feet. On its south shore, which comes within 5 miles of the Mississippi River, are the north suburbs of New Orleans, and two canals navigable for small vessels reach to the heart of the city, where they terminate in basins. The south shores are low and in parts marshy, with cypress swamps on the west. The north shore is elevated and healthful, being adjacent to the pine barrens, and affords good sites for summer residences and resorts.

PONTE, pôn'tȧ, JACOPO DA. See BASSANO.

PONTE, LORENZO DA (1749–1838). An Italian librettist and teacher, who lived for many years in the United States. He was born at Ceneda, Venetia, and studied for five years in the seminary there. He taught rhetoric at the University of Treviso, was appointed by Joseph II court poet at Vienna, and while there served as librettist to Mozart, for whom he wrote the librettos *Le nozze di Figaro*, *Don Giovanni*, and *Così fan tutte*. When the Emperor Joseph died in 1790 Ponte left Vienna, lived in London and in Holland for a time, and after 1805 resided in the United States, where he became a teacher of Italian in New York City and professor of Italian at Columbia College.

PONTECORVO, pôn'tȧ-kôr'vō. A city in the Province of Caserta, Italy, situated on the Garigliano, 53 miles northwest of Naples (Map: Italy, D 4). It has a cathedral with mediæval manuscripts, fine churches, a Gymnasium, and an old castle. There are manufactures of rope, hats, and macaroni. Pontecorvo formerly belonged to the Papal States. In 1810 Napoleon I gave the title of Prince of Pontecorvo to Marshal Bernadotte. Pop. (commune), 1901, 12,237; 1911, 11,354.

PONTEDERA, pôn'tȧ-dā'rȧ. A town in the Province of Pisa, Italy, situated at the junction of the Era with the Arno, 13 miles southeast

of Pisa, with which it is connected by steam tramway (Map: Italy, C 3). The town has bridges over both rivers, a thirteenth-century church, and a Gymnasium. The weaving of woolen and cotton cloth and the manufacture of oil and chicory are the chief industries. Pop. (commune), 1901, 13,044; 1911, 15,673, (town) 9600.

PONTEFRACT, pŏn'tĕ-frăkt. A market town and municipal borough in Yorkshire, England, 21 miles south-southwest of York (Map: England, E 3). There are a grammar and a national school, and other schools, several almshouses, a large workhouse, and a splendid market hall. The town owns its water, cemetery, markets, and recreation grounds. Its trade is chiefly in agricultural and garden produce, cattle, and malt; licorice is largely cultivated for the Pontefract cakes, known since 1562. The castle of Pontefract was built shortly after the Conquest. It was the scene of the imprisonment and death of Richard II, and here also Rivers, Grey, and Vaughan were put to death at the instigation of Richard III. It was besieged four times during the Civil War and was dismantled in 1649. There are but meagre remains of the structure. Pop., 1901, 13,400; 1911, 15,949.

PONTE MOLLE. See MILVIAN BRIDGE.

PONTEVEDRA, pŏn'tâ-vā'drâ. The capital of the province of the same name in Galicia, Spain. It is situated in a beautiful and fertile valley at the head of a bay on the northwest coast of the peninsula (Map: Spain, A 1). A stream flowing through the town is crossed by a Roman bridge (*pons vetus*) of 12 arches. The town is well built, with spacious streets and beautiful alamedas or promenades lined with trees. There are a number of convents and monasteries, a Gothic church, and many modern buildings, the finest of which is the provincial government palace built in 1889. Sardine fisheries and manufacturing are leading industries. Pop., 1900, 22,806; 1910, 24,222.

PONTEVEDRA. A town of Negros, Philippines, in the Province of Western Negros, situated on the west coast of the island, 22 miles south of Bacolod. Pop., 12,000.

PON'TIAC (c.1720–69). A famous chief of the Ottawa Indians and leader of the confederate tribes of the Ohio valley and Lake region against the English in 1763–65. He was born in what is now northwestern Ohio, his mother being an Ojibwa. He distinguished himself in the French service at an early age, and is said to have led the warriors of his own tribe against Braddock in 1755. When Major Rogers was sent out in 1760 to take possession of the Western posts in behalf of the English government, he was halted by Pontiac near the present city of Cleveland with the significant warning, "I stand in the path," but finally with Pontiac's consent he proceeded on his way to Detroit. Pontiac professed loyalty to the English King, apparently in good faith, but in a short time he organized a confederacy which embraced virtually all the tribes from the head of Lake Superior almost to the Gulf coast. His declared object was to drive out the English and recover the country for the Indians, who were still to hold themselves friendly to the French. According to the arrangement the warriors of each tribe, on a concerted day, early in May, 1763, were to attack the garrison in their immediate neighborhood. Pontiac himself was to lead the assault at Detroit. Throughout the great wilderness extending from the Pennsylvania frontier to Lake Superior there were then 14 English (formerly French) posts, of which the most important were those at Fort Pitt, Detroit, and Mackinaw. The attacks were made as planned, and the Indians captured all but four of the 14 posts, Niagara, Pitt, Ligonier, and Detroit. Mackinaw was taken by a stratagem and the entire garrison was massacred. A plot for the capture of Detroit seems to have been betrayed to the commanding officer, Major Gladwin, by an Indian girl, and completely failed, whereupon Pontiac at once laid siege to the post. The siege continued five months, varied by desultory attacks and sorties, and attempts to relieve the fort with men and supplies. The most notable event of the siege was the action at Bloody Bridge, July 31, 1763, in which a sortie of troops was repulsed by Pontiac. Forts Pitt and Ligonier, to which the Indians had laid siege, were relieved by Colonel Bouquet, who defeated the Indians at Bushy Run, near the former post. Reënforcements finally succeeded in entering Detroit; Pontiac's men began to desert him, and the news of the signing of a treaty of peace between France and England removed all hopes of French aid. Pontiac, thoroughly discouraged, thereupon raised the siege of Detroit. In 1764 Bouquet led a second expedition into Ohio, which compelled the tribes to submission; and on Aug. 17, 1765, Pontiac himself entered into a formal treaty of peace at Detroit, which he confirmed at Oswego with Sir William Johnson the following year. He was murdered at Cahokia, Ill., in 1769, by an Illinois Indian, who seems to have been bribed by an English trader. Consult Parkman, *Conspiracy of Pontiac* (Boston, 1851; new ed., 2 vols., New York, 1908).

PONTIAC. A city and the county seat of Livingston Co., Ill., 91 miles southwest of Chicago, on the Vermilion River and at the junction of the Wabash, the Chicago and Alton, and the Illinois Central railroads (Map: Illinois, H 4). It is the seat of the State Reformatory, and has a hospital, a fine public library, a courthouse, city hall buildings, and two parks. The commercial interests of the city are important, the surrounding region being a productive farming and stock-raising country, possessing extensive deposits of bituminous coal. The principal industrial establishments are shoe factories, with a large product, manufactories of candy, and a canning factory. The government is vested in a mayor, elected every two years, and a unicameral council. It was founded in 1829 by settlers from Ohio and Indiana, and was first incorporated in 1856, receiving a city charter in 1872. Pop., 1900, 4266; 1910, 6090.

PONTIAC. A city and the county seat of Oakland Co., Mich., 26 miles northwest of Detroit, on the Clinton River and on the Grand Trunk and the Pontiac, Oxford, and Northern railroads (Map: Michigan, F 6). It is situated in a picturesque lake region, noted for its hunting and fishing, is the seat of the State Hospital for the Insane, with grounds occupying more than 500 acres, and has a public high school library and a ladies' library, the latter possessing its own building. Pontiac has a large trade in wool, fruit, and farm produce, and is a growing industrial centre, the manufactures including automobiles and accessories, buggies, wagons, farm machines, straps, springs, forgings, paints, varnishes, foundry products, and flour. The water works are owned and operated by the municipality. Named in honor of the famous Ot-

tawa Indian chief, Pontiac was settled in 1818, and was chartered as a city in 1861 (having been incorporated as a village in 1837). The commission form of government was adopted in 1911. Pop., 1910, 14,532; 1915 (U. S. est.), 17,042.

PONTIANAK, pŏn'tē-ä-nük'. The chief town of the Dutch possession of West Borneo, situated on the west coast of the island, right under the equator (Map: East Indies, C 5). It is one of the principal ports of Borneo and the seat of a Dutch resident. Pop. (est.), 14,000.

PONTIANUS, pŏn'shĭ-ā'nŭs, SAINT. Pope, 230–235. He took part in the controversy between Origen (q.v.) and Demetrius, favoring the latter. The greater part of his pontificate fell under the reign of Alexander Severus, who was well disposed towards the Christians, but a new persecution broke out on the accession of Maximinus, and Pontianus was banished to Sardinia, where he died from harsh treatment. His day is November 19.

PONTICELLO, pŏn'tē-chĕl'lō (It., little bridge). In music, the bridge of a bow instrument. *Sul ponticello* is the direction given to violinists to play with the bow near the bridge, which produces a hard, sharp tone. The opposite of *sul ponticello* is *flautando*, which calls for a clear, sweet flutelike tone produced by drawing the bow across the string at some distance from the bridge.

PON'TIFEX (Lat., bridge maker; probably from *pons*, bridge + *facere*, to make. R. G. Kent, in *Classical Philology*, viii, Chicago, 1913, holds that *pons* originally meant "path," especially between men and the gods; the pontifex, then, kept this path open. The ordinary view had explained the name as given because of the function of the pontifex as builder and repairer of the famous Pons Sublicius over the Tiber). The title borne by the members of one of the four great priestly colleges among the Romans. The other three were the *collegium augurum* (see AUGURIES), the *collegium XV virorum sacris faciundis*, and the *collegium VII virorum epulonum*. The last two were of younger origin. The former of these two (consisting at first of 2, then 10, and after Sulla of 15 members) was instituted to have charge of the Sibylline books and the oversight of the foreign cults, classed as *Græcus ritus*, while the latter (of 3, 7, and 10 members) relieved the pontifices of their duties in connection with the sacrificial banquets of the Roman and the plebeian games. The *collegium pontificum* in its widest and technical meaning included several elements. Besides the *rex sacrorum*, who had succeeded to the priestly duties of the King, the flamines (see FLAMENS), and the six vestal virgins, there were the pontifices, properly so called, whose number increased from 3 to 6, 9, 15, and 16. At their head was the *pontifex maximus*. This college was the guardian of all the ceremonial attending the worship of the ancient Roman gods (*patrius ritus*). It had charge of the calendar; its members alone possessed knowledge of the prayers and rites needed for the proper performance of religious ceremonies; they were consulted about the rites which the appearance of prodigies might require from the state or from individuals, and by their replies established a large body of law affecting religious observances and duties, based upon the mass of precedent with which they were familiar. From their number the pontifex maximus was elected, after 212 B.C. and perhaps earlier, by an assembly of 17 tribes chosen by lot. He was, as it were, the legal embodiment of the collective body of pontifices, and possessed over the other members of the great college an authority which preserves plain traces of original absolutism. The pontifices filled vacancies by their own vote, but the rex and the flamines were appointed, even against their will, by the pontifex maximus, though in later times his choice was limited by a list of nominations. The vestal virgins also were originally chosen by him, though later the lot decided from 20 names of his choosing. He had the power to fine his colleagues, and even to remove the rex and the flamines. To the vestals he stood in the position of a father, and could inflict corporal punishment upon them, though the death penalty for unchastity could be inflicted only by the college. In the time of the Empire the office of pontifex maximus regularly belonged to the prince, and a *promagister* was named to preside over the college. The pontifices are among the oldest Roman officials, evidently belonging to the regal period as a council of the monarch. Their importance is shown by the fact that with the augurs they are the only priests regularly provided for the colonies. Originally all the pontifices were patricians, but in 300 B.C. the Lex Ogulnia provided that five of the nine pontifices and five of the nine augurs should be plebeians. Later, when the numbers were increased, the majority appear to have been drawn from patrician families. Even with the growth of Christianity the pontifices and vestals continued to exist, though the Emperor Gratian resigned the title of pontifex maximus, and it was not till the end of the fourth century that the edicts of Theodosius put an end to the forms of the old Roman religion. Consult: Bouché-Leclercq, *Les pontifes de l'ancienne Rome* (Paris, 1871); Bardt, *Die Priester der vier grossen Collegien* (Berlin, 1871); Marquardt, *Römische Staatsverwaltung* (2d ed., Leipzig, 1884); Mommsen, *Römisches Staatsrecht* (ib., 1887–88); Habel, *De Pontificum Romanorum inde ab Augusto usque ad Aurelianum Condicione Publica* (Breslau, 1888); W. W. Fowler, *Roman Festivals* (London, 1899); id., *The Religious Experience of the Roman People* (ib., 1911); G. Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

PONTIFEX MAXIMUS. See PONTIFEX.

PONTIFICAL (ML. *pontificale*, book of offices, from Lat. *pontificalis*, relating to a pontiff, from *pontifex*, high priest). 1. The name in Roman Catholic usage of the book containing the several rites in which the bishop exclusively, or at least a priest delegated by the bishop, officiates. There were many such collections for the various national churches; but that which is now in universal use throughout the Western Church is the *Pontificale Romanum*, edited by the papal master of ceremonies Burchard and published at Rome in 1485. It was revised by Clement VIII and its use extended to the whole Latin church in 1596. The current edition is that published at Regensburg in 1888 by authority of Leo XIII. Another of the service books of bishops is called the *Ceremoniale Episcoporum*, but it is chiefly confined to a description of the peculiar ceremonial with which bishops are required to celebrate solemnly those offices, as of the mass, vespers, and the funeral office, which are common to them with priests. Consult Catalanus, *Pontificale Romanum* (Paris, 1850). 2. In the plural, "pontificals" (*pontificalia*) is used collectively for the articles of

garb and ornaments used by bishops in the exercise of ecclesiastical functions. Consult Barbier de Montault, *Le costume et les usages ecclesiastiques* (2 vols., Paris, 1897–1901).

PONTIFICAL BOOK, THE. See LIBER PONTIFICALIS.

PONTIFICAL STATES. See PAPAL STATES.

PONTIGNY, pôn'tē'nyē'. A village in the Department of Yonne, France, 32 miles southwest of Troyes. Pop., 1901, 778; 1911, 805. It is noted for its extensive Cistercian abbey, founded by Count Thibaud of Champagne in 1150, and frequently the asylum of the archbishops of Canterbury when at variance with the English kings. Thomas à Becket found refuge there in 1164, Stephen Langton in 1208, and Edmund Rich in 1239. The abbey and church were much damaged by the incendiarism of the Huguenots in 1568. The church has been restored and is now a national monument and a pilgrimage resort, especially of British Roman Catholics. It is one of the most perfect survivals of unadorned early Gothic. Some of its distinctive features are a small open narthex and the narrow lancet-shaped windows.

PON'TINE ISLANDS. See PONZA ISLANDS.

PONTINE MARSHES (Lat. *Pomptinæ Paludes*). A low-lying district, forming the southern part of the Campagna di Roma (q.v.) and extending in a southeasterly direction from Cisterna to the sea at Terracina. Its greatest length is about 31 miles and its breadth from 5 to 8 miles. It does not reach the seacoast on the west, being separated from it by a broad sandy tract covered with forest; but even this barrier partakes to some extent of the character of the marshes themselves, being quite as flat and largely intermixed with swamp and lagoon. The Pontine Marshes were undoubtedly formed by the stagnation of the streams that take their rise in the Volscian hills and by the accumulation of sand along the shore from Astura to the Circean promontory, but this formation undoubtedly belongs to prehistoric ages. The first attempt to drain the Pontine Marshes in ancient times was made in 160 B.C., by the consul Cornelius Cethegus, but his efforts were only partially successful. Julius Cæsar projected the drainage of this pestilential district, but his murder prevented the complete realization of his project. Augustus also appears to have done something; but in the time of Juvenal it was a mere haunt of robbers. Theodoric the Goth likewise tried to reclaim it; but the desolations of succeeding reigns soon reduced it to a hopeless condition, and it remained an uninhabitable region. The first in modern times to resume the labors of the ancients was Pope Boniface VIII, who drained the district about Sezze and Sermoneta by means of a large canal. Several subsequent efforts were made, but nothing was really accomplished till the time of Pope Pius VI, who, in 1778, began to drain the marshes and completed the drainage in 10 years. The reclamation of the land, however, has been found possible only in part. Though much is under cultivation and in pasturage, a great portion is apparently irreclaimable, and the whole region is so unhealthful that during the summer months the inhabitants are obliged to remove to the neighboring mountains. Consult: Prony, *Description hydrographique et historique des Marais Pontins* (Paris, 1823); H. Nissen, *Italische Landeskunde*, vol. i (Berlin, 1883); De la Blanchère, *La malaria de Rome et le drainage antique* (Paris, 1884); Berti, *Le Paludi Pontine* (Rome, 1884); Donat, *Le Paludi Pontine ed il loro prosciugamento* (ib., 1887); G. Tomassetti, *La Campagna Romana*, vol. ii (ib., 1910).

PON'TIUS, GAIUS. A chieftain of the Samnites (q.v.), who defeated the Romans at the Caudine Forks (q.v.).

PONTMARTIN, pôn'mär'tăn', ARMAND FERRAND, COUNT DE (1811–90). A French author, born at Avignon and educated in Paris. He entered journalism in 1830 and later became a critic and satirist. His best works were *Causeries littéraires* (1845–56); *Causeries du samedi* (1857–81); *Semaines littéraires* (1861–63); *Souvenirs d'un vieux critique* (1881–89). In these, in his *Mémoires* (1885–86), and in his many novels he showed himself master of a brilliant style.

PONTOISE, pôn'twäz'. The capital of an arrondissement in the Department of Seine-et-Oise, France, 17 miles northwest of Paris by rail, at the confluence of the Oise and the Viorne (Map: France, N., G 3). The town rises from the Oise in an amphitheatrical form on a hill crowned by the twelfth-century Gothic church of St. Maclou. The churches of Notre Dame and St. Maclou, the hôtel de ville, the museum, and the hospital are also notable buildings. There are remains of mediæval fortifications. Pontoise has a considerable commerce in grain, and manufactures mill machinery, chemicals, and hosiery. It was the Briva Isaræ, a village antedating the Roman conquest, and was destroyed by the Northmen in the ninth century. It became the capital of the Vexin Français, and was the frequent residence of the Capetian kings. Pop., 1901, 8180; 1911, 9023.

PONTOON'. See BRIDGES AND DOCKS, MILITARY.

PONTOPPIDAN, pôn-tôp'ē-dăn, ERIK LUDVIGSEN (1698–1764). A Danish prelate. He was born at Aarhus, Jutland, and studied theology as well as geography and history at the University of Copenhagen. He was made chaplain to the King in 1735, professor of theology at Copenhagen in 1738, Bishop of Bergen, Norway, in 1747, prochancellor of the University of Copenhagen in 1755. He was a learned man and the leader of the Pietists in Denmark. Among his numerous publications were: *A History of the Church in Denmark* (1741–47); *A Natural History of Norway* (1752–53; Eng. trans., London, 1755); *An Account of the Geography, Natural History, and Antiquities of Denmark* (7 vols., 1763–81). His *Explanation of Luther's Catechism* (1737) was used as a textbook for many years in the schools of Denmark, and is still used in Norway and among people of Norwegian descent in the United States.

PONTOPPIDAN, HENRIK (1857–). A Danish novelist, born in Fredericia and educated at the University of Copenhagen. His first book, *Stäkkede Vinger* (1881), immediately gained for him a prominent position among the younger Danish writers and marked him as a broad and accurate observer of social and political conditions among the Danish peasantry. His earlier writing betrays imitation of the Norwegian novelist Kielland, but in *Fra Hytterne* (1887), *Folkelivsskildringer* (1888–90), and the trilogy *Muld* (1891), *Det forjættede Land* (1892), and *Dommens Dag* (1895), his originality and narrative power are strongly apparent. His other writings include *Sandinge*

Menighel (1883); *Landsbybilleder* (1883); *Lykkeper* (8 vols., 1898–1904; 2d ed., 3 vols., 1905); *Den gamle Adam* (1905); *Ung Elskov* (1906); *Aasgaardsrejen* (1906); *Den kongelige Gæst* (1908), a drama; *Storeholt* (1913).

PONTOR/MO, JACOPO DA (properly JACOPO CARUCCI) (1494–1557). An Italian painter of the Florentine school, called Pontormo from the place of his birth. He was a pupil of Leonardo da Vinci, Albertinelli, Piero di Cosmo, and finally of Andrea del Sarto. The "Visitation" (1516), in the church of the Annunciation, Florence, is in the style of the last-named master. But he was influenced also at different times by Dürer and Michelangelo and his admiration for the latter caused a deterioration of his personal style. At his best he shows a rare instinct for the decorative, great feeling for line, and poetic fancy, as in the lunette at Poggio a Caiano, called by Berenson "the most appropriate mural decoration now remaining in Italy." Almost as fine is the dreamlike "Deposition," at Santa Felicità, Florence. His portraits also are of the highest order, but many of his later works are meaningless caricatures of Michelangelo. His best portraits include those of Cosimo de' Medici (San Marco, Florence); "Lady with Dog" (Städel Institute, Frankfort); "A Cardinal" (Borghese Gallery, Rome). Among his drawings are many real masterpieces. Consult Bernhard Berenson, *Drawings of the Florentine Painters* (New York, 1903); id., *Florentine Painters of the Renaissance* (ib., 1909).

PONTREMOLI, pŏn-trĕm'ô-lē. An episcopal city in the Province of Massa e Carrara, Italy, situated on the south slope of the Apennines, on the Magra, 37 miles southwest of Parma (Map: Italy, B 2). It has a cathedral and an episcopal library. There are manufactures of silk, oil, and lime and a trade in wine, fruit, and cattle. There are also marble quarries and mineral springs. Pontremoli was a republic in the twelfth century. Pop. (commune), 1901, 14,194; 1911, 16,176.

PON'TUS (Lat., from Gk. Πόντος, *Pontos*). The ancient name of a district in the northeastern part of Asia Minor, bordering on the Pontus Euxinus (whence its name) and extending from the river Halys (now Kizil Irmak) in the west to the frontiers of Colchis and Armenia, a short distance beyond the modern Batum, in the east. Its southern limits were the ranges of Anti-Taurus and Paryadres, so that it corresponded pretty nearly to the modern provinces of Trebizond and Sivas. On the east and the south Pontus is mountainous, but along the coast there are large and fertile plains which in ancient times produced, and indeed still produce, abundance of grain, fruits, and timber. Game, according to Strabo, who was a native of Amasia, also was plentiful. Apiculture was common, and honey and wax were among the chief articles of commerce. Iron was the principal mineral. Besides the Halys at the west the chief rivers were the Iris and its tributary, the Lycus, and at the east the Acampsis. Small, but famous from its association with the Amazons, was the river Thermodon.

Pontus was not an ethnological, but purely a geographical, division. The name does not occur before the fourth century B.C., and is not common till after the time of Alexander the Great. Properly the region was called Cappadocia ad Pontum. The early inhabitants appear to have been barbarous but warlike tribes, over whom the monarchs of Assyria, Lydia, and even Persia had but little more than a nominal control, though the region formed one of the satrapies under Darius. The advantages of the fertile coast and the prospects of trade early attracted Greek merchants, and the Argonautic epic (see ARGONAUTS) reflects the voyages of the early Æolian and Ionian traders. As early as the seventh century B.C. the Milesians had founded Sinope (see SINUB), and that city and Miletus planted a number of settlements along the Pontic coast, of which the most famous was Trapezus (Trebizond); others were Amisus (Samsun), Cotyora, and Cerasus (near the later Pharnacia). In the interior were native cities which later attained prominence, such as Amasia, the old capital and burial place of the earlier kings; Comana Pontica, the chief seat of the worship of the Asiatic goddess Ma; and Cabira or Neocæsarea, the modern Niksar. Some of the earlier satraps or local princes appear to have assumed a royal title in the fourth century B.C., or at any rate were regarded as the founders of the dynasty; but the foundation of the Kingdom of Pontus was really laid by Mithridates III Ctistes (or founder), who in 302 B.C. fled to this region from Antigonus. At first little more than a robber chief, he so skillfully used the disturbances of this time that in 280 B.C. he could assume the title of king. He appears to have died about 266 B.C., master of Paphlagonia and northern Cappadocia, though Sinope was still independent. He was succeeded by his son, Ariobarzanes III, who was followed by Mithridates IV, and Pharnaces I, who took Sinope and removed the inhabitants of Cotyora and Cerasus to his new city of Pharnacia. But he was forced by the Romans to give up most of his Paphlagonian conquests. He was succeeded by Mithridates V. About 121 B.C. the great Mithridates VI Eupator (see MITHRIDATES), one of the most dangerous opponents of Roman rule in the East, ascended the throne. After his overthrow by Pompey (63 B.C.) his kingdom was divided. The portion west of the Halys was joined to the Province of Bithynia. Next to this district the valley of the Iris and the region inland were given to King Deiotarus, and from that time were known as Pontus Galaticus. The eastern region was given to other princes, and later the central portion was given by Antonius to a certain Polemon, whence it was called Pontus Polemoniacus. It was ceded to Rome in the reign of Nero and at first was joined to Galatia. Later both divisions of Pontus were joined to Cappadocia; in the redistricting of the Empire by Constantine Pontus formed two provinces. The narrow eastern strip along the Black Sea was called Pontus Polemoniacus, and the western district, extending to the highlands of Cappadocia, was named Hellenopontus. Consult: E. Meyer, *Das Konigreich Pontus* (Leipzig, 1879); T. Reinach, *Trois royaumes de l'Asie Mineure* (Paris, 1888); *Mithridate Eupator, roi de Pont* (ib., 1890); W. M. Ramsay, *Historical Geography of Asia Minor* (New York, 1890); Anderson and Cumont, *Studia Pontica* (1903 et seq.); H. Grégoirè, "Voyage dans le Pont," in *Bulletin de correspondance hellenique* (Paris, 1909); De Jerphanion, "Notes de géographie et d'archéologie pontiques," in *Byzantinische Zeitschrift*, vol. xx (Leipzig, 1911).

PONTUS, AQUILA OF. See AQUILA PONTICUS.

PONTUS DE THYARD, tē'ȧr' (1521–1605). A French poet, a member and last survivor of the Pléiade (q.v.). His first book, *Erreurs amoureuses* (1549), was published shortly after the appearance of Du Bellay's *Défense et illustration de la langue française*. His name is connected with the early history of the sonnet. Pontus de Thyard translated *Leo Judæus* and probably had some influence on Platonism. He wrote also *Œuvres poétiques* (1573). His complete work is found in *Collection Pléiade* of Marty-Læveaux (1875).

PONTUS EUXI'NUS. The ancient name of the Black Sea (q.v.).

PONTYPRIDD, pŏnt'ē-prĭd', *Welsh pron.* pŏn'tē-prĭth' (Welsh, bridge of beauty); also called NEWBRIDGE. A town in Glamorganshire, Wales, on the Taff, 11 miles southeast of Merthyr Tydfil (Map: Wales, C 5). Its growth and importance are due to its various manufactures, collieries, iron mines, and supplemental industries. Pontypridd is named from the famous bridge built by a self-taught architect over the Taff in 1755. Pop., 1901, 32,316; 1911, 43,211.

PONY (probably from Fr. *poulenet*, dim. of *poulain*, from ML. *pullanus*, foal, colt, from Lat. *pullus*, young animal, chicken; connected with Gk. πῶλος, *pōlos*, foal, and ultimately with Eng. *foal*). A small horse. The name "pony" is commonly applied to the many small active breeds of horse (q.v.) which are to be found throughout the world, more especially in the warmer parts and in mountainous or sterile regions. In general they are exceptionally hardy and possess a strength great in proportion to their size. Possibly the smallest race of ponies is the Shetland, although the Iceland pony differs but little from it and is sufficiently hardy to flourish in the winter of Iceland. The Galloway, Welsh, Dartmoor, Exmoor, and Canadian breeds are types of ponies considerably larger than that of Shetland. Sardinia and Corsica also possess small races of ponies, which have existed unchanged from ancient times.

PONY EXPRESS. The name given to a mail service established between St. Joseph, Mo., and San Francisco, Cal., in 1860. At this time there were three transcontinental mail lines, but the greater part of the mail between the East and the Far West was sent by way of Panama in about 22 days. The demand for a more rapid mail service between the East and the West led to the establishment in the spring of 1860 of the famous "pony express," the mail being carried rapidly overland on horseback under the direction of the Central Overland California and Pike's Peak Express Company. The first pony express left, on April 3, 1860, St. Joseph and San Francisco, between which places the schedule allowed eight days. Stations averaging at first 25 miles apart were established, and each rider was expected to cover 75 miles a day. Eventually there were 190 stations, 200 station keepers, 200 assistant station keepers, 80 riders (who were paid from $100 to $125 per month), and between 400 and 500 horses. The quickest trip was that made for the delivery of President Lincoln's inaugural address, the distance, between St. Joseph, Mo., and Sacramento, Cal., about 1400 miles, being covered in 7 days and 17 hours. At first the company charged $5 for each half ounce, but later the charge was reduced to $2.50. The regular pony-express service was discontinued on the completion of the line of the Pacific Telegraph Company, in October, 1861. The service was often interrupted by Indian hostilities and was extremely hazardous for riders and for station keepers alike. Consult an article in the *Century Magazine*, vol. xxxiv (New York, 1898).

PONZA (pŏn'tsȧ), or **PON'TINE, ISLANDS.** A group of small islands, of volcanic origin, belonging to Italy, situated west of Naples, in the Mediterranean Sea, in about long. 13° E. (Map: Italy, D 4). There are in fact two groups. The western and larger belongs to the Province of Caserta, the eastern to the Province of Naples. They are used as penal settlements. To the former collection belongs Ponza, the largest island, with 4901 inhabitants in 1911. The latter group consists of two islands. The islands served the Roman emperors as a place of banishment.

POOD (Russ. *pudŭ*, from Lat. *pondus*, weight). A Russian weight equal to 40 Russian pounds or 36.1128 pounds avoirdupois.

POODLE (Ger. *Pudel*, from Ger. *pudeln*, to splash in water; connected with LG. *pudeln*, *puddeln*, to waddle, Eng. *puddle*, pudgy person). A breed of long-haired domestic dogs now kept chiefly as pets. The poodle has long been known and appreciated; his quaintly clipped and shaven body is found depicted on Roman sculptures. From Italy he was introduced into Spain and France and thence into England. He is not only naturally a good retriever or water dog, but has the nose and the sudden stop of both the pointer and setter; indeed, so keen is his nose that even the inferior kinds, or patched dogs, are employed by the poor natives of Hampshire and Wiltshire in England to hunt for and point out truffles. His remarkable general intelligence is indicated by his predominance in all bands of trick and performing dogs. Three varieties are recognized—the red, the white, and the black; and two classes of covering—corded and curly. Their weight is divided, for competitive purposes, into three grades: large size, more than 40 pounds; medium, 20 to 40 pounds; small, 20 pounds or less—the last grade are sometimes called barbets. The general appearance is that of a strong, active, playful, and intelligent dog, well built, and covered with thick, close curls of a silky texture, or with strong, hanging, ropelike cords, sometimes measuring 25 inches, as in the case of the champion Nero. The poodle has a long, capacious skull, the parts over the eyes well arched; good, level teeth; a strong neck; muscular, straight forelegs and hind legs with hocks well let down; strong, well-proportioned and well-padded feet; and a tail carried well up. The ears are long, well set, and lie close to the cheek; and the eyes are black and vivacious. The little white-coated, short-haired, curly poodle, with whose covering the least liberties have been taken, is the widest known of the three varieties, although not the most popular on the show bench. These are essentially family pets, and their quizzical whiskered faces are in evidence in every country from California round the world eastward to China, where this breed is still used in his ancient hunting capacity as a water dog. See Plate of DOGS.

Poodles are usually clipped over the larger part of the body, leaving the cords or curls here and there, after a pattern dictated by the caprice of his master.

POOL. See BILLIARDS.

POOL, THE. The upper portion of the harbor of London; the part of the Thames just below

London Bridge, which forms the limit of navigation for seagoing vessels.

POOL, MARIA LOUISE (1845–98). An American writer, born in Rockland, Mass. She removed to Brooklyn, N. Y., in 1870, where she wrote first for a Philadelphia paper and afterward for the *Evening Post* and the *Tribune* of New York. Later she resided in Wrentham, Mass. It was not until 1887 that she became widely known through her *A Vacation in a Buggy*. Her literary work, which consists of sketches, chiefly of New England life, most of which appeared in the periodicals, was issued in book form as follows: *Tenting at Stony Beach* (1888); *Dolly* (1891); *Roweny in Boston* (1892); *Mrs. Keats Bradford* (1892); *Katharine North* (1893); *The Two Salomes* (1893); *Out of Step* (1894); *Against Human Nature* (1895); *Mrs. Gerald* (1896); *In the First Person* (1898); *Boss and Other Dogs* (1898); *A Golden Sorrow* (1898); *The Malvon Farm* (1899).

POOLE. The chief seaport of Dorsetshire, England, on the east coast of the county, 5 miles west of Bournemouth (Map: England, E 6). Its harbor is tidal and has a quayage of 2000 feet. Poole is an ancient town and a municipal county. The town owns much corporate property, has built an esplanade and shore drive, carried out harbor improvements, and established a free library. It has manufactures of sailcloth, tiles, ropes, etc., and a considerable coasting trade, and exports Purbeck clay and grain. The town is named after the pool or bay on which it stands and which at high tide covers an area 7 miles long by 4½ broad. Pop., 1901, 19,500; 1911, 38,886.

POOLE, or **POLE,** MATTHEW (1624–79). An English biblical scholar, born in York and educated at Emmanuel College, Cambridge (B.A., 1649). He became rector of St. Michael-le-Querne, London. A stanch Presbyterian, he resigned his living on the passage of the Uniformity Act (1662). Having a small but independent income, he now devoted himself to his great undertaking, the writing of *Synopsis Criticorum Aliorumque Sacræ Scripturæ Interpretum* (5 vols., 1669–76). This is a summary of the critical labors of Rabbinic and Roman Catholic commentators, but contains little from Calvin and nothing from Luther. Poole began also a synopsis in English, called *Annotations upon the Holy Bible*. Two volumes appeared in 1683–85, and the work was continued by others (last ed., 3 vols., 1840). Frightened by the Popish plot —for Titus Oates (q.v.), on account of Poole's tract on the *Nullity of the Romish Faith*, had represented him as marked for assassination (1678)—Poole left England and passed his last years at Amsterdam.

POOLE, PAUL FALCONER (1806–79). An English historical and genre painter. He was born at Bristol and was almost entirely self-taught. First attracting attention in 1843, with a historical painting, "Solomon Eagle Exhorting the People to Repentance," he soon gained great popularity and, after Watts, was for many years the first English painter of imaginary subjects. Though a poor technician, he possessed dramatic and inventive ability. Among his best-known paintings are "The Vision of Ezekiel," Tate Gallery; "Last Scene in King Lear," South Kensington Museum; "The Goths in Italy," Manchester Gallery; "The Dragon's Cavern" (1877); "The Lion in the Path" (1873); and a number of idyllic subjects. He became a member of the Royal Academy in 1861.

POOLE, REGINALD LANE (1857–). An English historian, born in London and educated at Balliol and Wadham colleges, Oxford, and at Leipzig. In 1880 he became assistant in the department of manuscripts in the British Museum. Of the *English Historical Review* he was assistant, joint, and then sole editor. He was lecturer in modern history at Jesus College, Oxford, from 1886 to 1910; lecturer on diplomatics in the University after 1896; and became fellow of Magdalen College (1898), keeper of the archives (1909), and curator of the Bodleian Library (1914). He also lectured at Cambridge. Poole wrote, notably: *The Huguenots of the Dispersion* (1880); *Sebastian Bach* (1882); *Illustrations of the History of Mediæval Thought* (1884); *Wycliffe and Movements for Reform* (1889); *The Exchequer in the Twelfth Century* (1912); *On the History of the University Archives* (1912); and reports on historical manuscripts on ecclesiastical muniments (1895–1914). He edited, among other works, *Historical Atlas of Modern Europe* (1897–1902) and, with W. Hunt, *Political History of England* (12 vols., 1905–10). For his brother, see LANE-POOLE, STANLEY; for his uncle, POOLE, REGINALD STUART; and for his great-uncle, LANE, EDWARD WILLIAM.

POOLE, REGINALD STUART (1832–95). An English archæologist, born in London. He was educated in Cairo, Egypt, by his uncle, Edward William Lane (q.v.), and became assistant in the department of antiquities in the British Museum in 1852, but was soon transferred to the department of coins and medals, of which he was keeper from 1870 to 1893. He assisted Amelia B. Edwards (q.v.) in establishing the Egyptian Exploration Fund, lectured at the Royal Academy schools in 1883–85, and in 1889–94 was professor of archæology in University College, London. He wrote much concerning Greek and Oriental coins during his connection with the British Museum, contributed to Smith's *Bible Dictionary*, and wrote the descriptive parts of Firth's *Views in Egypt*.

POOLE, STANLEY LANE-. See LANE-POOLE.

POOLE, WILLIAM FREDERICK (1821–94). An American librarian. He was born in Salem, Mass., and graduated at Yale in 1849. While at college he was librarian of the Brothers in Unity Society library, and in his junior year compiled the first edition of his *Index to Periodicals*. He was librarian of the Boston Mercantile Library (1852–56); then became librarian of the Athenæum, where he remained 13 years, becoming well known as one of the leading librarians of the country. He had charge of the Cincinnati Public Library in 1869–73, of the Chicago Public Library in 1873–87, and of the Newberry Library, Chicago, from 1887 till his death. Dr. Poole is most widely known for his admirable *Index to Periodical Literature*, of which he published enlarged editions in 1853 and in 1882. A later edition and several supplements have been compiled by the coöperation of many American librarians, and other volumes have been edited by W. J. Fletcher, librarian of Amherst College. Dr. Poole was much interested in the study of American history. In 1885–87 he was president of the American Library Association and in 1887 president of the American Historical Association. His writings

include: *The Battle of the Dictionaries* (1856); *Websterian Orthography* (1857); *Cotton Mather and Salem Witchcraft* (1869); *Anti-Slavery Opinions before 1800* (1887). He organized the Bronson Library at Waterbury, Conn. (1869); the Athenæum Library at St. Johnsbury, Vt.; and the library of the United States Naval Academy.

POOLING (from *pool*, from Fr. *poule*, pool, stakes, hen, from ML. *pulla*, hen, from Lat. *pullus*, young animal, chicken). A division of business or of the proceeds of business among otherwise competing carrier or other parties, intended to minimize the effects of competition by maintaining rates. Pools may be divided into four classes. A division of traffic may be either (1) a division of the field, where the business of a particular territory is assigned to each competitor, or (2) a tonnage pool, where a certain percentage of the competitive business is assigned to each. A division of revenue may be either a (3) gross or (4) net money pool, according to whether it is based upon gross or net receipts. A net money pool almost necessary involves a system of joint accounting, and is therefore a close form of combination.

Railway pooling became a matter of importance in England about 1850, but its origin is obscure. The first railway pools in the United States were probably among the New England railways, but it was in the West that pooling first became a matter of public importance. Both freight and passenger traffic between Chicago and Omaha were pooled in 1870, and the arrangements remained in force, with but one short interruption, for 17 years, the pool being merged in 1884 in the Western Freight Association. The principal roads carrying anthracite coal to the Atlantic seaboard, which also owned about 75 per cent of the anthracite coal fields, had an effective pooling arrangement from 1872 until 1876. In 1873 the roads from Atlanta to the coast formed a pool out of which afterward grew the strong Southern Railway and Steamship Association. The lines from Chicago and Milwaukee to St. Paul arranged a money pool for both freight and passenger traffic in 1874. During the next few years numerous pools were organized, until they covered nearly every part of the country.

Railway freight pooling was forbidden and made a misdemeanor by the Interstate Commerce Act passed in 1887, but the wisdom of this prohibition was, and has continued to be, a much mooted question. (See RAILWAYS.) Most students of the subject, both from a practical and theoretical point, favor the legalization of pooling under government supervision. Pooling prevents discrimination and is conducive to stability of rates, which is generally considered more important than absolute lower rates. It is argued that when the division of competitive traffic is as certain as that of noncompetitive traffic both will be treated without discrimination, for there will be no reason for favoring competitive points; through traffic will then be made to bear its just share of the cost of transportation.

Upon the passage of the Interstate Commerce Act existing pooling contracts were annulled, but the attempt to prevent pooling has not been altogether successful. Traffic associations have endeavored to continue the division of traffic without resorting to the usual pooling machinery. There is abundant evidence of a physical division of cotton freight from Memphis and other interior points to the seaboard; indeed, this pool has been sustained by the Supreme Court of Tennessee. It does not fix rates, but all the roads concerned accept the lowest rate to Liverpool prevailing on any given day. There is said to be a somewhat similar division of the fruit traffic from southern California. The so-called Buffalo grain pool, which was investigated by the Interstate Commerce Commission in 1900, was intended to divide the grain traffic from Buffalo to New York and to maintain a rate of four cents a bushel.

At common law the American courts have usually held pooling agreements to be contracts in restraint of trade and against public policy. Pools have therefore been extralegal agreements not enforceable by the courts, but dependent upon the good faith of the parties, and hence lacking in permanence. In England the courts look upon pooling with much less disfavor than in the United States; while on the Continent pooling is regarded with such favor that the government railways of Prussia, Austria, and other countries maintain pooling arrangements with competing water routes.

Pooling is not confined to transportation lines. The Western Elevating Association is an organization of grain elevators at Buffalo which establishes uniform rates for elevating and storing grain, collects the earnings, and, after deducting expenses, distributes the remainder to the participating elevators in certain specified proportions based upon their working capacity and the business they control. Manufacturing concerns sometimes form pools for the purpose of keeping up prices by limiting production.

The term "pool," or "pooling," is applied also to various other forms of combination for concerted action. In a Wall Street or stock pool stockholders of a company assign their stock to a firm of bankers or brokers, to be sold within a given time, usually at not less than a stated price, otherwise the stock is to be returned to the holders, the profits, if any, being shared by all alike. Receivers of farm produce in the Cincinnati market have formed pools for economy in handling the goods, fewer salesmen being required by this method.

Consult: Cooley, *Popular and Legal Views of Traffic Pooling* (Chicago, 1884); Hadley, *Railroad Transportation* (New York, 1885); Hadley, "Prohibition of Railway Pools," in *Quarterly Journal of Economics* (1890); H. T. Newcomb, *Railway Economics* (Philadelphia, 1898); W. Z. Ripley, *Trusts, Pools, and Corporations* (Boston, 1905); also *Reports of the United States Industrial Commission* (Washington).

POOL SELLING. A method of gambling by the distribution of chances in a common pool, or combination of stakes, on some uncertain event, as a horse race. For example, in a pool on a horse race each better pays in a certain amount, naming the horse he desires to back and receiving a ticket as a receipt, and on the determination of the race the winner is paid the total amount wagered by all the betters on the race, less a commission, usually 10 per cent, which is retained by the manager or person selling the pools. The term is also sometimes inaccurately applied to the method of betting with bookmakers in places at a distance from the race track. Pool selling and the keeping of pool rooms are prohibited by statute in most of the United States. See GAMBLING.

POONA, pōō'nä, officially PUNA. The capital of a district in Bombay, British India, on the river Mutha, near its confluence with the Mula, on an almost treeless plateau, about 74 miles southeast of Bombay (Map: India, B 5). Poona is about 1700 feet above the sea level; its climate is healthful and pleasant, and it is very much resorted to, particularly in the rainy season. The city, the former capital of the Mahrattas, is divided into seven quarters, named after the days of the week, and contains the ruins of a palatial structure formerly the residence of the peshwa. It is the headquarters of the Bombay army and the seat of the Bombay government from July to November. The Deccan College, founded in 1821, has a staff of European professors with native assistants, providing higher instruction in the liberal arts and in law in connection with Bombay University. There are numerous other educational institutions, including the Government College of Science, the Maharasthra College, and the Fergusson College. One of the most interesting objects in the neighborhood of Poona is a large *bund*, or embankment, solidly built of hewn stone over the Mutha-Mula River for the purpose of providing a supply of water for the cantonment, and especially the bazar or native town connected with it. Poona was formerly a great mart for jewelry and precious stones, but this trade has quite ceased. The native manufactures also have been supplanted by the introduction of European piece goods, and the principal commerce is in connection with grain and other agricultural produce. Poona suffered severely from the plague, and from 161,390 in 1891 its population decreased to 111,385 in 1901, but advanced again to 158,856 in 1911. Poona is first mentioned in the sixteenth century. It became the Mahrattan capital in 1750; it was captured and destroyed by Nizam Ali in 1763, and later in the same year the combined forces of the peshwa and Sindia were completely defeated here.

POONA WOOD (Kanarese *ponne*). The timber of the poon trees (*Calophyllum inophyllum* and *Calophyllum angustifolium*) of India, commonly used for planks and spars in shipbuilding. See CALOPHYLLUM.

POOP (OF. *poupe, pouppe*, Fr. *poupe*, from Lat. *puppis*, stern of a ship). A light deck, raised above the main or upper deck and extending a short distance forward from the stern. It is all that remains of the old stern castle, which towered above the upper deck in ships of the seventeenth century and of several preceding centuries.

POOR, OVERSEERS OF THE. See OVERSEERS OF THE POOR.

POOR, CHARLES LANE (1866–). An American astronomer, born at Hackensack, N. J. He graduated (1886) from the College of the City of New York and took his degree of Ph.D. at Johns Hopkins (1892), where he taught until 1899, becoming associate professor of astronomy. At Columbia he was lecturer (1903–04), professor of astronomy (1904–10), and thenceforth professor of celestial mechanics. Poor served as editor of the *Annals* of the New York Academy of Sciences in 1901–06, and became president of the Lowe Manufacturing Company in 1905. He is author of *The Solar System* (1908) and *Nautical Science in its Relation to Practical Navigation, together with a Study of the Tides and Tidal Currents* (1910).

POOR, ENOCH (1736–80). An American soldier, born at Andover, Mass. He became a shipbuilder at Exeter, N. H., but in 1775, after the battle of Lexington, was commissioned colonel of one of the three regiments raised by the New Hampshire Assembly. In 1777 he was promoted brigadier general in the Continental army, and had a conspicuous part in the battles of Saratoga, his brigade bearing the brunt of the action on September 19. He distinguished himself at Monmouth also (June 28, 1778), and the next year, during Gen. John Sullivan's campaign against the Indians of the Six Nations, led his troops in a difficult flank movement which resulted in the decisive victory at Newtown, the present Elmira (Aug. 29, 1779). In 1780 he was transferred to one of Lafayette's two brigades of light infantry at that general's request. Soon afterward he died, while stationed at Hackensack, N. J.; here a monument was erected to his memory.

POOR, HENRY WILLIAM (1844–1915). An American banker and expert on railroads, born at Bangor, Me. He graduated from Harvard in 1865 and in 1868, the year that he entered the brokerage business with his father under the firm name of H. V. and H. W. Poor, he issued the first number of his valuable annual, *Poor's Manual of Railroads*. He became a member of the New York Stock Exchange in 1890, director of the United States Casualty Company, and senior member of the H. W. Poor banking house of New York and Boston.

POOR, THE (OF. *poure, pouvere, povre*, Fr. *pauvre*, from Lat. *pauper*, poor). The term used to designate those for whom it is a struggle to procure the necessaries of life. In law it has reference to those who are wholly or in part dependent on public support. See MENDICANCY; PAUPERISM; VAGRANT.

POOR CLARES. See CLARES, POOR.

POORE, BENJAMIN PERLEY (1820–87). An American journalist, born near Newburyport, Mass. His father sent him to a military school to prepare for admission to West Point, but he ran away and apprenticed himself to a printer. At the expiration of his service his father bought for him the *Southern Whig*, an Athens, Ga., newspaper. After only two years as editor, however, he accepted an appointment as attaché to the American Legation in Brussels. During the seven years following he visited the principal countries of Europe, Egypt, and Palestine, and acted as foreign correspondent of the Boston *Atlas*. During the last four years he acted also as historical agent for Massachusetts in France, copying from the French archives many papers of historical value and illustrating them with maps and sketches. After his return to America in 1848 he edited the Boston *Bee* and *Sunday Sentinel*, and in 1854 became the Washington correspondent of several newspapers. For a short time during the Civil War he served as major of the Eighth Massachusetts Volunteers, but soon returned to his journalistic work, at which he continued until 1884. During these years he was for a long period clerk of the Senate Committee on Printing Records, and in this capacity compiled and edited several publications dealing with the government, including *The Conspiracy Trial for the Murder of the President* (1865); a *Descriptive Catalogue of the Government Publications of the United States, 1774–1881* (1885); *The Political Register and Congressional Directory* (1887). In addi-

tion he published, among other works: *Rise and Fall of Louis Philippe* (1848); *Life of General Zachary Taylor* (1848); *The Life and Public Services of Ambrose E. Burnside* (1882); *Perley's Reminiscences of Sixty Years in the National Metropolis* (2 vols., 1886). But Poore is best known for his invaluable compilation called *Federal and State Constitutions, Colonial Charters, and Other Organic Laws of the United States* (2 vols., 1877).

POORE, HENRY RANKIN (1859–). An American figure, animal, and landscape painter, born in Newark, N. J. He was a pupil of the National Academy of Design in New York, and of the Pennsylvania Academy, under Peter Moran, and afterward studied in Paris with Luminais and Bouguereau. At first he made a specialty of a combination of figure and animal subjects, particularly dogs, but later devoted more attention to pure landscape, preferably the subdued and melancholy aspects of New England scenery. His composition is vigorous, his color pleasing though lacking brilliancy, and his treatment sympathetic. Among his works are "The Ploughing of the Ephrata Brethren" (1894); "Hounds in Winter" (1898); "Clearing Land" (1903); "The Long Day" (1914); "Pilgrim Sons" (1915). He is represented in the Buffalo Academy, the St. Louis Museum, and the Art Association, Indianapolis. His publications include *Pictorial Composition and the Critical Judgment of Pictures* (1903; 7th ed, 1913), a valuable book for students and professionals, the fruit of several years' teaching, and *The New Tendency in Art* (1913). He became an associate of the National Academy of Design and received the $2000 annual prize of the American Art Association in 1889 and a gold medal at Buenos Aires (1910).

POORE, SIR RICHARD (1853–). A British admiral, who, as fourth Baronet, succeeded his father in 1893. He served with the Perak expedition of 1875–76, at Alexandria in 1882, and in the Khartum expedition in 1884–85; became rear admiral in 1903; commanded the Channel fleet in 1904–05; and was vice admiral in 1907, commander in chief of the Australian station in 1908–11, admiral in 1911, and then commander in chief at the Nore.

POOR LAWS. The laws regulating the public relief of the poor. Charities may be provided in two ways—by private initiative, as in the case of the Friendly Societies in England, or directly by the state. This latter relief is of many kinds, including the almshouse for those permanently indigent or disabled, the workhouse in case of confirmed mendicancy, and temporary outdoor aid for the casual poor. There appears to be a growing inclination on the part of the nations to make poor relief a public obligation, either by directly assuming the responsibility or by more closely regulating private efforts. There has also been a steady movement in the last 75 years towards limiting the amount and scope of relief to the poor. The English legislation of 1834 and subsequent years, which virtually abolished outdoor relief and threw the support of bastard children on the mother, strongly marks this tendency. For an extended discussion of the history of the poor laws in various countries, see PAUPERISM.

POOR RATE. The name of the tax raised in England for the maintenance of the public poor relief. The first tax levied for this purpose was in 1573. The assessment and collection were in charge of the overseers of the poor (q.v.). The earlier levies seem to have been on the basis of the number of acres owned, but later degrees of value were recognized. The overseers were made subject to the courts and their assessment had to be countersigned by two justices. Great inequalities arose in the different parishes, and no fixed basis of assessment was reached until 1836, when the Parochial Assessment Act (6 and 7 Wm. IV) established the principle that the "net rent is the standard of ratable value." This Act was permissive only, but in 1845 the justices were empowered to appoint an assessment committee for the purpose of determining the county rate. Owing to the varying contributions of the different parishes, the Law of 1861 (24 and 25 Vict., c. 55) made the share of each parish to accord with its ratable value, and in 1862 the Union Assessment Committee Act was passed. This required the guardians to appoint a committee, to which the overseers of each parish submit their lists of property. These lists are made public, and property owners are given a chance to appear and to appeal. The list given out by this committee becomes the basis for levying the rate. In 1867 a special act was passed to meet conditions in London. Originally rates were levied upon personal as well as real property, but the liability of personal property was abolished by 3 and 4 Vict., c. 89. Consult George Nicholls, *History of the English Poor Law* (new ed., 3 vols., London, 1899). See PAUPERISM; POOR LAWS.

POOR RICHARD'S ALMANAC. A popular almanac published by Benjamin Franklin in 1732 and continued for 25 years. As "Richard Saunders" Franklin supplied in his almanacs, of which 10,000 were sold yearly, a fund of proverbs, homely wisdom, and common sense of the greatest practical value.

POOR ROBIN. The assumed name of the author of an almanac, first issued in 1662 and continued until 1776. It was ascribed wrongly to Robert Herrick and is supposed to be the work of William Winstanley. Throughout the seventeenth century a number of publications were issued under the name of Poor Robin, the most popular of which was *Poor Robin's Jests* (1667).

POORTEN-SCHWARTZ, pōr'ten-shvärts, JOOST MARIUS WILLEM. See MAARTENS, MAARTEN.

POOR'WILL'. A small nightjar (*Phalænoptilus nuttallii*) abundant on the Western plains of the United States, named from its two-syllabled characteristic note. The plumage is peculiarly soft and bronzelike or silver gray. The poorwill lays white, unspotted eggs. Compare WHIPPOORWILL.

POPAYÁN, pō'pä-yän'. Capital of the Department of Cauca, Colombia. It is situated near the banks of the river Cauca, 225 miles southwest of Bogotá, in a wide and beautiful plain 6000 feet above the sea and dominated by the volcano of Puracé (Map: Colombia, B 3). The principal buildings are the cathedral and the archiepiscopal palace. It has a university, seminaries, and a normal school, and manufactures woolen blankets and other articles for home consumption. Pop., 1912, 18,724. Popayán was founded in 1536 by Belalcazar. In the eighteenth century it was an important commercial and gold-mining centre, and a mint was established there in 1748. It suffered much in the civil wars and is now in decay.

POP CORN. See MAIZE.

POPE. See PAPACY.

POPE, TEMPORAL POWER OF THE. See TEMPORAL POWER OF THE POPE.

POPE, ALBERT AUGUSTUS (1843–1909). An American manufacturer, born at Brookline, Mass. At the beginning of the Civil War he enlisted in the Thirty-fifth Massachusetts Infantry and at its close was brevetted lieutenant colonel. He then engaged in selling shoe manufacturers' supplies and in 1877 founded the Pope Manufacturing Company, which made small patented articles. It was in this year that Pope first imported bicycles, and in 1878 he began to manufacture them himself, being the American pioneer in the industry. During the tremendous popularity of bicycling Pope made a fortune, but later, when he tried to manufacture automobiles in response to the change in public favor, he was not so successful; indeed his company went into the hands of a receiver in 1907. He was particularly active in the movement for better roads.

POPE, ALEXANDER (1688–1744). An English poet, born in London, May 21, 1688. His father, a linen draper, withdrew from business about 1700 and settled at Binfield, in Windsor Forest; in 1716 he moved to Chiswick on the Thames, near London. The poet's mother was Edith Turner, who belonged to a Yorkshire family. The elder Pope was a Roman Catholic, and to this faith the poet also nominally adhered, thus debarring himself from a university career. He learned to read from an old aunt and received some education in two Catholic schools as well as from private tutors (Roman Catholic priests), but for the most part he taught himself. He read widely in English poetry and studied French, Italian, Latin, and Greek. Thus left to himself, he never became an accurate scholar. Soon after the death of his father (1717) he leased (1719) a house and five acres of land at Twickenham, on the banks of the Thames, whither he withdrew with his mother, to whom he was tenderly attached, and there he dwelt till his death. In the famous villa Pope was visited by the most celebrated wits, statesmen, and beauties of the day. He died May 30, 1744. In his tenth year Pope was stricken by an illness which distorted his frame and robbed him of his plumpness and his color. His physical infirmity, susceptible temperament, and incessant study rendered his life "one long disease." He was, Lord Chesterfield said, "the most irritable of all the *genus irritabile vatum*, offended with trifles, and never forgetting or forgiving them." Of his many quarrels that with Addison was least justifiable. Yet when no disturbing jealousy, vanity, or rivalry intervened, Pope was generous and affectionate, as witness the long friendship with Arbuthnot, Gay, and Swift, and his devotion to his mother.

Pope was the most precocious of English poets. About 1702 he made a translation of the first book of the *Thebaïs* of Statius (not published till 1712), and about the same time he wrote an epic called *Alexander*, which he burned about 1717. By 1706 he had composed his *Pastorals*, which were first published in Tonson's *Miscellanies* in 1709. The smooth and melodious verses at once made Pope known. The experiment in the pastoral was followed by the *Essay on Criticism* (1711), which expounded the canons of taste; the *Messiah* (1712); *Windsor Forest* (1713), a descriptive poem, less artificial than the *Pastorals;* and the *Rape of the Lock* (first draft, 1712; altered and enlarged in 1714), the most graceful, airy, and fanciful of Pope's poems. In 1714 appeared *The Wife of Bath*, imitated from Chaucer, from whom he also got *The Temple of Fame*. In 1717 Pope published a collection of his works, where first appeared the *Epistle of Eloisa to Abelard* and the *Elegy on an Unfortunate Lady*, his most noteworthy lyrics. Pope was already engaged on the work that was to give him solid fame. His translation of the *Iliad* was published in six volumes (1715–20). Out of the profits of this work he purchased and adorned his villa. The translation, though wanting in Homeric simplicity, naturalness, and primitiveness, is nevertheless a fine piece of writing, judged apart from its original. The *Iliad* was followed by the *Odyssey* (1725–26), which was, however, mostly the work of William Broome and Elijah Fenton. Though a pecuniary success, the *Odyssey* added nothing to Pope's fame. Pope now made his famous attack on Grub Street. The *Dunciad* was finished by 1727; but before publishing it Pope stirred up his enemies with "Bathos, or the Art of Sinking in Poetry," in the *Miscellanies* (March, 1728), written in conjunction with Swift and Arbuthnot. The *Dunciad*, in three books, first appeared May 28, 1728, and was enlarged the next year. Pope took as his supreme dunce Lewis Theobald (q.v.), who had criticized an edition of Shakespeare that Pope had brought out in 1725. Around Theobald gyrated the other dunces. In 1742 Pope added a fourth book, dethroned Theobald and put Colley Cibber (q.v.) in his place. This long lampoon, though mean in spirit, is brilliant in style. Pope closed his poetical career with the *Moral Essays* (1731–38) and a group of satires called *Imitations of Horace* (1733–38). The former group contains the famous *Essay on Man* (1733), a philosophical poem, in which is expounded the deism of Bolingbroke, taken back in the sequel, the *Universal Prayer* (1738). To the latter group belongs the delightful *Epistle to Dr. Arbuthnot* (1735).

Pope has been variously estimated. To his generation he seemed the greatest of English poets. This position was questioned by Joseph Warton, who, in his *Essay on the Genius and Writings of Pope* (vol. i, 1751), placed Pope below Spenser. And the later romantics, who laid the stress on the matter of poetry rather than on its technique, had doubts as to whether Pope was a poet at all. On his rank a memorable controversy was started by W. L. Bowles in 1806. If, in the language of Wordsworth, "poetry is the breath and finer spirit of all knowledge," uttered in impassioned language, there is little poetry in Pope. He was hardly successful in *Eloisa* and the *Unfortunate Lady*, his two experiments in pathos. They are only the rhetoric of emotion. Likewise the *Rape of the Lock* is a poem of the fancy rather than of the imagination. Without deep feeling or great imagination, Pope yet possessed rare excellences. In execution he could be faultless. He evoked the melodies of the heroic couplet and molded it to the expression of keen wit and epigram. His proverbial philosophy, so often quoted—as "A little learning is a dang'rous thing"—is likely to be false or only half true, for Pope himself was no thinker; but in the realm of satire, as represented by the *Imitations of Horace*, he is still in the first rank of English poets.

Bibliography. Collective editions of Pope's

Works have been edited by W. Warburton (9 vols., 1751), Joseph Warton (1797), W. L. Bowles (10 vols., 1806), W. Roscoe (1824), and by Croker, Elwin, and Courthope (10 vols., London, 1871–98), the standard edition. Consult also: Abbott, *Concordance to Pope's Works* (ib., 1875); Leslie Stephen, *Alexander Pope, 1688–1744*, in "English Men of Letters Series" (ib., 1880); John Dennis, *The Age of Pope, 1700–1744* (ib., 1894); E. M. Symonds, *Mr. Pope: His Life and Times* (New York, 1909); G. K. Chesterton, in *Varied Types* (ib., 1903). For poems alone, consult the convenient Globe edition (New York, 1869), the edition with memoir of Pope by John Dennis (London, 1891), and the Cambridge edition by H. W. Boynton (Boston, 1903).

POPE, ALEXANDER (1763–1835). An Irish actor and artist, born in Cork. Between 1787 and 1821 he exhibited 59 miniatures at the Royal Academy. In 1785 he appeared at Covent Garden, London, playing the part of Oroonoko (in Mrs. Aphra Behn's famous tragedy of that name), and continued to act at that theatre, for the most part, until 1808. Subsequently he played at the Haymarket and Drury Lane and also in Edinburgh. Pope excelled in tragic parts, particularly in that of Othello.

POPE, CHARLES A. (1818–70). An American surgeon, born at Huntsville, Ala. He studied at the Cincinnati Medical College and at the University of Pennsylvania (M.D., 1832), and at St. Louis University was professor of anatomy and physiology (1843–47) and of surgery (1847–53), and dean (1848–53). He was professor of surgery at the St. Louis Medical College (Washington University) from its foundation in 1853 to 1867. In 1854 he served as president of the American Medical Association. Pope spent considerable time in Paris in 1839–40, 1846, and 1864, and in 1867 settled there.

POPE, FRANKLIN LEONARD (1840–95). An American electrical engineer, born at Great Barrington, Mass. In the employ of the Russo-American Telegraph Company (1864) Pope made surveys in the region between British Columbia and Alaska. When this project failed he went to New York, formed a partnership in 1867 with Thomas A. Edison, with whom he invented (1870) the stock ticker and (1872) the rail circuit for automatic control of block signals. An able patent solicitor, he was for some time attorney to the Western Union Telegraph Company. He was killed in his own house in Great Barrington, Mass., by an electric shock received from a powerful transformer. In 1886–87 he was president of the American Institute of Electrical Engineers. Pope edited the *Electrical Engineer* (1884–95) and wrote *Modern Practice of the Electric Telegraph* (1871; 15th ed., rev., 1892) and *Life and Work of Joseph Henry* (1879).

POPE, JOHN (1822–92). An American soldier. He was born at Louisville, Ky., March 16, 1822, and was the son of Nathaniel Pope, who for many years was United States judge for the District of Illinois. He graduated at West Point in 1842. After graduation he served as brevet second lieutenant in the topographical engineers and in 1846 joined General Taylor in Mexico. He was brevetted first lieutenant for gallantry at the siege of Monterey and captain for services at the battle of Buena Vista. After the close of the war he conducted an expedition which explored the region of the Red River of the North, was on engineering service in New Mexico in 1851–53, and from 1853 to 1859 had charge of the work of surveying a route for the Pacific Railroad. He was commissioned captain in 1856. Upon the beginning of the secession movement Pope came out on the side of the Union and in the winter of 1860–61 delivered a number of Union speeches. For criticizing the policy of President Buchanan in one of these speeches he was summoned to appear before a court-martial, but the trial never took place. In May, 1861, he was appointed a brigadier general and received command of the District of Northern Missouri. In the following December he defeated Gen. Sterling Price at Blackwater, capturing about 1500 prisoners and a large quantity of supplies. He next coöperated with the flotilla of gunboats under Foote in the operations against Island No. 10, which place surrendered in April, 1862, with about 7000 men and 158 cannon. He then took part in the operations against Corinth, after which he was promoted major general of volunteers and brigadier general in the regular army and received command of the Army of Virginia, comprising the corps of Generals Frémont, Banks, and McDowell.

He entered upon the new campaign with a somewhat bombastic proclamation, but after some engagements between portions of his army and the forces of General Jackson, and after he had been reënforced by a large part of the Army of the Potomac, he was badly defeated by Lee and Jackson at the second battle of Bull Run (q.v.), Aug. 29 and 30, 1862, and was forced to retire to the defenses of Washington. He attributed his defeat to the inactivity of the army under McClellan and to the failure of certain officers, particularly of Gen. Fitz-John Porter, to carry out his orders. A court-martial found Porter guilty and dismissed him from the service, but years afterward the decision was reversed. Pope himself asked to be relieved from command; the request was granted, and he was sent to carry on the war against the Sioux Indians. There has been much dispute as to Pope's responsibility for the disastrous outcome of his campaign against Jackson and Lee, but the weight of opinion has on the whole been unfavorable to him. In January, 1865, after the close of the Indian war, Pope was placed in command of the military Division of the Missouri, which was later enlarged into the Department of the Missouri. In 1867–68 he commanded the Third Military District, organized under the Reconstruction Act; in 1868–70, the Department of the Lakes; from 1870 to 1884, the Department of the Missouri; in 1882 was made major general in the regular army; and from 1884 until his retirement in 1886 commanded the Department of the Pacific. Pope died at Sandusky, Ohio, Sept. 23, 1892. He published a report in vol. ii of *Reports of Explorations for a Railroad* (1855) and *The Virginia Campaign* (1863). For an excellent account of his campaign against Lee and Jackson, consult Ropes, *The Army under Pope* (New York, 1881).

POPE, JOHN HENRY (1824–89). A Canadian statesman. He was born in the Eastern Townships, Province of Quebec, and was educated at the Compton high school. He entered politics as a Conservative in 1857, and until Confederation (1867) was member for Compton County in the Canada Legislative Assembly. For more than 20 years after Confederation he

represented the same county in the House of Commons. He was Minister of Agriculture in 1871–73, during the first Dominion administration of Sir John A. Macdonald, and after the latter's return to power was for the second time Minister of Agriculture (1878–85) and in 1885 became Minister of Railways and Canals. As such he had a prominent share in negotiations for the building of the Canadian Pacific Railway, and in 1880, with Sir John A. Macdonald and Sir Charles Tupper, he went to England to procure British approval and financial support for the undertaking. The contract was made and afterward was confirmed by the Dominion Parliament.

POPE, WILLIAM BURT (1822–1903). A Methodist theologian, the first to write from the point of view of modern theological science. He was born at Horton, Nova Scotia, was educated at Richmond College, London, was pastor in England in 1841–67, and then became professor of theology at Didsbury College, Manchester. He is the author of *Discourses on the Kingdom and Reign of Christ* (1869); Fernley Lectures on *The Person of Christ* (1875; 3d ed., 1899); *Christian Theology* (2d ed., 3 vols., 1877–80); *The Prayers of St. Paul* (1876); *Sermons and Addresses* (1878); *A Higher Catechism of Theology* (1883). Consult R. W. Moss, *The Life of W. B. Pope, Theologian and Saint* (London, 1912).

POPE, WILLIAM JACKSON (1870–). An English chemist, born in London and educated at the Finsbury and London Central Technical colleges. He was head of the chemistry department in the Goldsmiths' Institute of London (1897–1901) and in the Manchester Municipal School of Technology (1901–08), professor in the University of Manchester, and, after 1908, professor at Cambridge, where he was a fellow of Sydney Sussex College. He made important researches in crystallography and discovered with William Barlow the connection, in relation to valency, of chemical constitution and crystal structure. In 1900 he delivered the Cantor lectures of the Society of Arts, on the relation of geometry to the chemistry of fermentation. In 1915 he was one of the technical experts chosen to aid the Admiralty and the War Office in the "mobilization of invention."

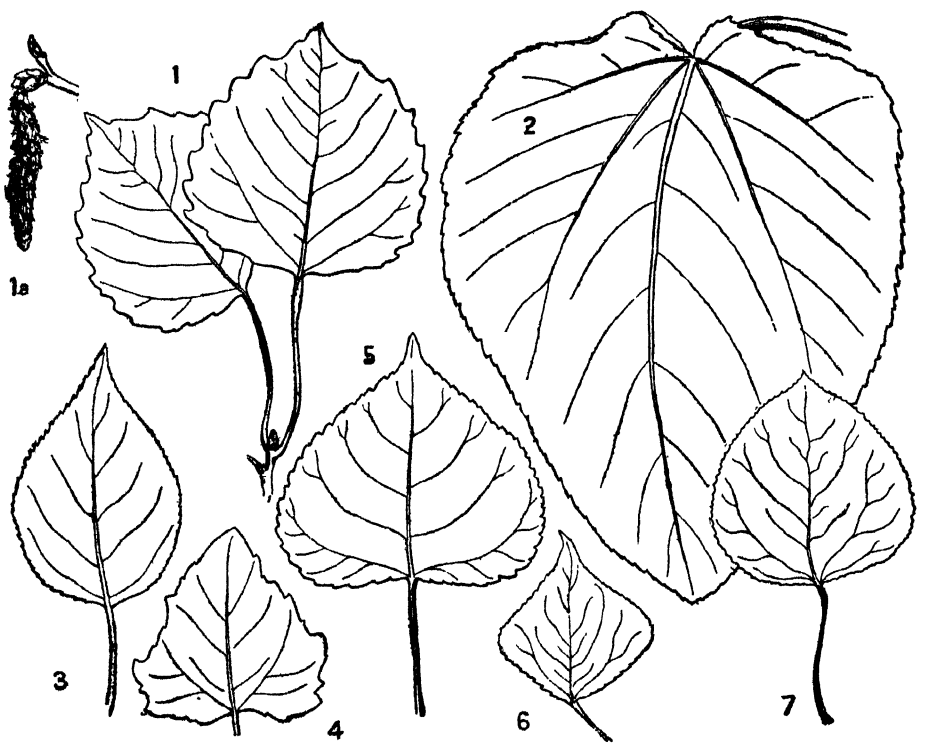
POPE OF GENEVA, THE. A popular name given to John Calvin.

POPERINGHE, pōp'rĭng'. A town in the Province of West Flanders, Belgium, 6½ miles from Ypres by rail and 4 miles from the French frontier (Map: Belgium, A 4). The town is walled and its thirteenth-century parish church is interesting. Its manufactures, which date from mediæval days, include lace, linens, and woolen cloths. Hops are grown in the district. Pop., 1900, 11,552; 1910, 12,205. During the European War which broke out in 1914 Poperinghe was overrun time and again by the contending armies in the severe fighting around Ypres. See WAR IN EUROPE.

POPERY LAWS. In the stricter sense of the expression, certain legislation in England directed against the asserted authority of the Pope to administer, through his own appointees, the patronage and resources of the English church. The first of these statutes seems to have been enacted in the twenty-fifth year of Edward I. In the reign of Richard II the famous statute of Præmunire (q.v.) was enacted, and from time to time this was supplemented by further legislation. A number of these old laws still stand on the statute books. In a more general sense the expression has come to be applied also to the body of legislation of an extremely drastic character which from the twenty-third year of Elizabeth was directed against the observance and practice of the Roman Catholic faith in England. Many of the disabilities then imposed upon Catholics have been removed by act of Parliament (Catholic Emancipation Bill, April, 1829), but many of them are still nominally in force, though in practice never applied. Consult Blackstone, *Commentaries on the Laws of England* (4th ed., Chicago, 1899), and A. V. Dicey, *The Relation between Law and Public Opinion in England in the Nineteenth Century* (London, 1905).

POP'EYE'. A fish of the North Pacific (*Macrurus cinereus*), one of the grenadiers (q.v.), and so excessively numerous in the depths of Bering Sea that it outnumbers all other fishes there and furnishes an abundance of food for the marine animals of that region.

POPHAM, pōp'ăm, GEORGE (c.1550–1608). An English colonist, born in Somersetshire. As an associate of Sir Ferdinando Gorges in a colonization scheme for a part of Maine, he sailed from Plymouth, England, in 1607, with two ships and about 120 men and, landing in August at the mouth of the Kennebec River, there made the first English settlement in New England, building a storehouse and a fortification which was called Fort St. George. Popham was elected President of the new colony, but died the following year, and the colonists, becoming disheartened by the severity of the climate, returned in the spring to England.



POPHAM, SIR JOHN (c.1531–1607). An English jurist. He was born at Wellington, Somersetshire, studied at Balliol College, Oxford, and in the Middle Temple, and may have been a member of Parliament in Queen Mary's days. He was recorder of Bristol, from 1572 to 1583 was a member of Parliament for that city, and in 1580 was elected Speaker. In 1581–92 he was Attorney-General. In 1592, after conducting many state trials as crown prosecutor, especially those of the Babbington conspiracies, Popham was made Chief Justice and was knighted. A severe judge, he presided at the trial of those implicated in Essex's insurrection, of Sir Walter Raleigh, and of Guy Fawkes. He wrote *Reports and Cases* (1656), a work of small value. He became interested in American colonization, and with Ferdinando Gorges obtained from James I patents for two companies known respectively as the London Company and the Plymouth Company, the patentees being authorized to make settlements in America and to maintain a general government for 21 years. Popham sent out an exploring expedition under Martin Pring, and in the following year the short-lived Popham colony, under his brother, George Popham, was established at the mouth of the Kennebec River in what is now the State of Maine.

POP'INJAY (OF. *popejaye, papegai, papegau, papegaut,* Fr. *papegai, papegaut,* parrot, from ML. *papegallus,* from MGk. παπαγάλλος, *papagallos,* παπαγάς, *papagas,* parrot). A name of the green woodpecker (*Picus viridis*), a bird common in most of the wooded districts of England and Scotland. (See WOODPECKER.) The name was originally applied to parrots, but is no longer in use in that sense. In the Middle Ages and even later the names *popinjay* in Eng-

land and *papegai* in France were given to a target made to look like a parrot. The effigy was set on a pole and shot at by archers. The most skillful marksman often received a silver popinjay as a prize. Consult Strutt, *Sports and Pastimes* (London, 1801 et seq.), and Jusserand, *Jeux et sports d'exercise dans l'ancienne France* (Paris, 1901).

POPISH PLOT. See OATES, TITUS.

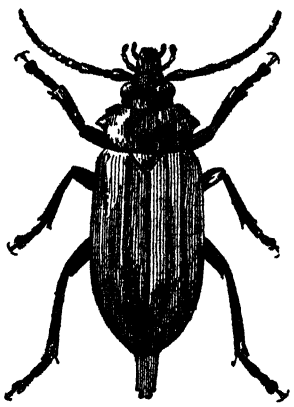
POP'LAR (OF. *poplier, peuplier*, Fr. *peuplier*, from *peuple*, poplar, from Lat. *populus*, poplar), *Populus*. A genus of trees, forming with willows the family Salicaceæ. The species number about 20, chiefly natives of the temperate and the cold regions of the Northern Hemisphere, half of them occurring in the United States. They are large trees of rapid growth, with soft wood, and usually have broad, heart-shaped, ovate triangular or lozenge-shaped, deciduous leaves, on rather long stalks. Many of them are beautiful. The catkins appear long before the leaves, and proceed from distinct lateral buds. Few of the poplars are of much value for their timber, which is generally white, soft, and light; but from their rapid growth they are useful as yielding firewood where the scarcity of other fuel renders necessary the planting of trees for this purpose. They are often planted as ornamental trees, since they produce an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. For windbreaks and shade in the prairie regions of the West they are also popular. The wood is employed extensively in making wood pulp and paper. Besides the species known by the name "aspen" (q.v.), or tremulous poplar, the fol ing appear the most worthy of notice. white, or silver-leaf, poplar, or abele (*Pop alba*), a native of southern Europe, is 80 fee upward, with a fine spreading head and ro ish, heart-shaped, lobed, and toothed leaves, w are smooth, shining, and dark green ab downy and silvery white beneath. It has introduced into the United States and has sp from New Brunswick to Pennsylvania. wood is used by cabinetmakers, turners, toy makers. It is little liable to swell or shr which adapts it to these purposes. The poplar, which is a form of *Populus alba*, is similar to the white poplar, a large, sprea tree with leaves similar to those of the w poplar, but not so dark green above nor so wh beneath. It is of less rapid growth than white poplar, and its wood, which is believed be harder and better, makes good flooring is preferable to pine for the neighborhood fireplaces, being less likely to take fire. It used also for doors, carts, barrows, etc., and, being liable to warp, is esteemed by wood ca ers. The tree usually begins to rot in the he when 40 or 50 years old. Like most other p lars, it fills the ground with sprouts. The bl poplar (*Populus nigra*), a native of most pa of Europe, is a tree of 50 to 100 feet high, w an ample, spreading head, viscous leaf buds, deltoid or unequally quadrangular, perfec smooth leaves. It has been introduced and well established in the valleys of the Hud and Delaware rivers and elsewhere. The w is used for the same purposes as that of

POPLAR LEAVES.

1, large-toothed aspen (*Populus grandidentata*), 1a, ament of above; 2, swamp poplar (*Populus heterophylla*); 3, bal poplar (*Populus balsamifera*); 4, silver-leaf poplar (*Populus alba*); 5, cottonwood (*Populus deltoides*); 6, Lombardy po (*Populus nigra*, var. *italica*); 7, American aspen (*Populus tremuloides*).

POPLARS

1. ASPEN FOREST, ARIZONA (Populus tremuloides).



2. LOMBARDY POPLAR (Populus nigra, var. Italica).

white and the gray poplar. The cotton from the seeds has been used in France and Germany for making cloth hats and paper, but these uses of it were not found profitable. The Lombardy poplar (*Populus nigra*, var. *italica*, sometimes called *Populus fastigiata* and *Populus dilatata*) is a variety of the black poplar, with erect instead of spreading branches, which appears to have been introduced into Europe from the East, is very common in the Punjab and in Persia, and now also in Lombardy and other parts of Italy. It attains a height of 100 or even 150 feet, and is remarkable for its erect form, contracted head, and very rapid growth. It is sometimes planted as an ornamental tree. Owing to extensive planting during the latter part of the eighteenth century and the early years of the nineteenth, the tree is very common in Europe and the United States. The balsam poplar, or tacamahac (*Populus balsamifera*), a common ornamental tree, is a native of both North America and Siberia, has viscid leaf buds and whitish, ovate-oblong leaves, which in spring are of a delicate yellow tint and have an agreeable fragrance. The erect, fastigiate manner of growth approaches that of the Lombardy poplar. The cottonwood (*Populus deltoides*), frequently planted for ornament, is the largest of the poplars, specimens 150 feet high and 7 feet in diameter being not uncommon in moist soil along rivers and lakes. It abounds from Quebec to the Northwest Territory, and south to Florida and New Mexico. In Europe it is known also as the black Italian poplar and Canadian poplar. In the Western States the tree is planted for fuel and for its timber, which is considered valuable. *Populus heterophylla*, the swamp poplar, is common from New York to Georgia and west to Arkansas and Texas. It is a tree 80 feet high and has very large cordate leaves. There are a number of other American species, which differ mostly in size of tree and shape of the leaves.

Fossil poplar leaves are known in the Cretaceous rocks of Greenland and are common in most plant-bearing beds of the Tertiary, differing little from the modern species.

POPLAR BLUFF. A city and the county seat of Butler Co., Mo., 73 miles west by south of Cairo, Ill., on the Black River and on the St. Louis, Iron Mountain, and Southern, the Butler County, and the St. Louis and San Francisco railroads (Map: Missouri, F 5). It is situated in a district interested chiefly in lumbering and cattle raising, and carries on a considerable trade in the products of its manufactories, which include automobile spoke works, stave, heading, and hoop mills, a large cooperage, and lumber mills. The water works are owned by the municipality. Pop., 1900, 4321; 1910, 6916.

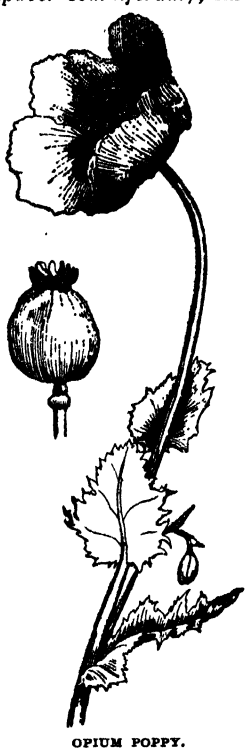
POPLAR INSECTS. Of several borers which damage the trunks and twigs of both native and Lombardy poplars, *Saperda calcarata* is most objectionable. The beetles are found and lay their eggs commonly in August and September. The same species also affects cottonwood in the Western States. The poplar girdler (*Saperda concolor*) frequently girdles the upper branches of large trees, the beetles issuing about the end of May. One of the largest of the longicorn beetles of the United States (*Prionus laticollis*) lives in the larval state in the trunks and roots of the Lombardy poplar, but occurs also in apple, grapevine, and pine. The poplar goat moth (*Cossus centerensis*) lays its eggs commonly on the bark of the aspen (*Populus tremuloides*) and also on the bark of balm of Gilead (*Populus balsamifera*). Another common borer in this tree is the Lombardy poplar borer (*Agrilus granulatus*), and still another is the poplar ægeria (*Ægeria tricincta*). A number of caterpillars attack the leaves, including the common tussock-moth caterpillar, the poplar spanworm (larva of *Biston ursaria*), the larva of the Antiopa butterfly, and the larva of the common butterfly, *Limenitis disippus*, as well as the larva of the Io moth and several other moths. The insect fauna of the poplar in the United States comprises more than 100 species, including several geometrid and noctuid larvæ, a number of leaf miners and leaf folders, and several species of plant lice. Consult A. S. Packard, *Insects Injurious to Forest Trees* (Washington, 1890).

BROAD-NECKED PRIONUS (*Prionus laticollis*).

POP'LIN (Fr. *popeline, papeline*, from It. *papalina*, poplin, from *papa*, pope; so called because first made at Avignon, the papal residence from 1309 to 1376). In the fifteenth century a fabric was woven in Avignon called *papeline*, which was made of silk and was much esteemed. An attempt to imitate it was made in England, and in 1775 the manufacture was introduced into Ireland by French Protestant refugees, and from that time Irish poplins have been famous. What the exact nature of the original *papelines* was is not certainly known; but the best modern poplins consist of a warp of silk and a filling of worsted, which gives to the material substance combined with great softness and elasticity. The filling, or weft, is made heavier than the warp. This gives the material a corded surface resembling rep. In double poplin both the warp and the woof are very heavy, making the corded appearance more prominent.

POPOCATEPETL, pō-pō'kȧ-tā'pĕt'l (Aztec, smoking mountain). A volcano situated about 40 miles southeast of the city of Mexico (Map: Mexico, J 8). It rises in the form of a cone to a height of 17,520 feet above sea level and is composed chiefly of porphyritic obsidian. Forests girdle its lower parts, and vegetation ceases only near the snow line. About the period of the Spanish conquest it was very active, but no considerable eruption has been recorded since 1548, though minor eruptions occurred as late as 1802, and the crater still emits fumes. Its crater, which has a diameter of about 2700 feet, contains vast quantities of native sulphur in a very pure state. It is exploited from time to time by mining engineers, the system being unique. Indians are employed who ascend the mountain daily, fill sacks with sulphur in the crater, and then descend by sliding down the precipitous snow side of the volcano. The mountain was first ascended by Diego Ordez in 1522, and since that time the ascent has been accomplished a number of times.

POPOL VUH, pō-pōl′ vo͞o′ (Quiché, national book). The sacred book of the Quiché (q.v.) of Guatemala. It consists of fragments, more or less complete, of the national traditions and legends, written down in the Quiché dialect, at some unknown early date after the conquest, by a native who was evidently familiar with the ancient records. It is in two parts, the first containing the ancient mythology, the second the early history of the tribe, supplemented by a history of the neighboring and cognate Cakchiquel (q.v.). There is evidence that at least a part of it was originally in rhythmic form. A Spanish translation by Father Ximenes was published in Vienna in 1857, and the original text, with French translation, was issued at Paris by the Abbé Brasseur de Bourbourg in 1861.



POPOV, pō′pŏf, Ivan Gregorevitch (1859–). A Russian composer. He was born at Ekaterinodar and received his musical education at the Moscow Philharmonic School. After 1900 he was director of a music school conducted by the Russian Imperial Music Society at Stavropol (Caucasia). His published compositions include: *Symphony in E Minor*, a symphonic poem *In der Freiheit*, *Andante Religioso* for string orchestra, the overture *Ivan the Terrible*, *Oriental Suite*, *Armenian Rhapsody*, *Spanish Dance*, and a number of songs.

POPPÆ'A SABI'NA (?–66 A.D.). A wife of the Emperor Nero. She was the daughter of Ollius, a client of Sejanus (q.v.), but took the name of her mother's father, who was consul in the year 9. She married Rufius Crispinus, prætorian prefect, but, after becoming the mistress of Otho (q.v.), was divorced from Crispinus. She then married Otho and soon aroused the desires of Nero, who sent her husband to Lusitania, made her his mistress, put his mother (Agrippina) to death at her instigation, then divorced and killed Octavia for her sake. Poppæa bore him a daughter in 63. The child died when but four months old. Poppæa was killed by a kick from her husband when she was again pregnant. She was entirely unscrupulous, luxurious, and proud, if we are to trust the highly colored narrative of Tacitus (*Annales*, xiv, 60 ff.; xv, 23). Besides her beauty her only good point seems to be that she urged on Nero clemency to the Jews, wherefore she won high praise from Josephus.

PÖP'PER, David (1843–1913). An Austrian violoncellist. He was born in Prague, studied in the conservatory there, became soloist and conductor in the Vienna Royal Opera, married the pianist Sophie Menter (q.v.) in 1872, and with her toured Europe. In 1886 he was divorced from his wife and settled at Budapest, where he was professor at the conservatory until his death. He died in Vienna. His playing, which was brilliant and remarkably sympathetic, placed him in the front rank of modern violoncellists, and his compositions for the cello are in universal use.

PÖPPIG, pĕ′pĭk, Eduard Friedrich (1798–1868). A German traveler and naturalist. He was born at Plauen, and after studying at Leipzig set out for Cuba in 1822. He spent two years there, then for some time he traveled in the United States, especially in central Pennsylvania, and in 1826 went through southern and central Chile. After spending two years in the forests of the Province of Maynas, where he lived with the Indians, he returned to Germany (1832) with valuable collections of botanical and zoölogical material, became professor of zoölogy at Leipzig (1833), and did much for the foundation of the zoölogical museum in that city. He wrote *Reise in Chile, Peru, und auf dem Amazonenstrom* (1835) and *Illustrierte Naturgeschichte des Tierreichs* (1851).

POP'PY (AS. *popig*, *papig*, from Lat. *papaver*, poppy), *Papaver*. A genus of the family Papaveraceæ, annual and perennial bristly-haired herbs, natives mostly of warm countries. The leaves are alternate and entire or lobed and cut. The poppy has been in cultivation from early times. It was grown by the Swiss lake dwellers, and a species native to the shores of the Mediterranean was utilized by the Greeks and Romans. By far the most important species is the opium, white, or oil poppy (*Papaver somniferum*), important alike for its yield of opium (q.v.) and for the bland, fixed oil of the seeds, used like olive oil. The seed contains no opium nor any narcotic principle, and was well known to the ancients as a pleasant article of food. The seeds yield about 40 per cent of the oil, and the oil cake is useful for manure or for feeding cattle. In the cultivation of the poppy for oil the seed is often sown in autumn, where the severity of the winter frosts is not to be feared; in more northern parts it is sown in spring, and sometimes the seed is scattered on the snow. Being very small, it needs little or no harrowing. Early sowing is favorable to the size of the plant and the yield. The plants are often cultivated in drills. An open but rich soil is best, and a sheltered situation is necessary, as in exposed situations much of the seed is scattered by the wind. In the United States the poppy is known chiefly as a garden flower.

OPIUM POPPY.

Under cultivation the flowers of the poppy readily become double, and a large number of ornamental varieties have been derived from various species. As ornamental plants they are popular on account of their large showy flowers, their hardiness, and their ease of culture. The Oriental poppy (*Papaver orientale*), a native of Armenia, is one of the most important decorative species. Its flowers, which are deep crimson, are larger than those of any other species. The Iceland poppy (*Papaver nudicaule*), a native of Siberia and of the northern parts of America, has orange or yellow flowers and is a widely distributed alpine species. The Oriental and the Iceland poppy are the best perennial species cultivated for ornament. The corn poppy, or common red poppy (*Papaver rhœas*), is an annual occurring as a weed in European grain fields, especially on calcareous soils. Its

POPPY AND PEPPER-TREE

BRANCH OF PEPPER-TREE (Schinus Molle).

bright-red flowers make it very conspicuous. A large number of ornamental varieties have been developed from this species. The ornamental poppies grow well in any garden soil, but they produce the best results on sandy loams. The seed is sown in spring in shallow drills where the plants are to bloom, and the young plants are later thinned to about 1 foot apart. The California poppy is *Eschscholtzia* (q.v.). For illustration of California poppy, see Plates of CALIFORNIA FLORA and POPPY AND PEPPER TREE. See also OPIUM.

POPPY ANEMONE. See Plate of ANEMONE.

POPPY FAMILY. A family of plants. See PAPAVERACEÆ.

POPPY-SEED OIL (*Oleum papaveris*). A pale-yellow drying oil obtained from the seeds of the opium poppy (see POPPY) by pressure. It is used for salads, soap stock, and as a paint vehicle. When used, either boiled or unboiled, in mixed paints with zinc base, it is less likely to injure delicate shades than is linseed oil.

POPULARES. See OPTIMATES AND POPULARES.

POPULAR GOVERNMENT. In the most general sense the government of the political affairs of a nation by the people at large, either by popular assemblies of the mass of the people or through representatives chosen by them by some form of election. It thus includes the direct control by the popular will not only of legislation but of administration and of judicial action as well. As in any form of popular government which has yet been realized the expression of the popular will is much hampered by tradition, custom, and the legal forms through which it is forced to operate, popular government has come to signify the extent to which the people at large have succeeded in directing the actual energies of the government in a given nation. In many countries in which the forms of popular government have been adopted or retained, as in the early Roman Empire and in Germany to-day, the actual control exercised by the popular will is small, while in others, as in Switzerland and the United States, it is much larger, but nowhere is it complete. It may be said, therefore, to represent an ideal and a tendency rather than an actual achievement and to be one with the democratic movement of the present time. Consult: Jean Jacques Rousseau, *Du contrat social* (1762); J. S. Mill, *Liberty* (London, 1859); id., *Representative Government* (ib., 1911); John Morley, *Rousseau* (ib., 1873); Sir J. F. Stephen, *Liberty, Equality, Fraternity* (ib., 1873); H. S. Maine, *Popular Government* (New York, 1886); *The Federalist* (ib., 1904); Lobingier, *The People's Law* (ib., 1909); E. Faguet, *The Cult of Incompetence* (ib., 1911); L. T. Hobhouse, *Liberalism* (ib., 1913); H. Croly, *Progressive Democracy* (ib., 1914). See DEMOCRACY; GOVERNMENT; REPUBLIC.

POPULAR SOVEREIGNTY, or SQUATTER SOVEREIGNTY. Terms in American history used interchangeably by many writers and having reference to the right of the inhabitants of a Territory to regulate their internal affairs in their own way without the intervention of Congress. Strictly speaking, the term "popular sovereignty" was applicable only in the case of an organized Territory, while "squatter sovereignty" applied only to an unorganized territory inhabited by squatters. The theory of popular sovereignty grew out of the discussions over the question as to whether slavery should be permitted in the territory acquired from Mexico. The first assertion of the doctrine by a man of prominence appeared in the noted Nicholson letter of General Cass, Dec. 24, 1847, in which he expressed the opinion that the people of the Territories should be left "to regulate their internal concerns in their own way." The new doctrine was accepted by the South, and was quite generally regarded with favor as being in harmony with the American traditions of local self-government, and furthermore as relieving both Congress and the States from the responsibility of settling a vexatious question. The compromise measures of 1850, in providing for the organization of New Mexico and Utah as Territories without any reference to slavery, would seem to have been the first recognition of the principle, although, on account of the evasive language used, it is difficult to say whether popular sovereignty was a feature of the bill or not. In the later discussions the Southern Democrats declared that it was not; but Stephen A. Douglas, the great champion of the new theory, asserted that it was. In 1854 the Kansas-Nebraska Bill (q.v.) expressly adopted the principle as the basis for the government of those Territories. Shortly afterward the South came to repudiate the doctrine of popular sovereignty as dangerous to slavery, and put forward the claim that neither Congress nor the Territorial authorities could legislate against slavery in the Territories, but that it was their constitutional duty to protect the right of property in slaves as recognized by slave States. There is an *obiter dictum* in the famous Dred Scott case (q.v.) which upholds the Southern contention so far as the national government was concerned. The controversy regarding the question of popular sovereignty, as involved in the Lecompton Constitution (q.v.) for Kansas, brought about a division between the Douglas Democrats of the North and the more radical Southerners, which eventually developed into the split of 1860. With the Civil War and the abolition of slavery the question lost its significance.

POP'ULATION (ML. *populatio*, from *populare*, to populate, from Lat. *populus*, people; connected with *plenus*, full, and ultimately with Eng. *full*). The number of living human beings. This article presents the principal facts regarding the number of human beings and the number in various classes, reserving for the article VITAL STATISTICS the main facts regarding the increase in the number of human beings. The distinction between population and vital statistics corresponds closely to the distinction between the main sources of information, viz., the census reports and registration reports. In census reports the element of time is either disregarded or reduced to a minimum and an attempt is made to photograph certain aspects of the population as they were on the census day. Registration reports are records of certain defined events within a population group, such as births and deaths, marriages and divorces, immigration and emigration, legal punishments for crimes, the record being made at the time of, or soon after, the event recorded. Inferences regarding the increase of a population may in time be derived from comparing a series of censuses; but the census cannot give detailed information about increase or decrease derivable from registration reports.

At present two-thirds of the population of the earth has been counted. The extension of representative institutions has necessarily ex-

tended the census as an accurate means of counting population, for under a representative system political power is distributed in some measure according to numbers. It is not surprising, therefore, that the United States, as a great modern country with representative institutions, was the first to count its population by a census. The world's population has been estimated by leading statistical authorities at various dates during the past century as follows (stated in millions):

YEAR	Europe	Asia	Africa	America	Oceania
(a) 1810	180	380	99	21	3
(b) 1828..	214	481	109	40	4
(c) 1848	245	620	190	50	5
(d) 1874	301	798	203	85	5
(e) 1886..	347	822	197	112	6
(f) 1907 .	406	918	126	150	7
(g) 1914..	440	908	162	165	8

Statistical authorities: (a) Gotha, (b) Balbi, (c) Muchelot, (d) Behm-Wagner, (e) Levasseur, (f) Bodio, (g) Austin.

The population of the earth's surface in 1914 was probably about 1,675,000,000. About nine-tenths of this population is included within the jurisdiction of eleven of the principal states of the world. The distribution in round numbers is as follows, the figures embracing all colonial possessions and dependencies of every kind (some merely nominal):

COUNTRY	Population in millions
Chinese Empire	325
British Empire	440
Russian Empire	174
France	80
United States (including Porto Rico and the Philippine and Hawaiian Islands)	110
German Empire	79
Austria-Hungary	50
Japan	73
Netherlands	44
Ottoman Empire	21
Italy	37

Increase. At no time since recorded history began has the increase of population been so rapid as during the last century, especially the second half of it, when the outflow of people from western Europe to America, Australia, and South Africa added great numbers to the population of those continents, without a corresponding decrease in the countries from which they set forth. (See EMIGRATION.) The world's population in 1814 is estimated by the best authorities at about 700,000,000 and in 1914 at 1,675,000,000, having thus considerably more than doubled in a century. This rapid growth in world population in the last century is owing in part to improved medical and sanitary conditions by which the span of life is extended, in part to the opening to population and production of great areas formerly unpopulated and unproductive, and in part to improvement in facilities for transporting food supplies from the producing areas to those whose dense population is engaged in other industries. The population living within the present area of the German Empire in Europe increased about 62 per cent in the half century 1814–64 and about 75 per cent in the half century 1864–1914, notwithstanding the large emigration during a part of that period. The population on the present territory of Italy increased in the first half of the nineteenth century about 43 per cent and in the last half about 35 per cent. The population of Great Britain and Ireland increased in the first half of the century about 70 per cent and in the last half about 50 per cent. The United States of America increased in population during the first half of the century 340 per cent and during the second half 228 per cent. In the 50 years ending with 1912 the increase in population was: Russia in Europe, 90 per cent; Germany, 62 per cent; England, 59 per cent; Hungary, 46 per cent; Austria, 41 per cent; France, 10 per cent; Europe as a whole, 50 per cent; and the United States, 190 per cent, the large per cent of increase in the United States being due in part to immigration. But in a case where the initial population is small, percentages are less significant than figures of actual increase. The United States added to its population between 1800 and 1850 nearly 18,000,000 people, between 1850 and 1900, disregarding the accessions of territory since 1890, it added nearly 52,500,000, and in the period 1900 to 1915 the increase was 14,000,000. At the present time there is no great country except Argentina in which population is increasing at a higher rate than in the United States. Notwithstanding the comparative sparseness of settlement in Canada, Mexico, and Australia, the percentage of increase in those countries is less, and in Europe there is no country in which the rate of growth approaches that of the United States.

Urban Population. No feature in the rapid increase in the population of civilized countries during the nineteenth century has been more marked than the growth of cities, both in the older European countries and in the newer countries whither that European population has migrated. In the United States the proportion of the population living in towns of 2500 or more was, in 1880, 29.5 per cent; in 1890, 36.1 per cent; in 1900, 40.5 per cent; and, in 1910, 46.3 per cent. In England and Wales the percentage of population classed as urban by the official census was, in 1881, 67.9; in 1891, 72; in 1901, 77; in 1911, 78.1. In France the share of the population living in towns of 2000 or more was, in 1861, 28 per cent; in 1901, 37 per cent. In Germany the share of the population living in towns of 2000 or more was, in 1895, 50.2 per cent; in 1905, 57.4 per cent; in 1910, 60 per cent. In certain of the countries of Europe a strict determination of the line between urban and rural population is rendered difficult by rea-

COUNTRY	Per cent of population living in cities having at least 10,000 inhabitants	
	1800	1890
England and Wales	21.3	61.7
Scotland	17.0	49.9
Australia		41.4
Belgium	13.5	34.8
Saxony	8.9	34.7
Netherlands	29.5	33.5
Uruguay		30.4
Prussia	7.3	30.0
Argentina		27.8

Russia	3.7	9.3
British India		7.3

son of the fact that many engaged in agriculture live in towns and villages and go to their fields from day to day. The figures on page 52 speak for 1800 and 1890, or the nearest census years. The countries are arranged in the order of the proportion of urban population in 1890 in the table there shown. The figures illustrate the degree to which the growth of city population during the nineteenth century in nearly all parts of the civilized world outstripped that of population as a whole.

Sex. About half the probable population of the world has been enumerated with relation to sex. From the results it appears that about 50.3 per cent are male and 49.7 per cent female. In Europe alone, among the great divisions of the earth's surface, do the females outnumber the males, there being on that continent among the enumerated population about 49.4 per cent males and 50.6 per cent females. The numerical excess of females in Europe is much greater than the excess of males in the continents to which migration has mainly gone, such as America and Australia, therefore it follows that in the countries representing Caucasian or white civilization females outnumber the males. But in most other parts of the world for which we have information the reverse is true. Thus, in British India 50.9 per cent, in the tributary states 51.7 per cent, and in Japan 50.5 per cent of the population are male. The excess of males in these countries more than offsets the excess of females in all Europe.

Age. It is usual for a census to report the number of persons of each year of age, or at least the number falling within certain wider age limits. In large population groups the true number of persons living at any year of age is larger than the true number of persons at the next higher year, this being because of the fact that each such group as it advances from infancy to old age is steadily depleted by death. If the group is receiving a large number of immigrants, this would tend to neutralize for certain age groups the wasting away through death, but immigration is seldom, if ever, sufficient in amount to balance the losses from mortality. The births in successive years also vary in number, and thus the initial size of these successive groups differs; but neither this cause alone nor this combined with immigration and other minor disturbing factors makes it likely that the true number of persons in a country at any one year of age is ever smaller than the true number at the next greater year of age. The reported number very often is greater, this difference between the true and the asserted number being due to inaccuracy in the statements of age made in answer to the inquiries of the census enumerator. These inaccuracies vary with the degree of education and the economic position of the class reporting. Where they exist in large numbers they are indicated by a disproportionate number of individuals reported with ages at multiples of 5 and especially of 10. Internal evidence of the relative accuracy with which ages are reported, and perhaps indirectly of the relative accuracy with which other census questions are answered, may be found by measuring this concentration of reported ages on multiples of 5 and 10. The true number of persons in a community aged 30, 35, 40, 45, 50, 55, and 60 is probably about one-fifth of the total number whose age is reported as between 28 and 62 inclusive. The per cent by which the reported number of these seven ages exceeds the estimated number affords a measure of the irregularity of the age distribution and so of the probable error in the returns.

Perhaps the best single figure indicating the age composition of a population group is the median age, or an age such that half the members of the group are above and half are below it. For the white population of the United States this median age increased almost steadily during the nineteenth century from 16 in 1800 to 23.4 in 1900, the increase being due in part to the increased longevity of the adult population and in part to the steadily decreasing proportion of children.

The proportion of the population falling within various age classes is of importance for itself and as indicating reasons for other statistical differences between population groups. Thus, in Oklahoma 14.6, in South Carolina 15.1, and in Utah 14.1 per cent of the population were in 1910 under 5, these being the regions of the United States in which the proportion of children is greatest. At the other extreme there are the District of Columbia, with 8.1 per cent, California, with 8.1, and Nevada, with 7.8. The greatest proportion of elderly persons is found in the northern New England States, Vermont having 8.2, New Hampshire 7.9, and Maine 8.2 per cent of the population over 65 years of age.

Marital Condition. The relation of the population to the social institution of marriage is measured by numbering the classes of the single, the married, the widowed, and the divorced. This relation depends largely upon the age composition of the population group. The great majority of those who live to adult years marry, and half of those who marry are widowed, a small additional number being divorced. The age at which marriage is entered differs greatly according to the character of the civilization. Thus, in countries dominated by Caucasian standards it is usual to assume that marriage does not take place below the age of 15. In India, on the contrary, in 1891, 6 per cent of the boys and 17 per cent of the girls under 15 years of age were married. In uncivilized and semicivilized countries marriage of adults is practically universal. Celibacy is regarded as unnatural and is almost prohibited by social opinion. So in India of the women over 50 less than 1 per cent and of the men about 3 per cent remain single. In Europe and America, among persons who have lived through the reproductive period of life, the proportion of the single is from 10 to 20 per cent for women, except in Hungary and the United States, and from 7 to 14 per cent for men. In the United States the proportion of the population who are married has been ascertained for 1890 and 1900, with results that differ but little from the above. When the figures are analyzed by age it appears that among the young of both sexes there was a slight increase in the proportion of married persons, and at higher ages a slight decrease in the proportion of married, the two about offsetting each other. This change is contrary to the general trend in most countries and in one or two American States for which figures covering a longer period are available. It is probably the result of very prosperous conditions in the two or three years immediately preceding 1900, marriage figures constituting a sensitive measure of prosperity.

Religion. Civilized countries differ in regard to making inquiries into the religious affiliation of the population. In Italy, France, Great Brit-

ain, and the United States it is thought unwise to ask this question through the census. Accordingly the population, or the enumerated population, of the earth cannot be distributed with accuracy according to religious confession. According to a careful attempt made to secure approximate results in this field, the figures in round numbers are as follows:

RELIGION	Estimated number of adherents in millions
Christianity	570
Confucianism	275
Hinduism	210
Mohammedanism	225
Buddhism	140
Taoism	50
Shintoism	25
Judaism	13
Polytheism	120

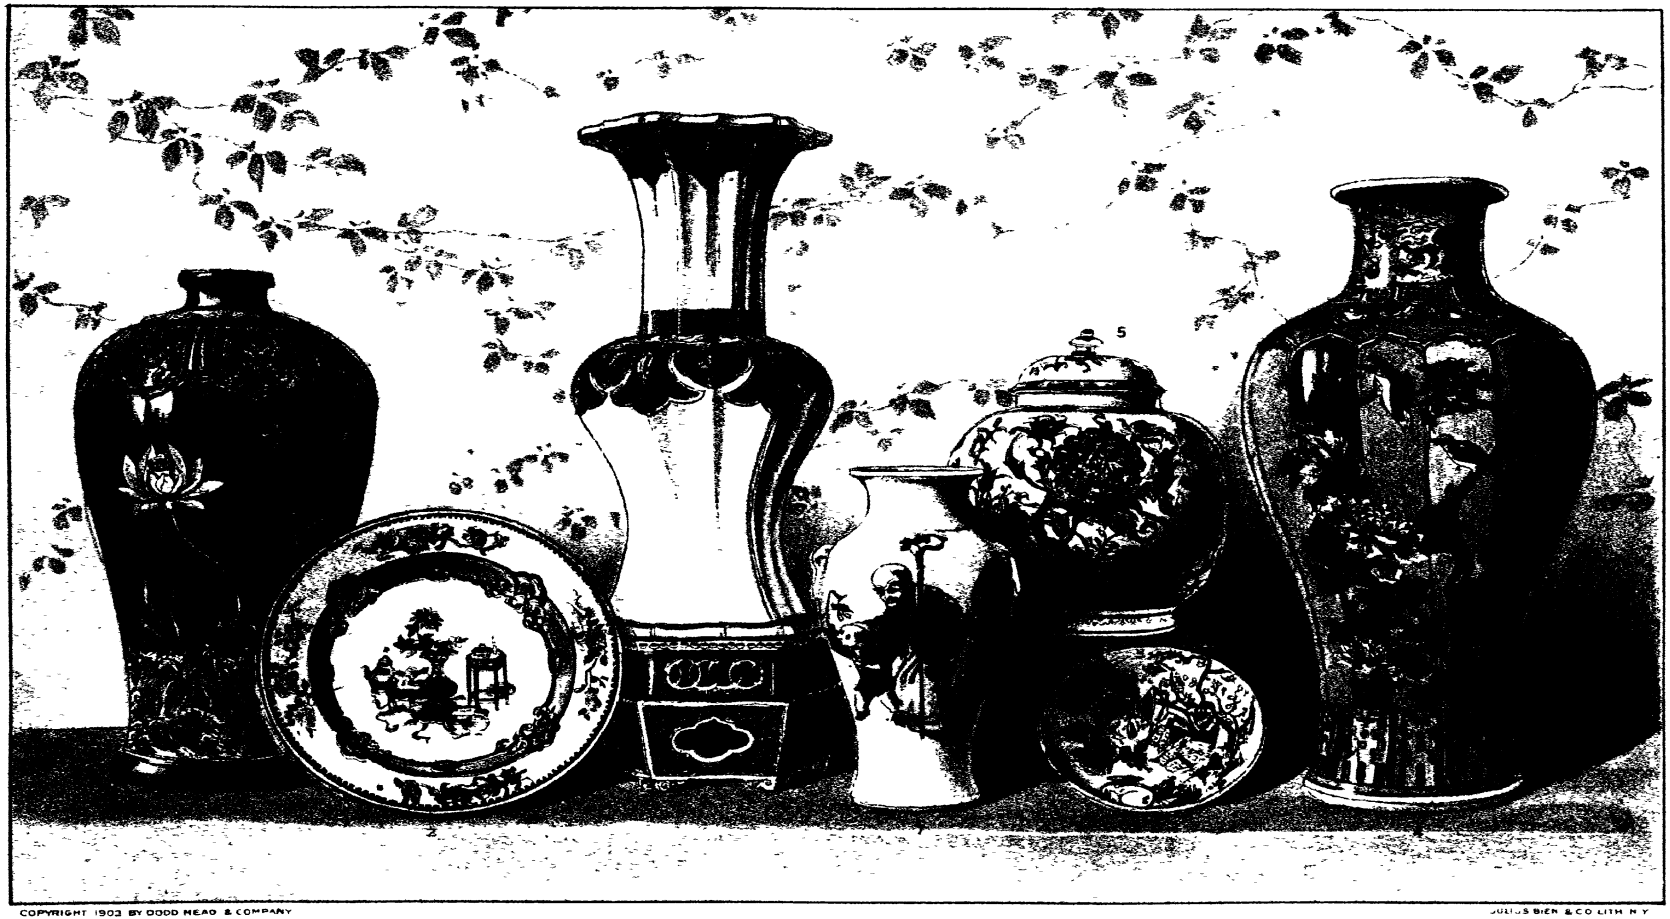
The adherents of Christianity are subdivided as follows:

RELIGION	Estimated number of adherents in millions
Catholicism	270
Protestantism	175
Greek church	120
Minor divisions	5
Total	570

Language. There are no trustworthy statistics for the population of the earth as a whole or even for the civilized countries, indicating the number of persons using the main languages as their ordinary means of communication. There is no doubt that the number of languages spoken on the earth has rapidly decreased and is rapidly decreasing. There is no doubt that the number of persons speaking the main Aryan languages is rapidly increasing, both by the natural increase of the Caucasian population and by the extended use of these languages, with the extension of the trade and commerce of these countries.

Illiteracy. It is common, although not universal, to inquire at a census whether the person is able to read and write. With the extension of education in most civilized countries the proportion of illiterates among the population is declining. At present this proportion, in Christian countries, is greatest in the Slavic peoples and among the negroes of the United States. An intermediate position is held by the Romance countries of Europe and Hungary, and the highest position is occupied by England, the United States, and the Germanic countries of Europe. Consult: A. F. Weber, *Growth of Cities in the Nineteenth Century* (New York, 1899); C. E. Stangeland, *Pre-Malthusian Doctrines of Population* (ib., 1905); C. E. Woodruff, *Expansion of Races* (ib., 1909).

See EMIGRATION; IMMIGRATION; VITAL STATISTICS.



POPULATION, CENTRE OF. See CENSUS.

POP'ULIST PARTY, or PEOPLE'S PARTY. A political party in the United States, organized at Cincinnati in May, 1891, by a national convention composed chiefly of representatives of the agricultural and industrial classes. The party grew out of the movements previously inaugurated by the Grangers and the Farmers' Alliance (q.v.), which had in view the general social development of country people. Its leaders were mostly young men of ability and devotion. They first went into active politics in 1890, when they carried the Legislatures of Kansas and Nebraska and elected 9 Farmers' Alliance members of Congress and forced 34 others, Democrats and Republicans, to pledge themselves to carry out the ideas of the farmers' movement. Its platform of principles demanded the free and unlimited coinage of silver; the abolition of the national banking system; the issue of fiat money in sufficient quantity to transact the business of the country on a cash basis, and the loan of such currency to the people at not more than 2 per cent per annum on nonperishable agricultural products; national ownership of all means of public communication and transportation; a graduated income tax; popular election of United States Senators; the adoption of the initiative and referendum in legislation; and the prohibition of alien ownership of land. On July 2, 1892, a national convention of the Populist party met at Omaha, Neb., for the purpose of nominating candidates for President and Vice President of the United States. It adopted a platform embodying the above-mentioned views and nominated James B. Weaver of Iowa for President and James G. Field of Virginia for Vice President. The Populist ticket received 22 electoral votes and a popular vote of 1,055,424. It carried several State Legislatures and sent five Senators to Washington. In the next presidential campaign, that of 1896, the Populist party nominated for President W. J. Bryan, who had already received the nomination of the Democratic party, and for Vice President Thomas E. Watson of Georgia. Most of the Populist party supported Bryan and the Democratic candidate for Vice President, Arthur Sewall, but a considerable portion of the party stood for the independence of their movement, and voted for Bryan and Watson. On account of their refusal to depart from the path marked out by themselves the latter were called the Middle-of-the-Road Populists. In order to have the full Populist vote counted for Bryan, an arrangement was made between the two parties in 28 States by which each was to have a proportionate representation on the electoral ticket. As a result of this arrangement Bryan received 176 electoral votes, while Sewall received 149 and Watson 27. The Populist platform of 1896 differed but slightly from that of 1892. In the campaign of 1900 the Populist party again nominated for President W. J. Bryan, who was also the Democratic nominee, but it again refused to indorse the Democratic nominee for the vice presidency (Adlai E. Stevenson of Illinois). After a spirited contest Charles A. Towne of Minnesota received the nomination for Vice President, but he subsequently withdrew, and the National Executive Committee of the Populist party substituted Stevenson. In addition to its old principles the party in 1900 denounced the imperialistic policy of the government, expressed sympathy for the Boers in their struggle with Great Britain, advocated municipal ownership of public utilities, and condemned the practice of the courts in issuing injunctions in labor disputes between employers and employees. Consult: Reynolds, *National Platforms and Political History* (Chicago, 1898); H. T. Peck, *Twenty Years of the Republic, 1885–1905* (New York, 1907); J. A. Woodburn, *Political Parties and Party Problems in the United States* (2d ed., ib., 1914).

POR'BEAGLE (from Fr. *porc*, hog + Eng. *beagle*), or MACKEREL SHARK. Specifically, a ferocious shark (*Lamna cornubica*), bluish gray in color and reaching a length of 10 feet, which is found in both the North Atlantic and the North Pacific. The term is extended, however, to include the whole of its family (Lamnidæ),

TEETH OF A PORBEAGLE (SIDE VIEW).

which contains several pelagic species, often of great size, power, and ferocity, with stout bodies, a wide mouth with separate, triangular, highly specialized teeth (the third in the upper jaw always small), large gill openings, and great fleshy fins. In addition to the typical porbeagle (a British name) a well-known species (*Isurus oxyrhynchus*) haunts the Mediterranean, where it is called *cane de mare;* and a rarer one (*Isurus dekayi*) occurs on the North American coast. The largest and most cosmopolitan of the family is the great white man-eater shark (q.v.).

POR'CELAIN (OF. *porcelaine, porcellaine*, Fr. *porcelaine*, from It. *porcellana*, porcelain, Venus-shell, so called because the highly polished surface suggested that of the Venus-shell, whose curved upper surface resembled a pig's back; from *porcella*, dim. of *porco*, pig, from Lat. *porcus*, swine, hog, pig). A variety of pottery whose principal characteristics are vitrification and translucency. All porcelains may be divided into three groups, according to their body composition, viz., (1) hard paste, (2) artificial soft paste, (3) natural soft paste.

Manufacture. Hard paste porcelain is composed of two essential materials, kaolin and feldspar (Chin. *petuntse*), but quartz and certain kinds of sands are occasionally added. In the usual process of manufacture the paste is slightly baked at a comparatively low temperature. The glazing preparation, which is composed of the same materials as the body, but in different proportions, and to which not unfrequently (as in Chinese wares) lime is added, is then applied to the biscuit, usually by dipping, but sometimes with a brush or by insufflation, after which the porous ware, covered with the dry glaze, is placed in a sagger and removed to the kiln, where it is subjected to an intense heat ranging from 1500° C. (2732° F.) to 1800° C. (3272° F.). The body of the ware, at this great temperature, becomes vitrified throughout the mass, and the glaze is melted into the paste, forming a hard, homogeneous material. Hard porcelain is usually left unglazed on the base, to prevent adhesion to the saggar in the great heat of the kiln. It is so hard that it cannot be scratched by steel, when applied by hand, and is, as a rule, of a bluer tint than soft paste porcelain, and when pressed with the palm of the hand or touched with the tongue is perceptibly colder, being a better conductor of heat. An examination of the edge of a broken piece will show that it has a conchoidal fracture, that it is vitrified throughout, and that the glaze is incorporated with the body.

Artificial soft paste porcelain, or fritted porcelain (Fr. *pâte tendre*), is an alkaline paste into which the ordinary china clays do not enter. It is a connecting link between hard paste porcelain and natural soft paste porcelain. It is a glasslike substance composed of siliceous sand, nitre, gypsum, alum, soda, and sea salt, fritted together, combined with a small portion of calcareous marl or chalk, the proportions of the ingredients varying at different factories. It is covered with a rich lead glaze of a creamy-white tint and an unctuous, waxy surface. Fritted porcelain is the result of the first attempts of European potters to imitate the Chinese and Japanese wares. One of its most marked peculiarities is the presence in the paste of pyrophanous effects, in the form of translucid spots, known as "mooning," caused by the imperfect blending of vitreous particles. These spots can be distinctly seen when a piece of this variety of porcelain is held before a strong artificial light. This phenomenon does not occur in natural soft paste nor in hard paste porcelain, except in some of the earliest Meissen ware.

Natural soft paste porcelain is varied in composition at different factories, being made up of ball clay, kaolin, feldspar, and a large proportion of phosphate of lime in the form of bone dust. In some varieties steatite, or soapstone, is introduced. It does not require so high a temperature as hard paste. A boracic glaze is generally used, which, being exceedingly fusible, causes the colors of the decoration to sink in, thus producing beautiful, soft effects. Unlike hard paste the bases of pieces are usually glazed, as they are supported in the kiln by stilts, triangles, or cockspurs. As the glaze is not incorporated with the paste as in hard porcelain, the fractured surface of a broken piece will show the glaze, as a thin layer of transparent glass, and when touched with the tongue the unglazed edge has a slightly absorbent quality.

History. 1. Hard paste porcelain originated in China, and Chinese writers have attributed to it an impossible antiquity, some even carrying the invention back to the Han dynasty (206 B.C.–220 A.D.). It is now believed that true porcelain, as we know it to-day, first appeared during the Ming dynasty, which was not established until the fourteenth century. Indeed, it is extremely doubtful whether any authentic specimens antedating the fifteenth century are known to exist. The Chinese themselves classed all ceramic wares of great hardness which possessed the property of resonancy (an indication of vitrification) with porcelain, including those opaque varieties which are to-day grouped with stoneware. The green porcelain of the Sung and Yuan dynasties, known to the French as celadon, cannot properly be included with porcelaneous pastes, but before the general manufacture of translucent bodies a porcelaneous glaze was used on stoneware to some extent. While porcelain was produced through most of the reigns of the Ming and recent Ch'ing dynasties, there are several periods which stand out in greater prominence on account of the superior excellence of their manu-

factures. The Chia Ch'ing reign (1522–66) was noted for a rich dark blue, almost approaching black, called Mohammedan, or Mussulman, blue, which was imported from abroad. In the Wan Li period (1573–1619) porcelain was made in great abundance, and the majority of pieces in collections attributed to the Ming dynasty are of this reign. Enamel colors were first introduced in combination with underglaze blue. The most brilliant epoch in Chinese ceramic art, however, was in several of the reigns of the Ch'ing dynasty. In the K'ang Hsi period (1662–1722) many new glazes were developed, including the much prized *sang de bœuf*, or ox blood; the peach bloom; the *clair de lune*, so called by French collectors; enamels in rich greens (the *famille verte* of Jacquemart); the powder blue and mirror black. The so-called hawthorn vases are also attributed to this reign. This was also the best period of underglaze blue painting. In the next two reigns, the Yung Cheng and Ch'ien Lung, the *soufflé* and *flambé*, or transmutation, glazes were brought to great perfection. Pink or rose enamels (the *famille rose* of Jacquemart) appeared, and crackled glazes were greatly improved. Rice-grain porcelain and the celebrated lace bowls were first produced, and many new glazes, including the iron rust and tea dust, were brought to great perfection. It was at the end of the Ch'ien Lung reign that the ware until recently known in England and the United States as Lowestoft china began to be made for the European and American markets.

The manufacture of porcelain in Japan does not antedate the sixteenth century, when the art was transplanted from China. The porcelain of Japan is similar in composition and technique to that of China, although the materials used are of a somewhat different character. The Japanese paste is not quite so pure, and the ware is usually thicker and less skillfully potted. Beautiful porcelains, however, were produced at Arita, notably an ivory-white, fine-grained ware which was originated by a potter named Kakiyemon. The decorations consisted of simple motives painted in brilliant enamels and gold, scattered sparingly over the surface. This new and chaste style, which was fully perfected about the middle of the seventeenth century, took the name of its originator, and was imitated on the fritted porcelains of Europe, particularly those of Chantilly, Bow, Chelsea, and Worcester.

Hard paste porcelain was not produced in Europe until about 1709, when Johann Friedrich Böttger began his experiments at Meissen, near Dresden. His first success was in closely imitating the Boccaro ware (so called by the Portuguese), or red stoneware of the Ming dynasty, and a few years later, by an accidental discovery of kaolin, he succeeded in producing a white porcelain closely resembling, in all important respects, the Oriental wares. Hard-porcelain factories were established at Berlin and Vienna, and later in other parts of Europe. In 1769 the manufacture of hard paste was commenced at Sèvres, where it has been continued uninterruptedly until the present day. In England the production of hard paste was commenced at Plymouth in 1768 and at Bristol in 1770, but these enterprises were comparatively short-lived. At Capo di Monte and other places in Italy a peculiar kind of hard paste, of rather coarse grain and grayish tint, was made about the middle of the eighteenth century, which manufacture extended into the nineteenth. This ware was distinguished by its colored reliefs representing mythological scenes. In 1825 the first hard-porcelain manufactory in the United States was established in Philadelphia by William Ellis Tucker, who derived his inspiration from the French porcelain of the period.

2. Artificial soft paste porcelain was the result of the first attempts of Occidental potters to reproduce the wonderful and much admired ware from the Orient, which reached Europe near the close of the sixteenth century. About 1580 a hybrid porcelain was made at Florence, Italy, under the patronage of the Medici family, and examples which have come down to us are marked in blue with the Medici arms or with the cupola of the Florence Cathedral. The forms of the pieces and the style of decoration are suggestive of Japanese influence. About 1677 artificial soft paste was first invented at Saint-Cloud, in the style of the stanniferous enameled faïence of the period. Factories were established at many other places in France during the eighteenth century—at Lille in 1711, at Chantilly in 1725, at Mennecy about 1734, at Vincennes about 1738, at Tournay about 1750, at Sèvres in 1756, and at Bourg-la-Reine about 1773. Early in the same century fritted porcelain also was being made at several places in Italy, notably at Venice, Doccia, Capo di Monte, and Le Nove. When Charles III ascended the throne of Spain in 1759, he took with him to Madrid (Buen Retiro) a colony of potters from Capo di Monte and founded a factory there. The ware was somewhat similar in style to the Italian, but more diaphanous and waxy in quality. In England artificial porcelain was produced at Stratford-le-Bow as early as 1745 and at Chelsea about the same time. At Derby the manufacture was commenced about 1756, and at Worcester, under the direction of Dr. John Wall, in 1751, where it was known as Tonquin porcelain, and a similar ware was being produced at Caughley about 1772. The English fritted porcelain was almost identical in composition with that of the contemporary French factories, and it is believed that French workmen were employed to introduce the manufacture at some of these works. Japanese porcelain furnished the inspiration for many of the painted patterns used on the fritted porcelains of the eighteenth century in France and England.

3. Natural soft paste porcelain, or bone china, is essentially an English invention, which was perfected when fritted porcelain was abandoned. Natural clays were substituted for the alkaline substances which largely composed the paste of the earlier wares, and bone ash was employed in large quantities, sometimes reaching 40 to 60 per cent of the whole. At Lowestoft natural soft paste was produced during the latter half of the eighteenth century, recent discoveries having dispelled the erroneous belief that the manufacture of hard paste was ever attempted there. Josiah Spode, the younger, of Stoke-upon-Trent, is generally credited with having fixed the standard for the composition of bone china, about 1800, since which time the principal British factories have been engaged in its manufacture.

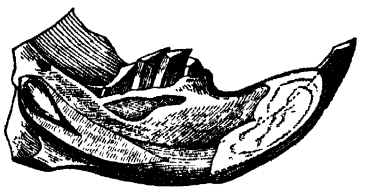
PORCELAIN TOWER. An octagonal structure in Nanking, China, erected in the early part of the fifteenth century. It had nine stories, faced with variegated porcelain, from which bells and lamps were hung. The tower was destroyed by the Taipings in 1853.

POR'CELANITE, or PORCELAIN JASPER. A metamorphic rock formed by the hardening under heat and pressure of argillaceous beds. It has the fracture of flint, and is gray to red in color, somewhat resembling jasper, from which it differs, however, in being more fusible.

PORCH (OF., Fr. *porche*, from Lat. *porticus*, porch, gallery, from *porta*, gate). A roofed structure built in front of and accessory to the entrance or doorway of a building. The roof may be a mere canopy supported on brackets, or a pedimented or arched roof, or even a balcony carried on columns, which may be few or many; or it may be a vaulted structure carried by piers or by walls, forming a chamber or vestibule external to the building, like the galilees (q.v.) of English churches. The term is not, however, applied to the pronaos (q.v.) or epinaos of classic temples, which are parts of the main structure; nor to a narthex (q.v.). A porch is always an accessory and external feature. When the porch has many columns it becomes a portico (q.v.).



The porch first attained importance in Italian Romanesque architecture, especially in Lombard churches, whose entrances were often sheltered by arched or vaulted canopies supported on two columns borne on the backs of monsters. It reached its most magnificent development later in France (St. Gilles, St. Trophime at Arles, etc.), particularly in the superb porches of Notre Dame, Paris, and the cathedrals of Bourges, Rheims, Chartres, and Amiens. (See PORTAL.) The cathedral porches of the thirteenth century, especially in France, are made to shelter great numbers of statues of life size and larger and a still greater crowd of small figures under niches, and, in addition to this, much floral sculpture. In England there still remain many wooden porches of the fourteenth and fifteenth centuries, and one or two exist on the Continent. Finally, it must be mentioned that the lower story of a tower is often made to serve as a porch, having, perhaps, three doorways in its three free sides and in the fourth side a doorway into the church. The most elaborate porch of this character is connected with the church of Saint-Benoît-sur-Loire (Loiret), France.

In domestic buildings, especially in lands where there is much hot sun, it is common to have verandas, and these are porches if the access to the doorways of entrance is by means of them. The porches of American houses of 1730–1820 are often of elegant design and are now receiving the study they deserve.

The propylæa of a Greek palace or temple inclosure is to be considered a porch, although the person entering does not reach the main building immediately. See PORTAL; PROPYLÆA.

POR'CIA GENS (Lat., Porcian clan). A plebeian gens of Rome, appearing first in the third century B.C. Its most famous family bore the name of Cato (q.v.).

POR'CUPINE (OF. *porc espin*, It. *porco spino*, from ML. *porcus spinosus*, porcupine, spine hog, from Lat. *porcus*, swine, hog, pig + *spina*, spine, thorn). A large forest-dwelling rodent of the family Hystricidæ, characterized prominently by an armature of horny spines (porcupine quills) intermixed with coarse hairs. The family includes two well-defined subfamilies, the Old World porcupines, Hystricinæ, which are terrestrial and fossorial, and the New World porcupines, Sphingurinæ, which are arboreal and not fossorial. Other differences also occur in

LOWER TEETH OF A PORCUPINE.

Showing the method of growth of the great incisor, reaching back beyond the roots of the molars; the hinder end is cut away to expose the pulp and pulp cavity.

the skeletons. Of the Hystricinæ the best-known species is the common porcupine (*Hystrix cristata*) of the Mediterranean region. It is one of the largest of rodents, being from 2 to 3 feet in length, besides the tail, which is about 6 inches long. The occiput and the neck are furnished with a crest of long, erectile bristles. The muzzle and limbs are covered with very short hair; the back and sides with spines, which on the middle of the back are almost of the thickness of a goose quill, and more than a foot long. The spines are supported by a slender pedicle, terminate in a sharp point, and are ringed with black and white, which gives a general gray color to the animal. Their ordinary position is flat, with the points directed backward; but when the animal is excited they are erected, giving the beast the bristling appearance shown in the accompanying plate. It can roll itself up like a hedgehog, with spines pointing in every direction. The spines or quills at the tip of the tail are of very singular structure, being open thin-sided tubes, about 2 inches long, supported upon slender flexible pedicles, and they make a sound by rattling together when the tail is shaken. The animal is solitary and nocturnal, burrows in the ground, and in winter becomes torpid. It feeds on roots, bark, fruits, and other vegetable substances, sometimes committing dep-

redations in gardens. The spines or quills of this as well as of other porcupines are used for various purposes and have a certain commercial value. A larger species of porcupine (*Hystrix leucurus*), with the quills of the tail quite white, is found in India, and other species inhabit different parts of Asia and Africa. The Malayan and West African brush-tailed porcupines of the genus *Atherura* differ from the true porcupines in having the quills flattened like blades of grass and those of the tail gathered into a tuft at the end of it.

Of the other subfamily, the Sphingurinæ, the best-known species is the North American porcupine (*Erethizon dorsatum*) of the forested parts of Canada and the northeastern United States. It is about 2½ feet long, the tail adding about 6 inches more. The spines are only 2 or 3 inches long, yellowish white, mingled with black hair, giving the animal a black and white color. The spines are largest along the sides of the broad, flat tail. The Canada porcupine is often seen on the ground, where it makes a home among the rocks, or in a hollow stump, but spends most of its time in trees, especially evergreens. It is harmless and inoffensive, but is able to resist attack well, not only by its armature of quills, but also by powerful strokes of its tail, and feeds on bark, buds, leaves, fruit, etc. The flesh of the young ones is very good. A closely allied species, the yellow porcupine, is found in the West. The other species of this subfamily are small strictly arboreal species, with more or less prehensile tail, found in Mexico and South America. They are called tree porcupines and belong to the genera *Sphingurus*, which has short spines, and *Chætomys*, in which the body is clad with stout, wavy bristles. Consult: C. H. Merriam, *Mammals of the Adirondacks* (New York, 1893); Ernest Ingersoll, *Wild Neighbors* (ib., 1898); E. T. Seton, *Life-Histories of Northern Animals* (ib., 1909); Stone and Cram, *American Animals* (new ed., ib., 1914).

PORCUPINE FISH. One of a family, Diodontidæ, of the family Plectognathi, allied to the globefishes, Tetraodontidæ, from which they differ chiefly in the stronger armature of the skin and in having no division in the bony plate of either jaw. They are short and broad in form and are covered everywhere with spines, each rooted upon a bony base, and in some species with strong, hairlike bristles. Each jaw is covered with a bony plate, like a beak of a bird, and the nostrils form small tentacles. They are sluggish fishes, inhabiting warm seas of various parts of the world and living on the bottom among weeds and corals. When disturbed they swallow air and float belly upward on the water, but their capacity of inflation is much less than that of the globefishes. They are generally regarded as poisonous, and therefore are rarely used as food, but are often utilized as curiosities. The best-known species is *Diodon hystrix*, common everywhere in the tropics, and often taken in Florida, where its Spanish name is erizo. (See Plate of PLECTOGNATH FISHES.) It reaches a length of about 3 feet. Another smaller and darker species of these fish is *Diodon holacanthus*, also well known. An allied species, *Chylomycterus schoepfi*, only 6 to 10 inches long and very abundant in the bays and lagoons from Virginia to Florida, swells up when touched, after the manner of the northern puffers. It is greenish in color, with the abdomen paler, the back and sides marked by round black spots and parallel black stripes. Its common names are bur fish, rabbit fish, and swelled toad.

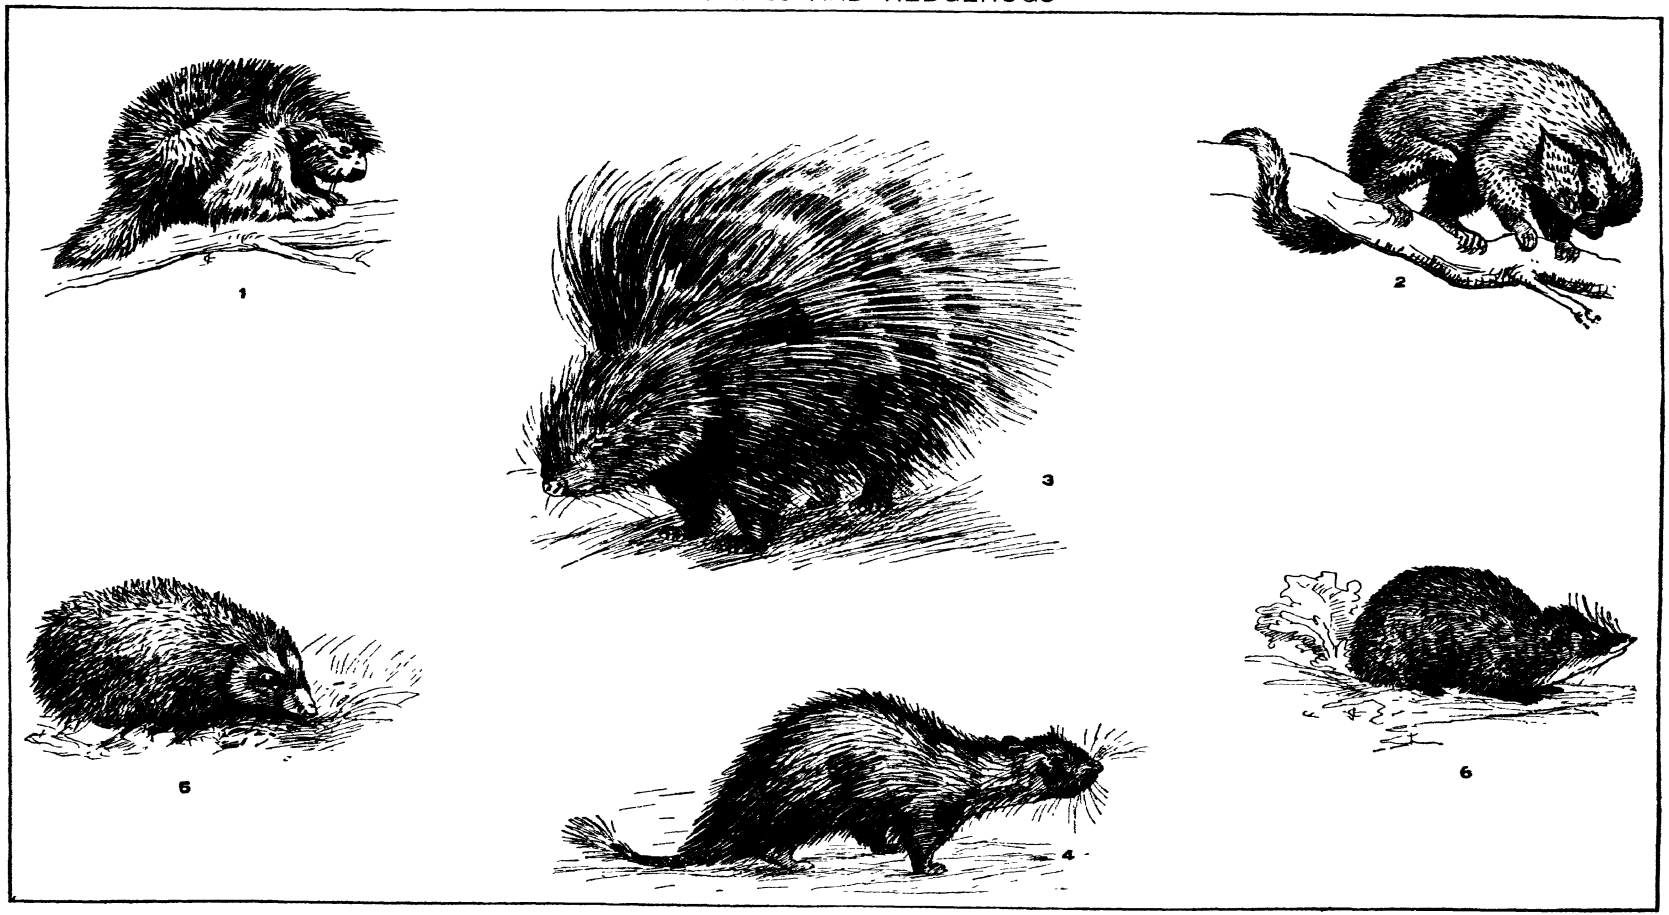
PORCUPINE RIVER. The most important of the northeastern affluents of the Yukon, into which it flows at Fort Yukon (Map: Alaska, L 1). It is navigable for about 100 miles by steamboats and 200 by poling boats. Through a portage to Peel River it affords the best route to the lower Mackenzie River.

PORCUPINE WOOD. The wood of a palm. See COCONUT.

PORDENONE, pôr'dā-nō'nā. A town in the Province of Udine, Italy, on the Noncello, 29 miles southwest of Udine (Map: Italy, D 2). Ruins of its old walls and of an ancient castle still remain, and the cathedral contains notable frescoes by Pordenone, the painter, who was born here in 1483. There are manufactures of cotton, linen, and silk fabrics, paper, and earthenware, and a trade in wine and grain. The site is supposed to be that of the Portus Naonis of the Romans. Pop. (commune), 1901, 12,482; 1911, 13,756, (town), 8400.

PORDENONE, GIOVANNI ANTONIO DA (1483–1540). A Venetian painter of the High Renaissance. He is sometimes wrongly called Licinio. His family name was Sacchi, and he usually called himself Pordenone, after his native town in Friuli. He studied probably under Alvise Vivarini, but developed his style under the influence of Giorgione and Titian and painted in the churches of Friuli as early as 1504. Although he lived mostly in Pordenone, he received many commissions in other cities. In 1521–22 he assisted in the decorations of the cathedral at Cremona and in 1528 was employed to decorate the church of San Rocco in Venice, where he settled definitely in 1535, having been previously knighted by the King of Hungary, and assumed the name of Regillo. At the invitation of the Duke, Pordenone in 1538 went to Ferrara, where he died suddenly in January, 1540. His most important works are frescoes and portraits, although he executed many altarpieces. Most of his paintings have suffered much from age and restoration, but the altarpiece in Sant' Elemosinario, Venice, still retains some of its richness and beautiful coloring. His most important frescoes, besides those already mentioned, are in the church of San Salvatore in Castel Coralto, in the cathedral at Treviso, dated 1520, in the Madonna di Campagna at Piacenza, and in the Duomo at Pordenone. Although not ranking with the greatest Venetian masters, Pordenone possessed great force, a sense of the decorative, and dramatic power. His portraits are broad in execution and original in color. Among the best of these are "The Ottoboni Family with the Madonna of Carmel and Saints" and the "Portrait of a Lady," in the Venice Academy.

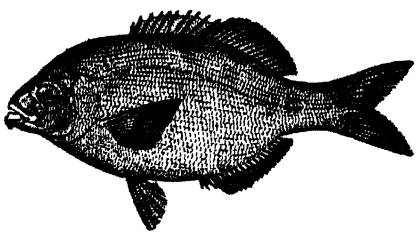
PORE. See SKIN.



PORE FUNGI. See BASIDIOMYCETES.

POREL, pô'rĕl', MADAME. A French actress. See RÉJANE, MADAME.

PORFIRIO DÍAZ, pôr-fē'rē-ō dē'ās, CIUDAD. A town of Mexico. See CIUDAD PORFIRIO DÍAZ.



PORGY, or **PORGEE** (corrupted from American Indian *mischcuppauog*, or from Lat. *pagrus, pager*, from Gk. *πάγρος, pagros*, sea bream). Any of several fishes of the family Sparidæ. They are carnivorous shore fishes of the tropical seas, abundant in American and European waters, and are excellent food fishes. The common American porgy (*Stentotomus chrysops*) is

PORCUPINES AND HEDGEHOGS

1. NORTH AMERICAN PORCUPINE (Erethizon dorsatum).
2. BRAZILIAN TREE PORCUPINE (Chaetomys subspinosus)
3. EUROPEAN PORCUPINE (Hystrix cristata).
4. AFRICAN BRUSH-TAILED PORCUPINE (Atherura africana).
5. EUROPEAN HEDGEHOG (Erinaceus europæus).
6. TENDRAC OF MADAGASCAR (Ericulus spinosus).

more commonly known as scup (q.v.) along the Atlantic coast of the United States, and several allied species occur about Florida and the West Indies and are marketed locally. The European red porgy (*Pagrus pagrus*), known in the Mediterranean as besugo and pargo colorado, attains a length of about 2 feet and is common on the European coasts and also in the Gulf of Mexico and southward, where it is highly valued.

CALIFORNIAN PORGY (*Damalichthys argyrosomus*).

On the Pacific coast the name is given to one of the Californian surf fishes (see SURF FISH), otherwise known as white perch (*Damalichthys argyrosomus*). Consult J. S. Kingsley, in *Standard Natural History*, vol. iii (Boston, 1885). See MARGATE FISH.

PORIF'ERA (Neo-Lat. nom. pl., from Lat. *porus*, Gk. *πόρος*, pore, passage + Lat. *ferre*, to bear). The second or next to the lowest phylum of animals—the sponges; also its single constituent class. See SPONGE.

PO'RISM (from *πόρισμα*, *porisma*, corollary, from *πορίζειν*, *porizein*, to bring about, deduce, from *πόρος*, *poros*, passage; connected with Lat. *peritus*, skilled, OChurch Slav. *perĭti*, to fly, Skt. *par*, to cross over, Goth., OHG., AS. *faran*, Ger. *fahren*, Eng. *fare*). A kind of geometric proposition common in Greek mathematics. The word seems to have been loosely employed, Proclus (q.v.) telling us that it is used in geometry to designate either a corollary or a proposition which partakes of the nature of both a theorem and a problem. The most ancient tradition divides propositions into theorems, problems, and porisms, according as it is required to demonstrate, to do, or to find. Thus, "To construct an equilateral triangle on a given line" is a problem; "To find the centre of a given circle" is a porism. The term "porism" was also used by Diophantus with reference to certain propositions in arithmetic. Consult: Chasles, *Les trois livres de porismes d'euclide* (Paris, 1860); James Gow, *Short History of Greek Mathematics* (Cambridge, 1884); Chasles, *Aperçu historique* (3d ed., Paris, 1889); T. L. Heath, *The Thirteen Books of Euclid's Elements*, vol. i (Cambridge, 1908).

PORK (OF., Fr. *porc*, from Lat. *porcus*, swine, hog, pig). The flesh of swine. This meat is widely used and extensively exported for food and is valued for its pleasant flavor and the many ways in which it can be prepared for the table, the good keeping qualities of certain pork products, such as ham and bacon, as well as for the protein it supplies and its relatively high energy value, especially fat pork, and for the ease with which it may be preserved by salting, drying, or smoking. The pork-packing industry has grown to enormous proportions in the United States. In 1909 there were slaughtered in that country 33,870,616 hogs, valued at $483,383,848. The flavor of pork is affected more or less by the feed given to the pig, as is also the character of the fat. Fat with a low melting point is characteristic of soft pork, while a higher melting point is found in that of better quality. Acorns are believed to cause the peculiar and delicate flavor noticed in the flesh of pigs which are allowed to run where they have access to them. The overfat carcass is now quite generally recognized as undesirable, and smaller pigs with fat and lean well distributed are more satisfactory. Pork contains on an average more fat than other meats, but does not differ from them markedly in other respects as regards composition or thoroughness of digestion. It is often said that pork is unwholesome, but this seems to be wholly a matter of opinion, since so far as scientific food experiments go there is nothing to show that good pork is less desirable for men in health than other meats. It is very likely that much of the prejudice against pork comes from the fact that it is one of the foods avoided by the Jews and Mohammedans on account of their respective religious beliefs. See FOOD; HAM; MEAT; PACKING INDUSTRY.

POROG'AMY. See CHALAZOGAMY.

POROMUSHIR, pō'rō-mōō-shēr'. One of the Kurile group of islands. See KURILE ISLANDS.

POROS'ITY (from Lat. *porosus*, full of pores, from *porus*, pore, passage). A term expressing the experimental fact that no kind of matter completely fills the space it occupies; in other words, that all bodies are full of minute cavities or interstices, such as are illustrated on a large scale by a sponge.

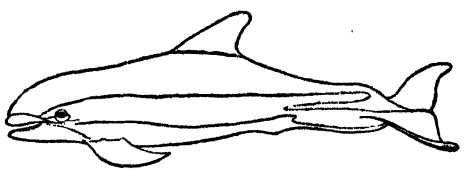
PORPHYR'IO, or PORPHYRION, POMPONIUS. A Latin grammarian, of the third century A.D. His commentary on Horace is the most valuable that has come down to us, though it is sometimes fanciful and is frequently marred by interpolations made by mediæval clerks. It was edited by Meyer (1874) and by Holder (1894). Consult Martin Schanz, *Geschichte der römischen Litteratur*, vol. iii (2d ed., Munich, 1905), and W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913). See HELENIUS ACRO.

PORPHYR'ION (Lat., from Gk. *Πορφυρίων*). In Greek mythology, a giant destroyed in the combat with the gods because at the sight of Juno's beauty he forgot to defend himself. See GIANTS.

PORPHYRIT'IC TEXTURE. See IGNEOUS ROCKS.

PORPHYR'IUS (in Eng. *Porphyry;* Lat., from Gk. *Πορφύριος*, *Porphyrios*) (233–c.304 A.D.). One of the most important Neoplatonists (see NEOPLATONISM) and the chief disciple of Plotinus (q.v.). He was born at Batanea in Syria, where he received his early education. His original name was Malchus (King), but this was changed, according to tradition, to Porphyrius (wearer of the purple; cf. Gk. *πορφύρεος*, *porphyreos*, purple) by Longinus (q.v.), whose disciple he was at Athens from 252 to 262. In 262 he went to Rome and soon attached himself to Plotinus. About 267 he moved to Sicily, but returned to Rome under Aurelian and continued his teaching into the reign of Diocletian. Porphyrius was not a deep thinker. He devoted himself to grammar and history as well as philosophy, but his great service was as an expositor and definer of Plotinus' obscure doctrines, which Eunapius declares he made clear to the common understanding. One of his pupils was Iamblichus (q.v.). He was a very prolific writer. Suidas

(q.v.) has preserved to us an incomplete list of his writings, some of which deal with speculative philosophy, but most of them were devoted to the history of philosophy and its exposition. The most important of these are his *Life of Pythagoras*, his work *On Abstinence from Animal Food*, an *Introduction and Commentary to Aristotle's Categories*, and a work addressed to his wife, Marcella. Of his lost works the most important was one directed against the Christians, which was publicly burned at the order of Theodosius II. That he was originally a Christian, as is stated by Socrates, the Church historian, and by St. Augustine, there is not the slightest proof. A complete edition of his works and fragments never has been published. The most important editions of single works are the following: *Porphyrii Opuscula Selecta*, by Nauck (2d ed., Leipzig, 1886); *The Life of Pythagoras*, together with Iamblichus' similar work, by Kiessling (ib., 1816); his *Commentaries to Aristotle's Categories* is now published in the great Berlin edition of the *Commentaries to Aristotle*, vol. iv, edited by Busse (Berlin, 1887); *Porphyrii de Philosophia ex Oraculis Haurienda Librorum Reliquiæ*, edited by Gustav Wolff (ib., 1856); *Quæstiones Homericæ*, edited by Schrader (Leipzig, 1880, 1890); *Sententiæ*, by B. Mommert (1907). There is a translation of *Select Works*, by Taylor (London, 1823), and of the *Sentences*, by Davidson (ib., 1869). Consult: Eduard Zeller, *Philosophie der Griechen* (3d ed., Leipzig, 1881); T. Whittaker, *The Neo-Platonists* (Cambridge, 1901); J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., ib., 1906); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913). For Porphyrius' relation to Christianity: A. J. Kleffner, *Porphyrius der Neuplatoniker und Christenfeind* (Paderborn, 1896).



PORPHYROGENITUS, Constantine. See Constantine Porphyrogenitus.

POR'PHYRY (OF., Fr. *porphyre*, from Gk. *πόρφυρος, porphyros*, purple, from *πορφυρά, porphyra*, purple fish). A term formerly much employed to designate in a general way any rock of porphyritic texture (see Igneous Rocks), and in a special sense such rocks when of siliceous composition and having the larger crystals (porphyritic crystals) chiefly of orthoclase feldspar or orthoclase feldspar and quartz. Thus, quartz porphyry included the finer-grained granites occurring as bosses or dikes.

PORPHYRY. See Porphyrius.

PORPHYRY DEPOSITS. See Copper.

POR'POISE (OF. *porpeis, porpois, pourpois*, dialectic Fr. *pourpeis*, from Lat. *porcus*, swine, hog, pig + *piscis*, fish; cf., with reversed order of components, Portug. *peixe porco*, OIt. *pesce porco*, porpoise). A small active cetacean, of the family Delphinidæ, having a form similar to the dolphins, but the muzzle short, uniformly convex, and without a beak; a dorsal fin; the teeth numerous, simple, and equal. The common porpoise (*Phocæna communis*) is plentiful in all northern seas and is only 6 to 8 feet in length. The body is spindle-shaped, the skin perfectly smooth and destitute of hair, and there are from 40 to 50 teeth in each jaw. The eye is rather small, with the pupil in the form of a V, and the opening of the ear is very minute. The crescent-shaped blowhole is situated between the eyes. Large numbers are often seen together, sometimes gamboling, sometimes swimming in file, when their backs, appearing above the surface of the water, are likely to suggest the idea of a great sea serpent. They feed on fish and pursue the herring, mackerel, etc., into bays and estuaries. The porpoise sometimes ascends rivers, apparently in pursuit of salmon, as far as the water is brackish, and is not infrequently caught on such occasions, for the sake of its skin, oil, and flesh. The skin is nearly an inch thick, but is planed down until it becomes translucent, and is made into excellent leather, which is used for shoestrings and for other purposes. Under the skin is a layer of fat, about an inch in depth, which yields oil of the finest quality. The flesh was in former times highly esteemed, but it is now little eaten by civilized people. Several other species of *Phocæna* occur in the South Atlantic, Indian, and Pacific oceans, while the name "porpoise" is carelessly extended to almost any of the smaller dolphins. Consult: G. B. Goode, *Fishery Industries*, sect. i (Washington, 1884); F. W. True, in *Bulletin of the United States National Museum, No. 36* (ib., 1889); F. E. Beddard, *A Book of Whales* (London, 1900).

SKUNK, OR BAY, PORPOISE.

POR'PORA, Niccolò Antonio (1686–1766) An Italian composer, born at Naples. He studied music under Padre Gaetano, of Perugia, and under Mancini. He produced his first opera, *Agrippina*, in 1708. *Berenice* followed in 1710. He began the work for which he subsequently became famous in 1712, when he founded the music school in Naples, which numbered among its pupils Farinelli, Tosi, Senesino, and Caffarelli. He held many important appointments in Austria, Prussia, and Italy, and in 1728 became singing master to the royal family at Dresden, in which city he also became concert master of the opera. The following year he was invited to go to London, where a considerable opposition had been organized against Handel (q.v.). Although some of his best work was written and produced in London, he could not succeed against his rival, and returned in 1736 to Venice, where he was appointed director of the conservatory. After a period of about nine years he went to Vienna in the train of the Venetian Ambassador, and during the three years of his stay was held in high repute as a teacher, Haydn studying under him part of the time. He went to Dresden in 1748, where he became court kapellmeister, and returned to Naples in 1755. From 1760 until his death, which occurred at Naples, he was maestro at the cathedral and director of the Conservatory Sant' Onofrio. He wrote more than 50 operas; also six oratorios, many masses, and much other sacred music.

PORRAS, pôr'räs, Belisario (1860–). A Panaman politician, born in Panama. He was educated in Bogotá and Brussels, and afterward served as counsel for the French Canal Commission and as professor of international law in the universities of San Salvador and Managua. Entering public life, he was a judge of the Supreme

Court and later was Colombian Consul General in Belgium. In 1907 he was a delegate to The Hague Conference from Panama, and in 1910 was appointed Minister to the United States, where he served one year. Returning to Panama, he entered politics and was elected President in 1912. He endeavored to give the country an efficient administration.

POR'REX. See GORBODUC.

PORRO, pôr'rô, EDUARDO (1842–1902). An Italian obstetrician. He was born in Padua and took his M.D. in 1865 at the University of Pavia, where, after spending several years as assistant at the Ospedale Maggiore at Milan, he became professor of obstetrics (1875). From 1885 to 1902 he held a similar chair at Milan. Porro improved the so-called Cæsarean operation by excision of the uterus and annexa, described in *Della amputazione utero-ovarica come complemento di taglio cesareo* (1876), the best known of his writings.

POR'SENA, or **PORSEN'NA,** LARS. In the early and uncertain history of Rome, a powerful King of Clusium (now Chiusi, q.v.) in Etruria. According to the legend told by Livy, when Tarquin the Proud was expelled from Rome he sought the help of his Etruscan kinsmen, in Veii and Tarquinii, against his revolted subjects; but, their efforts not proving successful, he turned to Porsena, who willingly espoused his cause, and marched with a great army against Rome. The Etruscan King seized the Janiculum, a fortified hill on the west side of the Tiber, and would have forced his way into the city across the Bridge of Wooden Piles (*pons sublicius*), had not a brave Roman, Horatius Cocles, kept the whole of Porsena's army at bay while his comrades behind him hewed down the bridge (see HORATII), after which he plunged into the Tiber and safely swam across it. Porsena now laid siege to Rome, and after a while the inhabitants began to suffer so severely from famine that they had recourse to a desperate expedient. Three hundred of the noblest Roman youths swore to risk their lives in an attempt to assassinate the Etruscan King. The first on whom the lot fell was C. Mucius, who stole into the camp of Porsena, but, not knowing the King, killed his secretary instead. He was instantly seized and put to torture; but the unshrinking audacity with which he thrust his hand into the fire and let it burn moved the King so much that he pardoned him, whereupon Mucius, ever afterward called Scævola (the left-handed), told him of the jeopardy in which he was placed.

Porsena resolved to make peace with Rome at once, and his conditions being accepted by the sorely pressed citizens, he withdrew his forces. This version of the story is believed by many scholars to have been invented to conceal the fact of a temporary Etruscan conquest of Rome, and the evidence in favor of this view is overwhelming. Tacitus expressly affirms that Porsena conquered the city; Dionysius informs us that the Senate sent him an ivory sceptre, a golden crown, and a triumphal robe, which was the form that had been adopted by the Etruscan cities themselves of acknowledging the supremacy of the Roman King, Tarquinius Priscus; and Pliny mentions that Porsena forbade the citizens of Rome to use iron except for agricultural purposes. What seems most reasonable to believe is that a great rising of the Etruscan races against the Latin took place and that Rome was exposed to the first brunt of the war and suffered a disastrous defeat, but that shortly afterward the Etruscans themselves were decisively beaten and were forced back into their own territories; for, after the conquest of Rome, Aruns, a son of Porsena, proceeded against Aricia, under the walls of which city (according to Livy) his army was routed by the combined forces of the Latin cities, with the help of Greek auxiliaries from Cumæ. Consult: Livy, ii, 9–15; Dionysius of Halicarnassus, *Antiquitates*, v, 21–34; G. Lewis, *Inquiry into the Credibility of Early Roman History* (London, 1855); A. Schwegler, *Römische Geschichte* (2d ed., 1867–73); E. Pais, *Storia di Roma*, vol. i (Rome, 1898–99).

POR'SON, RICHARD (1759–1808). A brilliant Greek scholar, born Dec. 25, 1759, at East Ruston, Norfolk, England, where his father, a worsted weaver, was parish clerk. The curate of the parish, Mr. Hewett, impressed by the boy's rare abilities, had him educated along with his own sons. Porson afterward found a patron in Mr. Norris, the founder of the Norrisian professorship at Cambridge, who, in 1774, sent him to Eton, where he remained about four years, but without distinguishing himself. Another patron, Sir George Baker, sent him in 1778 to Trinity College, Cambridge, of which he was elected a scholar in 1780. In 1781 he won the Craven scholarship and the first chancellor's medal. In 1782 he was chosen a fellow of Trinity. He now began to give indications of his subtlety and taste in the difficult verbal criticism of the Greek dramatists. For four years he contributed to *Maty's Review*—his first critique being on Schutz's Æschylus and his finest on Brunck's Aristophanes. He opened also a correspondence with Professors Ruhnken, Heyne, and Hermann. In 1787 he contributed to the *Gentleman's Magazine* three sarcastic letters on Hawkins's *Life of Johnson*. For the same periodical he wrote also his far more famous and trenchant *Letters to Travis on the Three Witnesses* (1788–89). The question concerned the disputed text 1 John v. 7, and was occasioned by a pretentious defense of the passage by Archdeacon Travis against the scornful attack of Gibbon. Porson definitely proves the verse to be spurious, and naturally incurred great odium on account of the side he took in this controversy. Since Porson's fellowship was vacated by his refusal to take orders, his friends now procured for him an annuity of £100. He was also elected, in 1792, to the regius professorship of Greek in the University of Cambridge, an office worth £40 a year. This place he held till his death. The only thing he ever did in connection with his Greek professorship was to deliver a Latin prelection on Euripides, written, it is said, in two days. In 1795 he edited the plays of Æschylus for the Foulis Press at Glasgow; between 1797 and 1801 he edited four plays of Euripides, the *Hecuba*, the *Orestes*, the *Phœnissæ*, and the *Medea*. He also collated the Harleian manuscript of the *Odyssey* for the Grenville Homer. In 1806 he was appointed librarian of the London Institution, with a salary of £200, but neglected his duties. By this time Porson had weakened in mind and body. Ever since the loss of his fellowship, he had lived mostly in London, occupying rooms at Essex Court in the Temple. There he would confine himself to work for days; and for years he was at times a hard drinker. He was like-

wise remarkable for personal peculiarities that are duly chronicled by his biographers. He died of apoplexy, Sept. 25, 1808, and was buried in the chapel of Trinity College, Cambridge.

Porson was famed for his wit and learning and, unfortunately, for the negligence with which he treated persons to whom he owed courtesy. His burlesque of Hawkins has been compared with Thackeray at his best. He certainly was a master of irony. His contributions to the knowledge of Greek syntax and metres are solid and permanent. To the emendation of texts he brought rare keenness and a marvelous memory. Though more scientific methods now prevail, especially in textual collation, it is generally agreed that Porson opened the way to the new era. The Greek type which is now in general use was copied and cast from Porson's elegant script and is known as the Porsonian type. After his death several works left in manuscript were published: *Ricardi Porsoni Adversaria* (1812), *Tracts and Miscellaneous Criticisms* (1815), *Pausanias* (1820), *Lexicon of Photius* (1822), *Notes on Suidas* (1834), *Correspondence*, edited by Luard (Cambridge, 1867). Consult: J. S. Watson, *Life of Richard Porson* (London, 1861); H. J. Nicoll, *Great Scholars* (Edinburgh, 1880); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908); Tompkins, *The Tragedy of Porson* (London, 1911); H. T. Peck, *A History of Classical Philology* (New York, 1911).

PORT. In English and American law, a haven or harbor for ships, with wharves, warehouses, etc., for the lading and unlading of goods and their safe custody, and with certain rights or privileges, as the right to collect tolls for the use of the same. Ports are the *ostia regni*, or gates of the realm, and every public port is a franchise, i.e., lies within the royal prerogative and cannot lawfully be set up by a subject or private citizen without charter from the crown or state. This restriction is due to two facts: first, that a port is always established in public waters, viz., a bay of the sea or a tidal river; and, second, that it involves the right to levy tolls and duties which can pertain only to the crown, or state, and which cannot be exercised by a subject except under a franchise from the crown. Even where a subject happens to be the owner of the soil where it is established, he cannot make a port without such franchises. When once set up, whether by public authority, as is now usually the case, or by a private citizen or corporation acting under a grant or franchise, a port is open to all vessels in times of peace, and must be maintained in good order and kept free from hindrances to navigation. The crown, or state, also has the right to exercise a general superintendence over it and to make and enforce regulations for the purpose of preserving the public peace, health, and safety. Formerly in England the privilege, or franchise, of setting up a port was occasionally granted to a subject, but in that country, as in the United States, ports are now invariably public institutions, set up and administered by the state. Consult Sir William Blackstone, *Commentaries on the Laws of England* (4th Amer. ed., 2 vols., Chicago, 1899), and S. A. Moore, *History of the Foreshore* (London, 1888). See HARBOR; PORT OF ENTRY.

PORT (of uncertain etymology). 1. A naval term to denote the left side of a vessel to an observer looking forward. See HELM. 2. In architecture the term "port" is used as an equivalent of portal (q.v.).

PORTA, CARLO (1776–1821). An Italian poet, born in Milan. He was employed in the Bureau of Finance in Venice and afterward in Milan. Manzoni, Grossi, and others of the Romantic school in Milan were his intimate friends. He is the best poet in the dialect of Milan and one of the most interesting of the dialect writers of Italy. His works and a biography appeared in Milan in 1821.

PORTA, GIACOMO DELLA (1542–1604). An Italian architect, born at Milan. He was the pupil of Vignola and Michelangelo and completed various works left unfinished by both his masters. The most important of these was the cupola of St. Peter's in Rome, the original profile of which he altered slightly after the death of Michelangelo in 1564. He designed also the mosaics of the interior of the dome. Other building work of his in Rome includes the completion of the church of Il Gesù, begun by Vignola; the Farnese palace, begun by Michelangelo; the Greek church, in the Via Babuino; the church of the Madonna dei Monti; the façade of the church of San Luigi de' Francesi; and the palaces Paluzzi, Chigi, Serlupi, and d'Este. He built also in Rome some fine fountains, in which his taste for the decorative in architecture showed itself. Of these an especially noted one is the Fontana delle Tartarughe. Other works by Porta are the chapel of St. John the Baptist in the cathedral at Genoa and the Villa Aldobrandini, near Frascati.

PORTA, GIAMBATTISTA DELLA (1543–1615). An Italian savant, born at Naples. He traveled widely in Spain, France, and Italy, and founded an association known as *I Segreti*, for the purpose of carrying on scientific investigations. Accused of practicing magic, the society was dissolved by the Pope. Porta studied optics successfully and invented the camera obscura (q.v.). He wrote widely on scientific topics. His most important works are: *De Humana Physiognomia* (1586); *Magis Naturalis* (1589); *Ars Reminiscendi* (1602); *De Aeris Transmutationibus* (1609).

PORTA CAUCASIA, or CAUCASICA. See DARIEL.

PORTA COLLINA. See COLLINE GATE.

PORT ADELAIDE, ăd'e-lād. The port of the city of Adelaide (q.v.), South Australia.

PORT'ADOWN'. A town of Ireland in County Armagh, situated on the Great Northern Railroad, 5 miles south of Lough Neagh (Map: Ireland, E 2). It has manufactures of linen and cotton goods and trade in agricultural products. Pop., 1901, 10,046; 1911, 11,727.

PORTAELS, pôr-täls', JEAN FRANÇOIS (1818–95). A Belgian historical and portrait painter, born at Vilvorde, near Brussels. He studied in the Academy of Brussels and in Paris under Paul Delaroche, and in 1842 he took the Prix de Rome. After extensive travels in the Orient, in 1847 he was appointed director of the Academy of Ghent. Later he opened a studio in Brussels, where his solid, practical teaching had great influence on the development of modern Belgian art. After further travels he became director of the Academy of Brussels in 1878. His early paintings are chiefly religious subjects, such as "The Daughter of Sion" and "Drought in Judæa" (Brussels Gallery). Later he painted genre pictures, including "Box in a Budapest Theatre" (ib.), portraits, and Orien-

tal scenes, among the best known of which are "A Funeral in the Desert of Suez" and "Caravan in Syria Overtaken by a Simoom" (Brussels Gallery). His works are rather good in composition and possess grace and charm, but are painted in the smooth manner of the school of Delaroche.

POR'TAGE. A town in Livingston Co., N. Y., 62 miles by rail southeast of Buffalo, on the Erie and the Pennsylvania railroads (Map: New York, B 5). It is in an agricultural region producing chiefly beans, potatoes, and hay. Portage contains the beautiful Letchworth Park, presented to the State by William Pryor Letchworth in 1907. It covers about 1000 acres on both sides of the Genesee River. Attractive features are the three falls, with a combined descent of 340 feet, and a cañon whose walls rise to a height of 350 feet. Spanning the river near by is the Portage Bridge, 800 feet long and 234 feet high. There is also a museum in the town. Pop., 1900, 1029; 1910, 1273.

POR'TAGE. A borough in Cambria Co., Pa., 7 miles southeast of Ebensburg, on the Pennsylvania Railroad (Map: Pennsylvania, D 6). It is in a productive coal region, and coal mining is the chief industry. Pop., 1900, 816; 1910, 2954.

PORTAGE. A city and the county seat of Columbia Co., Wis., 93 miles by rail west by north of Milwaukee, on the government ship canal between the Fox and Wisconsin rivers and on the Minneapolis, St. Paul, and Sault Ste. Marie and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, D 5). It has a public library, and among the prominent buildings are the high school and the city hall. Portage is the commercial centre of a productive farming region, and manufactures hosiery and knit goods, brick, flour, etc. The commission form of government was adopted in 1912. Portage was settled in 1835 and was chartered as a city in 1854, having been first incorporated two years earlier. Near the city limits are the remains of old Fort Winnebago, built in 1828. Pop., 1900, 5459; 1910, 5440.

PORTAGE LA PRAIRIE, pōr'tăj lă prā'rĭ. A city and the capital of the Portage la Prairie electoral district, Manitoba, Canada, on the Canadian Pacific, Canadian Northern, Grand Trunk Pacific, and Great Northern railways, 56 miles by rail west of Winnipeg (Map: Manitoba, E 4). It possesses the district official buildings, courthouse, general hospital, home for incurables, provincial training school, Indian school, Old Folks Home, armory, and drill hall. It is a popular summer resort. Industrial establishments include flour and oatmeal mills, grain elevators, brick and lumber yards, steel grain bins, and manufactories of threshing machines, farm implements, corrugated-iron culverts, structural castings, pumps, sashes and doors. Pop., 1901, 3901; 1911, 5892; 1915 (local est.), 6500.

POR'TAL (OF. *portal*, Fr. *portail*, from ML. *portale*, entrance, vestibule, neut. sing. of *portalis*, relating to a gate, from Lat. *porta*, gate). A doorway or gateway and, by extension, the architectural composition which incloses and decorates such a doorway, or several doorways. The term is often applied to the lower part of the west front of a church or of the northern or southern transept front, in which the doorways are opened, or to any group of doorways at one front or flank of a building, with the architectural accessories, such as gables, canopies, columns, and the like. The porte-cochère of a large French building, i.e., the great doorway through which a carriage or wagon can be driven, is properly called a portal.

The portal and the porch (q.v.) are not to be separated absolutely; but in general the porch designates a sheltering structure external to the doorways, which with their architectural decorations form the portal or portals. In Oriental architecture the architectural treatment of the portal is usually extended to the top of the building, as often also in Spanish and in Elizabethan and Jacobean architecture.

PORTA LATINA. See LATIN GATE.

PORTALEGRE, pôr'tà-lā'grâ. The capital of the district of the same name in Portugal, situated near the Spanish frontier, 95 miles northeast of Lisbon (Map: Portugal, B 3). It is a fortified town and has a handsome cathedral. It manufactures woolen goods, and cork is obtained in the vicinity. Pop., 1900, 11,893; 1911, 11,603.

PORTALIS, pōr'tà'lĕs', JEAN ETIENNE MARIE (1746–1807). A French jurist and statesman, born at Bousset, near Toulon. He studied law at the University of Aix and in 1765 was admitted to practice before the provincial Parliament. Charged with a commission to investigate the legal status of the Protestants in France, he published in 1771 *Consultation sur la validité des mariages des protestants en France*, in which he established the character of marriage as a civil contract, the general tone of the work being wholly favorable to religious toleration. From 1778 to 1782 he was provincial assessor of Provence, returning subsequently to the practice of law. Always moderate in his views, Portalis retired to his estate when the Revolution entered upon its stormy phase. He was compelled to flee to Lyons and thence to Paris, where in December, 1793, he was arrested. He was liberated on the fall of Robespierre, and in 1795 was elected to the Council of Ancients, of which in June of the following year he became president. His clemency to the adherents of the old régime aroused the hostility of the Directors, and after the coup d'état of the 18th Fructidor (Sept. 4, 1797) he escaped deportation by seeking refuge in Switzerland. Returning in 1800, he was made by Napoleon a member of the commission charged with the preparation of a civil code. He took a most important part in the labors of the commission, for which he was peculiarly fitted by his extensive knowledge of the civil law. After the conclusion of the Concordat (1801) Portalis was intrusted with the task of formulating a body of supplementary rules to serve as a basis for the administrative policy of the state with regard to the Catholic religion. Made Minister of Public Worship in 1804, he effected important changes in the organization of religious instruction. In 1806 he became a member of the Academy. He died in Paris, Aug. 25, 1807, after an operation to cure total blindness, from which he suffered for two years. Consult C. A. Sainte-Beuve, *Causeries du lundi*, vol. v (Paris, 1852), and René Lavolée, *Portalis, sa vie et ses œuvres* (ib., 1869).

PORTAL VEIN. See CIRCULATION; LIVER.

PORTA MAGGIORE, pôr'tà màd-jō'rā. The ancient Porta Prænestina at Rome, a gate with two arches, one of which is now closed, through which issued the Via Prænestina and the Via

Labicana. It was originally designed to carry the aqueducts known as Aqua Claudia and Anio Vetus over the two roads. Its inscriptions record its construction and restorations. It was included as a gate in the walls of Aurelian. During the restoration of the walls by Arcadius and Honorius the level of its threshold was raised 10 feet by the leveling of the accumulated rubbish. Consult K. Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909), and S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

POR'TAMEN'TO (It., carriage). A musical term used to denote the sustaining of the voice in passing from one note to another. In legato the voice passes directly from one tone to the next, while in portamento it passes through all intermediate tones. But this passing is so rapid that no single tone is heard separately. The effect of portamento can best be attained upon a stringed instrument played with a bow. The finger quickly glides along the string from one note to the next.

PORTA NIGRA, pôr'tȧ nī'grȧ (Lat., Black Gate). A famous gateway of Treves, dating probably from the fourth century A.D. It is constructed of sandstone and is blackened with age, whence its name. The gate was fortified with two towers, one of which was occupied early in the eleventh century by Simeon, a Greek hermit, and from this fact the gate is called also Simeonsthor.

PORT ANTO'NIO. A seaport town on the north coast of Jamaica (Map: Cuba, J 8). It is the second commercial town of the island and is the centre of the fruit trade. It is connected by rail with Kingston. Pop., 1911, 7074.

PORTA OSTIENSIS. See OSTIENSIS, PORTA.

PORTA PRÆ'NESTI'NA. See PORTA MAGGIORE.

PORT AR'THUR. A city, port of entry, the capital of the Thunder Bay district, Ontario, Canada, on Lake Superior and on the Canadian Northern and the Canadian Pacific railways (Map: Ontario, P 13). The city possesses a public library, an armory, a sailors' institute, district judicial buildings, and a Y. M. C. A. building. There are government, railway, and private grain elevators. Industrial establishments include blast furnaces, a shipbuilding company, railway coal and ore docks, lumber companies, cold-storage plants, and manufactories of bricks, tents, awnings, aërated waters, beer, etc. Pop., 1901, 3214; 1911, 11,220; 1915 (local est.), 18,500.

PORT ARTHUR (Chin. *Lushunkow*). A town and strongly fortified naval station near the Lao T'ich Shan promontory of the peninsular portion of the Manchurian province of Shingking or Fengtien (Map: China, M 4). The town lies on the slope of the high hills which surround the oval inlet which forms the harbor. The inlet on which it stands measures about 2 miles from east to west and 1 mile from north to south, and is well protected from storms by a spit of land which runs diagonally across its north end. The harbor proper has been much enlarged by blasting and dredging; new docks, barracks, an arsenal, and warehouses have been built and the place rendered impregnable. On the west side of the town is the terminus of the former Russian Railway to Harbin, now called the South Manchurian Railway since its lease by the Japanese. Pop., 1912, 17,884 (9637 Japanese, 8222 Chinese, and 25 foreigners). A regiment of Japanese soldiers is stationed here. See MANCHURIA.

Lushunkow was formerly only a small fishing village at the lower end of a long mountainous peninsula until it was selected by Li Hung Chang, under the advice of German engineers, for a strongly fortified naval station for the defense of the Pei-ho and Peking. In 1894, however, it was captured by the Japanese, and the Treaty of Shimonoseki provided for its cession to Japan with the whole south coast of Manchuria from the Liao to the Yalu; but Russia, France, and Germany intervened and induced Japan to relinquish all this territory for the sum of 30,000,000 taels, and on Nov. 30, 1895, its evacuation was begun. With adjacent territory it was leased by China to Russia for 25 years, in March, 1898. The object of Russia was to secure a naval station which she could defend for the use of her war vessels in Eastern waters, and the lease was granted with the distinct understanding that "it shall not prejudice China's sovereignty over the territory." It was further agreed that the port should be closed to all vessels except Chinese and Russian men-of-war. Strongly fortified, it became the chief Russian naval base in the Far East. It was invested by the Japanese in the Russo-Japanese War (q.v.) and surrendered Jan. 2, 1905. By the Treaty of Portsmouth, September, 1905, Port Arthur was ceded to Japan for the duration of the Russian lease. The lease was further extended in 1915. See DALNY; SHINGKING; TALIENWAN.

PORT ARTHUR. A city in Jefferson Co., Tex., 20 miles southeast of Beaumont, on the Kansas City Southern and the Texas and New Orleans railroads (Map: Texas, F 5). It is situated on various steamship lines and on the Intercoastal, the Port Arthur Ship, and the Sabine-Neches canals; has an important trade, being the port of entry of the Sabine district, the foreign commerce of which in 1914–1915 was valued at $30,097,548; it is the oil-refining centre for a vast territory, and there are rice-milling and horticultural interests. Among the noteworthy features of the city are the pleasure piers, parks, Sabine Lake, Port Arthur College, Mary Gates Hospital, and the Federal building. Port Arthur has adopted the commission form of government. Pop., 1900, 900; 1910, 7663; in 1915 it was nearly twice this figure.

PORTA SEBASTIANI, FRANÇOIS HORACE DE LA. See SEBASTIANI, F. H. DE LA PORTA.

PORT-AU-PRINCE, pôr'tō'prăns', or PORT RÉPUBLICAIN. The capital and principal seaport of Haiti, West Indies, situated on the west coast of the island, opposite the island of Gonaïves (Map: West Indies, D 3). It lies in a marshy region and, although well laid out, is in a state of decline and unsanitary. It is built largely of wood and is partly in ruins as a result of the earthquakes of the eighteenth and nineteenth centuries. The principal buildings are the wooden palace, the Senate building, and the cathedral. The town contains also the mint, the customhouse, a lyceum, and a college. It has a United States consul. The harbor is safe and fortified. Pop. (est.), 1909, 100,000.

PORT CARBON. A borough in Schuylkill Co., Pa., 2 miles northeast of Pottsville, on the Schuylkill River and on the Philadelphia and Reading Railroad (Map: Pennsylvania, J 6). It is in a coal-mining region and has ironworks. Pop., 1900, 2168; 1910, 2678.

PORT CASTRIES. See CASTRIES.

PORT CHESTER. A village in Westchester Co., N. Y., 26 miles northeast of New York City, on Long Island Sound and on the New York, New Haven, and Hartford Railroad (Map: New York, B 2). It enjoys considerable popularity as a summer resort and is also a residential suburb of New York. Among the noteworthy features are Monument Park, the Jared V. Peck Memorial Library, the United Hospital, and fine public school and bank buildings. The village has large nut and bolt works, foundries, planing mills, manufactures of shirts, boilers, gas stoves, medical supplies, etc. Port Chester was settled probably as early as 1742, and was known as Saw Pit until 1837, when the present name was adopted. It was incorporated as a village in 1868. Pop., 1900, 7440; 1910, 12,809; 1915 (State census), 15,129.

PORT CLARENCE. See FERNANDO PO.

PORT CLINTON. A village and the county seat of Ottawa County, Ohio, 35 miles by rail east by south of Toledo, on Lake Erie, at the mouth of the Portage River, and on the Lake Shore and Michigan Southern Railroad (Map: Ohio, E 2). It has a fine harbor and is the commercial centre of a region engaged largely in fruit growing. There are also large lime, plaster, and stone interests and manufactories of boats, ice, and crayons. The mining of gypsum, basket making, fishing, and canning are carried on. Pop., 1900, 2450; 1910, 3007.

PORTCUL'LIS (OF. *porte coleïce, porte coulisse*, sliding gate, from *porte*, from Lat. *porta*, gate, and *coleïce, coulisse*, fem. of *coleïs, coulis*, sliding, from Lat. *colatus*, p.p. of *colare*, to flow, to strain, from *colum*, sieve). A frame of iron, or of wood strengthened with iron, made in the form of grating, designed to slide in vertical grooves built in the jambs of the entrance gate of a fortified place, in order to defend the gate in case of assault. The vertical bars were pointed with iron below, and struck on the ground when the grating was dropped. (See CASTLE.) Portcullis is the title of a pursuivant in the English college of arms, whose office was instituted by Henry VII.

PORT DE PAIX, pôr de pâ. A town and port of Haiti, on the Tortuga Channel, 100 miles north of Port-au-Prince, and on the right bank of the Trois Rivières at its mouth (Map: West Indies, D 2). The agricultural interests of the section are largely devoted to coffee. Columbus visited the port in 1492. It was taken by French filibusters in 1665. Pop. (est.), 10,000.

PORTE, SUBLIME PORTE, or OTTOMAN PORTE. The name given to the Turkish government. The origin of this name is to be referred to the ancient Oriental custom of making the gates of cities and of kings' palaces places of assembly in connection with the affairs of government and of the administration of justice. In the Byzantine Empire this custom was adopted, and the term was transferred from the high gate of the Imperial palace to the government whose authority was there exercised. The Turks found the term in common use among the Byzantines some time previous to their establishment at Constantinople, and adopted it on the organization of their Empire. The use, among European nations, of the French term *sublime porte* (lofty gate) is accounted for by the fact that French is the language of European diplomacy. See TURKEY.

PORTE-COCHÈRE, pôrt'-kô'shâr' (Fr. *porte*, door + *coche*, coach). A French term commonly used in English to designate a carriage porch, i.e., a porch or shelter projecting from a building in such fashion as to allow carriages to be driven up to the entrance under cover. The original French term has, however, a quite different meaning. It signifies a door, doorway, and passage arranged to permit carriages to drive through from the street to the interior court. One leaf of the door is usually provided with a smaller opening and door which can be opened for pedestrians when the great main doors are closed.

PORTE CRAYON (Fr., pencil holder). The pseudonym of David H. Strother (q.v.).

PORTE DU THIEL, FRANÇOIS JEAN GABRIEL. See LA PORTE DU THIEL, F. J. G.

PORT ELIZ'ABETH. The largest and most important city of Cape of Good Hope Province next to Cape Town. It is situated on Algoa Bay 400 miles east of Cape Town, on the barren peninsula of Cape Recife (Map: Cape of Good Hope, G 10). It is a well-built city. There are fine, substantial public buildings and large commercial houses. There are also a college and other schools and a botanical garden, the latter irrigated from the city's water supply, which is brought over an aqueduct 28 miles long. The location of Port Elizabeth midway between Cape Town and Durban, and at the nearest point on the coast from Kimberley, with which it is connected by a railroad, gives the town great commercial advantages. The imports in 1914 were valued at $37,322,931, and the exports, chief of which were gold, diamonds, wool, ostrich feathers, and hides, at $15,290,757. Pop., 1911, 30,688 (18,190 whites).

POR'TEOUS RIOT. An uprising in Edinburgh on the night of Sept. 7, 1736. John Porteous, captain of the city guard of Edinburgh, was hated by the populace, and when on April 14, 1736, he superintended the execution of an Edinburgh merchant, Andrew Wilson, who had robbed a customhouse, disturbances were feared, especially since the sympathy of the people was with smugglers and their allies. The mob remained quiet until Wilson was dead, and then some boys and a few adults, as was not unusual on such occasions, began to throw mud and stones. Porteous, without any warning, ordered his soldiers to fire into the crowd, but they were reluctant to do so until he threatened and fired himself. Six or seven persons were killed and 20 wounded. Porteous was brought to trial, found guilty, and condemned to death, although there were great discrepancies in the evidence against him. He, however, petitioned the government, and a reprieve of six weeks was granted. This aroused the people, and some men in disguise forced the jail on the night of September 7, took out Porteous and hanged him. As a result a bill was passed by Parliament which disqualified the provost of Edinburgh from holding any government office in the future, and fined the city £2000 for the benefit of the widow of Porteous. The participants in this riot never were discovered, but it was believed that persons of high social and official standing were connected with it. The plot of Sir Walter Scott's *Heart of Midlothian* turns upon some of the supposed happenings of the Porteous riot. Consult Andrew Lang, *History of Scotland*, vol. iv (New York, 1907).

PORTER. See BEER.

PORTER, ALEXANDER (1786–1844). An American jurist, who remodeled the jurisprudence of Louisiana. He was born near Armagh, Ireland, came to America in 1801, was admitted to the bar in Nashville, Tenn., in 1807, and, removing to St. Martinsville, La., became a member of the Constitutional Convention in 1811. His greatest labor was as judge of the Supreme Court of the State (1821–33), when he helped in the establishment of a new legal code. As a Whig he served in the United States Senate (1834–37). Porter was a friend of the United States Bank scheme and of Texan independence, an advocate of the division of surplus revenues among the States, and an opponent of the abolition of slavery in the District of Columbia. Re-elected to the Senate in 1843, he served there until his death.

PORTER, BENJAMIN CURTIS (1845–1908). An American portrait and figure painter. He was born in Melrose, Mass., was a pupil of Rimmer and Bicknell in Boston, and later studied at different times in Europe, especially in Venice and Paris. He opened a studio in Boston and afterward one in New York, making a specialty of portraits, which in their decorative quality, pose, and arrangement of costume are reminiscent of the French eighteenth-century painters. In tone they are warm and mellow. In 1880 Porter became National Academician. His earlier works include figure pieces such as "Henry V and the Princess Kate" (1868) and "Cupid with Butterflies" (1874). Among his portraits are "Lady with Dog" (1876) and "Boy with Dog" (1884).

PORTER, CHARLES TALBOT (1826–1910). An American mechanical engineer. He was born at Auburn, N. Y., graduated at Hamilton College in 1845, practiced law for several years, and then became an engineer, forming a partnership with John F. Allen to control the Porter-Allen engine. Porter was one of the first to compute the inertia forces of the reciprocating engine mechanism and therefore to use with success high rotative speed in stationary engines. He was the inventor of a central counterpoise governor for steam engines (1859) and of an isochronous centrifugal governor for marine engines (1861) and was the author of *Mechanics and Faith, Spiritual Truths in Nature* (1885), and *Engineering Reminiscences* (1908).

PORTER, CHARLOTTE (?–). An American editor and author, born at Towanda, Pa., and educated at Wells College (A.B., 1875). She was chosen an honorary member of the Browning Society and president of the American Drama Society. She edited *Shakespeareana* (1886–88); the *Ethical Record* (part of 1888); and founded and edited (with Helen A. Clarke) *Poet Lore.* Collaborations of hers with Miss Clarke are: *Poems of Robert Browning* (2 vols., 1896); *Clever Tales from the French, Russian, and Bohemian* (1897); *Browning's Complete Poetical Works* (Camberwell ed., 12 pocket volumes, 1898); *Mrs. Browning's Complete Works* (Coxhoe ed., 6 vols., 1900); *Shakespeare* (Pembroke ed., 12 vols., 1903); *Shakespeare Studies: Macbeth* (1901); *Shakespeare Study Programs: The Tragedies* and *The Comedies* (1914). She was sole editor of *The First Folio Edition of Shakespeare* (40 vols., 1903–11). Among her writings is *Playing Shakespeare's Plays in Shakespeare's Way* (1913).

PORTER, DAVID (1780–1843). An American naval officer. He was born in Boston, Feb. 1, 1780, the son of a naval officer in the Revolution. In 1798, after some experience on merchant vessels, in the course of which he was twice impressed by the British, but each time escaped, he entered the navy as a midshipman. In the following year he served on board the *Constellation* in her fight with the French frigate *L'Insurgente.* Being made a lieutenant in the following year, he served in the war with Tripoli, and in 1803 was captured with the *Philadelphia* and remained a prisoner until peace was made in June, 1805. He was commissioned master commandant in April, 1806; in 1807–10 he served about New Orleans, capturing several French privateers. In 1812 he was promoted captain.

During the first year of the War of 1812, as commander of the frigate *Essex,* 32 guns, he captured several English merchant vessels, a transport, and the corvette *Alert,* 20 guns. In the following February he entered the Pacific, and for almost a year preyed with great success upon the English whale shipping in that ocean. On his own authority Porter took formal possession (November, 1813) of the largest of the Marquesas Islands; in 1842, however, these islands were annexed by France. On this cruise he was accompanied by young David G. Farragut (q.v.), whom he had adopted in 1809. After inflicting much damage upon the enemy, the *Essex* was blockaded in the port of Valparaiso by two English vessels, the *Phœbe,* of 36 guns, and the *Cherub,* of 20 guns. Porter offered to fight either singly, but as this offer was refused, he made an attempt on the 28th of March to get to sea, with the result that in doubling a headland his vessel was struck by a squall, which carried away her fore-topmast and drowned several of her crew. Porter then returned to the harbor and anchored his vessel less than 3 miles from the town and only ½ mile from the shore. Here, disregarding the rules of neutrality, the British attacked her, and after a bloody and unequal conflict of two hours and a half forced her to surrender. Despite the loss of his vessel, however, Porter on his return home was received with great honors.

His career after the close of the war was varied. From 1815 to 1823 he was a member of the new Board of Naval Commissioners. In 1824, being now a commodore, he was sent in charge of an expedition against the West Indian pirates. In the performance of this duty he compelled the Spanish authorities at Fajardo, Porto Rico, to render an apology for an insult to his flag; for this action he was afterward court-martialed and, on the ground that he had exceeded his authority, was suspended from the service for six months. Disgusted with this treatment, he resigned and entered the Mexican navy as rear admiral. He remained in this service until 1829 and then, being dissatisfied with it, resigned. He was soon afterward appointed consul general to the Barbary Powers by President Jackson, and was later transferred as chargé d'affaires to Constantinople, where he died, March 3, 1843. Porter published a *Journal of a Cruise Made to the Pacifick Ocean by the United States Frigate Essex* (1815; 1822); a defense of his conduct at Fajardo (1825); *Constantinople and its Environs* (1835). Consult his son, D. D. Porter (q.v.), *Life of Commodore David Porter* (Albany, 1875).

PORTER, DAVID DIXON (1813–91). An

American admiral. He was a son of Commodore David Porter and was born in Chester, Pa., June 8, 1813. In 1824 he accompanied his father on his expedition against the West Indian pirates, and when his father became admiral of the Mexican navy he entered the same service as a midshipman. While serving under his cousin, Captain David H. Porter, who was in command of a Mexican vessel cruising against Spanish commerce, young Porter took part in a desperate engagement with a much superior Spanish frigate. The vessel on which he was serving was captured, and he was for a short time confined in the guard ship at Havana. Soon after his release he was commissioned a midshipman in the United States navy, and served until 1835 on the European station. Porter became a lieutenant in 1841, and served at the naval observatory in 1845–46. In 1846 he was sent by the Secretary of War on a secret mission to Haiti, and then served with distinction in the Mexican War as a lieutenant and afterward as commanding officer of the *Spitfire*. After the close of that struggle he obtained a furlough, and for some years commanded private passenger steamers.

The Civil War gave Porter the opportunity to distinguish himself. The beginning of that struggle found him a lieutenant on shore duty; in a little more than two years he was a rear admiral in command of a squadron. His first service in the war was to assist, as commander of the *Powhatan*, in the relief of Fort Pickens at Pensacola. Shortly afterward he was advanced to the rank of commander. A little later, largely through his recommendation, Farragut was given command of the West Gulf blockading squadron which was to operate against New Orleans, and Porter was put in charge of the fleet of bomb vessels under him. By Farragut's order Porter, in April, 1862, began a bombardment of Forts Jackson and St. Philip, which guarded the way up the Mississippi, and after six days and nights, in the course of which he threw into them more than 16,000 shells, he reduced them to such a condition that Farragut's fleet was able to pass them and capture New Orleans. Four days later the forts themselves surrendered to Porter. During the next few months he served with great credit in the operations between New Orleans and Vicksburg, his bombardment at the latter place assisting Farragut to run past the forts. In September, 1862, he was put in charge of the Mississippi squadron as acting rear admiral. He improvised a navy yard at Mound City, Ill., and soon increased his squadron of about a dozen effective vessels to more than 120 by converting ordinary river steamers into gunboats. With a part of this fleet he assisted the army in the capture of Arkansas Post in January, 1863, and next succeeded in running past the batteries of Vicksburg and reducing the Confederate forts at Grand Gulf. He then coöperated with General Grant in the siege of Vicksburg, and upon the surrender of that place received the thanks of Congress for "opening the Mississippi," and a commission as rear admiral. In the spring of 1864 he assisted General Banks in the disastrous expedition up the Red River, and it was only by the greatest exertions that he succeeded in saving his vessels. (See BAILEY, JOSEPH.) In the same year he was put in command of the North Atlantic blockading squadron. While in this command his most important service was in coöperating in the capture of Fort Fisher, which was taken by assault on the 15th of January, 1865, after a long and destructive bombardment by his fleet. For this service he again received the thanks of Congress.

After peace came he served from 1865 to 1869 as superintendent of the Naval Academy at Annapolis, and did much to increase the efficiency of that institution. In 1866 he was promoted to be vice admiral, and in 1870, on the death of Farragut, was advanced to the highest of all naval ranks, that of admiral. He died in Washington, Feb. 13, 1891.

Admiral Porter wrote a life of his father (1875); *Incidents and Anecdotes of the Civil War* (1885); *History of the Navy in the War of the Rebellion* (1887); two novels, *Allan Dale and Robert le Diable* (1885) and *Harry Marline* (1866); a posthumous novelette, *A Romance of Gettysburg*, which appeared in the *Criterion* for 1903; and articles for various publications.

Consult: Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887); J. E. Homans, *Our Three Admirals: Farragut, Porter, and Dewey* (ib., 1899); J. R. Soley, *Admiral Porter*, in the "Great Commanders Series" (ib., 1903).

PORTER, ENDYMION (1587–1649). An English Royalist. He was brought up in Spain, entered the service of the Duke of Buckingham, and became a groom of the bedchamber to Charles I. He accompanied Charles on his expedition to Spain in 1623, and was the faithful follower of the King during the Civil War. A member of the Long Parliament, Porter voted against Stafford's attainder, and later (1643) was expelled. From 1645 to 1649 he lived in France and the Netherlands. He was employed by Charles I in forming his great art collection, and was a friend and patron of the poets of his day.

PORTER, FITZ JOHN (1822–1901). An American soldier. He was born at Portsmouth, N. H., Aug. 31, 1822, graduated at West Point in 1845, and was assigned to the artillery, in which he became second lieutenant the following year. He served in the war with Mexico from the beginning, was wounded in the attack on the city of Mexico, Sept. 13, 1847, and was brevetted captain and major for gallantry in the battle of Molino del Rey and the storming of Chapultepec, respectively. After the war he was sent to West Point, where he served as adjutant of the post and as instructor of artillery and cavalry. In 1856 he was transferred to the Adjutant General's Department, and was assistant adjutant general of the Utah expedition under Albert Sidney Johnston in 1857. On May 14, 1861, he received the appointment of colonel of the Fifteenth Infantry, was made brigadier general of volunteers in the same month, and served as chief of staff with General Banks and General Patterson until August, when he was put in command of a division in the Army of the Potomac. He had charge of the siege operations against Yorktown during the Peninsular campaign, acted as military governor of the place for a time after its evacuation, and was then given the command of the Fifth Army Corps, which fought the battles of Mechanicsville and Gaines's Mill and bore the brunt of the fight at Malvern Hill. He was appointed brevet brigadier general in the regular army for gallantry at the battles of the Chickahominy, and on July 4, 1862, was commissioned major

general of volunteers. At the second battle of Bull Run his failure to move forward on the first day of the engagement led to his trial by court-martial on the charge of disobeying the orders of General Pope. He was found guilty and was cashiered and disqualified from holding any position of trust or profit under the United States government. The justice of the punishment was a subject of much controversy, and numerous attempts were made to secure a reversal of the verdict.

In June, 1878, a board of officers convened at West Point, by order of the President, to examine the evidence and to consider the findings of the court-martial. This board reported that, in the opinion of those forming it, justice required at the hands of the President of the United States "such action as may be necessary to annul and set aside the findings and sentence of the court-martial in the case of Major General Fitz John Porter, and to restore him to the position of which that sentence deprived him, such restoration to take effect from the date of his dismissal from office." This report was signed by the entire board, including Major General J. M. Schofield, Brigadier General Alfred H. Terry, and Brevet Major General George W. Getty. The report was laid before the House Committee on Military Affairs, and a majority of the committee, in January, 1881, reported a bill restoring him to his rank of major general in the United States army and requiring the Secretary of the Treasury to pay to him the sum of $75,000. The bill for his relief failed to pass, but President Arthur in 1882 remitted the disqualifying clause in his sentence. In 1886 a bill for his restoration to the army with the rank of colonel, but without back pay, was approved by the President, and soon afterward General Porter was retired.

After his return from the army General Porter engaged in business in New York City, where he afterward held several municipal offices, among them that of police commissioner and commissioner of the fire department. Until his death, which occurred May 21, 1901, at Morristown, N. J., he considered that he had been deeply wronged. Consult for the case against Porter, Cox, *The Second Battle of Bull Run as Connected with the Fitz John Porter Case* (Cincinnati, 1882); for a brief statement of the case in his favor: an article by Gen. U. S. Grant in *North American Review*, vol. cxxxv (New York, 1882); also Lord, *A Summary of the Case of F. J. Porter* (San Francisco, 1883).

PORTER, Gene Stratton (1868–). An American author and ornithologist, born in Wabash Co., Ind. In 1886 she was married to Charles Darwin Porter. She worked two years in the camera department of *Recreation*, two years on the natural-history staff of *Outing*, and four years for the *Photographic Times Annual Almanac*. Mrs. Porter used her own photographs in illustrating her books on birds. Some of her novels were widely popular. She wrote: *The Song of the Cardinal* (1902); *Freckles* (1904); *What I Have Done with Birds* (1907); *At the Foot of the Rainbow* (1908); *A Girl of the Limberlost* (1909); *Birds of the Bible* (1909); *Music of the Wild* (1910); *The Harvester* (1911); *Moths of the Limberlost* (1912); *Laddie* (1913); *Michael O'Halloran* (1915).

PORTER, Henry. An English dramatist who, alone or in collaboration with Ben Jonson, Chettle, or others, wrote plays for Philip Henslowe (q.v.) from 1596 to 1599. The only one extant is *The Pleasant Historie of the Two Angrie Women of Abington* (1599), which Lamb declared as good as *The Taming of the Shrew*. Edited by Havelock Ellis, it appeared in the volume *Nero and Other Plays*, in the "Mermaid Series" (1888), and, edited by C. M. Gayley, in *Early Comedies* (1903).

PORTER, Horace (1837–). An American soldier and diplomat. He was born at Huntingdon, Pa., studied for a year at the Lawrence Scientific School, Harvard, then entered West Point, where he graduated in 1860, and a year later was commissioned first lieutenant and detailed for duty as ordnance officer of the Port Royal Expeditionary Corps. At the reduction of Fort Pulaski, Ga. (April 10–11, 1862), he was the chief of ordnance and artillery, and by his gallantry earned the brevet rank of captain. In the attack on Secessionville, S. C. (June 16, 1862), he was wounded, but was able to act as chief of ordnance in the transfer of the Army of the Potomac from Harrison's Landing, Va., to Maryland, after the Peninsular campaign of 1862. He was then assigned to duty in the West, and participated in the Tennessee campaign (June 24–Nov. 1, 1863), during which he fought at the battle of Chickamauga and took part in the defense of Chattanooga. On April 4, 1864, he was promoted lieutenant colonel and was assigned to the staff of General Grant, with whom he remained until July 25, 1866, taking part in all the battles of the Richmond campaign until the surrender at Appomattox Courthouse. On March 13, 1865, he received the brevet rank of brigadier general in the regular army. After the war, when General Grant was for a few months in 1867 Secretary of War, Porter became his assistant, and when Grant was elected to the presidency Porter became his private secretary. In 1873 he resigned from the army to become vice president of the Pullman Car Company, and during the following years he filled executive positions on several railroads. In 1897–1905 he was Ambassador to France. During his ambassadorship General Porter interested himself in ascertaining the burial place of John Paul Jones, and finally found the body of the admiral in the old St. Louis churchyard in Paris on April 14, 1905. The body was conveyed to the United States by government war vessels, and was buried at Annapolis. General Porter's writings include: *West Point Life* (1866); *Campaigning with Grant* (1897); and the articles on "Five Forks and the Pursuit of Lee" and "The Surrender at Appomattox Court House," in *Battles and Leaders of the Civil War* (1887).

PORTER, James (1753–98). An Irish clergyman and author, the son of a poor farmer. He was born near Ballindrait in the County of Donegal. Leaving his father's farm, he taught school, and later studied for the Presbyterian ministry at Glasgow. In 1787 he was ordained minister at Greyabbey in the County of Down. For the Belfast *Northern Star*, a newspaper founded by Samuel Neilson in the interests of the Society of United Irishmen, Porter wrote several patriotic songs (1794), republished as *Paddy's Resource*, and the famous seven letters by "A Presbyterian," reprinted as *Billy Bluff and Squire Firebrand* (1796). These brilliant satires eventually cost Porter his life. On the

outbreak of the rebellion in 1798 he was, without fair trial, convicted of treason and hanged.

PORTER, JAMES (1808–88). An American Methodist Episcopal minister. He was born at Middleboro, Mass., and joined the New England conference in 1830. He was elected one of the agents of the Methodist Book Concern in 1856 and reëlected in 1860 and 1864; was secretary of the National Temperance Society in 1868–82; member of the board of overseers of Harvard University in 1852–55; trustee of Wesleyan University in 1855–71. He wrote a number of religious works.

PORTER, JANE (1776–1850). An English novelist, born in Durham. She was educated in Edinburgh, and lived with her mother and sister till their death at Esher in Surrey, where she passed her last years. In her childhood she was often visited by young Walter Scott, who delighted her with fairy tales and stories of the border. Her first work, *Thaddeus of Warsaw* (1803), was extremely popular and secured her a complimentary letter from Kosciuszko and election into the Teutonic Order of St. Joachim. In 1810 she published *Scottish Chiefs,* dealing with the times of Bruce and Wallace. This book was translated into German and Russian and won European fame. It is by far the best historical romance before Scott. She composed with her sister Anna Maria, *Tales Round a Winter Hearth* (1826) and *The Fields of Forty Footsteps* (1828). Her last novel, *Sir Edward Seaward's Diary* (1831), purporting to be founded on fact, created a great sensation.

PORTER, JERMAIN GILDERSLEEVE (1852–). An American astronomer, born at Buffalo, N. Y. He graduated in 1873 from Hamilton College, to which, after a year at Berlin, he returned as assistant professor of astronomy (1875–78). Porter was a member of the United States Coast and Geodetic Survey from 1878 to 1884, when he became director of the Cincinnati Observatory and professor of astronomy in the city's university. In 1894 he received the *Astronomical Journal* comet prize. His publications include, besides numerous catalogues of stars: *Our Celestial Home* (1888); *Charts and Measures of Nebulæ* (1891); *Historical Sketch of Cincinnati Observatory* (1893); *The Stars in Song and Legend* (1901); *Variation of Latitude* (1908).

PORTER, NOAH (1811–92). An American professor of philosophy and college president, born at Farmington, Conn. After graduating at Yale in 1831 he was for a short time rector of the Hopkins Grammar School and subsequently was a tutor in Yale College. He then entered the Congregational ministry, and was successively a pastor in New Milford, Conn. (1836), and in Springfield, Mass. (1843–46). In 1846 he became the first incumbent of the Clark professorship of metaphysics at Yale, a position he held until his death. In the winter of 1853–54 he studied in the University of Berlin. From 1871 to 1886 he was president of Yale. His principal publications are textbooks on *The Human Intellect* (1868) and on *The Elements of Moral Science* (1885). He was also the editor in chief of two quarto editions of Webster's Dictionary (1846, 1890). His minor works included: *Books and Reading* (1870); *Science of Nature vs. Science of Man* (1881); *Science and Sentiment* (1882); a commemoration of *Bishop Berkeley* (1885). After his death the tributes to his memory by some of his friends and colleagues were printed in a small volume.

One of the sisters of President Porter, Miss SARAH PORTER (1813–1900), established and maintained in Farmington, Conn., a school for girls which acquired a wide reputation. A brother, SAMUEL PORTER, spent his life as one of the professors in the Gallaudet College for Deaf Mutes in Washington, and wrote the guide to pronunciation for the edition of Webster's Dictionary of 1890.

PORTER, PETER BUEL (1773–1844). An American political leader and soldier, born at Salisbury, Conn. He graduated at Yale in 1791, and after 1795 practiced law, first at Canandaigua, N. Y., and then at Black Rock, now part of the city of Buffalo. He was elected a Democratic member of Congress in 1808, and there became a conspicuous advocate of internal improvements. He was reëlected in 1810, and for a time was chairman of the Committee on Foreign Relations. As such he wrote the report in 1811 which advised hostilities with Great Britain. At the outbreak of the War of 1812 he resigned his seat in Congress and led a body of New York and Pennsylvania volunteers to the Niagara frontier, where he joined the forces under Gen. Alexander Smyth. Porter soon became disgusted with his superior's management of the expedition, and charged him with being a coward. This led to a bloodless duel on Grand Island. Afterward, when Gen. Jacob Brown (q.v.) led the Americans into Canada, Porter commanded one of three brigades into which the army was divided, and participated in the battles of Chippewa and Lundy's Lane and the siege of Fort Erie. In 1815 he again entered Congress, and served until the following year, when he was appointed one of the commissioners under the Treaty of Ghent to determine the northwestern boundary. In 1828 he became Secretary of War in John Quincy Adams's cabinet, and served until the end of the administration a year later. He was a member of the first Erie Canal Commission.

PORTER, ROBERT PERCIVAL (1852–). An American journalist, born at Norwich, England. He emigrated to the United States, and in 1872 was one of the original staff of the Chicago *Inter-Ocean,* devoting his attention chiefly to economic questions. He made reports for the tenth census, and in 1882 was appointed a member of the Tariff Commission. The New York *Tribune* and the Philadelphia *Press* sent him to Europe to study industrial conditions, and in 1887 he joined Frank Hatton in founding the New York *Press.* From 1890 to 1894 he was superintendent of the eleventh census. In 1904 he joined the staff of the London *Times.* Later he was commissioned to investigate economic conditions in Japan, Cuba, and Porto Rico. He published: *The West in 1880* (1882): *Breadwinners Abroad* (1885); *Free Trade Folly* (1886); *Commerce and Industry of Japan* (1896); *Life of William McKinley* (1896); *Industrial Cuba* (1899); *Lectures and Addresses on Municipal Ownership* (1903); *Dangers of Municipal Ownership* (1907); *The Full Recognition of Japan* (1911).

PORTER, SYDNEY WILLIAM. See HENRY, O.

PORTER, THOMAS CONRAD (1822–1901). An American botanist. He was born at Alexandria, Pa., graduated at Lafayette College in 1840 and at Princeton Theological Seminary in 1843, and preached for five years. In 1848 he was

appointed to the chair of natural science in Marshall (later Franklin and Marshall) College, and in 1866 became professor of botany in Lafayette College. Porter retired from active duties in 1897, but remained curator of the botanical collections and dean of the Pardee Scientific School. He wrote several essays on Finnish literature and published: *Sketch of the Flora of Pennsylvania* (1872); *Sketch of the Botany of the United States* (1873); *Synoptical Flora of Colorado* (1874), with J. M. Coulter; *The Carices of Pennsylvania* (1887); *The Grasses of Pennsylvania* (1893).

PORTER, WILLIAM DAVID (1809–64). An American naval officer, son of Commodore David Porter and brother of Admiral David D. Porter, born at New Orleans, La. He entered the United States navy as a midshipman in 1823, rose to the rank of lieutenant in 1833, was placed on the reserved list in 1855, but in 1859 was restored to active service with the rank of commander. He saw service in the Mexican War, organized the United States lighthouse system, and after the outbreak of the Civil War commanded the ironclad *Essex* on the Mississippi. He took part in the capture of Forts Henry and Donelson, ran the gantlet of the Confederate batteries from Cairo to New Orleans, fought two engagements with the Confederate ram *Arkansas*, destroying her in the second (Aug. 6, 1862), and later in the same year shelled the batteries at Natchez, Vicksburg, and Port Hudson. He was promoted to the rank of commodore on July 16, 1862.

POR'TERSVILLE. A city in Tulare Co., Cal., 30 miles southeast of Visalia, on the Southern Pacific Railroad (Map: California, F 6). It is situated in a region producing citrus and deciduous fruit, olives, alfalfa, cattle, berries, etc., which it ships in large quantities, the annual shipment of citrus alone being about 5000 carloads for the district. There are also some lumber and mining interests, granite and marble works, canneries, creameries, and a cement-pipe plant. Portersville has a Carnegie library, high school, three parks, and a municipal water system. Pop., 1910, 2696.

PORTE SAINT-DENIS, pôrt săn'de-nē'. An arch on the Boulevard Saint-Denis in Paris, erected from designs by Blondel in 1672 to commemorate the victories of Louis XIV in Holland and on the lower Rhine, typified by a dead lion and a river god of the Rhine at the base of the arch. It is 81 feet in height, 82 in width, and 16 in thickness, with a single archway 50 feet high.

PORTE SAINT-MARTIN, săn'-mär'tăn'. A triumphal arch at the intersection of the Boulevard Saint-Martin with the Rue Saint-Martin, Paris, built in 1674 by P. Bullet in honor of Louis XIV. It is 57 feet in height and has three archways.

PORTFO'LIO, THE. A periodical edited in Philadelphia from 1801 to 1812 by Joseph Dennie. Among the contributors were Charles Brockden Brown and John Quincy Adams, whose *Letters from Silesia* appeared in it.

PORT GLASGOW, glăs'gō, *or* -kō. A seaport in Renfrewshire, Scotland, on the Clyde, 2 miles east of Greenock and 17 miles west-northwest of Glasgow (Map: Scotland, D 4). It was founded in 1668 by the magistrates of Glasgow as a harbor for the ships that belonged to or traded with their city, the Clyde at Glasgow being inconveniently shallow. Port Glasgow is a well-built town. The principal buildings are the townhouse and the customhouse. It has extensive manufactures of sail ropes and chain cables, and there are sugar refineries, foundries, ship-building yards, commodious quays, and an extensive wet dock. The municipal industries include the gas and water works, abattoirs, baths, and washhouses. A free library, an orphanage, and a cemetery are maintained. Pop., 1901, 16,840; 1911, 17,775.

PORT HOPE. A town, port of entry, and the capital of Durham County, Ontario, Canada, 60 miles east of Toronto, on Lake Ontario and on the Grand Trunk, Canadian Northern, and Canadian Pacific railroads (Map: Ontario, G 6). Situated in a beautiful valley on a fine harbor, the town is a popular summer resort, and has steamship connection with Rochester, N. Y., Toronto, and Montreal. The town is the seat of Trinity College School for boys, and has a public library, an opera house, and two parks. The industrial establishments include iron sewer pipe and connecting works, greenhouses, flour and planing mills, machine shops, preserving and canning works, tanneries, and manufactories of plumbers' supplies, leather, pottery, red brick, carriages, rubber, wooden and steel mats. Pop., 1901, 4188; 1911, 5092.

PORTHOS, pôr'tôs'. One of the three guardsmen in Dumas's "Three Musketeers" romances. He is gigantic in size, boastful, vain, and indiscreet, but lovable for the honest simplicity of his character.

PORT HUD'SON. A small village in Louisiana, on the eastern bank of the Mississippi River, about 135 miles above New Orleans, situated at the outward angle of an abrupt bend of the river. In 1862, during the Civil War, the Confederates constructed formidable batteries for a distance of 3 miles along the high bluffs around Port Hudson, and thus secured effectual control of the river at this point. In the spring of 1863 General Banks, with a large Federal force, proceeded against the position, and after trying ineffectually to turn it on the west, invested it on March 26, Admiral Farragut having previously, on the night of March 14–15, run by the batteries with two vessels of his fleet, the *Hartford* and the *Albatross*, and thus secured the control of the river both above and below Port Hudson. This control, however, was bought at the cost of one vessel, the *Mississippi*, destroyed, and four vessels, which had been forced to turn back, disabled. On March 27 Banks made a determined but unsuccessful assault, and on the following day began a regular siege. On June 14 another unsuccessful assault was made, and then the siege continued until early in July, when a third assault was planned. On July 7, however, news of the surrender of Vicksburg to General Grant was received, and on the following day General Gardner, in command of the Confederates, agreed upon terms of surrender, a Federal force taking possession on the 9th. The Federal attacking force numbered altogether about 20,000, though its effective strength never exceeded about 13,000. Of these 707 were killed, 3336 were wounded, and 319 were reported missing. The Confederate garrison numbered about 7500, of whom about 700 were killed or wounded, 500 were reported missing, and 6340 were surrendered. The capture of Vicksburg and Port Hudson secured to the Union the control of the Mississippi. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iii (New York, 1887).

PORT HU'RON. A city and the county seat of St. Clair Co., Mich., 60 miles northeast of Detroit, on Lake Huron, at the head of the St. Clair River, and on the Pere Marquette and the Grand Trunk railroads (Map: Michigan, G 6). It has also steamboat connection with Detroit, Chicago, Duluth, and other lake and river ports. The city is built on both sides of the Black River, which here flows into the St. Clair. A railroad tunnel under the St. Clair River connects with Sarnia, Canada; it is more than a mile in length. Port Huron has acquired considerable reputation as a summer resort, owing to its mineral water and lake site, but is greater as a manufacturing, shipping, and commercial centre. There are a Carnegie library, a public hospital and home, and several public parks. The city has many notable edifices, including the Federal government building, city hall, United States customhouse, county courthouse, and two Maccabee temples, besides a number of business buildings.

Port Huron is a port of entry, and controls a large commerce with Canada. Its total foreign trade for the year ending June 30, 1915, consisted of exports valued at $36,855,761 and imports valued at $8,051,029. It has a large dry dock and shipyard. Among the many other industrial establishments are railroad shops of the Grand Trunk, foundries, boiler and engine works, farm-machinery works, and manufactories of brass goods and automobile engines. The city has adopted the commission form of government. A French fort was established here in 1686 by Duluth and maintained for two years. In 1814 Fort Gratiot was built on the same site by the United States and maintained until 1879. Port Huron was organized as a village under its present name in 1849, and was chartered as a city in 1857. Pop., 1900, 19,158; 1910, 18,863.

PORTIA, pôr'shī-à. A rich heiress in Shakespeare's *Merchant of Venice.*

PORTICI, pôr'tē-chē. A town in the Province of Naples, Italy, situated on the Bay of Naples and on the slope of Vesuvius, 5 miles by rail southeast of Naples (Map: Italy, F 1). Its environs abound in fine villas. The castle built by Charles III in 1738 contains a school of agriculture. The town has a Gymnasium and a lyceum. The inhabitants are engaged in fisheries and in the weaving of silk. Portici has been several times destroyed by lava and rebuilt. Immediately adjoining the town are the ruins of Herculaneum. Pop. (commune), 1901, 14,538; 1911, 14,329.

POR'TICO (It. *portico,* from Lat. *porticus,* porch, gallery, from *porta,* gate). A covered space with a roof supported by one or more rows of columns and open on one or more sides. It is usually attached to an important building, but is sometimes detached as a shady walk. A portico is called tetrastyle, hexastyle, octostyle, and decastyle, according as it has 4, 6, 8, or 10 columns in front. The term is used to designate the space all around the cella of a Greek peripteral temple or of that in the front and rear of a temple *in antis.*

POR'TION (Lat. *portio,* share; connected with *pars,* part, *parare,* to prepare, Gk. ἔπορον, *eporon,* I prepared). A share of a parent's property or estate, or that of a person standing *in loco parentis,* which is devised or bequeathed by will, or descends to a child, or which is given to him by the parent during the lifetime of the latter and is intended to be a final provision for the child in case of the parent's death. The word "portion" has no special technical signification in the law to-day except where property is given to children by way of advancement, as a marriage portion, by which the parent anticipates the probable amount the child would receive in case of the parent's death. See ADVANCEMENT; DESCENT; INHERITANCE; WILL.

PORT JACKSON SHARK. One of the small cestraciont sharks of Australian and South Pacific seas, of which the principal species (*Cestracion philippi*) is common about the southern shores of Australia and takes its name from one of the harbors. The egg is very curious, consisting of a conoid leathery case, around which is wound spirally a broad flange, and two horny tendrils serve to attach it to some support. See CESTRACIONT; and Colored Plate of FISHES OF THE PHILIPPINES, accompanying article PHILIPPINE ISLANDS.

EGG CASE OF A CESTRACIONT SHARK.

PORT JER'VIS. A city in Orange Co., N. Y., 88 miles by rail northwest of New York City, on the Erie and the New York, Ontario, and Western railroads (Map: New York, A 1). It is picturesquely situated at the confluence of the Delaware and Navesink rivers and at the junction of the boundary lines of New York, New Jersey, and Pennsylvania. A popular summer resort, the city is of equal importance as the railway station for a considerable territory much frequented in summer and widely celebrated for beautiful scenery, many waterfalls contributing to its picturesqueness. Port Jervis has a large public library, St. Mary's Orphan Asylum, a public hospital, an Elks home, a fine Federal building, and a soldiers monument. Among the industrial plants are the Erie Railroad shops, foundries, silver-plating works, glass, stove, trousers, shoe, saw, glove, harness, underwear, and silk factories, etc. Pop., 1900, 9385; 1910, 9564; 1915 (State census), 9413.

PORT'LAND. A town in Middlesex Co., Conn., on the Connecticut River, opposite Middletown, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, E 3). The manufacture of governors for engines and the quarrying of brownstone are the chief industries. Pop., 1900, 3856; 1910, 3425.

PORTLAND. A city in La Salle Co., Ill. Pop., 1910, 3194.

PORTLAND. A city and the county seat of Jay Co., Ind., 49 miles south-southeast of Fort Wayne, on the Salamonie River and on the Lake Erie and Western, Grand Rapids and Indiana, the Muncie and Portland, and the Cincinnati, Bluffton, and Chicago railroads (Map: Indiana, H 4). It has a Carnegie library and handsome public buildings. The city is in an agricultural region which possesses a supply of natural gas. There are various manufactures, including automobile wheels, foundry and machine-shop products, creamery products, baseball bats, butter tubs and cases, spokes, handles, brick, flour, etc. Pop., 1900, 4798; 1910, 5130.

PORTLAND. The largest city and commercial metropolis of Maine, the county seat of Cumberland County, situated on Casco Bay, 108

miles north by east of Boston (Map: Maine, B 5). It is the terminus of the Maine Central, the Boston and Maine, and the Grand Trunk railroads, and of numerous coastwise steamship lines, notably those to Boston, New York, and St. John, New Brunswick. It is also the winter port of several transatlantic lines. The harbor, spacious, deep, and secure, is one of the finest on either coast. Portland is one of the strongest fortified ports in the United States, Its defenses, extensive and thoroughly modern, include Fort Preble (q.v.), Fort Williams on Portland Head, Fort Levett on Cushing's Island, Fort McKinley on Great Diamond Island, and Fort Lyon on Cow Island. Forts Scammel and Gorges, strongly built of granite, are out of date, and serve only to enhance the picturesqueness of the harbor.

Portland occupies a site of great natural beauty on an elevated peninsula extending into Casco Bay, which is dotted with wooded islands; many of these are popular summer resorts. The city itself is widely known as a resort, and offers easy access to numerous watering places and beaches, notably that of Old Orchard. Several suburban trolley lines afford ready transportation, while the street-railway service ranks with the best in the country. Steam lines belt the city proper, and a marginal road extends along the water front of the business section. Portland is more than 18 square miles in area. It is laid out with considerable regularity, and the fine shade trees lining its streets have given it the name of the Forest City. The public-park system of 113 acres includes Deering Oaks, Lincoln Park, Fort Allen and Fort Sumner Parks, Monument Square with a soldiers and sailors monument, and the Eastern and Western promenades. These promenades and the observatory on Munjoy Hill command magnificent views of the city and its waters and of the adjacent country, bounded by the White Mountains of New Hampshire 70 miles inland. On the south slope of Munjoy is the Eastern Cemetery, the burial place of persons historically prominent. The house in which the poet Longfellow was born and the Wadsworth Mansion in which he afterward lived are still standing. A bronze statue of the poet and also a statue of Thomas B. Reed are features of the city. Among the fine buildings are the city hall, of Maine granite, costing nearly $1,000,000 and housing a municipal organ, one of the largest in the country; the Federal and the county courthouses; the Masonic Building; the Fidelity office building; the Exposition Building; the home office building of the Union Mutual Life Insurance Company; the Sweat Memorial Art Building; the Public Library, containing over 70,000 volumes; the building of the Maine Historical Society; and several fine churches. Institutions worthy of mention are the Maine Medical School, connected with Bowdoin College at Brunswick; the Maine General Hospital; the Maine Eye and Ear Infirmary; the United States Marine Hospital; the Children's Hospital, a very finely equipped orthopedic institution; and State schools for the deaf and for the blind. The fine steel and concrete bridge, under construction in 1915, across the harbor to South Portland will cost nearly $1,000,000.

Portland has always been noted for its commercial interests. In Colonial days and until long afterward it had a large trade with the West Indies. Later it sent out hundreds of fishing vessels. It still does a considerable coastwise business, and imports much coal, sulphur, China clay, and pulp wood. Possessing two large elevators, it exports millions of bushels of grain and large quantities of other foodstuffs, as well as live stock, chiefly to Liverpool, London, and Glasgow. It is the greatest manufacturing centre in northern New England. Among its products are lumber and lumber manufactures, stoneware, structural iron, elevators, printers' machinery, gas and marine engines, boilers, stoves, wire screens, furniture, white lead and paints, canned goods, boots and shoes, hats, clothing, chewing gum, mineral and soda water, and laboratory products.

The government of the city is vested in a mayor, elected annually, a bicameral council, and the usual administrative officials. The school board, chosen by popular vote, elects the superintendent of schools.

Pop., 1800, 3822; 1850, 20,815; 1870, 31,413; 1890, 36,425; 1910, 58,571; 1915 (U. S. est.), 63,014.

Portland was settled by two Englishmen, George Cleves and Richard Tucker, in 1632, and until 1658, when its name was changed to Falmouth, was known as Casco Neck. In 1676 and again in 1690 it was completely destroyed by Indians, and all its inhabitants were massacred or captured. It was resettled in 1715, was bombarded and burned by a British fleet in 1775, was incorporated as a town under its present name in 1786, and was chartered as a city in 1832. On July 4, 1866, a fire consumed 1500 buildings, causing a loss of about $10,000,000. Longfellow, N. P. Willis, Commodore Preble, Neal Dow, and Thomas B. Reed were natives of Portland. Consult: William Willis, *History of Portland* (2d ed., Portland, 1865); Neal, *Portland* (ib., 1874); Goold, *Portland in the Past* (ib., 1886).

PORTLAND. The largest city in Oregon and the county seat of Multnomah County, an important commercial and industrial centre. It is situated on both sides of the Willamette River, at its confluence with the Columbia River, about 115 miles from the Pacific Ocean, 52 miles north-northeast of Salem, the State capital, and 774 miles north by east of San Francisco (Map: Oregon, C 2). It is built on slopes rising gradually from the river banks into wooded hills, with tall mountains in the distance—a site of great natural beauty. In the vicinity are numerous picturesque waterfalls; and Council Crest, in the western part of the city, commands a superb view of the distant mountains and the valleys of the Columbia and the Willamette.

The city has an area of 70 square miles, and is well laid out. There are a park system of more than 360 acres, a city zoo, and the finest sunken gardens in the United States. Among the noteworthy structures in Portland are the city hall, post office, courthouse, Portland library, high schools, and many large office buildings ranging from 10 to 15 stories high. The medical department of the State University is in Portland, and there are several well-known preparatory schools. The Portland Public Library contains 218,346 volumes. The city has a number of charitable institutions, of which St. Vincent's and Good Samaritan hospitals are the best known. Other features of interest are two handsome fountains, 25 bronze drinking

fountains, historical statues in city parks, and five big steel bridges spanning the Willamette River. It is likewise the seat of Reed College, with a $2,000,000 endowment.

Portland has exceptional advantages for a commercial centre, having in its exclusive trade district 154,000 square miles. Situated at the head of ocean navigation on the waterway formed by the Columbia and the Willamette, it possesses a fresh-water harbor (the only large one on the Pacific coast) commodious and accessible for the largest ships. Its port is the terminus of several ocean and coastwise steamship lines; and in the large union station seven great railroad systems terminate—the Great Northern, Northern Pacific, Southern Pacific, Union Pacific, Chicago, Burlington, and Quincy, Canadian Pacific, Chicago, Milwaukee, and St. Paul.

The tributary region, rich in timber and in agricultural and mineral resources, is one of the most productive in the United States, though but partly developed. In 1914 the foreign commerce of the port was valued at $18,366,920, the exports, principally grain, flour, and lumber, constituting a very large proportion of this total. The foreign trade is carried on chiefly with Great Britain, its possessions, and the Orient. Portland is highly important also as a distributing point, its wholesale and jobbing trade in 1914 amounting to about $200,000,000. Its industrial interests are extensive and are growing fast, representing during the calendar year 1914 an invested capital of $30,000,000 and having a production valued at $47,000,000. The manufactures are favored by the power obtained from the Willamette Falls at Oregon City (q.v.), 12 miles distant. This power, electrically transmitted to Portland, is utilized also for lighting and for the operation of street railways.

The leading manufactures include lumber and timber products, flouring and gristmill products, and the output of slaughtering and meat-packing plants. There are also bag factories, creameries, clothing factories, establishments for the roasting and grinding of coffee and spices, foundries and machine shops, including stove foundries, ironworks, manufactories of sashes and blinds, furniture factories, paint works, saddlery and harness factories, ship and boat building yards, soap and candle works, fruit drying and canning establishments, and bottling houses. A large floating dry dock, constructed in 1903, accommodates the largest vessels.

The government is vested in five commissioners, one of whom is mayor, elected every four years, all other city officials being appointed by the commission, except the auditor. The school board, however, is chosen by popular vote. Portland spent in 1914 in maintenance and operation $1,736,295: for fire department, $553,914; for the police department, $398,254; for the care of streets, $574,621; including lighting, $209,000. The net debt of the city in 1914 was $16,169,100; the assessed valuation of property, $307,918,080.

Portland was founded in 1845 by F. W. Pettygrove and A. L. Lovejoy. It was named by the former in honor of Portland, Me., and was chartered as a city in 1851. It suffered severely from fire in 1872 and 1873, the loss in the latter year having been about $1,350,000. Portland has had an exceedingly rapid growth, as indicated by the following figures of population: 1850, 821; 1870, 8293; 1890, 46,385; 1910, 207,214; 1915 (U. S. est.), 272,833. Consult Joseph Gaston, *Portland, Oregon: Its History and Builders* (3 vols., Chicago, 1911).

PORTLAND, DUKES OF. The English family of Cavendish-Bentinck has borne the title of Duke of Portland since 1716, when it was conferred by King William III upon HENRY BENTINCK (1682–1726), son and heir of WILLIAM BENTINCK (1649–1709), first EARL OF PORTLAND. Henry's grandson, WILLIAM HENRY, the third duke (1738–1809), son of William, the second (1709–62), was twice Prime Minister of England (1783, 1807–09). The fourth in the line was another William Henry (1768–1854), whose son, WILLIAM JOHN, the fifth duke (1800–79), built the famous underground ballroom, halls, and passages at Welbeck Abbey. Never married, he was eccentric and a recluse. His secluded habits gave rise to stories of his alleged double life, out of which grew the celebrated Druce Case. This involved a claim to the Portland title and estates by Mrs. Anna Maria Druce in behalf of her son, the grandson of Thomas Charles Druce, on the ground that the latter and the duke were one and the same person. A history of the case is given in Charles Archard, *Portland Peerage Romance* (2d ed., London, 1913). The fifth duke was succeeded by his cousin, WILLIAM JOHN ARTHUR (1857–). The owner of about 183,200 acres, with large holdings in London, he was one of the group against whom Lloyd-George (q.v.) directed his land-reform proposals in 1913. His heir, the Marquis of Titchfield, was born in 1893. See also BENTINCK.

PORTLAND, ISLE OF. A rocky peninsula projecting into the English Channel from the shore of Dorsetshire, 17 miles west of St. Alban's Head (Map: England, D 6). Its island character has been lost by connection with the mainland by Chesil Bank, a wave-built ridge of loose shingle. It is famous for its stone, of which some of the finest buildings in London are built, among them St. Paul's Cathedral. It contains a number of historic castles, such as Portland Castle, built by Henry VIII in 1520; Pennsylvania Castle, erected by a grandson of William Penn; and Bow and Arrow Castle, supposed to have been built by William Rufus. The peninsula is strongly fortified, and there is a huge convict prison with accommodations for 1500 prisoners, built in 1848. The Portland Breakwater (see BREAKWATER) affords a safe harbor of refuge. Pop., 1901, 15,202; 1910, 17,011.

PORTLAND CANAL. A long and narrow fiord indenting the west coast of North America northeast of Queen Charlotte Islands (Map: British Columbia, B 2). It extends northeastward for about 80 miles inland, is very deep, and is inclosed by precipitous cliffs and by mountains from 3000 to 6000 feet high. It forms the extreme southern boundary of Alaska, which it separates from British Columbia.

PORTLAND CEMENT. See CEMENT.

PORTLAND VASE. A beautiful vase, about a foot high, of transparent dark-blue glass, coated with opaque white glass, which has been cut away so as to resemble a cameo (q.v.). The scenes on the vase have as yet found no satisfactory explanation; one theory is that they are connected with the story of Peleus and Thetis. It was discovered in a large marble sarcophagus,

of the third century of our era, which was found at Rome about the middle of the seventeenth century, and had contained the ashes of the dead. Its style, however, shows that it belongs to an earlier period, probably the first century B.C. It was at first deposited in the Barberini Palace in Rome, but was purchased by Sir William Hamilton (1770) and finally by the Duchess of Portland. In 1810 the Duke of Portland lent it to the British Museum. In 1845 an insane visitor to the museum dashed it to pieces with a stone, but the fragments were so skillfully united that the damage is scarcely perceptible. It was copied by Wedgwood (q.v.) in his new style of pottery. Consult: Josiah Wedgwood, *The Portland Vase*, edited by Windus (London, 1845); Friedrichs and Wolters, *Die Gipsabgüsse antiker Bildwerke*, Nos. 2008, 2009 (Berlin, 1885); Furtwängler and Reichhold, *Die griechische Vasenmalerie* (Munich, 1900–04).

PORT LOUIS, lōō'is *or* lōō'ē. The capital and the principal port of the British colony of Mauritius, situated on an inlet on the northwest coast (Map: Africa, K 7). It is well built, with straight, though narrow, streets. Its most notable buildings and institutions are the Roman Catholic and Protestant cathedrals, a library, a theatre, an observatory, and a botanical garden. Its harbor is capacious, and is defended by forts. By far the larger part of the trade of Mauritius passes through Port Louis, and a railway line connects the city with the south and east parts of the island. The population is decreasing, and the Indian and Chinese elements are becoming prominent at the expense of the European, though the latter still include more than half of the inhabitants. Pop., 1901, 52,740; 1911, 50,060.

PORT MAHÓN, mȧ-hōn', or simply MAHÓN (Sp. Puerto Mahón). The chief town of the island of Minorca and one of the principal seaports of Spain, situated at the head of a bay on the east coast of the island (Map: Spain, H 3). It is a pleasant town with straight and regular streets, and many of its houses are built in the English style, dating from the time of the occupation by the British. The most notable buildings are the consistorial palace, the civil and military hospital, the fine Coliseum Theatre, and a church containing a magnificent organ. The town has a high school, a public library, and a museum. There are manufactures of cotton textiles and leather goods, but the chief importance of the town is derived from its harbor, which is one of the best in the Mediterranean. It has a large anchoring space, and is provided with a long quay accessible for the largest ships. Its situation makes it a convenient port of call between France and Algiers; it is also an important naval station. Trade amounts to over $1,000,000 annually; its chief exports are live stock and agricultural products. Pop., 1900, 17,975; 1910, 17,542. Mahón is supposed to have been founded by the Carthaginian general Mago, and its Roman name was Portus Magonis. It was in the possession of the English during the greater part of the eighteenth century.

PORT NATAL, nȧ-tăl', or **DURBAN**. The only city of Natal and the fourth seaport in importance in British South Africa (Map: Africa, H 8). It is situated in about lat. 30° S., long. 31° E., at the head of the landlocked Bay of Natal, the south end of which is marked by the fortified bluff and its lighthouse. Port Natal has become known as a watering place, and has electric street railways and all modern sanitary conveniences, including public baths. The centre of the town is occupied by the public gardens; there are also botanical gardens, a museum, an art gallery, a public library, a theatre, two parks, and a race course. In 1910 a new group of municipal buildings was completed at a cost of more than $1,500,000. Water is brought from a river 15 miles distant. The climate, although exceedingly hot during one or two months, is the most healthful of all African towns. The harbor, greatly improved by extensive wharves and dredging, is well protected, and is sufficiently deep for vessels of 30-foot draft. The shipping of the port in 1911 amounted to 3,079,000 tons entered and 3,134,000 tons cleared. The total value of the commerce in 1912 (mostly imports) was $76,705,000. Besides having a good harbor, Port Natal derives much importance from its position as the terminus of two railway lines leading into the Orange Free State and Transvaal provinces. Pop., 1904, 69,903; 1911, 69,187 (white, 31,783). The city was founded by the Dutch in 1828, and received its name Durban from Sir James D'Urban, then Governor of Cape Colony. Consult Ingram, *Story of an African Seaport: History of the Port and Borough of Durban* (London, 1900).

PORT NOLLOTH, nŏl'oth. See NAMAQUALAND.

PORTO ALEGRE, pôr'tô ȧ-lā'gre. The capital of the State of Rio Grande do Sul, Brazil, situated a short distance from the north extremity of the Lagoa dos Patos (Map: Argentina, J 4). It is one of the cleanest and best-built cities of Brazil, and has straight streets and several large squares, in one of which, the Praça de Dom Pedro, stand the government building and the house of the Legislature. Other notable buildings are the cathedral, the theatre of Dom Pedro, and the customhouse. The city has a high school, a normal school, a theological seminary, and a school of engineering. It is the chief outlet for the products of the north part of the state, and is connected with the interior by railroad. Its trade, however, is endangered by the rapid sanding up of the Rio Grande, the outlet of the lagoon, and extensive engineering works will be necessary to make the harbor of the city accessible to large vessels. The export trade, which is chiefly with Germany, the United States, and Great Britain, amounted to $1,277,585 in 1912, the chief articles exported being beef, salt pork, lard, hides, and flour. In 1912 its imports were valued at $11,537,354. Near the city is a coal mine yielding over 16,000 tons annually. Pop. (est.), 1914, 110,000.

PORTO-ALEGRE, MANOEL DE ARAÚJO. See ARAUJO PORTO-ALEGRE, MANOEL DE.

POR'TOBEL'LO. A popular watering place on the Firth of Forth, 3 miles east of Edinburgh, Scotland (Map: Scotland, E 4). Its manufacturing establishments comprise potteries and earthenware, bottle, brick, and paper works, etc., but it is noted chiefly as a favorite summer resort for sea bathing. It has a commodious town hall, a marine promenade, and a spacious amusement pavilion. Pop., 1901, 9200; 1911, 16,762.

PORTO D'ANZIO. See ANZIO.

PORTO EMPEDOCLE, pôr'tô ĕm-pā'dô-klȧ. A city on the south coast of Sicily, 6 miles by rail southwest of Girgenti (q.v.), of which it is the seaport. It was formerly called Molo di

Girgenti. The merchants of Girgenti have here great storehouses hewn in the rock for sulphur and for grain. The harbor is 26 feet deep, has a lighthouse, and is protected by a mole over a mile long. Pop. (commune), 1901, 11,529; 1911, 11,060.

PORT OF ENTRY. Any point that may be designated by the customs administration for the unloading of foreign goods and their release into domestic trade. Originally ports of entry were necessarily located on the frontiers, chiefly in seaports. With the development of shipment in bond it became possible for any city to receive the designation of port of entry.

PORTO FERRAJO, pôr'tô fĕr-rä'yô. The chief town of the island of Elba (q.v.).

PORT OF SPAIN. The capital of the British West Indian island of Trinidad, situated on the west coast of the island (Map: West Indies, G 5). It is considered one of the finest towns in the West Indies. There are a college and a fine botanical garden. Within the latter stands the magnificent residence of the Governor, and there are many other handsome buildings in the suburbs. Its excellent harbor can accommodate vessels of the heaviest draft. The port is the principal place of shipment for the products of the Orinoco region.. Pop., 1901, 54,100; 1911, 59,658.

PORTOLANI, pôr'tô-lä'nē (It., from *porto,* harbor). Ancient maps containing charts and sailing directions. See MAP; NAVIGATION.

PORTO MAGGIORE, pôr'tô mâd-jō'rā. A town in the Province of Ferrara, Italy, situated on an island in the lagoons of the Commachio, about 15 miles by rail southeast of Ferrara. The products are grain, beet root, and rope, and there is a trade in cattle and fish. Pop. (commune), 1901, 20,162; 1911, 21,223.

PORTO MAURIZIO, mou-rēt'sē-ô. The capital of the Province of Porto Maurizio, Italy, situated on a promontory projecting into the Ligurian Sea, 58 miles by rail southwest of Genoa (Map: Italy, B 3). It is a winter resort, has a fine church, a library, a theatre, a technical institute, and a school of navigation. There is a shipping trade in olive oil, agricultural produce, and fish. Pop. (commune), 1901, 7141; 1911, 7853.

PORTO NOVO, nō'vô. The capital of the French West African Colony of Dahomey, situated a short distance from the Gulf of Guinea and connected by a lagoon with the seaport of Kotonu (Map: Africa, E 4). It trades in palm oil and kernels, has an experimental farm, and has railroad connections with Pobé on the Lagos frontier, 50 miles distant. Porto Novo was the capital of the negro state of the same name, incorporated in 1893 with the Colony of Dahomey. Pop. (est.), 30,000.

PORTO NOVO (native, *Parangipetta*). A seaport town of Madras, British India, situated on the Coromandel Coast, 15 miles south of Cuddalore (Map: India, D 7). Both the Portuguese and the Dutch had a factory here in the seventeenth century. Porto Novo is celebrated for its iron foundry, which supplied much of the material for the Madras railways, but is famous chiefly for the battle fought here on July 1, 1781, when Sir Eyre Coote, retreating after his defeat at Chidambaram, was again attacked by Hyder Ali with an overwhelming force, and by adroit strategy routed his assailants with great loss. Pop., about 15,000.

PORTO RICAN EXPEDITION, MILITARY AND NAVAL SOCIETY OF THE. A patriotic society projected at Caguas, Porto Rico, Oct. 11, 1898, and organized at Columbus, Ohio, June 5, 1900. It comprises: (1) active members, who as officers or enlisted men in any branch of the United States service with the Porto Rican expedition were on the island before or on Oct. 18, 1898, the date of the raising of the American flag over the capitol at San Juan; (2) associate members, who are soldiers or sailors of good reputation belonging to organizations or vessels that composed the expedition, but who were detained in the United States by sickness or disability or on detached service, as well as members of the Red Cross Society, volunteer nurses, etc., who served with the army in Porto Rico; and (3) honorary members. The membership is about 500.

PORTO-RICHE, pôr'tô'rēsh', GEORGES DE (1849–). A French dramatist, born at Bordeaux. He was made an Officer of the Legion of Honor. His plays include: *Le vertige* (1873); *Un drame sous Philippe II* (1875); *Les deux fautes* (1879); *La chance de Françoise* (1889); *L'Infidèle* (1890); *Amoureuse* (1894); *Le passé* (1898). The four last named were published in 1899 in one volume entitled *Théâtre d'amour.* Later appeared *Les Malefilâtre* (1904) and *Le vieil homme* (1911).

PORTO RICO, pôr'tô rē'kô (Sp. *Puerto Rico,* rich port). An island of the West Indies, the most easterly of the Greater Antilles, the smallest among them, but the first in density of population. It lies between lat. 17° 50′ and 18° 32′ N., long. 60° 30′ and 67° 16′ W., is nearly 1200 miles from the equator, 1000 miles from Havana and Key West, 1500 from New York, and 3000 from Cadiz, Spain (Map: West Indies, F 3). It is roughly rectangular in shape, nearly three times as long as it is broad, the greater axis extending almost directly east and west. Length, about 100 miles; area, 3606 square miles, including the three small islands Mona, Vieques, and Culebra, or about three times that of Rhode Island. It contrasts sharply with the other Greater Antilles in appearance, for its mountains are lower and on the whole it presents a hilly and picturesque rather than a mountainous aspect. A number of islands lie off the coast, but only the three mentioned above are of importance.

Topography. The coast line is about 360 miles in length, with comparatively few important indentations. Around the whole periphery of the island are numerous fluvial valleys disposed at right angles to the coast. The coastal plains comprise about one-tenth of the area. There are a few headlands along the coasts, which, however, are usually low, especially on the south side. They also lack the fringing keys such as border Cuba.

Passing across the island from east to west, a little south of the middle, is a broken, irregular range of hills or low mountains which towards the eastern end trend to the northeast and culminate in the peak of El Yunque, 3700 feet high. Elsewhere the range is from 2000 to 3000 feet in altitude, with a few summits over 3000 feet and passes a little below 2000 feet. The range is known by various names in different parts of the island, Cordillera Central, Sierra de Cayey, and Sierra de Luquillo in the northeast. From this backbone of the island the land slopes north and south, its steep hilly surface deeply cut by streams. Towards the coast it becomes

somewhat more nearly level until it spreads away to the edge of the sea in broad, level, alluvial, fertile plains.

Hydrography. The central range of mountains forms the water parting of the island, most of the streams rising on its slopes and flowing northward or southward. Those flowing north have the longer courses and gentler slopes, and some of them are navigable for several miles by small boats and flat boats. The southern streams are not useful for navigation, and nearly all the Porto Rican rivers have troublesome bars at their mouths. The principal rivers are the Loiza or Río Grande, Bayamon, Morovis, Plata, Cibuca, Manati, Arecibo, and Guajataca, which flow to the north coast; the Culebrinas, Blanco, Mayaguez, and Guanajibo, flowing to the west; the Portugés, Jacaguas, Coamo, and Guamani, to the south; and the Humacao, Naguabo, and Fajardo to the east. The rivers give great facilities for water and steam power and irrigation. One reason why Porto Rico is more healthful than the other Antilles is because the streams afford such excellent drainage that there is an almost total absence of stagnant water. There are 8 small lakes on the north, east, and south slopes of the island.

Climate. Though the island is in the tropics, it is also under the régime of the persistent northeast trade winds, which temper the heat. The topography causes local climatic differences and the natives even speak of the "rigors of winter" in the upper altitudes. The annual range of temperature is from 98° F. to 50° F., which is sometimes reported among the mountains. The mean annual temperature of the island is 76° F., that of the coastal towns being somewhat higher and of the interior somewhat lower. The daily range of temperature is 10° or 11° on the coast and from 20° to 25° at inland points. The climate would seldom be oppressive if it were not for the constant high humidity. Rain falls almost daily, the average annual precipitation being about 77 inches. Nearly two-thirds of the precipitation falls in the summer and autumn. The average on the north coast is 65 inches. The rainfall is heavier in the highlands, which arrest much of the precipitation, so that the south slope of the island is much drier, and in some regions irrigation is necessary for the cultivation of crops. The heaviest rainfall occurs in the Luquillo where the annual average exceeds 135 inches. Among the causes that interfere with agricultural prosperity are hurricanes. Between 1515 and 1899 eighteen very destructive hurricanes occurred. The especially disastrous hurricane which visited the island on Aug. 8, 1899, caused large loss of life and immense damage to crops, and 250,000 persons were compelled for some time to depend upon the government for food.

Near the ocean the soil is quite sandy; it becomes loamy as it extends inland, and gradually changes from a sandy to a clay loam on ascending the lower foot hills. The soil of most of the coastal plains is rich alluvium, which gradually merges into the clay loam of the hills. The ferruginous clay of the mountains is a source of abundant supply of plant food.

Flora. The island is famous for the number and size of its trees. The fine forests of the higher region resemble those of other islands of the West Indies, but are almost destitute of parasitic vegetation excepting orchids. The trees include several species of palms, a beautiful tillandsia, whose wood, called sabrino, is used for timber, a hard wood called ausubo, which is much used for the frames of buildings, hard and soft Spanish cedar and ebony, the West Indian sandalwood, the laurel, willow, and many woods useful for construction. About 30 medicinal plants are utilized, 12 plants for condiments, 12 for dyes and tanning, and 8 for resins, and many large trees produce edible fruits. The pastures are covered with nutritious grasses.

Fauna. The native fauna is very limited, there being no large mammals excepting those which are domesticated. There are no noxious reptiles and few insect pests. Flamingos and other water birds abound along the coast; and in the mountains are many birds, including doves. Fish of valuable species are abundant both in the fresh water and along the coasts. The gigantic tortoise is closely allied to the famous large tortoise of the Galapagos Islands.

Geology and Mineral Resources. The island has three geological elements: (1) a central system of deeply ribbed and corrugated mountains with V-shaped gorges and ridges; (2) lower hills along the north and south coasts; (3) coastal plains with alluvial soil extending from the foot of the central mountains across the line of foothills to the sea. The central mountains are formed of volcanic ejecta—tuffs and conglomerates—with occasional dikes and interbedded bluish limestone, which, however, is of rare occurrence. These mountain rocks, which are of Cretaceous and possibly early Eocene age, are entirely decayed at the surface, breaking down into a red clay resembling that of the southern Appalachians. The foothills are all of later Tertiary and Pleistocene age, and are composed entirely of rocks of sea origin, consisting of the peculiar type of tropical white limestones of a chalky, marly, and shelly nature. The island abounds in clay suitable for ordinary brick and earthenware. Good building sand is found, but little of it is sufficiently pure for glass making. The white limestones of the coastal plain supply excellent lime. The building stones are volcanic bowlders and limestone. Houses made of bowlders have a picturesque and rubbled appearance. Those constructed of limestone are always stuccoed, and the most elaborate buildings are made of limestone, including all of the public buildings and fortresses. Beautiful marble of great hardness is quarried near Juana Díaz, but as yet is used only for structural purposes, such as bridge piers. Sandstone is comparatively rare, but fine flagstone is abundant all over the island. Gypsum is used extensively for stucco, plaster, and fertilizer. A large area of the south coast abounds in phosphates, but the industry has developed only on Mona Island, off the west end of Porto Rico, where large amounts of guano and phosphates are found in the caves already explored. Near Ponce and elsewhere numerous caves are filled with rich deposits of guano, which are now being worked. Lignite is found, but the fuel resources have not yet been investigated. Sufficient salt for the needs of the island may easily be obtained from many lagoons near the sea by natural evaporation of the brine. The principal deposits are the salines of Coamo, Guanica, and Sierra de Piñones de Cabo Rojo. Invalids resort to a number of mineral springs, chiefly at Ponce and Coamo.

No mining of metals is yet carried on. Those most frequently found are gold, carbonate and

sulphide of copper, and magnetic oxide of iron. Varying quantities of gold were taken from the alluvium deposits, during the early part of the Spanish occupation and since the discovery of the island gold has been washed in small quantities from many rivers, especially in the north and east. It is suspected that gold-bearing lodes of quartz or conglomerate exist among the hills whence these streams issue. Experience has shown that the placer deposits are not rich or extensive. At one place north of Juncos there is a large deposit of magnetic iron ore.

The exact extent of the mineral resources is yet to be determined. No systematic survey of the entire island has yet been made, though small stretches here and there have been explored at various times. These have uncovered deposits of agate, mercury, molybdenite, and other minerals, but in too small quantities to warrant commercial exploration.

Agriculture. Agriculture has been the chief industry of Porto Rico almost since its discovery by Columbus. Sugar cane has been grown for 300 years. The forests have long since been cleared away, and practically every acre of land fit for cultivation has been utilized for at least 200 years.

In 1910, out of a total area of 2,198,400 acres, 2,085,162 acres were in farms, of an average size of 35.7 acres. The improved lands in farms amounted to 1,570,304 acres. The value of farm property in 1910, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was $102,378,874. The average value of farm land per acre was $35.47. The total number of farms was 58,371. The three leading agricultural products are sugar, coffee, and tobacco. In 1909 there were 145,433 acres of sugar cane harvested. In the same year there were 186,875 acres devoted to growing coffee and 22,142 to tobacco (see also paragraphs *Manufactures* and *Commerce*, below). The growing of fruit and nuts ranks third among agricultural industries. The total value of these fruits in 1909 was $2,515,542. The most important are bananas, pineapples, plantains, oranges, and coconuts. The cereals are not grown to any extent. Beans form one of the most important vegetable crops. They are used not only as a food, but the plants are used as fertilizer for the soil. The growing of vegetables commonly found in more temperate climates has been rather unsuccessfully attempted. The climate seems to have a deteriorating effect upon good strains of vegetables brought from outside, and most of the vegetables sold in the market are of a tropical nature. It has been found that sea-island cotton can be grown on the island, but little effort has been made to further its cultivation.

Live Stock and Dairy Products. The total value of domestic animals in 1910 was $10,935,263. The cattle numbered 315,745 and were valued at $8,354,677; of these the dairy cows numbered 62,890, of $2,091,651 value. There were in the same year 58,201 horses, valued at $1,877,828; 4784 mules, valued at $342,799; 106,092 swine, valued at $257,645, and 49,079 goats, valued at $73,987. The total value of milk sold and cheese made in that year was reported at $722,148.

Manufactures. The manufactures of Porto Rico are directly dependent upon agriculture. The most important industries are the manufacturing of sugar and molasses, the making of cigars and cigarettes, and the cleaning and polishing of coffee. The first census of manufactures was taken in 1909, the most important figures of which are shown in the table below.

SUMMARY OF INDUSTRIES FOR 1909

INDUSTRY	Number of establishments	Wage earners (average)	Value of products	Value added by manufacture
All industries	939	15,582	$36,750,000	$15,271,000
Sugar and molasses	108	5,062	20,569,000	8,295,000
Tobacco manufactures	282	7,025	6,060,000	4,002,000
Coffee, cleaning and polishing	37	120	5,053,000	289,000
Bread and other bakery products	258	1,197	1,730,000	557,000
Liquors, distilled	14	58	1,117,000	974,000
Printing and publishing	43	353	371,000	235,000
Lumber and timber products	8	123	269,000	91,000
Boot and shoe shops	59	303	190,000	92,000
Cars and general shop construction and repairs by steam-railroad companies	6	342	186,000	125,000
Foundry and machine-shop products	6	188	178,000	120,000
Hats, straw	3	122	177,000	91,000
Leather, tanned, curried, and finished	4	46	176,000	85,000
All other industries	111	643	674,000	315,000

The value of the products of the sugar and molasses industry in 1909 formed 56 per cent of the total production of the island. The raw sugar produced amounted to 566,445,203 pounds and molasses to 17,874,097 gallons. The total value of the raw sugar was $20,164,187 and of the molasses $379,008. The tobacco industry is confined chiefly to the manufacture of cigars and cigarettes. In 1909 a total of 217,792,000 cigars were manufactured, of which 152,739,000 were for export. Third among the industries is the cleaning and polishing of coffee. In 1909, 65,225,378 pounds of rough coffee were treated. The modern wet process is superseding the old and dry method, which required a larger investment than the small planter can afford. As a result of changes in the method of preparing, the coffee market is being transferred from the plants to the large custom mills. See paragraph *Agriculture* above. Of the total number of wage earners 13,928 were males, 1654 females, of whom 758 were under 16 years of age.

The industries are not developed to any extent in the cities, as the population of the island is overwhelmingly rural. In San Juan and Ponce, the only cities of a population of over 25,000, the tobacco manufactories constitute the chief industry. Coffee cleaning and polishing is the chief industry of Mayaguez and Caguas, cities of over 10,000 inhabitants.

Commerce. The commerce has greatly in-

creased under conditions which followed the American occupation. The United States is the chief customer both in import and export trade. In the fiscal year 1915 the shipments of merchandise from the United States to Porto Rico amounted to $30,149,764, an increase of more than 100 per cent since 1905. The imports from foreign countries were $2,954,000. The shipments of domestic merchandise from the island to continental United States were valued at $41,950,419, representing an increase of 275 per cent for the same period, and the exports to foreign countries were $7,010,118. The principal imports from foreign countries were from Spain $679,413, Canada $506,328, England $253,278. The chief exports to foreign countries were to Cuba $2,786,944, Spain $187,806, France $815,282. The following table shows the chief articles of export to and import from the United States, with their values in 1915:

IMPORTS FROM AND EXPORTS TO CONTINENTAL UNITED STATES

(Year ending June 30, 1915)

IMPORTS	Value	Exports	Value
Cotton, manufactures of	$4,557,807	Coffee	$543,679
Iron and steel, and manufactures of	1,610,287	Fruits and nuts	3,434,707
Meat and dairy products	3,650,366	Sugar, unrefined	27,277,839
Wood, and manufactures of	1,036,307	Tobacco, manufactures of	6,026,721
Mineral oils	663,522		
Paper, manufactures of	593,687		

Transportation and Communications. With no point more than 18 miles from the sea, the only transportation problem is caused by the mountainous character of the interior. Up to the time of the American occupation in 1898 the Spaniards had constructed 170 miles of excellent highways, of which the principal one is the Military Road. This runs across from San Juan to Ponce. Since then about 1000 miles of macadamized roads have been built, extending to all parts of the island.

The railway lines are confined to the coastal plains. A steam railway operates along the northern coast from Carolina by way of San Juan to the west end of the island, and south by way of Mayaguez and Ponce to Guayama, thus making a circuit of about four-fifths of the island. This is supplemented by many short branches which connect it with the sugar centrals and other centres of industry. The main railways embrace those of the American Railway Company of Porto Rico, the Central Fortena Lines, and the lines of the Ponce and Guayama railway company, aggregating in all about 450 kilometers. The other railway lines are chiefly local, and have only short trackage.

Ocean transportation facilities are of even more importance to Porto Rico than land transportation. There are passenger and freight lines to New York, Spain, France, Germany, and Italy. The postal service and railway mail service are maintained by the Post Office Department of the United States. There are a modern telegraph service and telephone lines between the principal towns. Porto Rico has been in cable connection with the rest of the world for many years.

Banking. There were, in 1914, 15 banks and branches of banking institutions. These had a capital stock of $2,236,984, deposits of $11,017,045, surplus and profits of $1,000,910. The largest banks are the American Colonial Bank of Porto Rico, the Banco Comercial de Puerto Rico, and the Banco Territorial y Agrícola.

Government. The jurisdiction of the government of Porto Rico embraces the island of that name and adjacent islands lying east of the seventy-fourth meridian, ceded to the United States by Spain. The existing system of government is contained in the Organic Act of 1900, generally known as the Foraker Act. This was designed as a provisional law to enable a form of government to be maintained until Congress should have provided a permanent constitution. This Act provides among other things that the inhabitants of Porto Rico, who were Spanish subjects on Sept. 11, 1899, with the exception of such persons as wished to hold their allegiance to Spain, constitute a body known as the People of Porto Rico, which includes also the citizens of the United States resident in Porto Rico.

This Act has been amended by joint resolution of Congress, the most important of which is the Olmsted Act, which was passed on July 15, 1909. This Act made provision for the allotment of funds to keep up the government in the event of the failure of the local Legislature to enact the necessary budgets, and for the centralization of matters pertaining to the government of Porto Rico in one department in Washington. All reports are now made by the government or members of the Executive Council to the War Department, in which was established the Bureau of Insular Affairs.

Legislative.—The legislative power is vested in the Legislative Assembly, consisting of the Executive Council and the House of Delegates, corresponding respectively to the Senate and the House of Representatives. The Executive Council consists of 11 members appointed by the President for a term of four years. At least five of these must be native inhabitants of Porto Rico. One of these five and the other six are also the heads of the seven executive departments. The members of the House of Delegates are elected biennially, five from each of the seven electoral districts. Both houses of the Assembly convene annually on the second Monday in June of each year and remain in session for 60 days. The Legislature has the power to enact laws not in conflict with the Organic Act on all matters except the granting of franchises, privileges, and concessions, which power is vested in the Executive Council alone.

Executive.—The Governor is appointed by the President and holds office for a term of four years. He in turn appoints all judges and prosecuting attorneys of the district courts, justices of the peace, and other insular officers. The insular police force is also under his control and supervision. Other executive officers are Secretary, Treasurer, Auditor General, Commissioner of the Interior, Commissioner of Edu-

cation, and the head of the Department of Health, Charities, and Corrections. All these are appointed by the Governor.

Judiciary.—The Department of Justice embraces the office of Attorney-General, the supreme, district, and municipal courts, justices of the peace, registrars of property and notaries. The Supreme Court is composed of five judges appointed by the President. Writs of error and appeals from the final decisions of this court in certain cases may be taken to the Supreme Court of the United States. The judges of the district courts are appointed by the Governor for a term of four years. Each district has a fiscal or prosecuting attorney. The municipal courts have jurisdiction in all criminal cases in which the offense charged is less than felony. The judges of these courts are elected by popular vote, each for a term of four years. Although the code of laws under which Porto Rico was governed under the old régime has been largely superseded, the Spanish law relating to inheritance, civil status, contracts in obligation, land titles and liens, the law of water, mines and commerce rules still remain in force.

Suffrage and Elections.—The Legislature has the power to determine the franchise, and that right has been conferred upon practically all adult males.

Local and Municipal Government.—There are about 70 municipalities in Porto Rico. The principal town in each district is the administrative centre. The people elect the chief officers, who appoint subordinates. Each municipal government has at its head a mayor or alcalde. He is the chief executive officer and the representative of the community before the courts and insular government. The local legislative power is conferred by a body known as the municipal council, composed of from nine to five members. The mayor and the members of the municipal council are elected for a term of four years.

Miscellaneous Provisions.—There are laws regulating the operation of public-service corporations, and the Executive Council has the practical power of a public-service commission. There are an employers' liability law and laws regulating the employment of women and children.

Finance. The revenues of the government are derived from customs, various forms of taxation, and miscellaneous sources. The total income of the government from all sources in the fiscal year 1913–14 was $7,714,973. The largest amount, $2,843,561, was derived from the excise tax. The total expenditures for the same year amounted to $7,278,328. The largest expenditure was for the Department of Education, $1,742,754. In addition to the regular revenues there is an income from trust funds derived from revenues in the United States on importations from Porto Rico. These are placed at the disposal of the President, to be used for the government and benefit of Porto Rico, for the aid and relief of the people, and for education and other public benefits. The total receipts from these funds in 1914 were $4,928,616, the expenditures were $3,774,621, and a balance in the treasury from the insular revenues of $284,273 and from the trust funds $1,154,065.

Population. The population of the island at different periods has been as follows: 1800, 155,426; 1860, 583,308; 1900, 953,243; 1910, 1,118,012. The average number of persons to the square mile in 1910 was 325.5. This was more than 10 times as great as in the United States proper. The urban population was 224,620, and the rural 893,392. The population was divided by color in 1910 as follows: white, 732,555; black, 50,245; mulatto, 335,192. The total native-born was 1,106,246 and the foreign-born 11,766. There were 557,301 males and 560,711 females. There are 2 cities (San Juan and Ponce), 64 towns, and 12 villages. The population of San Juan was, in 1910, 48,716, and of Ponce 35,005. Larger towns with populations in 1910 were: Mayaguez, 16,563; Caguas, 10,354; Arecibo, 9612; Guayama, 8321.

Health and Sanitation. Problems connected with health and sanitation have been among the most difficult with which the American authorities have had to contend. What success has accompanied these efforts is shown by the fact that the death rate has decreased from 40.81 per thousand in 1900 to 18.6 per thousand in 1913. The continued lowering of the death rate has resulted almost entirely from the service of sanitation, organized in 1912. An aggressive campaign has been started for the building in the various cities and towns of modern aqueducts for a supply of pure water, sewer systems, sanitary slaughterhouses and meat markets, and clean dairies. Attention has also been given to the work and personnel of the municipal physicians, from whom the poor receive all the medical attention that is within their reach. Twenty-six towns and cities now possess water works.

About 6 per cent of the yearly deaths are from tuberculosis, but 38 per cent of all deaths from preventable diseases are caused by this. Uncinariasis, or hookworm, has for many years been prevalent throughout the island. The first work for its eradication was done there by Dr. Bailey K. Ashford, and the report prepared by the Anæmia Commission, organized and maintained at the expense of the people, is accepted as an authority on this disease. In 1914, 69,004 cases of hookworm were treated. Several stations have been established at different points for giving treatments. Of the persons under treatment 81.6 per cent were white and 18.4 per cent colored. Leprosy is found, for the treatment of which an asylum is maintained. Other diseases found are typhoid fever, malaria, trachoma, and infantile tetanus. There were, in 1913–14, 27,405 deaths. Institutes of tropical medicine and hygiene, reorganized and made independent by the Legislature of 1913, have done most efficient service in the study of the diseases mentioned above.

Education. From the first years of the American occupation the authorities have directed the most vigorous efforts towards improving educational conditions. These efforts have been eminently successful, and great improvement in conditions has resulted. At the time of the American occupation there were only 528 schools in the island, with an enrollment of about 22,000 children. There was not one building specially constructed for school purposes, and schools were free only for poor children. In 1913–14 the total enrollment in all public schools was 207,010, out of a school population (ages 5 to 18 years) of 414,000. The average daily enrollment in all schools in the same year was 169,719, and the average daily attendance was 155,830, or 92 per cent. There were in operation an average of 4330 schools; in charge were 2564 teachers.

The school system is in the general charge of

the Commissioner of Education. The 70 municipalities of the island are divided into 41 school districts, each under the direction of a supervising principal, who is appointed by the Commissioner of Education as his personal representative. The administration of the schools from a material point of view in each municipality is intrusted to a local school board, composed of three members, elected every four years by popular vote. In addition to the supervising principals there are three general superintendents and supervisors of athletics, agriculture, manual training, household economics, drawing, music, and writing.

The rural schools are the foundation of the school system of Porto Rico. Schools of this class are found in the most remote and mountainous districts of the island. Of the total population (1914), 1,235,000, approximately 79 per cent live in the rural districts, and over 70 per cent of these are illiterates. It has been found that the most effective means of eliminating this overwhelming majority of adult illiterates is the establishing of night schools. In 1914 there were approximately 351,000 children of school age living in rural districts; of these 109,524 were enrolled at some time during the school year. The average daily enrollment was 91,260. The average number of rural teachers during that year was 1335, all of whom were Porto Ricans. The salary of rural teachers is fixed by law at $45 and $50 for 20 days per month, depending upon the length of service.

There are graded schools within the urban limits of all towns and cities as well as in the villages and barrios of the island. These schools are taught by English graded teachers, all of whom are authorized to give instruction in all branches of the curriculum, using English as a medium, by principal teachers, and teachers in English. All English graded and principal teachers are Porto Ricans, whereas the teachers of English with few exceptions are Americans. The salaries of teachers in these schools vary from $65 to $90 per month. The course of study covers the eight grades of the elementary course.

Continuation schools are maintained in 25 of the larger towns of population for the purpose of taking pupils from the completion of the eighth grade and carrying them two years further in their educational curriculum without the necessity of leaving home.

Complete high schools in the four courses are established at San Juan, Ponce, Mayaguez, Arecibo, and Humaco. In addition to the regular high-school course they also have facilities for commercial courses and work in manual training and household economics. The total number of scholars enrolled in the secondary schools was 2288. The salary schedule for the high-school teachers varies from $810 to $1440 per year. Some practical instruction in agriculture and manual training is obligatory for all students taking work in the advanced schools.

All revenues for the support of the public-school system are from appropriations from the insular government and by appropriations from the local government. The local authorities are required to set the rate of 25 per cent of the local funds received from taxation for school purposes. In 1914, $2,993,417 were available for school purposes. The only institution of collegiate rank is the University of Porto Rico (q.v.).

Charities and Corrections. The charitable and correctional institutions include an insane asylum, an asylum for the blind, girls' charitable school, boys' charity school, the penitentiary, and a reform school. The total number of prisoners in the penal institutions was, in June, 1914, 11,243. Convict labor is employed upon the roads.

History. The island of Porto Rico has from the beginning played a secondary part in the history of the West Indies. It was discovered by Columbus on his second voyage in 1493 and was named San Juan Bautista by him. In 1508 Juan Ponce de León crossed the Mona channel from Hispaniola to investigate the reports of a rich and fruitful land in the island of San Juan. He was hospitably entertained by the native chief Agueynada, whose power seems to have extended over most of the island. Two years later, having secured authority to conquer and govern the island, Ponce de León returned thither with a large military force. He followed the north coast till he discovered the spacious bay on which he established his headquarters, founding a city which he named San Juan Bautista de Puerto Rico, whence comes the modern name for the whole island. Juan Ponce devoted himself for 10 years, except during his first expedition to Florida, to the pacification of the island and the extirpation of the hostile Caribs from the islands towards the southeast. After his death in 1521, successive Spanish administrators continued to rule the island, which had a peaceful, uneventful history for nearly 200 years. Under the repartimiento system, by which the Indians were forced to work on the Spanish plantations, the natives gradually decreased in numbers, and the consequent dearth of laborers resulted in the abandonment of many of the outlying estates. The Caribs in turn reëntered the island and occupied largely the eastern portions, so that for many years the Spaniards appear to have been restricted to the districts immediately dependent upon San Juan, Ponce, and one or two other towns. The corsairs and West Indian pirates also visited the island, using various places on the coast for more or less temporary headquarters. In 1595 Drake, after trying to induce the inhabitants to ransom the town with money which they did not possess, sacked San Juan, and three years later it again suffered similarly from the Duke of Cumberland. Heinrich, a Dutch sea captain, undertook to do the same thing in 1615, but was beaten off, losing his life in the assault. About the middle of the eighteenth century negro slaves and colonists from Spain began to be introduced in considerable numbers, and by 1780 the population had risen to nearly 80,000. In 1797 San Juan successfully withstood a three days' attack from the English Lord Abercrombie. During the first quarter of the nineteenth century the island became a popular resort for large numbers of those who desired to escape from the turmoil and disaster incident to the revolutionary movements in South America. As a result the population came to have a large preponderance of whites over the black and colored elements. Another consequence was the marked aversion of the populace to strife of any sort. An attempted rising against Spain in 1820 made headway for two or three years, but had no strong popular support. In 1867 another revolt was attempted by those who were engaged in the plots to free Cuba, but this was speedily

suppressed. In 1869 Porto Rico was created a province of Spain, with representation in the Spanish Cortes by delegates elected by popular vote under the same suffrage as in Spain. The Governor-General was made the resident representative of the crown, and in practice all administrative power was in his hands. In 1873 the Spanish Cortes passed an Act for the abolition of slavery in Porto Rico. During the Spanish-American War the fortifications of San Juan were bombarded by a fleet under Admiral Sampson. On July 25, 1898, an expedition under General Miles landed on the island. Ponce surrendered on the 28th, and the American forces met with no effectual resistance until hostilities were terminated by the peace protocol of August 12. On October 18 the United States flag was raised over San Juan. By the Treaty of Paris, signed Dec. 10, 1898, Porto Rico was ceded to the United States. Following the establishment of a civil government in 1900, elections were held for the choice of a commissioner to Washington and members to the House of Delegates of the Porto Rican Legislature.

Much of the history of Porto Rico during the American régime has consisted of the orderly succession of the American governors and the varied legislation for improving the conditions of the country. One of the problems resulting from the transfer of the sovereignty in Porto Rico from Spain to the United States was the question of the Church lands. The Roman Catholic church brought suit against Porto Rico to recover certain lands, and in 1906 decisions were rendered in favor of the island in two cases and in favor of the Church in one. This question was finally adjusted by a commission of six members, appointed by the United States, Porto Rico, and the Church. The elections in 1908 were hotly contested by the Unionist party, which favored independence and self-government for the island, and the Republicans, whose platform was similar to that of the party of the same name in the United States. The elections resulted in a Unionist victory, and the following year the Insular House adopted a policy of refusing to pass the appropriation bills, in order to call attention to the opposition to the Organic Act and to endeavor to secure modifications of it. The United States Congress passed a measure reënacting the budget of the preceding year, and in turn the Insular House passed various measures obnoxious to the Governor and the Executive Council. Since this date there has been more or less of agitation in favor of greater independence in the insular government and the United States has considered steps looking towards a modification of the existing régime. In 1912 laws were passed providing for sanitary reform, a bureau of labor, and minority representation. The following year important labor legislation was enacted.

The list of American governors of Porto Rico is as follows:

Charles H. Allen	1900–1901
William H. Hunt	1901–1904
Beekman Winthrop	1904–1907
Regis H. Post	1907–1909
George R. Colton	1909–1913
Arthur Yager	1913–

PORTO RICO, UNIVERSITY OF. An institution for higher education at Río Piedras, Porto Rico. It was first established as a normal school at Fajardo. It became evident that a more central location was necessary, and in 1909 the school was transferred to Río Piedras. The University of Porto Rico was created by an Act of the Legislature, March 12, 1913, and the normal school, with its land and property placed under the control of the university board of trustees, became the first department of the university. In 1913 colleges of law and pharmacy and the university high school were created. In the same year the course of the college of liberal arts was extended to cover four years, with the degree of B.S. or B.A., on satisfactory completion of the course. In addition to the department already mentioned there was a college of agriculture and mechanical arts. The material equipment of the university consists of about 200 acres of land, more than 100 of which are at Río Piedras and the remainder at Mayaguez. The campus in the former place contains nine structures used by the colleges of liberal arts and agriculture, and by the normal department. The university represents the logical point of academic contact between the Spanish and the English-speaking people of the Western Hemisphere. Its curriculum offers more extended courses in the Spanish language and literature than does any institution in the United States, and more extended courses in English than are to be found in either Spain or America. The enrollment in the normal department is more than 300, and in the college of liberal arts it is about 200. The normal department holds a summer session, which is attended by about 100 students. The university is supported by appropriations and by the insular government. Its total assets amount to about $400,000. The president in 1915 was E. M. Bainter, B.S.

PORTO SANTO, sän'tô. One of the Madeira Islands (q.v.).

PORTO TORRES, tôr'râs. A seaport in Sardinia. See SASSARI.

PORTOVIEJO, pôr'tô-vyā'hô. The capital town of the Province of Manabí, Ecuador, 98 miles north of Guayaquil (Map: Ecuador, A 4). It is an old town with narrow streets. The principal buildings are the cathedral, the governor's house, and the bishop's palace. Its high school is one of the best in the Republic. Cacao, coffee, sugar cane, and togua are produced in the vicinity. Its chief industry is the manufacture of straw hats. Pop. (est.), 8000. The town was founded in 1534.

PORT PHILLIP. The harbor of Melbourne (q.v.), Australia (Map: Victoria, D 6).

PORTRAITURE. In the fine arts, the representation, by means of painting, sculpture, or engraving, of the appearance of an individual or a group of persons. As regards size, portraits may be busts, half figure, three-quarter, or full length; as regards the position of the countenance, they are full face, half profile, profile, or *profil perdu*, if the face is further reversed. Portraiture is of very ancient origin. Sepulchral statues of the earliest Egyptian kingdom show that the art was even then highly developed. During the best period of Greek art ideal portraits of individuals, of a certain likeness, but rather intended to represent character types, were frequently executed, both in statues and in busts, as may be seen from the most celebrated surviving examples, the Lateran "Sophocles" and the bust of Pericles in the British Museum. Realism does not enter portraiture till the age of Lysippus, who was especially celebrated for his portraits of Alexander the Great, copies of which survive in the well-known busts in the principal European museums. At the same time, portraiture was first practiced in painting by Apelles, also celebrated for his likenesses of Alexander. The only surviving portrait paintings of Greek art are those discovered in the Fayum, of Græco-Egyptian workmanship, good examples of which are in the Metropolitan Museum, New York (second century A.D.).

The realistic tendencies of the Etruscan art were favorable to portraiture, especially in bronze, the material in which the Etruscans excelled; a good example is the bust of Brutus in the Capitoline Museum at Rome. Their art had a strong influence upon the Roman, which was, however, even more influenced by Greece in the development of portraiture, which became the most characteristic form of Roman sculpture. As with the Greeks, the body was portrayed as a type, in the ideal fashion, the resemblance to the individual being confined to the face. Costumes and insignia were portrayed with much elaboration. Busts were especially popular, and it became quite the fashion to collect them. (See BUST.) Beginning with the Empire, portraiture flourished at Rome until about the beginning of the third century, and about the time of Justinian, in the sixth century, it sank into disuse. A very common form of portraiture under the Empire was upon ivory diptychs, which Roman, civil, and ecclesiastical officials distributed among their friends. This practice was continued by the Byzantines, who also used mosaics for portraiture, as may be seen in the celebrated examples of Justinian and Theodora in San Vitale, Ravenna.

The chief use of portraiture during the Middle Ages was for sepulchral figures, which were carved recumbent, seated, or kneeling. Attempts at portraiture are often apparent in the faces of the statues of the Gothic cathedrals in France, and in the thirteenth century it attained a splendid development in the statues of donors, erected in German cathedrals of the transitional period, as at Naumburg and Bamberg. These likenesses were of an ideal character, but a more realistic portraiture was practiced in the latter fourteenth century, especially by the Netherlandish school, with centre at Dijon. The chief master was Claux Sluter, and the statues produced were the most realistic portraits imaginable. The element of portraiture was dominant even in the religious painting of Jan van Eyck and the early Flemish school; he and others, like Rogier von der Weyden, Hans Memling, and Quinten Matsys, painted admirably realistic portraits of highly detailed finish.

In so naturalistic an age as the early Renaissance portraiture flourished to a high degree. It was first practiced at Florence by the sculptors, Donatello having revived the art in the form in his busts, which unite excellent characterization with an admirable naturalism, tempered by the antique. The art was continued by Desiderio da Settignano and other marble carvers of the sixteenth century, and with high success in bronzes by Verrocchio. It was not practiced during the first half of the fifteenth century by the realistic painters of Florence, chief among whom was Castagno, or by Filippo Lippi; but during the latter half Botticelli, Ghirlandaio, Pollaiuolo, and others attained high success. In northern Italy Pisanello of Verona, the first important Italian portraitist, executed both medals and painted portraits in profile form. In the next generation Mantegna at Padua and Giovanni Bellini in Venice achieved noble likenesses, as did Piero della Francesca in central Italy. The sixteenth century united with realism and subjective conception an ideal rendering of the subject, which made the portrait typical in the highest sense. This success was attained by most of the chief masters of the Renaissance, such as Leonardo, Andrea del Sarto, Raphael, and Lorenzo Lotto; among the Venetians by Giorgione, Palma Vecchio, Titian, Tintoretto, and by Morone of Brescia. During the same period the Germans practiced portraiture of quite a different type, less refined in form and more careful in detail, but with strong characterization in the work of men like Dürer, and with a perfect, objective realism in that of Holbein, who was active chiefly in England.

Since the sixteenth century portraiture has found its chief expression in painting. Even during the decline of the Italian and other schools portraiture remained comparatively good, because in it the artist is compelled to adhere to nature. With the great development of painting in the seventeenth century, portraiture assumed a new importance, especially in the schools that attained the highest development, viz., those of the Netherlands and of Spain. In Holland Rembrandt, by the skillful manipulation of light and shade and by skillful coloring, achieved highly poetic, yet realistic and characteristic; results. Frans Hals, whose chief activity was in portrait painting, portrayed his figures in full light and with genial observation;

while Van der Helst and many others did good work in portraiture. This school developed the group picture and heightened the effect of the portrait by an appropriate background. The work of the Flemish school represents a modification of the purely realistic conception by Italian refinement of color. Rubens's portraits were of wonderful strength and characterization, while Van Dyck's were of a more refined and courtly character. In Spain portraiture attained the highest possible development in the works of Velazquez, who with the subtlest intellectual observation and the highest technique portrayed his royal and noble sitters from the standpoint of absolute realism. During the same period portraiture of good, though of a more artificial, character was practiced by the Eclectic schools in Italy and by the courtly painters of France.

In France, under Louis XVI, Largillière and Rigaud painted majestic but artificial likenesses, while Philippe de Champagne was more natural. During the rococo period portrait painting was more natural and pleasing, though flippant, in the canvases of artists like Nattier and the pastels of Quentin de la Tour. It found strong and realistic presentation in the productions of sculptors like Houdon and in the work of the great portrait engravers Nanteuil and Edelinck. During the eighteenth century there developed in Britain a strong school of portraiture influenced by the old masters, but based on a pleasing conception of nature. Among its chief representatives were Hogarth, Reynolds, Gainsborough, Romney, and Lawrence, and Raeburn (in Scotland).

Nearly all the great figure painters of the nineteenth century tried their hands at portraiture. The best productions of the French Classicists, like David and Ingres, are their portraits; among the Realists Courbet, Bonnat, Carolus Duran, Benjamin Constant, and Fantin-Latour are especially known as portraitists, and among the Impressionists Renoir and Besnard. In Germany by far the foremost portraitist was Lenbach, who with good color and excellent characterization depicted the men who created the German Empire. Mention should also be made of the younger Kaulbach and of Arthur Kampf. The foremost portraitists in England include Millais, Frank Holl, and Watts of the past generation, and Shannon, Lavery, P. W. Steer, and William Orpen of the present. The foremost Italian portraitist is Boldini; in Spain Sorolla and Zuolaga are best known, and in Sweden, Zorn. The sculpture of the nineteenth century in all European countries has been concerned chiefly with monumental portraits. See SCULPTURE.

Virtually all American painting of the early period was portraiture under British influence. The chief portraitist of the Colonial epoch was Copley; of the Revolutionary, Gilbert Stuart, who in characterization and brushwork excelled his contemporaries, Trumbull and the two Peales. During the middle period (1825–80) the principal portraitists were Harding, Healy, Huntington, Page, and Eastman Johnson. But by far the best portraiture in the United States, beginning with refined likenesses by Whistler, has been done chiefly in recent years by men of European training. Among the foremost of recent American portraitists have been Sargent, a brilliant and facile realist, W. M. Chase, J. W. Alexander, Irving Wiles, Thomas Eakins, Carroll Beckwith, B. C. Porter, Louise Cox, Cecilia Beaux, Melchers, and Robert Henri, whose portraits rise to the dignity of types. The invention of the photograph has deprived portraiture of one of its chief reasons for existence, and the technical progress in this branch has been less marked than in others. An important variety of portraiture, miniature painting (q.v.), is treated under a separate heading.

PORTREE'. The seaport and chief town of Skye Island, Inverness, Scotland (Map: Scotland, B 2). See SKYE.

PORT'REEVE (AS. *portgerēfa*, from *port*, port + *gerēfa*, reeve, probably from *ge-*, generalizing prefix + **rōf*, OHG. *ruova*, Icel, *rōf*, number, or from *rōf*, famous, Goth. *hrōps*, OHG. *ruof*, Ger. *Ruf*, outcry, AS. *hrōpan*, to cry out). The principal magistrate in a maritime town. The chief officer under the Saxons in London was called the portreeve, and the early mayors of that city and elsewhere were so designated, but the word gradually came in time to mean a chief magistrate and sheriff of a port, whose duties were to represent the crown, preserve order, and collect the revenues. The term is still used in certain parts of England to designate a port warden.

PORT RÉPUBLICAIN, pôr rā'pụ'blē'kăN'. The capital of Haiti. See PORT-AU-PRINCE.

PORT ROYAL. The principal station of the British naval forces in the Caribbean, on the island of Jamaica, West Indies (Map: Cuba, J 9). It is situated on a sandy spit at the entrance to Kingston harbor, and contains an arsenal, barracks, and a military hospital. The old Port Royal, which before its destruction by earthquake in 1693 was one of the chief towns of the West Indies, stood near the site of the present town.

PORT ROYAL. A town in Beaufort Co., S. C., 81 miles by rail northeast of Savannah, Ga.; the terminus of the Port Royal and Augusta Railroad, and on the Beaufort River (Map: South Carolina, D 4). Pop., 1910, 363. In this vicinity, in 1664, Captain Ribault, at the head of a company of French Huguenots, built a fort, which, in the following year, was taken by a force of Spaniards under Menéndez, who massacred all the garrison; and in 1686 Lord Cardross founded a town, which was almost immediately broken up by the Spaniards. At the outbreak of the Civil War the entrance to Port Royal Sound, some distance below the town, was fortified by the Confederates, Fort Beauregard being built north of the entrance and Fort Walker south of it. Against these fortifications a strong Federal squadron, consisting of two frigates, three sloops, and seven gunboats, all under Captain (later Rear Ad-

miral) Du Pont, was sent late in 1861, and on November 7 the forts were captured and the harbor secured. The Confederate forces at this point were commanded by Gen. Thomas F. Drayton. The Federal loss in killed and wounded was about 30, that of the Confederates about 50. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. i (New York, 1887).

PORT-ROYAL-DES-CHAMPS, pōr-rwä'yȧl' dā-shäN'. A convent of the Cistercian or Bernardine nuns, near Versailles, which obtained much celebrity during the seventeenth century as a centre of Jansenism. It was founded by the wife of Mathieu de Montmorency in 1204, and soon after its establishment obtained from the Pope the privilege of receiving lay persons who, without taking monastic vows, desired to live in religious retirement. The discipline of the convent was much relaxed in the fifteenth and sixteenth centuries, and the superior was appointed from worldly or political motives. In 1602 Angélique Arnauld (q.v.), sister of the celebrated brothers Arnauld, was appointed, when a child, coadjutrix of the abbess, whom she succeeded at the age of 11. As the new abbess advanced in years she undertook a reformation of the community, demanding a strict observance of religious poverty, abstinence from meat, complete seclusion, and the most severe ascetic exercises. The community removed to Paris in 1626, because of the malarial situation of Port-Royal, and in 1633 obtained a new convent, which was thenceforward called Port-Royal-de-Paris; and from this time the old establishment of Port-Royal-des-Champs was the home of a lay community in accordance with the original papal privilege. This community became very celebrated, and numbered among its inmates some of the most distinguished scholars of the time. The rule of life of the Port-Royalists was austere, and they devoted many hours to prayer, spiritual reading, instruction, and manual labor.

In 1643, inspired by profound love for children, the Port-Royalists founded the Little Schools, first at Port-Royal and then in Paris, in which they received a small number of pupils. They prepared for these schools the well-known textbooks of the Port-Royal series, such as Greek and Latin grammars, works on general grammar, geometry, and logic. The study of the vernacular was strongly emphasized, the general aim being to develop the reason, judgment, and power of personal reflection rather than a mastery of Latin. For the first time in the history of French education, the study of French received careful consideration.

Greater importance for the time was given to the community by its pertinacious adherence to the Jansenist views (see JANSENISM) and by the number of polemical works which issued from Port-Royal. In 1648 some of the nuns returned to Port-Royal, and there was a revival of the convent. But later, the nuns having refused to subscribe the formula condemning the five propositions of Jansenius, a royal order was issued in 1660 for the suppression of the school and the removal of the boarders, and the abbess and several other nuns were arrested and confined as prisoners in other monasteries. After the "peace of Clement IX" they were permitted to return; but the two communities, Port-Royal-des-Champs and Port-Royal-de-Paris, were placed under separate government. This led to many disputes and to a continued adherence at Port-Royal-des-Champs to the Jansenist spirit and opinions; and when the final steps for the repression of the Jansenists were taken in 1705 and the following years, a formal bull was issued by Pope Clement XI for the suppression of the old convent and the transfer of its property to Port-Royal-de-Paris. In 1709 the nuns were finally dispersed and distributed among convents of different orders throughout France. The property of the convent and church was transferred to the Paris house, and all the buildings of Port-Royal-des-Champs were leveled to the ground by order of the King.

PORT SAID, sä-ēd'. An important seaport of Egypt, situated at the Mediterannean end of the Suez Canal (Map: Egypt, C 1). Its harbor, with colossal piers of concrete, has ample docks and accommodations for vessels. It is noted for its lighthouse, whose light is visible 24 miles out at sea. Port Said has an export trade in cotton, and is an important coaling station. Large salt works exist on the east side of the harbor. It is the seat of the Governor-General for the Suez Canal. The town dates from 1859, when work on the canal was begun. Pop., 1911, 54,400, of whom about one-fifth are Europeans.

PORTSMOUTH, pōrts'mŭth. A county borough, seaport, and the chief naval arsenal of Great Britain, situated in Hampshire, on the southwest shore of Portsea Island, 74 miles southwest of London (Map: England, E 6). Portsmouth has the most complete fortifications in Britain. These comprise, on the landward side, the outer line of the Portsdown forts and the Hilsea lines; to seaward, the Spithead forts.

Southsea, which is situated outside the walls skirting Southsea Common, is rapidly increasing, and is a fashionable watering place. From the ramparts and batteries pleasing views may be had of the harbor, the roadstead of Spithead, and the Isle of Wight. The town itself is uninteresting. Among the few notable buildings is the church of St. Thomas à Becket; the chancel and transepts date from the twelfth century. The town of Gosport (q.v.) is separated from Portsmouth by the harbor entrance. Portsmouth harbor, about 220 yards wide at its entrance, extends inland for about 4 miles and has a breadth of 3 miles along its northern shore. The outward entrance is defended by Monkton Fort and Southsea Castle. The harbor is situated close to the magnificent anchorage of Spithead, where numerous battleships may ride without inconvenience, under shelter of the Isle of Wight. The government dockyard has an area of 293 acres. Of this vast naval estab-

lishment the most noteworthy features are the dry docks, spacious enough to admit the largest vessels.

The local trade of Portsmouth is supported mainly by the government dockyard and other public establishments. Brewing is carried on, and there is considerable traffic in timber, coal, cattle, and agricultural produce. The importance of the port dates from the reign of King Henry VIII. Its defenses were strengthened by Elizabeth and by William III. The municipality holds various charters, the first granted by Richard I in 1194. Its principal asset is its docks. It owns an electric-lighting plant and tramways, and maintains public baths, cemeteries, libraries, and a technical school. As a parliamentary borough Portsmouth returns two members. Portchester Castle, a ruined Norman fortress to the north of the harbor, occupies the site of the Roman Portus Magnus. The town was burned by the French in 1372. In 1642 it was taken by the Parliamentarians. In 1782 the *Royal Gcorge* sank in the harbor with a loss of nearly 1000 lives. Portsmouth is the birthplace of Charles Dickens and George Meredith. Pop., 1891, 159,981; 1901, 188,928; 1911, 231,141. Area, 6100 acres. Consult W. H. Saunders, *Annals of Portsmouth* (London, 1880).

PORTSMOUTH. A city and one of the county seats of Rockingham Co., N. H., 57 miles by rail north-northeast of Boston, on the Piscataqua River, about 3 miles from the Atlantic Ocean, and on the Boston and Maine Railroad (Map: New Hampshire, J 7). It is a port of entry and the only seaport in the State, situated on a peninsula overlooking the harbor, which is very deep and commodious, fortified, and dotted with islands that make the site of the city very picturesque. On one of the islands, formerly called Fernald's Island, is the United States navy yard, the place of construction of such famous vessels as the *Ranger* and the *Kearsarge*. Many of the islands in this vicinity, particularly the Isles of Shoals, are noted summer resorts. Portsmouth itself is a well-known resort, attractive for its fine situation and for the historic interest of its Colonial mansions, several of which are still standing. It is also closely connected with the popular watering places of the coast.

There are three parks, Goodwin, Langdon, and Haven, and a large playground. Among the edifices of note are the old residences of Governors Wentworth and Langdon, St. John's Church, the Federal government building, and the Portsmouth Athenæum, with a museum and library. The city has also a public-library building, designed by Charles Bulfinch in 1809, and several charitable institutions. Portsmouth is of considerable importance as a manufacturing centre, its establishments including a large shoe factory, several breweries, a shoe-button factory, and manufactories of locks, iron forgings, and boot and shoe heels. There are also marble and granite quarries. The government, under a revised charter of 1905, is vested in a mayor, annually elected, a unicameral council, and in administrative officers, among whom the police commissioners are appointed by the State Governor. Pop., 1900, 10,637; 1910, 11,269; 1915 (U. S. est.), 11,602.

Portsmouth was settled in 1623 by the Laconia Company, headed by Sir Ferdinando Gorges and Captain Mason, and for many years was known as Strawberry Bank. Before New Hampshire was organized in 1679, Portsmouth lay within the limits of Massachusetts. It was incorporated as a town and named Portsmouth in 1653, and in 1849 it was chartered as a city. Until 1807 it was the capital of the State. In 1905 the treaty ending the Russo-Japanese War was signed here.

PORTSMOUTH. A city and the county seat of Scioto Co., Ohio, 115 miles east-southeast of Cincinnati, at the junction of the Ohio and Scioto rivers, at the terminus of the Ohio Canal, and on the Baltimore and Ohio Southwestern, the Norfolk and Western, and the Chesapeake and Ohio railroads (Map: Ohio, D 8). Several steamboat lines add to the transportation facilities. Situated on a plain in a productive agricultural region, with considerable mineral wealth, the city is an important industrial and commercial centre. It has a Carnegie library, a city hospital, and homes for old ladies and children. There are several attractive parks—Grandview, Millbrook, Tracy, York, and Athletic. The Scioto valley is famous among archæologists for the many remains of the mound builders.

The manufacturing interests of Portsmouth are developing rapidly. There are large shoe factories, fire-brick, paving and building brick plants, gasoline engine and tractor works, stove and range works, car shops, planing mills, foundries and machine shops, furniture and veneering factories, hub and spoke works, stone saw mills, rolling mills, paper-box factories, a brewery, and a distilling and rectifying plant. The government is administered by a mayor, elected every two years, and a unicameral council. Most of the subordinate officials are appointed by the mayor and confirmed by the council, or elected by that body. The following important officers, however, are chosen by popular vote: city solicitor, city auditor, city treasurer, members of the school board, ward assessors, and justices of the peace. Portsmouth was settled in 1803 and was incorporated in 1814. Pop., 1900, 17,870; 1910, 23,481; 1915 (U. S. est.), 28,126.

PORTSMOUTH. A town and the county seat of Newport Co., R. I., 9 miles northeast of Newport, on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, C 3). It is in an agricultural and fruit-growing region, and contains a public library. Pop., 1900, 2105; 1910, 2681.

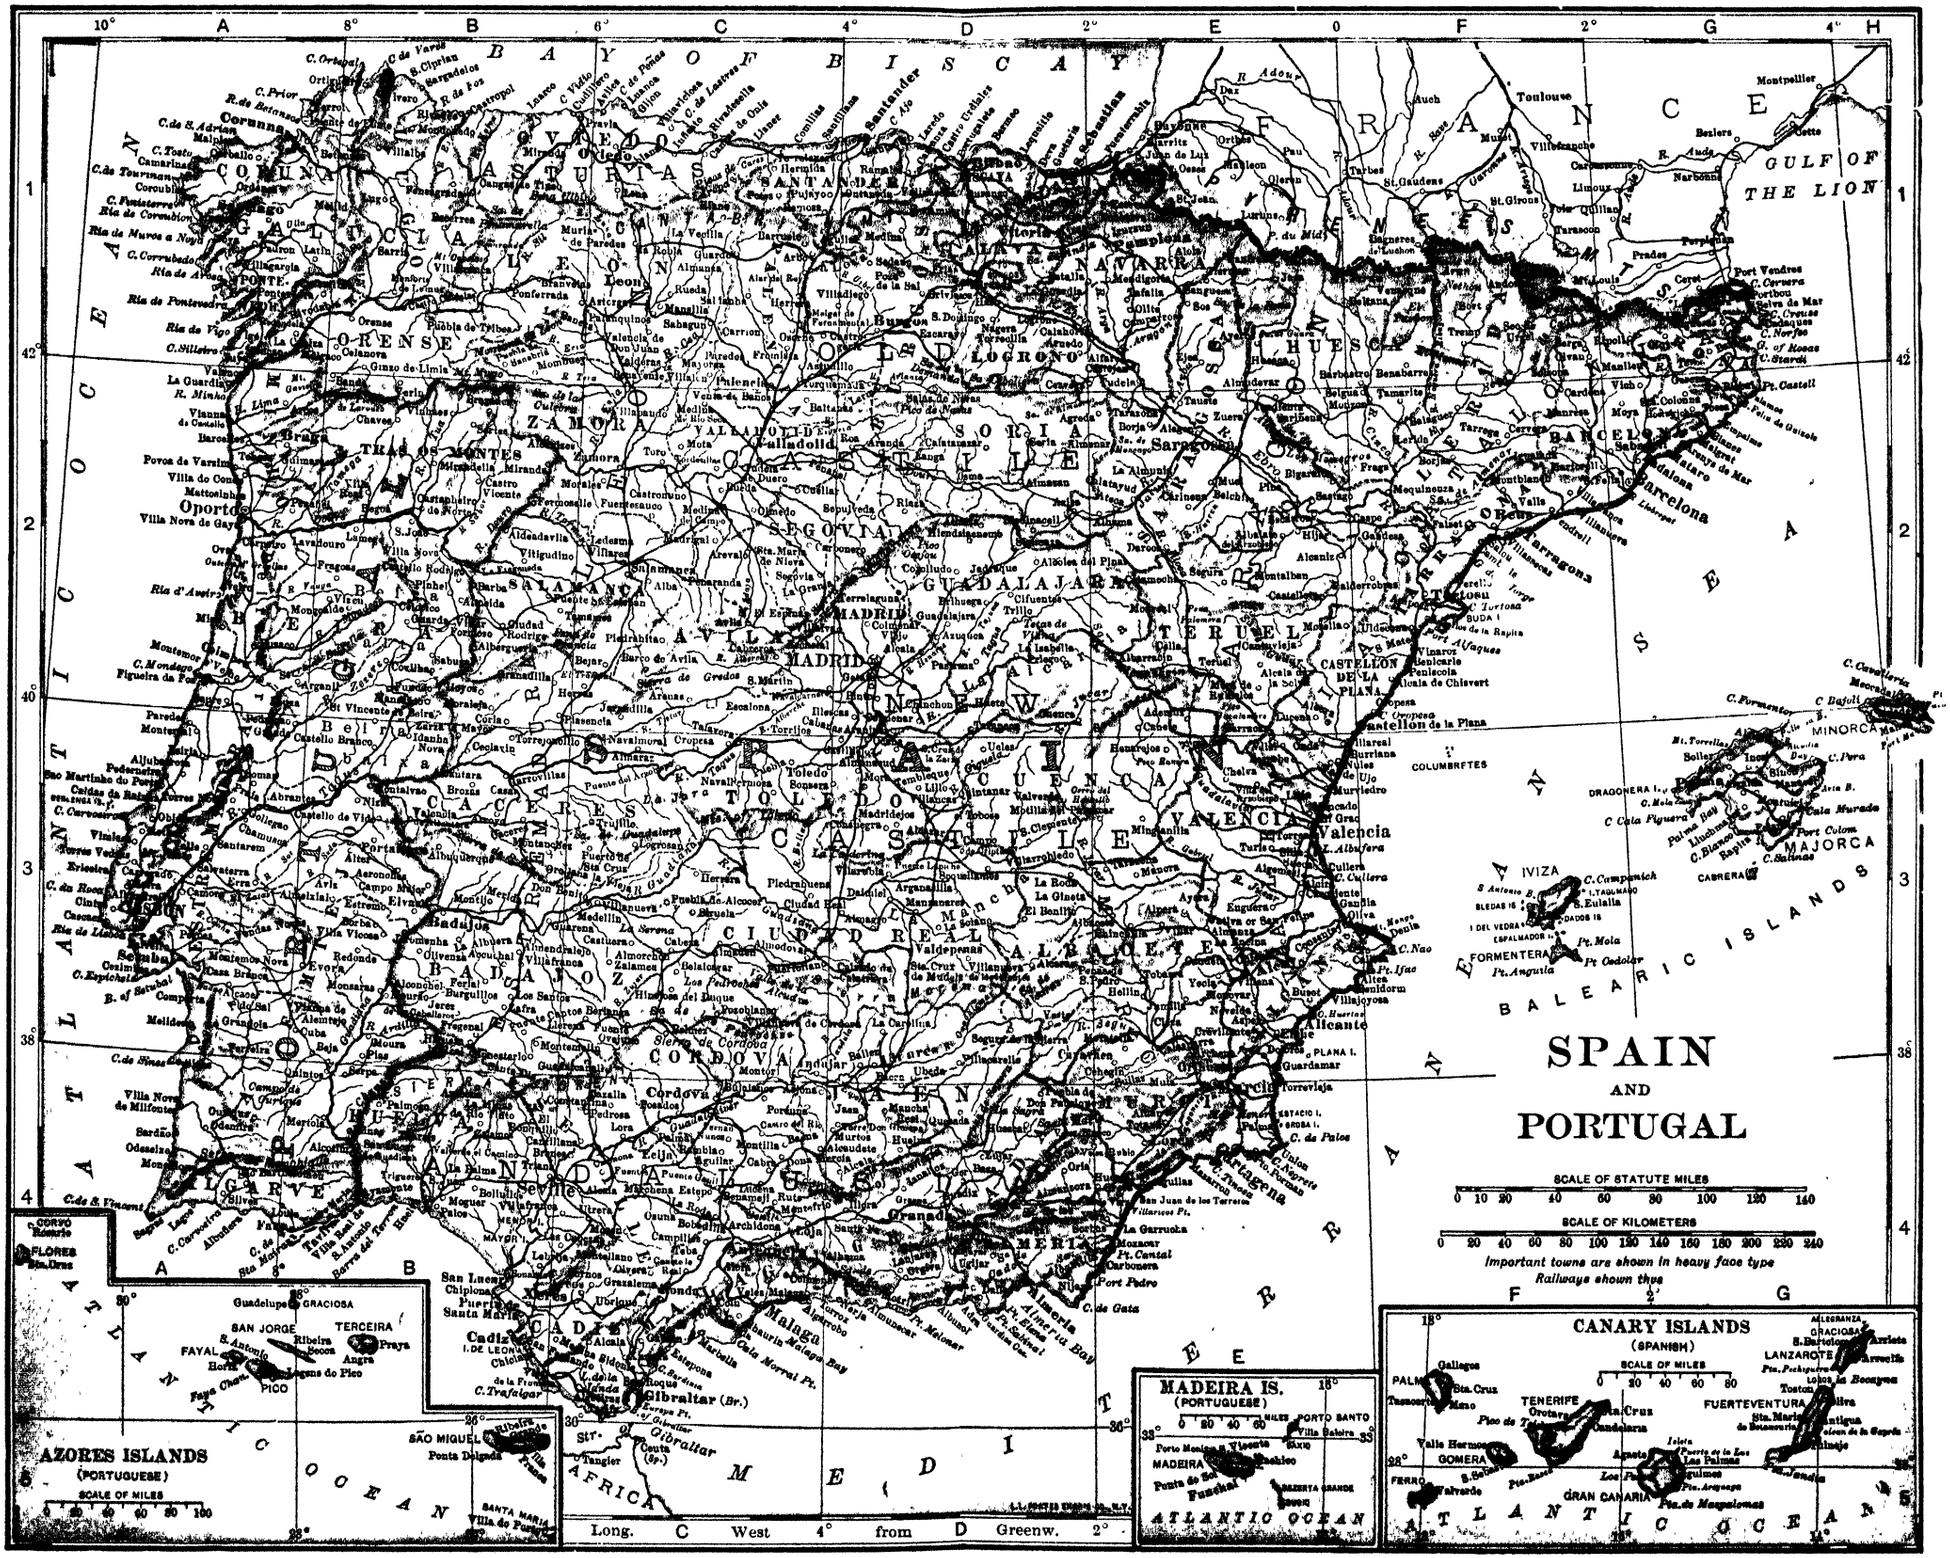
PORTSMOUTH. A city and the county seat of Norfolk Co., Va., on the Elizabeth River, opposite Norfolk, with which it is connected by ferry (Map: Virginia, H 5). The two cities, constituting in reality a single municipality, possess a fine harbor and good transportation facilities, being on the Albemarle and Chesapeake and the Dismal Swamp canals, on several steamship lines, and on the following railroads: Atlantic Coast Line, Chesapeake and Ohio, New York, Philadelphia, and Norfolk, and the Seaboard Air Line. The value of the foreign commerce of the Norfolk-Portsmouth customs district aggregated, in 1913, $17,723,000, of which $15,611,000 was for exports. See NORFOLK.

Portsmouth, in contrast with Norfolk, is regularly laid out, and is the home of many business men of the greater city. Its chief features include the United States Navy Yard (situated in the southern part of the city), which has three large dry docks and a plant for the construction of steel vessels, the naval training

station, naval magazine, and the United States Naval Hospital and park in the northern portion of the city. Other noteworthy structures are the King's Daughters Hospital, public library, armory, Y. M. C. A., homes for the aged and for orphans, and the Kirn, Commercial, and Law buildings. Trinity Church, erected in 1762, is also of interest. There are in Portsmouth extensive cotton mills, smelting works, cottonseed-oil mills, utilization works, lumber and knitting mills, hosiery and dye works, a fibre plant, and railroad shops of the Seaboard Air Line. There are also important garden-truck, oyster, fish, and crab interests. The city manager plan of government was adopted in 1915. The city council consists of seven members, the presiding officer being ex-officio mayor. Settled in 1752, Portsmouth was chartered a city in 1858. Before the Revolutionary War the British operated a shipyard on the site of the present navy yard. Pop., 1900, 17,427; 1910, 33,190; 1915 (U. S. est.), 38,610.

PORTSMOUTH, PEACE OF. See RUSSO-JAPANESE WAR.

PORT TAMPA CITY. A city in Hillsboro Co., Fla., 9 miles south of Tampa, on Tampa Bay (Map: Florida, D 4). It is the southern terminus of the Atlantic Coast Line Railroad, which here connects with steamers for Havana, Key West, Mobile, and other points, and has excellent harbor facilities. The town is the centre of a fertile region producing large quantities of phosphate, oranges, pineapples, and vegetables, and is the shipping port of Tampa (q.v.). It has also some reputation as a health resort. Port Tampa City was settled in 1889 and was incorporated four years later. It was the place of embarkation of the Santiago expedition in the Spanish-American War. Pop., 1900, 1367; 1910, 1343.



PORT TOWNSEND. A city and the county seat of Jefferson Co., Wash., 40 miles north by west of Seattle, direct, on Port Townsend Bay, at the entrance to Puget Sound. It is on the Northern Pacific Railroad, and has steamship connection with Alaska, San Francisco, and various ports of the Orient (Map: Washington, C 2). The harbor is one of the largest in the world, and is protected by three well-equipped forts. The city is favored with an equable climate, owing to the influence of the Japan Current, and is surrounded by picturesque mountain scenery. It is well laid out, and has fine business blocks, parks, public buildings, and private residences. Among the noteworthy edifices are the United States customhouse, county courthouse, city hall, school buildings, public library, United States Marine Hospital, St. John's Hospital, the Northwestern Sanitarium, and the United States Quarantine Station.

The neighboring region is engaged in lumbering, fishing, dairy farming, and fruit growing, and has also considerable oil and mineral wealth. Port Townsend is a port of entry for the Puget Sound customs district, the trade of which in 1913 was valued at $114,021,792, including exports to the amount of $62,548,109. Lumber, grain, farm and dairy products, live stock, fish, and oil are the chief articles of commerce. The industrial establishments comprise steam-boiler works, machine shops, saw and planing mills, a shipyard, salmon canneries, herring pickling and curing works, bottling works, etc. Under the charter of 1890 government is by a mayor, chosen annually, and a unicameral council. Port Townsend was settled in 1851 and was incorporated in 1860. Pop., 1900, 3443; 1910, 4181.

POR'TUGAL. One of the smaller states of Europe, occupying most of the western part of the Iberian or Pyrenean Peninsula. Comprised between the parallels of 37° and 42° N. and the meridians of 6° 15′ and 9° 30′ W., it has a continental area of 34,254 square miles, a little larger than Maine. The Azores and Madeira Islands, classed as an integral part of the Republic, have an area of 1236 square miles, making the total area 35,490 square miles. The colonial possessions are nearly 23 times as large as the Republic itself. Portugal is bounded on the north and east by Spain and on the south and west by the Atlantic Ocean. It extends about 350 miles from north to south, and has an average width of about 100 miles from east to west. No country is better provided with natural boundaries. Rivers or mountain ramparts separate it from Spain. The Minho, Douro, Tagus (Tejo), and Guadiana, flowing in deep valleys, form boundaries in parts of their courses. Portugal may almost be said to have a climatic boundary. The limit of rains brought by the westerly winds from the Atlantic coincides very nearly with the political boundary. On the side of Portugal are a humid atmosphere, copious rains, and luxuriant vegetation. On the side of Spain are cloudless skies, a thirsty soil, and treeless plains.

Topography. The Republic occupies the greater part of the Atlantic slope of the great peninsular table-land. The country has a coast line of nearly 465 miles. The harbors are relatively numerous, though those in the north are obstructed by sand bars. The most important are those of Lisbon, in the widened estuary of the Tagus; Oporto, on the Douro, near its mouth; and Setubal (the famous salt port), at the head of Setubal Bay. Lagos, founded by the Carthaginians, and Villa Novo, both on the south coast; Buarcos and Figueira, at the mouth of the Mondego; and the roadstead of Leixões, near Oporto, where an artificial harbor has been built, are smaller ports. It was partly due to the superior situation of the ports for intercourse with west Africa and South America that Portugal stood in the forefront of over-sea enterprises in the greatest era of geographic discovery.

A large part of the interior is filled with mountains. The country north of the Tagus is most mountainous and elevated. Of the three great mountain systems the fine Serra do Gerez of the north is the western extremity of the Pyrenean system, and the magnificent Serra da Estrella, between the Douro and the Tagus, is the western prolongation of the great central range of Spain. They have many offshoots and foothills, and the Estrella Range traverses the great plain of the Province of Beira. The Tagus divides Portugal into two portions, which differ much in appearance, climate, and soil. North of the Tagus are imposing mountain chains, transverse hill ranges, beautiful and fertile valleys; but south of the river the mountains rarely assume the aspect of ranges and do not rise high above the surrounding plateau. Thus, south Portugal is the least attractive part of the Republic—a succession of plains, hills, thinly wooded lands, and sandy coastal tracts. It includes, however, the third conspicuous orographic system of the country, the Serra de

São Mamede, on the border between Portugal and Spain.

Hydrography. The principal rivers have their origin in Spain, the only important rivers entirely possessed by the Portuguese being the Mondego, which waters a fertile valley, but is useless for commerce, and the Sado in the region of the famous salt pans. The rivers Minho, Douro, Tagus, and Guadiana are generally navigable as far as the Spanish frontier, and in the lower part of their courses even for large vessels. The Tagus is deep enough for seagoing ships for 90 miles, and the Douro as far as Oporto. While the rivers are very important in the communications of the country, they have not been effectively regulated for purposes of navigation. The Minho River forms part of the north boundary between Spain and Portugal; its valley is very fertile, and its salmon and lamprey fisheries are important. The Douro irrigates the vine regions which produce the famous port wine exported from Oporto. The lower Tagus crosses plains of great fertility, and widens at Lisbon to a great basin, one of the largest and finest harbors in the world.

Climate. Although not a large country, Portugal has a varied climate, owing mostly to the great differences in altitude. In the north it is cold and damp. High degrees of temperature are registered only in the south, and, owing to the neighborhood of the sea, the climate may generally be described as temperate. North of the Douro the mean annual temperature is 50° F., between the Tagus and Douro about 60° F., and in the Guadiana valley 65° F. Lisbon has a mean temperature in January of 50° F. and in July of 69.8° F. The prevailing winds blow from the northeast and the northwest, being of a monsoon character. The precipitation at Lisbon is about 40 inches a year, and Coimbra, the most populous town between Oporto and Lisbon, is the rainiest place in Europe, the clouds parting with their moisture against the sides of the surrounding mountains, where as much as 192 inches of rain have fallen in a year. On the whole the soils are not rich, for there are wide expanses of sandy and thin soils; some of the valleys and plains, however, are extremely fertile.

Flora. The vegetation, which is that of central and south Europe, is practically identical with the flora of Spain. The kind of vegetation is denoted by the prevalent forest trees—in the north the oak, in the middle the chestnut, and in the south the cork tree. The culture of the orange is extended the entire length of the coast. In the extreme south fig and carob trees are abundant, and wine is produced in large and increasing quantities. The olive is found everywhere, but the date palm is limited to a fringe along the south coast.

Fauna. The wild animals are those of Spain. Sardines and the tunny are most conspicuous in the coast fisheries, which are highly productive.

Geology and Mineral Resources. Almost all the geologic formations are represented. Granite is predominant among the northern mountains, gneiss throughout the Douro valley, mica schists occur irregularly here and there, and basalt is conspicuous in the surroundings of Lisbon. The older fossiliferous formations (Paleozoic) are conspicuous in the north and centre and cover most of south Portugal. Mesozoic formations occur along the coast between Lisbon and Aveiro, and several mountain chains in the central regions are formed of Jurassic rocks. Portugal suffers occasionally from the seismic disturbances which afflict the peninsula. The great earthquake of 1531 did enormous damage, and that of 1755, in which only one-quarter of Lisbon escaped destruction, was probably the most violent ever witnessed in Europe. The most important mines are in the copper region of Alemtejo and among the iron ores of Moncorvo. Coal is worked at Cape Mondego and is also found in the environs of Leiria, but the supply is inadequate. The mining industry, however, is in an even worse condition than that of Spain. Many mines are idle for want of fuel and cheap transport, and those that are worked are for the most part in the hands of foreigners. Very large quantities of salt, chiefly sea salt (at Setubal, 300,000 tons annually), are produced, and much is exported. The Portuguese sea salt is regarded as the best in Europe.

Agriculture. Statistics relating to the cultivated area of continental Portugal were published in 1913, but are for the year 1902. Out of a total area of 8,910,640 hectares, 5,067,763 hectares, or 56.87 per cent, were cultivated. Of the total cultivated area there were under cereals, pulse, grass, vegetables, etc., 2,337,775 hectares (46.13 per cent); the vine, 313,165 hectares (6.18); the olive, 329,156 (6.50); fruits, 131,221 (2.59); chestnuts, 83,988 (1.66); the holm oak, 416,670 (8.22); the cork tree, 366,002 (7.23). Of the total area 34.92 per cent was devoted to agriculture proper, 21.95 per cent was forest (including the cork tree, holm oak, and chestnut), and 43.13 per cent was unproductive. Farming is in a low state of development, and methods and implements are very primitive. There are three principal regions of cereal culture: that of maize, chiefly north of the Tagus River, where the climate is more humid than in the south; that of wheat, on the wide, dry, warm plains south of the Tagus; and that of rye, on the poorer dry soil and in the colder temperature of the eastern lands bordering Spain. Flax is extensively grown in the north, and citrus fruits and olives are produced in the south. Vine growing, the most noted branch of Portuguese husbandry, is of great importance, particularly on the Douro, where port wine is produced. Though the industry is carried on in somewhat antiquated fashion, Portugal is one of the leading wine countries, judged by the quality of its wine. The yield in 1908 was 6,869,400 hectoliters.

Live-stock raising is an important branch of agriculture. In 1906 there were 87,765 horses, 144,089 asses, 57,647 mules, 703,198 cattle, 3,072,988 sheep, 1,034,218 goats, and 1,110,957 swine. Cattle are raised in largest numbers in the valleys and on the plains of the north, while sheep and swine are found chiefly in the south. Silkworm culture is increasing, particularly in the north.

Manufactures. The manufacturing industries have only inferior development, but they are progressing, especially in Oporto and Lisbon. The chief manufactures are textiles, particularly woolens, and also cotton, linen, and silk goods. The cottons are made chiefly for export to the colonies. The chief seats of these manufactures are Lisbon, Oporto and the neighboring Braga, and Covilhão. Other products are hats, leather, spirits from sugar cane, porcelain, tobacco, shoes, ironware, brandy, and soap.

Shipbuilding has been increasing in importance within the last few years.

Commerce. The average annual foreign trade, in millions of dollars, may be seen in the following table:

	1891–95	1900–04	1912
Imports	44.3	63.5	80.5
Exports	38.1	32.2	37.1

The foregoing figures represent the special trade in merchandise. There is in addition a considerable exportation of colonial produce: this in 1911 included cacao to the value of 7,083,000 escudos and rubber to the value of 4,032,000 escudos (the escudo = $1.08). In the special trade in 1912 imports and exports were valued at 74,639,000 and 34,325,000 escudos; specie, 1,072,000 and 641,000. Leading imports include cotton, cotton goods, wheat, coal, metals, and sugar. The principal export is wine, which in 1911 was valued at 11,933,000 escudos (of which common wine 5,397,000, port 5,678,000); the other principal exports were: cork, 4,378,000 escudos; live stock, 3,943,000; fish, 3,104,000; southern fruits, 1,635,000; cotton goods, 1,185,000; wood, 905,000; copper, 869,000; olive oil, 544,000. In 1911 imports from the United Kingdom and exports thereto were valued at 19,398,000 and 6,935,000 escudos respectively; Germany, 12,128,000 and 3,300,000; United States, 5,835,000 and 842,000; Belgium, 5,267,000 and 1,070,000; France, 5,238,000 and 1,359,000; Spain, 5,106,000 and 5,764,000; Brazil, 1,854,000 and 6,316,000.

Communications. The domestic trade is much facilitated by the rivers. The wagon roads have been improved and extended in late years. In 1853 the first railway was opened, between Lisbon and the Spanish frontier. At the beginning of 1913, 1854 miles of railway were in operation, of which 713 miles belonged to the state. The railway lines are practically adequate to the needs. The coasting trade is very active. The chief ports in the foreign trade are Lisbon and Oporto. In 1912 there were entered at all the ports 11,134 vessels, of 23,197,000 tons (of which, steamers 7846, of 22,887,000 tons). The larger proportion of the shipping is under the British flag. In 1911 the Portuguese merchant marine numbered 66 steamers, of 70,193 tons, and 259 sail, of 43,844 tons. Regular shipping communication is maintained with many ports, as the steamers of most lines plying to South America, western Africa, the Mediterranean, and eastern Asia touch at Lisbon, and in many cases at Oporto also.

Banking and Currency. The present currency system of Portugal, established by a decree of the provisional government May 22, 1911, made the monetary unit the gold escudo, the value of which is $1.08 in United States currency; it is also equal to the gold milreis, the former unit of currency. The gold coin issued since 1854 is equal to about 8,000,000 escudos, and the silver coinage about 38,000,000 escudos. The gold escudo is issued in 2, 5, and 10 escudo pieces; the silver coins are the 1 escudo piece and 50, 25, and 10 centavo pieces. The exchange value of the inconvertible paper milreis is quoted by the United States Treasury Department in 1915 at about 94 cents. There is little gold in circulation.

The number of banks is about 30, but the Bank of Portugal, with head office at Lisbon, has 22 branches in as many cities and towns. It has the right of issue, and its notes issued up to 1914 amounted to 103,000,000 escudos. Its paid-up capital is 13,500,000 milreis, and the deposits, current accounts, etc., were, in 1914, 10,798,000 milreis. The Banco Lisboa and Açores has a paid-up capital of 4,500,000 escudos; securities deposited, 74,000,000 milreis. The Banco Ultramarino, with a capital of 7,200,000 escudos, has branches in Brazil and in the principal Portuguese colonies.

Education. Elementary instruction has been nominally compulsory since 1844, provided schools were available, but the law was not generally enforced until the promulgation of a decree of 1911. Portugal, indeed, has been notorious for its illiteracy. At the 1911 census the population of Portugal (including the Azores and Madeira) over six years of age numbered 4,262,221; of these 2,855,067 (1,117,273 males, 1,737,794 females) could not read. In 1911 there were about 7120 elementary schools (6320 public, 800 private); public secondary schools numbered 32, with 9749 students, and in 1912 with 10,621. Private secondary schools are maintained and also several schools for industrial, commercial, and technical training. There are three universities, at Coimbra, Lisbon, and Oporto; students in 1912, about 2700. See COIMBRA, UNIVERSITY OF.

Religion. The state religion was Roman Catholic (other religious forms being tolerated) until the advent of the republican government, which separated church and state. There are a few Protestants, chiefly foreigners. The country is divided into three ecclesiastical provinces, with their seats at Lisbon, Braga, and Evora. A patriarch presides at Lisbon, and if he is not a cardinal when he enters office, he receives that dignity as soon as a place is vacant in the Sacred College. Braga and Evora are under the jurisdiction of archbishops. In 1834 the 632 monasteries and 118 nunneries with over 80,000 nuns and monks and an annual income of nearly $5,000,000, were suppressed and their property confiscated for the benefit of the state. Subsequently a number of similar establishments were formed, but they were suppressed by the Republic.

Finance. The budget for 1914–15 showed estimated revenue and expenditure (ordinary and extraordinary) of 79,649,140 and 83,390,965 escudos respectively. The indirect taxes (including customs) were estimated at 25,680,200 escudos; direct taxes, 13,078,550; registration and stamps, 10,615,300; the remaining revenue is derived principally from state enterprises (including monopolies) and investments. The largest expenditure is for the public debt, 28,401,352 escudos; other estimated disbursements were for the Ministry of War, 10,738,777 escudos, and public works, commerce, and industry, 10,806,979.

At the end of 1913 the public debt stood at 889,085,870 escudos. The foreign debt amounted to 175,396,150 escudos, of which the sum of 138,445,920 escudos was at 3 per cent and the remainder at 4 and 4½ per cent. The internal debt was 713,689,720 escudos, including the consolidated debt, 565,134,076 escudos at 3 per cent, and a floating debt of 87,296,642 escudos.

Weights and Measures. The metric system is the legal standard of weights and measures,

but the old weights and measures also are in use.

Dependencies. The Portuguese dependencies are given in the table below. Published figures differ with respect to some of the areas; the figures here given in square miles correspond to an official statement in square kilometers published in 1913. The population figures are the most recent reliable estimates available (the figure for Timor, however, is for 1902).

	Sq. miles	Population
In Africa:		
Province of Cape Verde (islands)	1,516	142,552
Province of Guinea	13,948	820,000
Province of São Thomé and Príncipe (islands)	364	68,221
Province of Angola	484,855	4,200,000
Province of Mozambique	293,436	3,150,000
Total	794,119	8,380,000
In Asia:		
Province of India (Goa, 1301 sq. miles; Damão, 148; Diu, 20)	1,470	604,930
Province of Macao	4	74,866
Total	1,474	679,796
In the East Indies:		
District of Timor	7,332	150.299
Grand total	802,925	9,210,000

Population. Census returns show that the population of Portugal has increased as follows: Jan. 1, 1864, 4,188,410; Jan. 1, 1878, 4,550,699; Dec. 1, 1890, 5,049,729; Dec. 1, 1900, 5,423,132; Dec. 1, 1911, 5,960,056. In 1911 males numbered 2,828,691 and females 3,131,365; the proportional excess of females appears to be greater than in any other European country, there being 110.7 females for each 100 males. The density of population was 168 per square mile. Of the total population 60.7 per cent were unmarried, 33.1 married, 0.1 divorced, and 6.1 widowed. In 1911 the population seven years of age and over numbered 3,360,477, of whom 69.7 per cent could not read. In 1900 the urban population was 32.4 per cent on the continent and 37.5 on the islands. Foreigners numbered 41,197 in 1911, of whom 20,517 were Spaniards and 12,143 Brazilians. In 1912 there were 207,690 births and 119,317 deaths. Emigration in 1912, 88,929; in the period 1900–12, 1,496,004, chiefly to Brazil and the United States. There are few large cities. The populations of the largest in 1911 was: Lisbon, 435,359; Oporto, 194,009; Setubal, 30,436; Funchal (Madeira), 24,687; Braga, 20,844; Coimbra, 20,581; Evora, 17,911; Ponta Delgada (Azores), 16,179; Covilhão, 15,745; Faro, 12,680; Tavira, 11,665; Portalegre, 11,603; Aveiro, 11,523.

Area and population by provinces and their constituent districts are shown in the table given in the next column.

PROVINCES AND CONSTITUENT DISTRICTS	Area in sq. miles	Population 1900	Population 1911
Entre-Douro-e-Minho:			
Viana do Castelo	857	215,267	227,250
Braga	1,040	357,159	382,276
Pôrto	893	597,935	679,540
	2,790	1,170,361	1,289,066
Trás-os-Montes:			
Vila Rial	1,650	242,196	245,547
Bragança	2,514	185,162	192,024
	4,164	427,358	437,571

Total, islands	1,237	406,865	412,348
Grand total	35,500	5,423,132	5,960,056

Defense. *Army.*—In Portugal liability for military service is universal and compulsory from 17 to 45 years, both inclusive, actual service beginning at 20. The 25 years of service is divided as follows: active army, 10 years; reserve, 10 years; territorial army 5 years. Initial recruit training for the active army lasts from 15 to 30 weeks, followed by two weeks in the field during the annual manœuvres. For purposes of military administration and recruitment there are three territorial districts, each furnishing a division on paper. The skeleton organization of the active army is: infantry, 35 regiments of 3 battalions each; cavalry, 11 regiments of 4 squadrons each; field artillery, 8 regiments with a total of 63 batteries of 4 guns each; 2 horse batteries; 9 mountain batteries; 20 garrison batteries; the necessary auxiliary and supply units. In peace the active army is limited to 2800 officers and 30,000 men. The reserve army, on paper, consists of 35 regiments of infantry, 8 squadrons of cavalry, and 24 field batteries, with provision for the necessary auxiliary and supply units. In addition there are maintained in peace a military police of 5000 men, of whom 800 are mounted, called the Republican Guard; and a Fiscal Guard of 5200 men. Both of these forces may be employed in the field in war.

Arms: infantry, a magazine rifle (6.5 millimeter), the Mauser-Vergueiro; field artillery, a 7.5 centimeter Schneider-Canet gun.

Colonial troops: regulars in the Azores, 2 regiments of infantry, 2 battalions garrison artillery; in Madeira, 1 regiment of infantry, 1 battalion garrison artillery. Native troops: in west Africa, Mozambique, India, etc., a total force of about 650 European officers, 2500 European noncommissioned officers, 7000 natives, the

last being enlisted compulsorily. Budget, 1914–15, $11,088,405.

Navy.—See under NAVIES.

Ethnology. The Portuguese are the longest-headed people in Europe (cranial index, 75–77). In stature they are below the average (1.61–1.67 meters, or 5 feet, 3 inches to 5 feet, 5¾ inches in the south and an inch taller in the north). Blond hair is practically absent. Black hair is possessed by one-fifth of the population; in the remainder the hair is very dark. Portugal was engaged in the slave trade for nearly four centuries. During that period many thousands of African and Brazilian negroes finally settled in the provinces of Algarve and Estremadura, and a large mulatto contingent in the population is the result. Stone-age relics are common in Portugal. Megalithic monuments are also common, occurring in the shape of dolmens, from which the tumulary envelope has been removed. In the smaller ones the crypt is made up of four large dressed stones, covered by a fifth; in the more elaborate the chamber is larger, round or irregular in outline, and approached through an avenue. In them along with the dead are found implements of chipped and polished stone, weapons and ornaments, turquoise beads, etc. The most interesting remains of the classical epoch are the so-called *citanias*, hill cities or forts. Two of them crowning the summits of low mountains in the northwest corner of Portugal have been carefully explored. A long wide street is lined on each side with ruins of stone houses. The walls are built of large, irregular blocks well adjusted, the interiors being revetted with smaller stones. The foundations are round and are built up in spiral. A thatched roof, doubtless, was sustained by a central pillar of wood, the stone support of which is to be seen in many ground plans. On both sides of the door and along the wall are the remains of a penthouse sustained by six pillars, of which the stone bases yet remain. Pottery and glassware abound in them. Flagstones are covered with sculptures, and the walls are decorated with circles, coils, and frets. The latest coin found in any of them was of Constantine I (306–337). Inscriptions on some of the houses are in Roman letters.

Government. Portugal is a republic, proclaimed Oct. 5, 1910. Prior to that date the government was monarchical, under a constitution of 1826 with subsequent amendments. The executive authority was vested in the crown, hereditary in the house of Saxe-Coburg-and-Gotha-Braganza. The sovereign (king) was assisted by a council of state and acted officially through a cabinet of ministers responsible to the Lower House of the national Legislature. This body, the Cortes, consisted of the Chamber of Peers and the Chamber of Deputies. The Deputies, 155 in number, were elected for four years by male citizens who were 25 years or more of age and who could read and write or paid a small tax.

The constitution of the Republic bears date of Aug. 21, 1911. It vests the executive authority in a President, who is elected for four years by both Houses of the Legislature. The President, who must be at least 35 years of age and who is ineligible for reëlection, is assisted by a cabinet of ministers, whom he appoints and who are responsible to the Chamber of Deputies. The Legislature (Cortes) consists of the Senate and the Chamber of Deputies, or National Council. Senators, 71 members, are elected by municipal councils for six years, 35 (or 36) members being elected every three years. Deputies, 164 in number, are elected by direct male suffrage for three years. Senators must be at least 35 and Deputies at least 25 years of age.

For the purpose of local government Portugal, with the neighboring isles, is divided into 21 districts, corresponding somewhat to the French departments. The districts are again divided into communes (*concelhas*), and these are further subdivided into parishes, about 4000 in number. In each district there are a popularly elected assembly or *junta*, a permanent executive commission chosen from the membership of the junta and charged with the execution of its deliberations, an administrative tribunal for the settlement of administrative controversies, and a Governor charged with the supervision of matters of central administration in the district. The commune is an administrative circumscription whose chief organs of government are an elected municipal council with a president, whose duty it is to execute the resolutions of the council, and an *administrador* charged with the supervision of central affairs in the commune. In each parish there is an elected assembly or junta.

For the administration of justice the country is divided into *comarcas*, or districts, in each of which is provided a court of first instance held by a single judge. There are also in each district a number of justices of the peace, who have jurisdiction in minor civil and criminal cases. Above these are three courts of second instance, located at Lisbon, Oporto, and Ponta Delgada in the Azores, which have original jurisdiction in certain cases and hear appeals from the lower courts, while the ultimate judicial authority is the Supreme Court at Lisbon.

History. What later became Portugal was inhabited in prehistoric times by a branch of the Celtiberian race, made up of the native Iberian stock of the peninsula and the immigrant Celts. Greek colonies were planted at the mouths of the three rivers, the Tagus, the Douro, and the Minho, the name of Lisbon being derived from the ancient Greek Olisipo (city of Ulysses). The Carthaginian influence was weaker in this part of the peninsula than in the eastern. The Roman conquest was begun in 189 B.C. and was gradually completed in the two generations following, though with much difficulty, Viriathus (q.v.), the leader of the Lusitani in their revolt (c.149–139 B.C.), proving a formidable adversary. The Roman province of Lusitania under the Empire contained most of the territory of modern Portugal south of the Douro. In the fifth century Roman control in the peninsula gave way to that of the Visigoths without especially affecting this remote corner. It was included in the area of Mohammedan conquest in the eighth century. In 997 the territory between the Douro and the Minho was taken from the Arab-Moors by Bermudo, King of Galicia, and in 1064 the reconquest was completed as far south as Coimbra by King Ferdinand the Great of Castile, Leön, and Galicia. The reconquered districts were organized as counties, feudal appanages of Galicia. From the northern county, the Comitatus Portucalensis, extending about the Roman Portus Cale (the modern Oporto), the new nation finally took its name. In the division of Ferdinand's realm

Galicia with Oporto and Coimbra went to his third son, Garcia, but the eldest son, Alfonso VI of León, forcibly united all the family possessions in 1073. The new Mohammedan attack under the Almoravides (q.v.) put Alfonso on the defensive. Among those who came to his assistance was Count Henry of Burgundy, who married Theresa, an illegitimate daughter of Alfonso, and received Coimbra and Oporto, with the title of Count of Portugal (1095). During the internecine wars before and after the death of Alfonso in 1109 the Portuguese began to develop a national spirit and to distinguish themselves from the hitherto dominant Galicians. This was especially true after the death of Count Henry in 1112, when his wife devoted herself to upbuilding an independent kingdom for their infant son. The latter, Alfonso I, assumed the government in 1128, and fought valiantly against the Moors, over whom he won a splendid victory at Ourique in 1139. This was followed by his attempt to found a kingdom and long wars necessitated by the attempts of Castile to subdue his dominions. Alfonso took Lisbon from the Moors in 1147 and made it his capital. He died in 1185, after a long and brilliant reign. His son and successor, Sancho I (1185–1211), gained from the gratitude of a prosperous country the title of the Founder of Towns. Alfonso II (1211–23) did not follow Sancho's wise policy, but came into conflict with the papacy, which culminated in the King's excommunication and an interdict laid upon the Kingdom. His son Sancho II (1223–48) was also excommunicated, the country being put under an interdict, and was deposed by Pope Innocent IV. His brother, Alfonso III (1248–79), was on better terms with the clergy, and also proved to be a capable ruler. He assumed the title of King. The country had now reached its utmost European limits, and its course had been progressive, except for the unfortunate years of struggle with the Church. The long reign of Denis or Diniz (1279–1325), the son of Alfonso III, was a period of progress and development hardly equaled at that time in Europe. Under him Portugal entered on that course of commercial enterprise which was the source of all the country's wealth and greatness. In 1290 he founded the University of Lisbon (transferred to Coimbra in 1308). His son Alfonso IV (1325–57) was compelled to defend his Kingdom against Castilian and Moslem. Alfonso's son Pedro (1357–67) was succeeded by his son Ferdinand (1367–83), the last male in the legitimate line.

On the death of Peter his illegitimate son, John I, took measures to secure the government, and was recognized by the Cortes after some difficulty in 1385. This branch of the Burgundian house is sometimes known as the house of Aviz, the King having been grand master of the Order of Aviz. John's reign of nearly half a century was one of the most noteworthy in Portuguese history. He successfully defended his Kingdom against Castilian attack, and showed himself a statesman and general of uncommon ability. The fame of his reign rests, however, less upon the strong and intelligent administration of the King than upon the work done under the direction of his accomplished son, Prince Henry the Navigator (q.v.), in exploring the African coast with the object of discovering an eastward route to the Indies. In 1420 the Portuguese rediscovered Madeira, and at the close of John's reign they reached the Azores. A successful campaign by Portugal in Morocco, resulting in the capture of Ceuta in 1415, was followed by the acquisition of control over about half of Morocco, which was held until 1578. John I was succeeded by his eldest son, Duarte, or Edward (1433–38), and he by his son Alfonso V (1438–81). The work of Prince Henry's captains and their immediate successors led to the inauguration of a regular system of exploration and the acquisition soon after the middle of the fifteenth century of the Cape Verde Islands and the Guinea coast. Alfonso V interfered in the Castilian succession disputes (1474–76), and was severely defeated at Toro in the latter year. Alfonso was succeeded by his son John II (1481–95), during whose reign Pope Alexander VI issued his famous bull of demarcation (May 4, 1493), giving to Portugal all discoveries east of a meridian 100 leagues west of the Azores and Cape Verde Islands, a decision which was modified by the Treaty of Tordesillas (June 7, 1494) between Portugal and Spain, by which the line of demarcation was moved to a distance 370 leagues west of the Cape Verde Islands. This arrangement presently gave Portugal the important territory of Brazil in the Western Hemisphere. John's successor was his cousin Emmanuel (1495–1521), the son of a younger brother of Alfonso V. His reign was notable for the voyage of Vasco da Gama around the Cape of Good Hope to India (1497–98), opening the period of Portuguese activity in the East, and for the discovery and first settlement of Brazil, which remained for over three centuries an appanage of the Portuguese crown. In 1510 Albuquerque (q.v.) captured Goa, which became the seat of Portuguese power in the East. Within a few years this great commander extended the Portuguese conquests to Malacca and the Sunda Islands. The Portuguese also established themselves at various points on the east coast of Africa, and penetrated into Abyssinia and the Congo country. The reign of Emmanuel's son, John III (1521–57), saw Portugal at the height of its prestige. It ranked as one of the most powerful European monarchies, while Lisbon was one of the most important commercial cities of the Continent.

While Portugal's rise had been rapid, its decline was more sudden still. The numerous wealthy and industrious Jews whose able financial management had done much to establish Portuguese commerce were expelled from the country, while social tyranny and oppression in the colonies as well as at home depressed the energy and crippled the resources of the nation. The death of King John in 1557 made his grandson Sebastian, then a child of three years, King. Drawn by his ambition for new conquests and by the restlessness of the Moors into an African campaign in 1578, the young King met a total defeat and death at Kasr el Kebir (Alcazar Quivir). (This was the beginning of the loss of the Moorish dominions of Portugal. Of the few places remaining in Portuguese control after this unfortunate campaign, Ceuta was garrisoned by Spain in 1580 and ceded to that country in 1668; Saffi was ceded to the Moors in 1641; Tangier to England in 1662; several other places to the Moors in 1689; and the last, Mazagan, in 1770.) The death of Sebastian left but one representative of the old Burgundian line, Sebastian's aged granduncle, the Cardinal Henry, whose brief reign (1578–80) plunged the

country still further into misfortunes. His death gave rise to bitter disputes over the succession between several connections of the Portuguese royal house. Of the claimants Philip II of Spain, whose mother was a daughter of the late King Emmanuel, possessed the power and the opportunity to seize the coveted possession, which he promptly did, two battles sufficing for its conquest by the Duke of Alva. The annexation of Portugal to the Spanish monarchy subjected it to the deadly blight of Philip's stately and imposing tyranny; its resources were weakened by the heavy expenses incident to the ruinous wars of Spain; and the Dutch seized most of the Portuguese possessions in the East Indies. In the reign of Philip IV matters were brought to a crisis by the course of his Minister Olivarez, and in 1640 a successful conspiracy of the higher nobility freed Portugal from connection with Spain. This was accomplished under the leadership of John, Duke of Braganza, the descendant of an illegitimate son of John I, but whose rights to the throne came from his being the grandson of that Catharine whose claims to the Portuguese throne in 1581 ought to have given her precedence over Philip II (she being the daughter of Edward, sixth son of King Manoel, and Philip being only the son of Manoel's oldest daughter). The Duke ascended the throne, and the rule of the house of Braganza (which continued until the recent expulsion of young King Manoel, when the Republic was established) began in the person of John IV (1640–56). War with Spain was terminated in 1668, when in the Treaty of Lisbon the independence of Portugal was formally recognized. The succeeding history of Portugal offers little that is of interest. From its high rank as a commercial power the country sank into a position of practical dependence upon England, with which Portugal became closely allied by the Methuen Treaty in 1703. John IV was succeeded by two of his sons, Alfonso VI (1656–67) and Pedro II (1667–1706). To the latter's son, John V (1706–50), succeeded his son, Joseph (1750–77). In this reign the genius and resolution of the Minister Pombal (q.v.) infused temporary vigor into the administration and checked for a time the downward tendency of the national credit. Pombal carried on a relentless war against the nobles and the clergy, and as a result of his efforts the Jesuits were expelled from the country in 1759. The year 1755 was notable for an earthquake which nearly destroyed Lisbon (q.v.). There was a speedy relapse into reaction upon the accession of Joseph's daughter Maria and her husband, Pedro III, who was also her uncle. The latter died in 1786, and three years later, owing to the mental condition of the Queen, the government was put in the care of a regency under the Crown Prince John. Prince John gave evidence of ability and patriotism. Being unable to maintain himself in Portugal against Napoleon, who by the Treaty of Fontainebleau had agreed with Spain upon the partition of Portugal, he left the country in November, 1807, with his family, and transferred his government to Brazil, while a French army under Junot occupied Lisbon. The campaigns of the English and Portuguese forces under Sir Arthur Wellesley freed Portugal of its French invaders (see PENINSULAR WAR), and in 1816, upon the death of his mother, Prince John succeeded to the crowns of Portugal and Brazil as John VI. He continued to reside, however, at the Brazilian capital until 1821.

Portugal had for several generations been under an absolute form of government, the controlling springs of which were the court and the priesthood. The transfer of the seat of government to Brazil was a humiliation to the Portuguese, and aroused a spirit of discontent which made them especially susceptible to the revolutionary influences then alive in Europe. In 1820 the army took the lead in a revolution designed to bring in a constitutional government. King John returned to Portugal, leaving his son Dom Pedro as Regent in Brazil, with instructions to retain that country for the house of Braganza, even at the cost of separation from Portugal. The revolutionists at home insisted upon subordinating Brazil in the new arrangements, and produced a revolt in the latter country. This movement Dom Pedro, loyal to the interests of Brazil, headed, and in 1822 Brazil asserted its independence and the Prince Regent declared himself constitutional Emperor. Meanwhile in Portugal the Brazilian movement caused a reactionary revolt towards absolutism, headed by the King's younger son, Miguel (q.v.), who had been invested with the command of the army. The revolt was put down with British assistance in 1824. Upon the death of King John in 1826 his son, Pedro, Emperor of Brazil, who succeeded to the crown of Portugal, promulgated a constitution, providing for a bicameral Legislature, with an hereditary House of Peers and an elective House of Deputies, its legislative powers being subject to the King's sanction. The fundamental liberties of citizens were guaranteed, and other religions than the Catholic were to be tolerated. Pedro then resigned his right to the crown in favor of his seven-year-old daughter, Maria da Gloria, who, when of age, was to marry her uncle, Miguel. The latter was made Regent in July, 1827, and in this Pedro, who was an unselfish patriot, and not a politician, made his great mistake. The Regent at once took measures in defiance of the constitution to restore the ancient forms of government. He proclaimed himself King in 1828 and sought to reconcile the interests of the conflicting political parties and at the same time place the monarchy on its old basis. In this he was supported by the Absolutists, recruited from the army and the clergy. In 1832 Dom Pedro, who in the preceding year had been forced to abdicate the throne of Brazil, proceeded to uphold the rights of his daughter by force of arms. He placed himself at the head of an expeditionary force, which had been collected by the opponents of Dom Miguel at the island of Terceira, Azores, and in July he was welcomed as a deliverer at Oporto, the Liberal stronghold. A stubborn struggle ensued. In July, 1833, the fleet of Dom Pedro, commanded by Sir Charles Napier, vanquished the Miguelist fleet off Cape St. Vincent, and a few weeks later Lisbon capitulated to Dom Pedro, who proclaimed himself Regent for Dona Maria. Pedro was aided by the intervention of Spanish arms, backed by the influence of the short-lived Quadruple Alliance (England, France, Spain, Portugal). By the agreement of Evora, in 1834, Miguel pledged himself to a renunciation of all claims to the crown and to perpetual exile from the Kingdom. Pedro died Sept. 24, 1834, when Queen Maria was but 15 years of age. Her reign was a troublous one. Neither rulers nor people knew how to carry on a parliamentary

government. The fall of Miguel put an end to the Absolutist party, and the political division that took the place of the old was that between Chartists and Liberals, the former upholding the existing constitution, the latter seeking to restore the constitution of 1822, which represented popular sovereignty. The later political history of the country has been that of a series of progressive movements originating in the principal cities and combated, usually with success, by the conservative element. A military revolt in September, 1836, forced the Queen to restore the constitution of 1822, and gave their name to the Septembrists, who thereupon formed the constitution of 1838, modeled upon that of 1822. Another military revolt restored the Chartists to power in 1842, and they governed the country under the leadership of Costa Cabral (q.v.) until in 1852 a new party known as the Regenerators, composed of Septembrists and Chartist seceders, came into power under Saldanha and established direct suffrage. The Queen died Nov. 15, 1853, leaving her husband, Prince Ferdinand of Coburg, as Regent during the minority of their son, Pedro V. The latter died Nov. 11, 1861, having refused to flee from the cholera-stricken city of Lisbon. Ferdinand continued as Regent for the next heir, Luiz (1861–89). The autocratic methods of Saldanha split his party, and finally resulted in 1877 in constituting the Progressist party out of the more radical members of the old Liberal parties. King Luiz died Oct. 9, 1889, and was succeeded by his elder son, Carlos.

The reign of King Carlos was marked by extravagance and by general demoralization of the finances of the country. A practical dictatorship was established under the Premier, Dom J. F. C. Franco, in 1907. On Feb. 1, 1908, the King and his son, the Crown Prince, were assassinated in Lisbon, and the second son, Prince Manoel, became King, as Manoel II. Under this young ruler conditions did not improve, and on Oct. 5, 1910, as the result of a revolution, Manoel II was deposed and a republic was proclaimed, under the provisional presidency of Theophilo Braga. Manoel fled to England. The country was organized under a republican form of government, and in September, 1911, Dr. Manoel Arriaga was elected the first constitutional President. Since that date the country has frequently been rent by ministerial crises. In the Great War which began in Europe in 1914 Portugal decided to comply with her treaty obligations to support England, a declaration to that effect being made soon after the outbreak of war. This made it necessary substantially to reënforce her colonial army in Africa for possible operations against the German colonial forces. See WAR IN EUROPE.

PORTUGAL, pōr'tōō-gàl', MARCOS ANTONIO (1762–1830). A Portuguese composer, born in Lisbon. His real name was Da Fonseca. He was educated at the Priests' Seminary in his native town and continued his musical education under the opera singer Borselli, by whose influence he was appointed cembalist at the Madrid Opera in 1782. In 1787 he went to Italy, where, the following year, his first opera, *L' eroe cinese*, was produced. The slight success of his first work was compensated for by the popular favor accorded to *La bacchetta portentosa*, in 1788, at Genoa. In 1790 appeared *Il Molinaro* and *L' astuto*, both in Italy, and he was appointed court conductor at Lisbon, but later returned to Italy. From 1799 to 1810 he conducted at the San Carlos Theatre in Lisbon and produced a number of Italian and Portuguese operas. In 1810 he went to Rio de Janeiro, at which place he occupied the position of general musical director. In 1813, with his brother, Simão, he was appointed joint musical director

of the conservatory at Vera Cruz. In 1815 he visited Italy for the last time. He spent the remaining years of his life at Rio de Janeiro as an invalid. He wrote 40 Italian and Portuguese operas, five masses, and much sacred music.

PORTUGALETE, pōr'tōō-gä-lā'tā. A Spanish seaport near Bilbao (q.v.).

PORTUGUESE-BRAZILIAN LITERATURE. The literature of Brazil has followed to some degree the literary tendencies of the motherland in Europe. As it was long the custom to send Brazilian youths of promise to Coimbra for their training, the intellectual relations between Portugal and Brazil were very close during the colonial period. Since the winning of Brazilian independence, however, Brazilian writers have shown no slight originality.

Four periods may be marked: 1. From the age of discovery and exploration down to the middle of the eighteenth century, a period during which the seeds of culture are sown by missionaries from Europe, especially by the Jesuits. At first Portuguese and Spanish models are followed servilely, but in the first half of the eighteenth century a slight tendency towards independence manifested itself, even though Portuguese influence still ruled supreme. 2. The second half of the eighteenth century, an age which is characterized by the endeavors of the poets of the school of Minas-Geraes, who show in certain instances a growing desire to escape from the too rigid influence of the Old World. 3. The period ranging from the beginning of the nineteenth century to about 1840, and bearing the impress of the political independence that began in 1822. 4. The epoch dating from 1840, during which the Romantic movement comes to shake the power of pseudo-classicism as well in America as in Europe, and the feeling of national consciousness exerts a constantly growing influence.

1. From the settlement to the middle of the eighteenth century. The Jesuits sought as soon as possible to naturalize the literary forms popular in the old country and composed and had performed dramas religious in their nature and based on the *Autos* of Gil Vicente and his successors. Brazilians usually consider as their first author the Jesuit José de Anchieta (1533–97), a polyglot writer, whose works were composed in Spanish, Tupi, Latin, and Portuguese. Then came the poet Bento Teixeira Pinto (born about 1550). He was long credited with the authorship of the *Relação do naufragio que fez o mesmo Jorge Coelho vindo de Pernambuco a Náo Santo Antonio em o anno de 1565*, but this assignment can no longer be made. More important than Teixeira Pinto are the brothers Gregorio and Eusebio de Mattos. Gregorio (1623–96), the better of the two, was an inveterate satirist; he imitated closely the Spanish Juvenal, Quevedo, adopting also the methods of the Spaniards Lope de Vega and Góngora, and yet the entire movement of Brazilian literature in the seventeenth century revolves about him. Spanish Gongorism prevailed likewise in the lyrics of Bernardo Vieira Ravasco (1617–97) and Manoel Botelho de Oliveira (1636–1711); and Oliveira, like so many Portuguese of the period, wrote at least as much in Spanish as in Portuguese. Bahía, where the Viceroy dwelt, saw the greatest literary development in this first period. It was the centre of societies of men of letters, such as the Academia Brazilica dos Esquecidos (1724), whose members produced much occasional verse of a panegyrical nature. The panegyrics of João Brito de Lima (1671–1742) are typical compositions. We may mention the Franciscan Manoel de Santa Maria Itaparica (born 1704), whose poetical legend, *Eustachidos*, treats the well-known story of St. Eustace, and the *Historia da America portugueza* of Sebastião da Rocha Pitta (1660–1738). This is almost an historical novel, filled with descriptions and digressions, rather than a truly scientific and detailed account of the history of Brazil. The first distinguished dramatist of Brazilian birth now appeared in Antonio José da Silva (1705–?) (q.v.).

2. Second half of the eighteenth century. The influence of Portuguese literature, itself now wholly subordinated to the precepts of French pseudo-classicism, continued to hold sway during this period, but the note of protest against what was fast beginning to be felt as foreign domination rang out ever more loudly both in politics and in letters. On the model of the European academies and arcadias, Rio de Janeiro had the *Academia dos Felizes* (1736), and later the most celebrated of them all, the Arcadia Ultramarina, founded by the poet José Basilio da Gama (1740–85) and kindred spirits, at a date that is not known with certainty (c.1780 or 1783). The members of the coterie of Minas Geraes, many of them associated with the Arcadia Ultramarina, known as the *poetas mineiros* (who represent the best of the lyric and epic poetry of Brazil's colonial period), headed the luckless movement for political independence which emanated from that region. To José Basilio, a master of style and harmony, is due the epic *O Uraguay* (1769), which describes the struggles of the Spanish and Portuguese troops against the Indians of Paraguay. Another worthy endeavor to compose an epic is seen in the *Caramurú* (1781), of José de Santa Rita Durão (1737–84), which gives a résumé of Brazilian history during the three centuries of its colonial existence. By many it is considered the most thoroughly Brazilian piece that has appeared so far. The earliest of the lyric poets of the Minas Geraes group was Claudio Manoel da Costa (1729–90), who hanged himself in prison after the failure of the revolutionary plot in which he and his fellow poets had figured. His close friend Thomaz Antonio Gonzaga (1744–1807), the greatest member of the school and one of the most popular poets in the Portuguese speech, perished in exile. Gonzaga is best known by the pseudonym of Dirceu, which he assumed in his famous *Marilia de Dirceu*. This collection of impassioned lyrics is addressed to his beloved (Marilia). The erotic spirit also inspires the lyrics in the *Glaura* (1801) of Manoel Ignacio da Silva Alvarenga (1749–1814), who helped to found the Arcadia Ultramarina. Silva Alvarenga earnestly endeavored to infuse a more national and popular spirit into the Brazilian lyric. Domingos Caldas Barbosa (1740–1800), author of *cantigas*, *quintilhas*, sonnets, etc., and Francesco de Mello Franco (1757–1823), who, with the aid of José Bonifacio, wrote the mock-heroic poem, *O reino da estupidez*, belong more properly to Portugal. Bento de Figueiredo Tenreiro Aranha (1769–1811) imitated Horace in his odes.

3. From about 1800 to about 1840. The fetters of classicism were now shaken off by certain writers who advocated a wider use of Christian elements in poetic composition. Among them were Antonio Pereira de Souza Caldas (1762–

1814), known for his verse translation of the Psalms, etc.; Frei Francisco de São Carlos (1768–1829), author of the excellent epic, *A Assumpção da Santissima Virgem;* and José Eloy Ottoni (1764–1851), who made metrical versions of the Book of Job and of Proverbs. Although their enduring fame is rather that of statesmen and scientists, José Bonifacio de Andrada e Silva (1765–1838; patriotic and political odes, etc.), Francisco Vilella Barbosa, Marquis of Paranaguá (1769–1846; love lyrics), and Domingos Borges de Barros, Viscount da Pedra Branca (1783–1855) deserve to be mentioned here. Mythology and poetical metamorphosing mark the verse of Januario da Cunha Barbosa (1780–1846; poem *O Nictheroy*), who edited the *Parnaso brasileiro*, the first important anthology of Brazilian verse. Noteworthy prose was written by the eloquent Franciscan preacher Francisco de Mont' Alverne, whose family name was De Carvalho (1784–1858). The *Maximas, pensamentos e reflexões* of Marianno José Pereira da Fonseca, Marquis of Maricá (1773–1848), and the *Diccionario da lingua portugueza* (1789) and the *Epitome da grammatica portugueza* (1802) of Antonio de Moraes Silva (1755–1824) are important.

4. Since 1840. With an enlightened monarch like Dom Pedro II in power, letters and science grew stronger; the Emperor himself was a scientist of no mean ability, and he was a munificent patron of authors. The Romantic movement came to arouse the Brazilians to a still higher estimate of the part that the emancipated individual can play in the creation of a noble native literature. The triumph of the Romantic ideas and the consciousness of national independence are signally marked in all the poetry of Domingos José Gonçalves de Magalhães, Viscount of Araguaya (1811–82). His beautiful lyrics, mostly elegiac in tone, may be judged by those contained in the collections entitled *Suspiros poeticos e Saudades* and *Urania;* the poem *Napoleão em Waterloo* is deemed the best of all. Magalhães succeeds even better in his epic, for his *Confederação dos Tamayos*, celebrating in unrhymed hendecasyllable the struggles of certain Indian tribes against the Portuguese invaders, is imperishable. His dramas, such as the *Anton José* and the *Olgiato*, are not so good. Of his scientific or philosophical prose there may be noted the *Factos do espirito humano.*

Manoel de Araujo Porto-Alegre, Baron of Santo Angelo (1806–79), skilled in painting and architecture, cultivated belles-lettres also, and, besides composing several comedies, he enriched Brazilian literature with the idyllic and descriptive *Brasilianas* and the epic *Colombo.* Inspired by the *Brasilianas*, Antonio Gonçalves Dias (1823–64) put forth three volumes of lyrics, viz., *Primeiros cantos, Segundos cantos e sextilhas de Fr. Antão,* and *Ultimos cantos*, as well as an epic, *Os Tymbiras*, and several tragedies (*Leonor de Mendonça, Boabdil, Beatrice Cenci, etc.*). With Manoel de Araujo Porto-Alegre and Joaquim Manoel de Macedo (1820–82) he founded the influential literary review *Guanagara.* Macedo, favorably known for his novels (*Moreninha, etc.*), tragedies (*O Cégo, Cobé, etc.*), and vaudevilles, wrote the excellent lyrical and descriptive poem *A Nebulosa.* Odorico Mendes (1799–1864) is esteemed for his verse translations of Homer and Vergil (*Iliada, Odysse, Eneida, Georgicas*); in his original poems pedantry obscures his merits. Romantic tenets have generally been followed by Joaquim Norberto de Souza Silva (1820–91), an indefatigable writer (lyrical *Modulações poeticas*, epico-lyric *Balatas, Cantos epicos*, tales, and a prose *Bosquejo da historia da poesia brasileira* which prefaces his *Modulações*); by Antonio Gonçalves Texeira e Souza (1812–61: *Canticos lyricos*, the idyllic and allegorical *Tres dias de um noivado*, and such novels as *O filtho do pescador, A Providencia, Maria, etc.*); by Joaquim José Teixeira (apologues); by Pedro de Calasans; and by Bernardo Joaquim da Silva Guimarães (1827–85). The *Historia geral do Brasil* of Francisco Adolpho de Varnhagen (1816–78) shows talent.

Of more recent times we can hardly speak as yet with sufficient critical retrospect. As everywhere else, so in Brazil Romantic doctrines have been swept away by a Realistic movement. The change from an imperial to a republican form of government has also very naturally left its impress upon current literary production. Foremost among the writers of the last three decades of the nineteenth century stands Sylvio Romero, a lyric poet (*Cantos do fim do seculo, Ultimos harpejos*) and the author of critical works on ethnography, literary history, and philosophy. Out of many other forceful writers, only the lyric poet Olavo Bilac and the novelists Verissimo, Alencar, and Taunay need be cited here.

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. A colonial possession of Portugal, on the east coast of Africa, bounded by German East Africa on the north, the Indian Ocean (mainly Mozambique Channel) on the east, Zululand on the south, and the Transvaal Province, Rhodesia, the Nyassaland Protectorate, and Lake Nyassa on the west (Map: Africa, H 6). Area, 293,400 square miles. The coast is low and forms but few harbors. In the portion north of the Zambezi the country rises rapidly towards the west, where the Namuli Mountains form the principal mountain range of the colony and rise, in Namuli Peak, to an altitude of nearly 9000 feet. In the south the ascent is more gradual. The chief elevations here are the Manica plateau, with Mount Doc rising to nearly 8000 feet, the Gorangoza plateau, and the Lebombo Mountains. The eastern escarpment of the South African plateau follows the west boundary. The principal rivers are the Rovuma, which forms part of the north boundary of the colony, the Zam-

bezi, the Shire, the Pungwe, the Sabi, and the Limpopo. There are, besides, many small streams along the coast. The climate of the lowland along the coast is hot and humid, malarial fevers being frequent, but inland better conditions prevail. The mean annual temperature at Quilimane, near the coast, is 85° F., ranging from 106° to 49°. The rainy season lasts from December to March.

The vegetation is tropical. The coast region yields coconuts, bananas, and other fruits, indigo, tobacco, coffee, and rubber. Wheat, corn, beans, sugar cane, and rice are also grown to some extent. The country possesses great mineral wealth, including gold, iron, and coal. The gold deposits are found principally in Manica, near the frontier of Rhodesia, and are exploited almost exclusively by British subjects. There are large coal beds near Tete and Delagoa Bay. Iron is extracted to some extent by the Makua. The exploitation of the mineral resources of the country as well as its entire economic development is greatly obstructed by the lack of transportation facilities and the unfavorable climatic conditions, which prevent an extensive European immigration. The Mozambique Company, organized largely with British capital, secured a royal charter for the administration of the Manica and Sofala regions for a period of 50 years beginning with 1891. The Nyassa Company controls the region between the Rovuma, Lake Nyassa, and the Lurio.

The imports of the colony amounted in 1913 to 12,678,000 escudos; exports, 5,346,000; reexports, 8,935,000; transit, 34,044,000. The imports are mainly cotton goods, iron products, and beverages. The principal exports are rubber, wax, ivory, and minerals. Most of the trade passes through the ports of Lourenço Marques, Beira, and Mozambique. The Delagoa Bay Railway, 57 miles in the colony, connects Lourenço Marques with Pretoria, in the Transvaal. The Beira Railway extends from Beira 204 miles to the Mashonaland border, whence the line continues to Salisbury. The Gaza line from Chai-Chai to Manjacase has 32 miles in operation, and that from Mutamba to Inharrime 25 miles. Construction has been begun on a line from Lourenço Marques to the Swaziland border. A line is projected from Beira northward to Port Herold in Nyassaland. There is navigation on the Zambezi and Shire rivers. The colony, which is under a governor-general, comprises territories administered directly and others administered by the Nyassa and Mozambique companies. There are a government council (since 1907) and a provincial council. The capital is Lourenço Marques, with about 10,000 inhabitants, nearly half European. The budget for 1913–14 balanced at 5,878,598 escudos.

The population is estimated at 3,120,000, nine-tenths of whom belong to the Bantu race. The principal tribes are the Makua and Yao in the north, both Bantu; the Tavala in the central part; and the Vatwa, a Zulu tribe, and the Tonga, a tribe of mixed origin, in the south. The occupation of the east coast of Africa by the Portuguese dates from 1498, when Vasco da Gama landed at one of the mouths of the Zambezi. A number of settlements were founded along the coast during the first decade of the sixteenth century, and the military post of Tete, on the Zambezi, was founded in 1632. Slavery was abolished in 1878. The boundaries of the colony were fixed by agreements with Great Britain in 1891 and with Germany in 1886 and 1890. Consult: Andrade Corvo, *Estudos sobre as provincias ultramarinas* (4 vols., Lisbon, 1883–87); J. P. de Oliveira Martins, *Portugal em Africa* (Oporto, 1891); A. d'Almada Negreiros, *Le Mozambique* (Paris, 1904); G. M'C. Theal, *History and Ethnography of Africa South of the Zambezi* (3 vols., London, 1907–10).

PORTUGUESE GUINEA, gĭn'ē. A colony of Portugal in west Africa, bounded on the north by Senegal, on the east and south by French Guinea, on the west by the Atlantic (Map: Africa, C 3). The area is estimated at about 14,000 square miles. Numerous islands belonging to the colony, including the Bissagos, line the coast. The shores are deeply indented by estuaries, but difficult of navigation on account of strong currents and shifting channels. The land rises gradually from the flat coast region to the mountains of French Guinea and is generally fertile. The Rio Grande, or Comba, which rises in Futa Jallon, is the largest river. In the lower part of its course it forms a wide inlet of the sea. The climate is unhealthful and excessively hot. The average annual temperature is 78.8° F. The rainy season is between May and November. The flora and fauna are tropical, and the palm tree abounds. The forests contain a large variety of valuable woods. Rice and millet are the chief crops.

The French control the commerce. Bulama, the capital, on the island of the same name, has a safe harbor and shares the commerce with two other ports, Bissão and Cacheo. Imports and exports, in 1908, 857,000 and 492,000 escudos respectively; in 1911, 1,520,000 and 940,000. Ivory, groundnuts, wax, and rubber are exported. The colony is administered by a governor, but Portuguese authority is little felt beyond the trading centres, and the coast tribes are virtually uninfluenced by either Christian or Mohammedan culture The natives of the interior are mostly Mandingo and Fulah, both Mohammedan. The number of the people is variously estimated, one of the most recent figures being 820,000. The military force is very small. The budget for 1913–14 balanced at 743,885 escudos. Portuguese Guinea was a subject of contention between Portugal and Great Britain between 1792 and 1870; in the latter year President U. S. Grant as arbitrator disallowed the British claims.

PORTUGUESE INDIA. See DAMAN; DIU; GOA; INDIA, PORTUGUESE.

PORTUGUESE LANGUAGE. One of the Romance, or Latin, languages, as to-day spoken in Portugal, Brazil, the Spanish Province of Galicia (with archaic and dialectal elements), the Cape Verde Islands, Portuguese Guinea, and other Portuguese colonies. As in the case of the sister languages, Spanish, French, Italian, etc., Portuguese is the direct modern form of the popular Latin of the Roman soldiery and colonists rather than of classic speech of Rome. In its form it resembles the Spanish, its nearest neighbor, more than it does any one of the other Romance tongues. Its literature is much less important than that of the French, Spanish, or Italian, because it has been too largely imitative and too frequently subordinated to influences from France and Spain, and only exceptionally original in tone and content. Even the Portuguese vocabulary betrays considerable borrowing from France.

According to the best estimate there seem to

be 11 vowel sounds, at least, viz., three values of *a*, one long and open, like the *a* of *father*, a second less open and colored, with a short *o* sound, like the *a* of *malt*, and a third, slurred and indistinct in nature, but akin to the *a* of *around;* three *e* sounds, one close, another open, and a third (written *e* or *i*) indistinct in value and not unlike the French so-called mute *e* or the sound of *u* in *fur;* two *i*'s, one like the *i* of *bit* and the other like the *i* of *ravine*, this latter value being represented by the vocalic *y* and by *e*, as well as by *i;* two *o* sounds, an open and a close; and a *u* sound (denoted by *u* and *o*), approximate to the *u* of *flute*. These are all oral vowels. Nasalized forms of five vowels occur also, viz., a nasalized *a* (written *ã*, *an*, or *am*), a nasalized close *ẽ* (written *em* or *en*), a nasalized *i* (written *im* or *in*), a nasalized closed *o* (written *õ*, *om*, *on*), and a nasalized *u* (written *um* or *un*). Portuguese has a number of diphthongs. Several of these latter may also be nasalized; but the process of nasalization is not so complete in the case of either the vowels or the diphthongs as it is in French, for some trace of the nasalizing consonant (*m*, *n*) seems to persist (with a velar quality). The investigations of expert phoneticians like Vianna show the existence of no fewer than 26 consonantal sounds in the language. These are: *p*, *b*, a bilabial *b*, *f*, *v*, *w* (denoted by *u* or *o* in hiatus); *m*, *t*, *d*, a spirant *đ* (*d* pronounced like *th* in *the*), *l*, a palatalized *l* (written *lh* and pronounced approximately like the *li* of *filial*), a guttural *l*, *n*, a palatalized *n* (written *nh* and pronounced not unlike the *ni* of *onion*), a velar *n* (i.e., the *ng* sound which ordinarily follows a preceding nasalized vowel); tongue-trilled *r* and *rr* (written *r*, *rr*, and *rh*), the latter a reënforced form of the former and both carefully pronounced; the sibilants *s* (having the value of the English *ss* and written *s*, *ss*, *c* before *e* or *i*, *ç* before other vowels and occasionally *x*), *z* (pronounced like the English *z* and written *s* or *z*), *š* (the phonetic notation for the English *sh* sound, represented in Portuguese by *ch*, *x*, *s*, *z*), and *ž* (the phonetic notation for the sibilant sound heard in the English *azure* and represented in Portuguese by *j*, *g*, before *c* or *i*, *s*, and *z*); *y* (i.e., *i* or *e* with a consonantal value easily acquired in hiatus); *k* (the English *k* sound, denoted in Portuguese by *c* before *a*, *o*, *u*, by *q* before *ua*, by *qu* before *e* or *i*, by *ch* in a few learned words, and by *k* in some foreign words); and finally *g* (i.e., the sound in the English *go*, denoted by *g* before *a*, *o*, or *u* and by *gu* before *e* or *i*). Of the consonants *d*, *t*, *n*, *l* it should be remarked that their dental character is more pronounced than in English, as in the formation of them the tongue tends to touch the base of the upper teeth. The linking together in utterance of syntactically related words in a sentence accounts for the variations in value of certain consonants; it does so particularly in the case of the sibilants *s* and *z*. One of the most marked features of the Portuguese as compared with other Romance languages is the loss of intervocalic *l* and *n;* thus, *quaes* represents the Latin *quales* and *pessoa* the Latin *persona*. The forms of the article *o*, *a*, "the," are due to the intervocalic position of the *l* in such syntactical combinations as *de-lo*, *de-la*, "of the," whence have resulted the forms *do* and *da*, and by a redivision of the compound *d'o* and *d'a*. In common with Spanish, but probably to a greater degree, Portuguese shows an interchange of *l*, *r*, and *n*. A metathesis of vowels, consonants, and even whole syllables of the Latin etymon is not infrequent in the language. As a result of linking or sentence phonetics, contiguous vowels of different words in a sentence are often pronounced in a single syllable; thus, *toda a armada* becomes in rapid speech *todarmada*.

In its grammar Portuguese rather closely parallels Spanish. A great body of the substantives has the distinctive endings of *a* for feminines and *o* for masculines, corresponding to the Latin first and second declensions. There are traces of the survival of the Latin nominative case (*Deos*, *Domingos*, etc.), but the accusative is in general the norm of the Portuguese form. The sign of the plural is regularly *s*. As in Spanish the regular verbs of the *-ēre* conjugation have joined either the conjugation in *-ēre* or that in *-ire*. An extremely interesting phenomenon is the appearance of a personal or inflected infinitive, which makes possible a very succinct construction, comparable to the Latin accusative and infinitive. *Partir*, for example, may be conjugated: *partir eu*, I to depart; *partires tu*, thou to depart; *partir elle*, he to depart; *partirmos nós*, we to depart; *partirdes vos*, you to depart; *partirem elles*, they to depart; and "it is time for us to depart" may be rendered *tempo é de partirmos*. The earliest written specimens of Portuguese appear to be certain documents of 1192.

PORTUGUESE LITERATURE. The literature of Portugal was one of the latest to arrive at a consciousness of national unity and independence and therefore one of the latest to begin to achieve a literary history. Furthermore, as a result of the somewhat sluggish and unassertive temperament of the people as a whole, Portuguese literature has been less independent than that of the sister tongues, and has been only too ready to limit itself to imitation of what had arisen within the bounds of northern France, Provence, Italy, and especially of the near neighbor Spain. The lyric spirit, with decided tendencies towards the idyllic and the bucolic, has ever predominated in Portugal. It was so at the very outset, for, whereas lyric verse followed in the wake of epic verse in Spain and in France, it appeared at the very beginning of literary activity in Portugal, and the epic appeared there only three centuries and a half later, and then as the result of a consciously artistic development. And the love lyric, from which we date the rise of Portuguese literature, was not of spontaneous growth or native to the soil; on the contrary, it was an exotic that had thriven in France before it was transplanted to the more westerly land.

According to the scheme adopted by Theophilo Braga and by C. M. de Vasconcellos, six main periods may be distinguished in the course of Portuguese literary history.

1. In the first period (1200 to 1385) the impulse to literary production came from France. The first Portuguese dynasty was founded by Burgundian nobles, in whose train there entered into the land, with their French habits and predilections, soldiers and colonists who settled on the territory regained from the Arabs during the age of the reconquest. Moreover, the constant pilgrimages to the shrine of St. James at Compostella, ecclesiastical relations of various kinds, and royal and noble intermarriages made the relations between France and Portugal exceedingly close. The troubadours early penetrated the western territory, and met with particular favor in Galicia, a district linguistically connected with Portugal. Their strains were soon taken and reëchoed by native poets, who imitated as well as they might the love lyric, the panegyric, the satire, the debate, and the other conventional poetical forms of Provence. The flourishing period of composition in Provençal measures and according to Provençal ideals began with the reign of Affonso III (1246–79), and its high-water mark was reached in the reign of his successor, King Diniz (1279–1325), the greatest of all the native troubadours, whose poetical gifts were inherited by his natural sons, Affonso Sanches and Pedro, Count of Barcellos. Of these poets and about 200 others of this period nearly 2000 poems are preserved, nearly 140 of which are from the pen of the monarch himself, not a few of them being ascribed to courtiers such as the Chancellor Estevam da Guarda and the Admiral Gomes Charinho. We find the great body of this verse in certain *cancioneiros*, or song books, one set of which contains the Galician lyrics of the Castilian monarch Alfonso the Wise; three of them—the Cancioneiro da Ajuda and the Cancioneiro da Vaticana, so named from the libraries in which they are deposited, and the Cancioneiro Colocci-Brancuti, bearing the name of its present and also its former owners—have the poems of native Portuguese authors. Although the prevailing tone in the Galician-Portuguese literature of this age is that of the artificial Provençal lyric, there is a noticeable tendency to take up and adapt popular forms of a kind that still live in the oral tradition of Portugal and of northern and western Spain.

Prose composition at this time consists chiefly of genealogies (such as the *Livro das Linhagens* of the Count of Barcellos, 1289–1354) and translations from Latin—lives of saints, visions of the other world, etc.—and of translations and imitations of material borrowed from northern France and already well known in Spain, such as the Charlemagne and the Arthurian stories (cf. the *Cavalleiros da Mesa Redonda*, one of the few of them that have thus far been published) and those dealing with the quest of the Holy Grail. It has been asserted that original composition of chivalrous romances began in Portugal as early as the fourteenth century; for some persons think that the *Amadis de Gaula*, of which the earliest form preserved is a Spanish version, was written originally in Portuguese at this time and was taken thence by Spanish translators and elaborators. (See SPANISH LITERATURE.) Historical writing is represented by the appearance of chronicles dealing with religious matters or with military undertakings (*Chronica da conquista do Algarve*) and things of political import.

2. The second period continues from 1385 to 1521. The time is really one of transition, and shows by the increased interest taken in the works of classic antiquity the influence of the all-pervading Renaissance movement. The best spirits begin to turn away from Provençal ideals and, in imitation of the course pursued by the chief Spanish writers, to adopt not infrequently a more serious didactic tone, which is borne out by use of the Dantesque allegory.

The bulk of the poetry of the age was produced by the *poetas palacianos* of the courts of João II (1481–95) and Emmanuel the Great (1495–1521). García de Resende, one of these poets, played a part similar to that performed by Baena at the court of Castile, by collecting and publishing at Lisbon in 1516 the verse of the numerous *poetas palacianos*. Four of the authors represented in this *Cancioneiro Geral* of García de Resende merit particular mention. They are Gil Vicente (c.1470–c.1540), who is more remarkable, however, for the development which he gave to the drama; Christovam Falcão (c.1512–1550 or 1557), whose works are by some students attributed in their entirety to Bernardim Ribeiro, and whose idyll *Crisfal*, the first composition of this favorite kind in Portuguese, is said to record his own love experiences; Bernardim Ribeiro (?1486–1552), the author of eclogues and of the famous *Saudades*, a

work which with its pastoral and sentimental tendencies furnished the foundation of all such later productions in the land (the exact dates of Falcão and Ribeiro are very uncertain); and Sâ de Miranda (1495–1558), who, although he utilizes still the older poetical forms, infuses them with a new spirit and appreciates fully, as did to a considerable degree Falcão and Ribeiro, the value of the popular pastoral exemplified by the *serranilha* and similar compositions.

In prose the most important original works are didactic or historical in their nature and there is some translation of the Latin moralists and historians. At the request of his Queen, Dona Leonor, King Duarte between 1428 and 1438 composed a treatise on statecraft, entitled *O leal conselheiro*, and the Infante Dom Pedro gave expression to the experiences of an active and observant life in his *Virtuosa bemfeitoria*. The founder of true history writing appears in the person of Fernâo Lopes (born c.1380), who compiled the *Chronica de Dom Fernando*, the *Chronica de Dom Pedro*, and especially the *Chronica del Rey Dom Johann de boa memoria*. Further historical accounts were provided by Gomes Eannes de Azurara, who described the conquest in Africa, by Ruy de Pina (*Chronica do Senhor Rey D. Duarte*), and by João Alvares (*Chronica do sancto Iffante Dom Fernando*).

3 and 4. The two periods that come next and embrace the long stretch between 1521 and 1700 may conveniently be regarded as forming one continuous period, an age of glory in its first part and one of decadence and stylistic exaggeration in its second. The path that Portuguese literature was now to take was indicated by Sâ de Miranda, who returned in 1526 from his sojourn in Italy imbued with a love for Italian humanism. Before the visit to Italy Miranda had given new life and enduring consistency to the pastoral; now, along with the sonnet, the hendecasyllable, the octave, the *terza rima*, and other Italian lyric and narrative verse forms, he introduced elements of the highly refined Italian pastoral; and, furthermore, under the influence of Bibbiena and Ariosto, he produced two prose dramas, the *Estrangeiros* (c.1527) and the *Vilhalpandos*, which necessarily, like their Italian originals, derive from the drama of Plautus and Terence. It cannot be said that the plays of Sâ de Miranda had any widespread popularity; but they indicated the way for his disciple Jorge Ferreira de Vasconcellos (died 1585), who wrote moralities on the model of *La Celestina*. Another of the pupils of Sâ de Miranda was Antonio Ferreira, who chose a national subject and in his *Ines de Castro* (1558) gave Portugal her first classic tragedy, just as in his play *O cioso* he gave modern Europe one of its earliest character comedies. The Italian lyric measures imported by Sâ de Miranda were adopted by many disciples (the *Quinhentistas*), who modeled themselves on the singer of Madonna Laura. A thoroughly popular drama was that developed by Gil Vicente (c.1470–c.1540). He derived his inspiration from the Spanish playwright Juan del Encina, but he sought his subjects on all sides, and developed them with great originality of treatment and in a wholly national spirit. A third figure of this period rendered illustrious by Sâ de Miranda and Gil Vicente is the most famous of all Portuguese poets, Luiz de Camões (c.1524–80). Like those two authors he aspired to dramatic honors, and in three early comedies (*Filodemo*, *Rei Seleuco*, and *Enfatriões*) he showed himself to be an ingenious playwright. His fame, nevertheless, rests rather upon his lyric and epic achievements. The fiery passion and sentiments of the man and lover find expression in his various lyrics. The personal note rings out also in his glorious epic *Os Lusiadas*, filled with the spirit of national consciousness and patriotic fervor excited by a realization of the large part that Portugal had played in geographical discovery and in the conquest of territory in the distant Indies.

In the second part (1580–1700) of this long period the number of writers is legion, but the great majority of them lacked originality and force. Many *Camonistas*, or disciples of Camões, essay the epic, e.g., Francisco de Andrade, *Primeiro cerco de Diu* (1589); Sâ de Menezes, *Malacca conquistada;* Pereira Brandão, *Elegiada* (1588), commemorating the disastrous campaign of Dom Sebastian; Quevedo e Castellobranco, *Affonso Africano* (1611); Pereira de Castro, *Ulyssea* (1636); but none rise above mediocrity. The sadness and gloom resultant upon subordination to Spanish rule were not favorable to the composition of eminent or stirring epics. The tightening of the political bonds to Spain superinduced an even larger degree of servility to Castilian literary fashions, and Gongorism with its formal excesses, its bombast, its studied obscurity of style, and its strained conceits, invaded Portugal. Among the lyric poets of the time are Rodrigues de Castro, Lobo Soropita, Frei Bernardo de Brito, the nun Violante do Ceo (1601–93), and Manoel de Faria e Sousa; writers of pastoral poems and romances are Francisco Rodrigues Lobo (*Primavera*, *Pastor peregrino*, and *O desenganado*), Alvares do Oriente (*Lusitania transformada*), and Manoel da Veiga Tagarro. The taint of culteranismo is deplorably clear in the verse contained in the collections entitled *A fenix renascida* and *Ecos que o clarim da fama da*. A natural note is struck in the unaffected lyrics of the historian Manoel de Mello. Spanish *siglo de oro* plays held full sway on the Portuguese stage; but Manoel Coelho Rebello did produce humorous interludes in the home speech.

Composition in prose towards the middle of the sixteenth century was largely concerned with pastoral and chivalrous romances and with tales. The renowned chivalrous romance, *Amadis de Gaula*, so persistently claimed for Portugal by certain historians of her literature, was an exceedingly popular book, and it led to the writing of continuations and imitations of it, as an example of which may be cited the *Palmerim d'Inglaterra* of Moraes (1544). Of the Castilian *Celestina* a somewhat native tradition appears in the tales of Fernandes Trancoso. Unfortunately for Portugal the best pastoral poem of the age, the *Diana* of the Portuguese Jorge de Montemor, was written in Spanish. The sonorous and rhetorical qualities of Portuguese prose were excellently shown by Rodrigues Lobo in his *Corte na aldeia e noites de inverno*. The historians direct their attention particularly to the adventures of Portuguese heroes and arms in the Indies. The romantic side of the expeditions of exploration and conquest is made prominent in the collection termed *Historia tragico-maritima*. Other ambitious efforts are those of Barros in his *Decadas* and Albuquerque the Younger in his story of his father's deeds (*Commentarios*); personal observation guided the

records left us by Pinto, by Fernam Lopes de Castanheda, and by Correia. Several chronicles register the noteworthy events of the lives of the monarchs of the period of conquest, and a number of works of a comprehensive nature seek to furnish a general history of the fatherland. Manoel de Mello wrote most of his historical treatises in Spanish; his *Epanaphoras de varia historia portugueza* (1660) is in Portuguese. Pulpit eloquence is most ably represented by the discourses and sermons of the Jesuit Antonio Vieira (1608–97), and Portuguese epistolary style is seen at its best in the *Cartas* of both Vieira and Manoel de Mello.

5. During the period from 1700 to 1825 French classicism ruled supreme in Portugal. Xavier de Meneses promulgated his verse translation of Boileau's *Art poétique*, and sought to apply its precepts in his tedious epic, the *Henriqueida*. The Academia Real Portugueza was founded (1721) in the hope that it would control the literary destinies of the land; but it proved to be powerless, though the coterie of poets banded together in the Arcadia became really influential. The Arcadians were actuated somewhat by the wholesome principle of combining the plastic and correct forms of French classicism with elements derived from domestic models of the sixteenth century, but in the main the native tradition was slighted. Corrêa Garção and Antonio Diniz da Cruz e Silva were Arcadians who preached Horace and Boileau to their compatriots; Antonio Diniz's *Hyssope*, modeled on, but not a mere imitation of, Boileau's *Lutrin*, is the most noted mock heroic in Portuguese. Dramatic production is almost wholly in accordance with French rules. To the second half of the century belong its two most eminent authors, Francisco Manoel do Nascimento (1734–1819), known in the Arcadia by the pseudonym of Filinto Elysio, and Manoel Maria Barbosa du Boccage (1765–1805). Nascimento was a gifted lyric poet, with a refined and pleasing diction, which stood him in good stead also in his prose translation of Osorio's Latin history of Emmanuel the Great. The poetic talent of Boccage, who founded the Nova Arcadia (in which he was styled Elmano), was even more pronounced; no Portuguese poet has surpassed him in the use of the sonnet. Both Nascimento and Boccage had followers. To Boccage's unskillful imitators is due a new form of culteranismo for which the master has been unjustly blamed and to which the term Elmanismo has been improperly applied. A pretentious rival of Camões was José Agostinho de Macedo (1761–1831), who has now lost a good deal of the prestige that he once enjoyed by reason of his epic *O Oriente*.

6. The nineteenth century. The Peninsular War and the fierce struggle against Napoleonic encroachments stirred patriotic feeling in Portugal to greater activity than had been witnessed for several centuries. As everywhere else in Europe modern liberal thought made much headway in the land, and as everywhere else the young exponents of modern scientific ideas came into conflict with the unprogressive government of the country. João Baptista da Silva Leitão, Viscount d'Almeida-Garrett (1799–1854), returned from a period of expatriation spent in England and France, imbued with the Romantic principles which he found fully established in those lands, and with the strong desire to study the past of his own country and to revive its literary traditions. Even while still in exile he composed the noble poem *Camões* (Paris, 1825), replete with patriotic fervor, the satirical poem *Dona Branca*, and the versified novel *Adozinda* (London, 1828), the last named based on Portuguese folk tales. Many-sided in his endeavors, Almeida-Garrett tried unsuccessfully to create anew a national drama, for while his own plays *Un auto de Gil Vicente*, *O alfageme de Santarem*, and *Philippa de Vilhena*, revived the older traditions of the theatre of Gil Vicente and were successful, he had no successors. His lyric achievements, while less splendid than might have been expected, were none the less of healthful and permanent influence; and his success in the historical novel, which he essayed under the influence of Scott, is worthy of note. Scott was already well known in Portugal, having been translated and even imitated by Alejandre Herculano de Carvalho e Araujo (1810–77), who passed his exile in England. Events and pictures of the reign of João I are presented to us in his *Enrico* and his *Monge de Cister*, and some eight centuries are covered by his *Lendas e narrativas*. A residuum of Romantic feeling along with a more pronounced tendency towards the formal methods of the Arcadians may be perceived in the lyrics of Antonio Feliciano de Castilho (1800–75). His *Ciumes do Bardo* and his *Noite do Castello* have the Romantic tinge; his *Cartas de Echo a Narciso* and later volumes like the *Excavações poeticas* and the *Outono* show stress laid rather upon Arcadian elegance and finish of outward poetical form. In recent times the drama, the historical novel, and the lyric have been cultivated by many followers of the three leading authors mentioned, and at least a moderate degree of success has been attained by Augusto Rebello da Silva (1822–71; historical romances, *A mocidade de Dom Joao V*, etc.), Mendes Leal (1818–86), Silva Gayo, and especially Camillo Castello Branco (1825–90), who has the credit of having created the modern Portuguese novel of manners. An unwholesome sentimentalism prevails in the lyrics of Soares de Passos (1826–60); a romantic tone as well as some of the polish of Castilho's verse can be recognized in the poems of Thomaz Antonio Ribeiro Ferreira (1831–1901), whose verses to Portugal will probably live as long as there are Portuguese.

Although the Romantic doctrines are still professed by a number of Portuguese writers, a not unnatural reaction against the exaggerations of ultraromanticism has set in since 1865 and has found expression in the aims and utterances of writers of the school of Coimbra, an appellation which does not sufficiently indicate the expansion of the new movement. Under the influence of Hegelianism and the positivist doctrines of Comte, this movement has sought to develop a strictly scientific spirit and to apply it to the sober investigation of the mediæval past. An encouraging sign of the success of the reform thus undertaken is the appearance of the poet João de Deus Ramos (1830–96), the author of the lyrics *Flores do campo* (1869), *Ramo de flores*, and *Despedidas de verão*. And this same movement produced the man whose name, after those of João des Deus Ramos and Almeida-Garrett, is best known abroad to-day—Anthero de Quental (1842–92), whose famous sonnets are "as gleaming swords." Equally encouraging is the energy with which scientific investigation and literary study have been undertaken by per-

sons of the ability of Theophilo Braga, Gonçalves Vianna, J. Leite de Vasconcellos, and Francisco Adolpho Coelho.

PORTUGUESE MAN-OF-WAR. The popular name of certain remarkable siphonophores (q.v.) of the genus *Physalia*. The pneumatophore or float is an oblong, crested bladder, flattened on the lower side, from which are freely pendent the various individuals of the colony. The most notable of these are the long capturing filaments, which are extraordinarily extensible and contractile and are very richly supplied with the nettle cells so characteristic of Cœlenterata (q.v.). In a specimen the float of which is 8 inches long, these filaments trail out to a distance of fully 20 feet. The batteries of nettle cells are so numerous and so powerful that fishes of considerable size are paralyzed by coming in contact with them and devoured, the latter process, however, being performed chiefly by other individuals that are specially devoted to the process of digestion. The nettle cells of a specimen of *Physalia* of average size are powerful enough to produce great and sometimes serious discomfort to human beings if they come in contact with the hands or arms; and this is sometimes the result when dead specimens are picked up from the beach. The most common Portuguese man-of-war in the western Atlantic is *Physalia pelagica*, which has the float 6 or 8 inches long and 2 or 3 inches high. The float is a bright, iridescent blue, shading in some places into purple, with the lower part and edges red. The individuals of the colony are chiefly red, though various parts are blue. The float contains a gas, possibly air, which seems to be secreted by glandular epidermal epithelium at its bottom. The gas can be expelled through an air pore, by which the interior is always in communication with the outside. By contraction of its float the animal can sink below the surface, to which it rises again during calm weather. Portuguese men-of-war are found chiefly in the warm seas, and in some places in the tropics large numbers are blown ashore when the wind has blown landward for an unusual length of time. They are also carried northward in the Gulf Stream and during the latter part of the summer are often seen off the southern coast of New England.

PORTUGUESE MAN-OF-WAR.

a, swimming bell; *b*, crest of same; *c*, reproductive zoids, *d*, nutritive zoids (tentacles).

PORTUGUESE WEST AFRICA. Angola, a Portuguese colony. See ANGOLA.

PORTULACA, pōr'tū-lā'kà; commonly pōr'tū-lăk'à (Lat., *purslane*). A genus of dicotyledonous herbs belonging to the Portulacaceæ (purslane family). It includes about 20 species, nearly all of which are natives of America. One of the most widely naturalized weeds is *P. oleracea* (purslane); while *P. grandiflora* is cultivated under a large number of forms differing in color and size of flowers.

PORTU'NUS, or **PORTUM'NUS** (Lat., from *porta*, door, *portus*, port). The Roman divinity, originally of doors, then of harbors, and hence represented with a key. Later, he was identified with Palæmon (q.v.). His festival, the Portunalia, was celebrated annually on August 17. Consult: W. W. Fowler, *Roman Festivals* (London, 1899); id., *The Religious Experience of the Roman People* (ib., 1911); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

POR'TUS HER'CULIS LIBUR'NI. See LEGHORN.

PORTUS ITIUS. See ITIUS PORTUS.

PORTUS LABRO'NIS. See LEGHORN.

PORTUS NAONIS. See PORDENONE.

PORT WASHINGTON. A city and the county seat of Ozaukee Co., Wis., 26 miles north of Milwaukee, on Lake Michigan and on the Chicago and Northwestern Railroad (Map: Wisconsin, F 5). It has gasoline engine works, chair and woodenware factories, foundries, breweries, etc. Pop., 1900, 3010; 1910, 3792.

PORT WINE. See METHUEN TREATY; WINE.

PORT WINE MARK. See NAEVUS.

PO'RUS (Lat., from Gk. Πῶρος, *Pōros*) (?–317 B.C.). An Indian king, the most powerful of those conquered by Alexander the Great (q.v.). His kingdom lay in the north of India between the Hydaspes and Acesines (the modern Jhelam and Chenab), and he was a monarch of much importance and ancient lineage. When Alexander reached the Jhelam in his invasion of India in the spring of 326 B.C., he found Porus awaiting him with a strong army on the further bank of the Hydaspes (Jhelam) River. After some delay the Macedonian force succeeded in crossing the river by stratagem, and a fierce battle ensued, in which Porus was wounded and made captive. When the conqueror retired from India in the following year, he left Porus, as a token of respect for his bravery, ruler over the lands west of the Jhelam, comprising seven nations, and in addition made him an ally of his former enemy and rival Taxiles, probably Ambhi Raja of Takshasila. After the death of Alexander Porus seems to have extended his power over Sind by expelling Peithon, the Greek ruler. In 317 Porus was assassinated by Eudemus, who had been made satrap of the Punjab by Alexander to administer its affairs with Taxiles. The name Porus obviously represents the Sanskrit, *Pāurava*, or member of the race of Puru, a legendary monarch of the so-called lunar dynasty, whose descendants are represented by the Sanskrit writings as dwelling in the north of India.

The same name was borne by at least two other kings, one a nephew and an enemy of the great Porus. He was driven by Alexander from his country of Gandaris (Skt. *Gandhāra*), on the left bank of the Indus. There was also a Porus, King of Madura, who sent gifts and an embassy to the Emperor Augustus. Consult: J. W. M'Crindle, *Invasion of India by Alexander the Great* (2d ed., London, 1896); V. L. Smith, *Early History of India* (Oxford, 1908); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

POR'Y, JOHN (c.1570–1635). An English colonist and geographer. He graduated at Gonville and Caius College, Cambridge, in 1592, studied history and geography for a time after 1597 under Richard Hakluyt, and in 1600, at Hakluyt's suggestion, made a translation of the *Geographical Historie of Africa, written in Arabicke and Italian by John Leo, a More*, which at that period was considered the only original authority concerning north and Central Africa. From 1619 to 1621 he was secretary to Sir George Yeardley, Governor of Virginia. While in Virginia he made several excursions among the Indians, the accounts of which, in Smith's *Generall Historie*, are of historical interest. He returned to England in 1621, but in 1623 went back to Virginia as a commissioner from the Privy Council.

PÓSADAS, pō-sä'dȧs, COUNT OF. See FERNÁNDEZ DE CÓRDOBA, DIEGO

POSADOWSKY-WEHNER, pō'zȧ-dōf'skē-vā'nĕr, ARTHUR ADOLF, BARON VON POSTELWITZ, COUNT VON (1845–). A German statesman, born at Grossglogau, Silesia. After studying law and political science at Heidelberg, Berlin, and Breslau, he became Landrat in 1873. As a deputy to the Prussian House of Representatives in 1882–85 he sided with the Free Conservatives. Made head of the provincial administration of Posen in 1889, he completely reorganized the administration of the province and in 1893 was appointed State Secretary of the Imperial Treasury. Succeeding Bötticher as Minister of the Interior in 1897, he was intrusted with the representation of the Imperial Chancellor and made Prussian Minister of State. The German tariff of 1902 was one of the prominent results of his administration. Resigning in 1907, he entered the Prussian House of Lords and in 1912 became a member of the Imperial Diet. Posadowsky-Wehner wrote several pamphlets on social questions—old-age insurance, housing, etc.—and a history of his family (1891). Consult Penzler, *Graf Posadowsky als Finanz-, Sozial-, und Handels-politiker* (4 vols., Leipzig, 1907–11).

POSCHINGER, pōsh'ĭng-ĕr, HEINRICH, KNIGHT VON (1845–1911). A German administrator and author. He was born at Munich, studied law there and in Berlin, was for some years employed in the Bavarian state service, and in 1876 entered the Imperial employ as assistant in the chancery office. Afterward he removed to Berlin, entered the Department of the Interior, and became governmental Privy Councilor. After Bismarck's death he left the government service and removed to Nice. He wrote: *Bankgeschichte des Königreichs Bayern* (1874–76); *Banken im deutschen Reiche, Oesterreich und Schweiz* (1877); *Bankwesen und Bankpolitik in Preussen* (1878–79); *Preussen im Bundestag* (2d ed., 1882–85); *Lasalles Leiden* (4th ed., 1889); *Fürst Bismarck als Volkswirt* (1890); *Ansprachen des Fürsten Bismarck* (1894–99); and many other works on Bismarck (for the most part examined and approved by the Chancellor), on politics, and on banking. Poschinger edited, besides many documents relating to Bismarck, *Denkwürdigkeiten des Ministerpräsidenten Otto Freiherr von Manteuffel* (1901) and *Kinkels sechsmonatliche Haft im Zuchthause zu Naugard* (1901). A drama, which he wrote in 1905, in coöperation with Schick, and called *Bei Fürst Bismarck*, was forbidden by the censor.

POSEIDIPPUS. See POSIDIPPUS.

POSEIDON, pō-sī'dŏn. See NEPTUNE.

POSEN, pō'zĕn. A province of Prussia, bounded by Pomerania and West Prussia on the north, Russian Poland on the east, Silesia on the south, and Brandenburg on the west (Map: Germany, G 2). Its area is 11,194 square miles. The surface is mostly flat. There are extensive tracts of wooded marshland, now partially converted into agricultural land. Posen is watered principally by the Warthe and the Netze and to some extent by the Vistula. There are a large number of lakes and some important canals. Posen is chiefly an agricultural country. Over 60 per cent of its area is under tillage and in gardens. In the distribution of land large holdings prevail, about 58 per cent of the productive land being divided into estates of 250 acres and over. Rye, wheat, oats, barley, and potatoes are produced extensively and partly exported. Large quantities of sugar beets are raised for local sugar mills. In 1913 there were under rye

713,132 hectares; potatoes, 301,383; oats, 164,564; barley, 129,687; wheat, 79,354. Cattle raising is important. The number of cattle in 1913 was about 942,500; horses, 301,400; sheep, 242,000; goats, 148,800; swine, 1,322,000.

The manufacturing industries are only slightly developed and employ (including all other industries outside of agriculture) only 20 per cent of the total population. The principal manufactures are spirits (of which Posen is one of the chief producers in Germany), beet sugar, machinery, bricks, and wooden wares. The exports include grain, cattle, wood, and wool. The railway lines have a total length of over 1200 miles, almost exclusively controlled by the state. Posen is divided administratively into the two districts of Posen and Bromberg, with the city of Posen as the capital. In the Prussian Landtag the province is represented by 19 members in the upper and 29 delegates in the lower chamber. It returns to the German Reichstag 15 members. The population increased from 1,583,843 in 1871 to 1,751,642 in 1890, 1,887,275 in 1900, and 2,099,831 in 1910. In 1910 over two-thirds of the people (1,394,014) lived in communes of less than 2000. The only large city is Posen (pop., 156,691). In 1910 Roman Catholics, mostly Polish, numbered 1,422,238 (67.73 per cent); Evangelicals, mostly German, 646,580 (30.79); Jews, 26,512 (1.26). The Polish language and its dialects are spoken by the majority of the inhabitants. Posen formed a part of Poland till the first partition of that country in 1772, when Prussia acquired the districts north of the Netze. The other portion was taken by Prussia at the second partition in 1793. In 1807 it was annexed to the Duchy of Warsaw, but was restored to Prussia in 1815, receiving the title of a grand duchy. Posen has been the scene of bitter strife between the Polish and German elements, and the Prussian government has resorted to arbitrary measures in its efforts to Germanize the region. In 1914 it was the objective of a Russian campaign against Germany. See WAR IN EUROPE.

POSEN (Pol. *Poznan*). The capital of the province of the same name in the eastern part of Prussia, situated in a sandy plain at the confluence of the Cybina with the Warthe, 90 miles north of Breslau (Map: Germany, G 2). It is a first-class fortress, with a strong garrison, and is an important railway centre. Its appearance has been greatly improved by the building of new quarters and the construction of modern buildings. Of its numerous churches the most noteworthy are the eighteenth-century cathedral, well known for its golden chapel and for its fine monuments and the bronze statues of the first two Christian kings of Poland, the seventeenth-century parish church, and the fifteenth-century Gothic Marienkirche, the oldest church in Posen. The principal secular edifices are the old town hall, rebuilt after the fire of 1536 and adorned with a slender tower 214 feet high; the adjoining modern town hall, in Renaissance; the royal castle (1905–10), in so-called Romanesque; the Raczynski Palace, with the library of the same name; and the German theatre. Posen has a Roman Catholic and an Evangelical Gymnasium, a seminary for teachers, and one for Catholic priests. There is an Emperor William Library, with upward of 200,000 volumes. The old fortifications were demolished in 1902. The new ones comprise about 12 inner and 20 outer forts. The principal manufactured products are machinery of various kinds, spirits, flour, furniture, sugar, and cigars. There is an active trade in wood, grain, wool, potatoes, and spirits. Pop., 1900, 117,014; 1910, 156,691. The inhabitants are principally Roman Catholic, more than half Polish and about one-tenth Jewish.

Posen is one of the oldest cities of Poland. It became the see of a bishop in the tenth century and was the residence of the early Polish monarchs. It was a member of the Hansa and attained great prosperity in the sixteenth century, but afterward declined, its population in the eighteenth century having dwindled to about 12,000. The western part of the city, on the left bank of the Warthe, was founded by Germans in 1253 and had a separate administration until the annexation of Posen to Prussia in 1793.

POSEY, pō'zĭ, THOMAS (1750–1818). An American soldier. He was born in eastern Virginia, but removed to the western part of the Colony in 1769, became quartermaster under Gen. Andrew Lewis in Dunmore's War (q.v.), and took part in the battle of Point Pleasant in 1774. Early in 1775 he became a member of a Virginia Committee of Correspondence, and the next year helped defeat Lord Dunmore at Gwynn's Island. As captain he served in the campaign against Burgoyne, distinguishing himself in the battles of Saratoga. In October, 1778, promoted to major, he commanded a regiment sent against the Indians in the Wyoming valley; in 1779 he commanded a battalion under Wayne and was conspicuous at the Stony Point assault and subsequently (1781–82) served under Wayne in Georgia and helped to repel an attack of Indians under Gueristersigo. In 1793 he became a brigadier general and led a division of Wayne's army against the Indians. He settled in Kentucky in 1794 and became successively State Senator, Lieutenant Governor (1805), and major general of militia (1809). Subsequently he removed to Louisiana and was United States Senator from that State (1812–1813). From 1813 to 1816 he was Governor of Indiana Territory and then for two years was an Indian agent.

POS'IDIP'PUS, or **POSEIDIPPUS** (Lat., from Gk. Ποσειδιππος, *Poseidippos*). A Greek comic poet, the last exponent of the new comedy, dating from the first half of the third century B.C. He was born at Cassandria in Macedon, lived at Athens, and wrote 40 comedies, of which 18 titles have come down to us, and a few fragments, published in Th. Kock, *Comicorum Atticorum Fragmenta*, vol. iii (Leipzig, 1888). His *Didymoi* (The Twins) was the original of Plautus's *Menœchmi* and, through Plautus's play, of Shakespeare's *Comedy of Errors*. It is probable that others of his plays were imitated by the Roman comedian. A remarkably fine statue of Posidippus is in the Vatican at Rome. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911).

POS'IDO'NIA (Lat., from Gk. Ποσειδωνία, *Poseidōnia*). The ancient name of Pæstum (q.v.).

POS'IDO'NIUS (c.128–45 B.C.). A Stoic philosopher, born at Apamea in Syria. He was a pupil at Athens of Panætius, whom he succeeded as the leader of the Stoics, and was a teacher of Cicero, who frequently speaks of him with praise. Pompey visited him (67 B.C.) at Rhodes, where the greater part of his life was passed, and again (62 B.C.) after the close of the

Mithridatic War; and Posidonius wrote a history of the wars of Pompey. He went to Rome in 51 B.C. Besides his philosophical works he wrote treatises on history, astronomy, and geography, of which we have only the titles and a few quotations preserved by Cicero, Strabo, and others. He wrote *Meteorologica*, and Cicero alludes to his artificial sphere, which represented the motion of the heavens. The slight fragments from his works are published in Müller's *Fragmenta Historicorum Græcorum*, vol. iii (Paris, 1851). Consult: Eduard Zeller, *A History of Eclecticism in Greek Philosophy* (Eng. trans., by S. F. Alleyne, London, 1883); R. D. Hicks, *Stoic and Epicurean* (New York, 1910); E. V. Arnold, *Roman Stoicism* (Cambridge, 1911); Ritter-Preller, *Historia Philosophiæ Græcæ* (9th ed.; Gotha, 1913).

POSIDONOMYA, pŏs'ĭ-dŏn'ō-mī'ȧ (Neo-Lat., from Gk. Ποσειδῶν, *Poseidōn*, Neptune + μῦς, *mus*, shellfish): This genus of schizodont Pelecypoda is noted for its continuous existence from Silurian to Jurassic time. It includes more than 50 species, some of which are everywhere profuse in the Jurassic and Triassic strata. The shells are subcircular, thin, compressed, with straight hinge line and equal valves, and lack hinge teeth.

POSILIPO, pō-zē'lē-pō. A mountain ridge 2 miles southwest of Naples, remarkable for the tunnel known as the Grotta di Posilipo, through which the road from Naples to Pozzuoli formerly passed. The grotto is in some places 70 feet high and 21 feet wide and is 2244 feet long. Strabo assigns its construction to M. Cocceius Nerva, superintendent of aqueducts in the time of the Emperor Tiberius. Above the east archway of the grotto is the so-called tomb of Vergil. At the base of the hill of Posilipo anciently stood the poet's villa, in which he composed the *Eclogues* and *Georgics*, if not also the *Æneid*. Since 1885 new tunnels have been built for the railroad and steam tramway to Naples. Near by is the village of Posilipo, with 4500 inhabitants.

POS'ITIVISM (from OF., Fr. *positif*, from Lat. *positivus*, settled by arbitrary appointment, from *ponere*, to place). A term invented by Auguste Comte (q.v.) to designate his system of philosophy, inasmuch as that system purported to exclude all metaphysical theorizing and to confine itself to "positive" scientific knowledge of facts. It attempted to reduce the whole universe to experiential terms, excluding supernatural and spiritual agencies, hidden forces and immaterial essences, and causation regarded as a mysterious tie binding phenomena together. Instead of causes it looked for laws, i.e., the uniformities of coexistence and sequence among phenomena. When a certain uniformity has been discovered, no reason can be assigned, it declared, for that uniformity. The uniformity is an ultimate fact given us by our experience, and reasons for facts cannot be discovered. Views fundamentally like Comte's, in a greater or a less degree, may be discovered in Greek philosophy, especially among the Sophists. In modern times, beginning with Hume, positivistic views, though not so called till Comte's time, have been widely held. Prominent among German Positivists, developing from Kant, are Laas (q.v.), Riehl (q.v.), T. Ziegler, and F. Jodl. Allied in their positivism with these are such thinkers as Schuppe, Rehmke, and Avenarius. In England positivism has attempted to institutionalize itself by the establishment of a church with ritual, ceremonials, and the like, all in the worship of humanity. This tendency has its point of departure in Comte's religion of humanity. The leaders of this movement have been R. Congreve and Frederic Harrison. Of the last generation Lewes (q.v.) was the English protagonist of positivism, but he was interested more in its philosophical than in its religious side. In France E. Littré and H. Taine have been the most noted Positivists, while Renan was greatly influenced by Comte's doctrines.

PO'SO. See CHICA.

POSSART, pŏs'ärt, ERNST, KNIGHT VON (1841–). A German actor and theatre director. He was born in Berlin and was early an actor at Breslau, Bern, and Hamburg. Connected with the Munich Court Theatre after 1864, he became its oberregisseur in 1875. In 1877 he was made director of the Bavarian royal theatres; in 1887–92 toured the United States, Germany, Russia, and Holland; in 1895–1905 was intendant of the Bavarian Hoftheater; and in 1901 opened the Prince Regent's Theatre. In the private royal theatre (the Residenz) he produced several of Mozart's operas. Among his own rôles were Nathan, Gessler, Mephisto, Iago, and Shylock. He edited German versions of *Lear* (1875), *The Merchant of Venice* (1880), and *Coriolanus;* wrote the plays *Der deutsch-französische Krieg* (1871), *Recht des Herzens* (1898), and *Im Aussichtswagen* (1898); and published *Aufgabe der Schauspielkunst* (1895), *Lehrgang des Schauspielers* (1901), and descriptions of many of his own productions.

POSSE (pŏs'sē) **COMITA'TUS** (ML.). A legal term meaning power of the county. "Whenever, in the opinion of the sheriff, the responsible conservator of the peace, such a course becomes necessary, he may summon to his assistance what is known as the *posse comitatus*, that is, the body of male citizens of the county above 15 years of age, and may command them to aid him in the execution of process, in the preservation of peace, and in the performance of other lawful duties requiring and involving the use of physical force." So states Davis in his *Treatise on the Military Law of the United States.* "The several grants of power to the Executive in connection with the use of military force are coupled with an important statutory restriction

which makes it unlawful 'to employ any part of the army of the United States, as a *posse comitatus* or otherwise, for the purpose of executing the laws, except in such cases and under such circumstances as such employment of said force may be expressly authorized by the Constitution or by Act of Congress.' " (Sec. 15, Act of June 18, 1878, 20 Stat. at Large, 152.)

POSSES'SION (Lat. *possessio*, from *possidere*, to possess). In law, the actual present dominion or control which a person may have over a parcel of land or a chattel. The degree and kind of control necessary to constitute possession vary with the nature of the thing possessed and with the habits of the community.

Possession is a fact and is quite independent of any legal right to the thing possessed. A thief possesses the thing he has stolen, and the person who has surreptitiously or by force placed himself in control of a house possesses the house.

To the possessor as such, without regard to his right to possess, every legal system, even in the highest stage of development, accords certain advantages. The possessor is protected against every one who has no better right than himself. He is protected against disturbance (trespass), and if wrongfully dispossessed he recovers possession simply on the ground of his prior possession and the wrongfulness of the dispossession. Even when his adversary has a superior right to possess, the possessor may be protected against forcible dispossession.

Further, possession is, as the English lawyers express it, a "root of title." At Roman law ownership cannot be acquired without acquisition of possession, although when acquired it survives the loss of possession. Finally, in every system of law possession ripens by prescription (q.v.) or adverse possession into full property right.

In determining to what persons and under what circumstances the legal advantages of possession shall be accorded, every legal system develops a somewhat artificial doctrine of possession.

The law of possession is less clearly developed in the English law than in the Roman and the modern civil law. This is owing partly to the fact that the English law employs the same actions, viz., trespass, ejectment, and trover, for the protection of possession and for the enforcement of property rights, while the Roman law has distinct possessory remedies. In their practical operation, however, the two systems attain substantially similar results.

In both systems (as indeed in every legal system) the person who has physical control of a thing and holds it for himself—the person who, as the Roman jurists express it, has both the *corpus* of possession and the *animus possidendi*—is a legal possessor. Those who hold for others are differently treated in different systems. In no legal system are they possessors as regards prescription; but as regards protection against disturbance and against dispossession distinctions are drawn. Servants and employees acting under the direction of a master or employer are generally regarded as mere custodians. They have no independent possession, but, as it is sometimes put, their possession is the possession of the one employing them. Agents, bailees, and lessees are not possessors at Roman law; but in the modern civil law and in English law they have all the possessory remedies, at least against strangers, and they are therefore usually called possessors. If, as is usually the case in modern, though not at common, law, possessory remedies are given also to those for whom they hold possession, the latter (principals, bailors, and lessors) are said to have constructive or mediate possession. Pledgees and mortgagees who have physical possession are treated as legal possessors in every system of law.

The denial of possessory remedies to the person who holds for another does not exclude the right of defending physical possession against wrongful aggression. It signifies simply that if judicial proceedings are necessary, they must be taken by, or at least in the name of, the person for whom the property is held.

One of the chief differences between Roman and English law is found in the greater protection which the Roman law gives to the possessor of a movable against the person who has the right to possess. At Roman law, if the owner takes property forcibly from the possessor, he is obliged to restore it and pay damages; he cannot justify his employment of force by showing his right to possess. (It must be remembered, however, that at Roman law bailees and agents are not possessors.) At English law the owner of goods is permitted to use reasonable force for their recapture, even against a third person who has acquired them innocently with color of title. As regards realty the statutes against forcible entry have placed the English law on nearly the same footing as the Roman.

He who has acquired possession from another person by force or by stealth or by license is said, in the Roman and modern civil law, to have a vicious, or defective, possession. As regards that person he is protected against forcible dispossession, but not against disturbance (trespass). As against all other persons, however, vicious possession enjoys, as in English and American law, the same protection as any other kind of possession.

To the *bonæ fidei* possessor, i.e., to the person who not only possesses, but believes that he has a right to possess (a belief which regularly implies color of title), Roman and modern civil law give greater advantages than to the *malæ fidei* possessor. The honest possessor, when evicted by the owner, is not accountable for *fructus* or mesne profits no longer in his possession; or, as the civilians express it, he has the right of consumption and even the right of waste. Again, the honest possessor alone may acquire title by prescription. Finally, the honest possessor has an action for recovery of possession which runs against all the world, by which he prevails over every possessor who has not at least as much color of title as he has, and which, unlike the ordinary possessory remedies, is not limited to a brief term. These distinctions are generally drawn in modern civil law, but not in English law. In English and American law the honest possessor is accountable for mesne profits; he has no advantage as regards the perfecting of his title by lapse of time; and the actions of ejectment and trover may be employed by the dishonest possessor as well as by the honest possessor. In these English actions, however, the relatively better title prevails, so that substantially the same result is reached as in the Roman law.

In order to acquire legal possession a much more complete control must be established when

the thing seized was not previously in any one's possession (as in the capture of wild animals, birds, and fishes), or when the thing is taken without the consent of the prior possessor (disseisin), than is necessary in cases where possession is voluntarily transferred by a prior possessor. In case of delivery of possession, it it necessary only that the new possessor gain the degree of control ordinarily held by an owner.

In English and American law a further distinction is drawn between the person who has a right to possess and the person who has no such right. He who has a right to possess becomes legal possessor, even without the consent of the prior possessor, as soon as a partial control is established. This is one of the meanings attached to the English maxim that possession follows title. Another meaning is that, when it is uncertain who has the physical control, legal possession is with the person who has the better right to possess.

Legal possession is lost, in all legal systems, when physical control is lost. Control, however, as previously stated, does not mean complete control; and possession once established usually continues until the possibility of control is lost. Apart from the case of animals *ferœ naturæ*, this usually occurs only when an adverse possession is established.

Savigny, *Das Recht des Besitzes* (7th ed., Vienna, 1865); Rudolf von Ihering, *Ueber der Grund des Besitzschutzes* (2d ed., Jena, 1869); id., *Besitzklagen* (Weimar, 1874); Leo Piniński, *Der Thatbestand des Sachbesitzerwerbs nach gemeinem Recht* (2 vols., Leipzig, 1885–88); Pollock and Wright, *Essay on Possession in the Common Law* (London, 1889).

POS'SET (probably from Ir. *pusoid*, posset, Welsh *posel*, curdled milk, from *posiaw*, to gather). A dietetic preparation, made by curdling hot milk with wine, ale, vinegar, or other acidulous liquor. White wine or sherry is usually preferred, or old ale may be used.

POSSEVINO, pŏs'sȧ-vē'nō, ANTONIO (c.1534–1611). An Italian Jesuit and papal diplomat, born at Mantua. He studied at Rome, and became rector of the Jesuit College at Avignon. In 1577 he was dispatched to Sweden to effect a return of that country to the Roman communion, but he accomplished nothing permanent. In 1581 as the Pope's Viceroy as arbiter between Poland and Russia he aided in establishing peace (1582), but failed to unite the Greek and Roman churches. However, he secured religious freedom for Roman Catholic merchants and safe-conduct for papal nuncios and missionaries. Subsequently he was active as ambassador and missionary and in 1587–91 lectured at the University of Padua. In addition to numerous controversial writings he published *Moscovia, sive de Rebus Muscoviticis* (1586), containing a narrative of his own embassy; *Bibliotheca Selecta de Ratione Studiorum* (1593); and *Apparatus Sacer ad Scripturam Veteris et Novi Testamenti* (1603–06), an extensive and painstaking though not uniformly critical presentation of the sources of general theology.

PÖSSNECK, pēs'nĕk. A town of Saxe-Meiningen, Germany, situated 54 miles southwest of Leipzig. It has a Gothic church of the fourteenth century and a Gothic town hall of the fifteenth century. The chief manufactures are woolen and leather goods, porcelain, musical instruments, and dyes. Pop., 1900, 12,266; 1910, 12,934.

POST, ALFRED CHARLES (1806–86). An American surgeon, born in New York City. He graduated from Columbia College in 1822 and from the College of Physicians and Surgeons in 1827, studied in Paris, Vienna, Berlin, and London (1827–29), was professor in the Castleton Medical College, Vermont (of ophthalmic surgery, 1842–44, and of surgery, 1844–51), professor of surgery in New York University (1851–75), emeritus professor (1875–86), and president of the medical faculty (1873–86). He was a fellow of the Academy of Medicine, of which he was president in 1867–68. Post wrote *Observations on the Cure of Stammering* (1841). He was the inventor of several surgical instruments and appliances.

POST, GEORGE BROWNE (1837–1913). An American architect, born Dec. 15, 1837, in New York City. He graduated in civil engineering from New York University in 1858, and studied architecture under Richard M. Hunt (q.v.) in 1859–60. At the outbreak of the Civil War he went to the front as captain in the Twenty-third New York Volunteers, and before the close of the war had risen to the rank of colonel. He practiced architecture in New York City in partnership with Charles D. Gambrill for two years (1865–67), but afterward worked independently until late in life, when he was associated with his sons, W. S. and J. O. Post. Mr. Post was one of the remarkable group of New York architects which included R. M. Hunt, W. R. Mead, C. F. McKim, and others, who, with Richardson of Boston, were the leaders in the revival and upbuilding of American architecture between 1875 and 1890, and his work down to his last days was as virile as that of his youth and more scholarly and refined. He designed the original Equitable and Western Union buildings, the Produce and Stock exchanges, the World Building and the City College group and the residence of Cornelius Vanderbilt—all in New York; the Long Island Historical Society's building in Brooklyn; the Prudential Building in Newark, N. J., the Liberal Arts Building at the Chicago Columbian Exhibition, the Wisconsin State Capitol, and many other important civic, private, and commercial buildings. In 1908 Columbia University conferred on him the degree of LL.D. At various times Post served as president of the Architectural League of New York, the American Institute of Architects, the Fine Arts Federation, and the National Arts Club. He became a Chevalier of the Legion of Honor in 1901, an associate (1907) and a member (1908) of the National Academy of Design, and from 1909 until his death was a member of the National Commission of Fine Arts. In 1910 he received the gold medal of the American Institute of Architects. His death occurred Nov. 28, 1913.

POST, GEORGE EDWARD (1838–1909). An American medical missionary, born in New York City, where he graduated M.D. from the university of the city (1860) and from Union Theological Seminary (1861). He was elected professor of surgery at the Syrian Protestant College at Beirut, a chair which he held until his death. At the same time he was surgeon to the Johanniter Hospital. He was a son of Alfred Charles Post. Post was well known as a linguist, and wrote on many subjects in several

languages. In Arabic he wrote: *Flora of Syria, Palestine, and Egypt; Textbook of Botany; Textbook of Mammalia; Textbook of Birds; Translation of Butler's Physiology; Concordance to the Bible; Textbook of Surgery; Textbook of Materia Medica; Dictionary of the Bible.* In English appeared his *Flora of Syria, Palestine, and Sinai* and in Latin and French *Plantæ Postianæ.* He also contributed to Smith's, Hastings', Jacobus', and Barnes's dictionaries of the Bible.

POST, GUY BATES (1875–). An American actor, born at Seattle, Wash. He attended the University of California and studied law in his native city. He entered on his stage career in 1893, made his first New York appearance in 1901 in *My Lady Dainty,* and then played in *The Bird in a Cage* (1903), *Major André* (1903), and *The Virginian* (1904). He created the leading rôle in *The Heir of the Hoorah* (1905–07), was leading man with Mrs. Fiske in 1907–08, appearing in *Leah Kleschna, Tess of the D'Urbervilles,* and *Hedda Gabler,* and toured in 1909. Subsequently he played in New York in *The Bridge* (1909), *The Nigger* (1909), *The Witch* (1910), *The Challenge* (1911), *The Bird of Paradise* (1911–12), *Omar the Tentmaker* (1914).

POST, WRIGHT (1766–1828). An American surgeon, born at North Hempstead, Long Island. He studied medicine for six years in New York and London, and began to practice in New York in 1786. In 1792 he became professor of surgery, and afterward of anatomy and physiology, in Columbia College. He visited the celebrated schools of Europe, and returned in 1793 with a splendid anatomical cabinet. In 1813 he became professor of anatomy in the College of Physicians and Surgeons, and he was its president from 1821 to 1826. Post was one of the pioneers among American surgeons, and is still remembered as a successful operator, especially in the ligation of vital arteries.

POSTAGE STAMPS (from *post,* from Fr. *poste,* from ML. *posta,* station, fixed place on a road, from Lat. *postus, positus,* p.p. of *ponere,* to place). Printed labels issued by individuals, corporations, or governments, acting as carriers of letters or packages, to signify that the charges required for forwarding them have been prepaid. The postage-due or unpaid-letter stamp is not a postage stamp, but is merely a convenient means of indicating that a certain amount is due for a carrier's service which has been rendered. An individual or a corporation

may, in countries where the law allows it, establish a carrier service between different points and issue stamps for the prepayment of charges. This was the origin and use of United States local stamps, which the laws at one period allowed, but now forbid. The suspension of the United States mail service in the neighborhood of San Francisco in 1894, on account of a railway strike, produced a brief evasion of the law in the establishment of a bicycle mail route between Fresno and San Francisco. The postage on mail by this route was prepaid by a 25-cent stamp. Such a local arrangement has but little authority and receives scant recognition. A higher grade is reached in the semiofficial issues whose originators were, in such cases as those of the Baltimore carriers, authorized by the United States government to charge one cent for the delivery of letters at the post office. Postmasters' stamps have even more of authority. The United States government, being unwilling to undertake the risk and expense of a general issue of postage stamps, allowed, in 1845, the postmasters of certain towns and cities to issue stamps at their own expense and for their own convenience to test the feasibility of their use. The postmasters of Alexandria, Va., Brattleboro, Vt., Lockport, N. Y., Millbury, Mass., Baltimore, Md., New Haven, Conn., New. York, N. Y., Providence, R. I., and St. Louis, Mo., adopted the plan with so much success that the government undertook, in 1847, a general issue to supersede all the individual postmasters' issues.

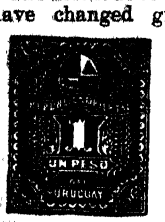
The highest authority pertains to government issues, and consequently universal recognition is accorded to them. A sharp distinction, however, is made between established governments and pseudogovernments. The attempts of the Cuban Revolutionary Committee to raise revenue from stamps manufactured and sold in New York, which never prepaid an ounce of Cuban mail, and of Aguinaldo in the Philippines to foist labels issued by his unrecognized government on the collecting public, met with small success.

There are two kinds of stamps—the adhesive and those that are impressed upon the envelope or wrapper.

Adhesives are attached to packages before mailing. The only exception to this is found in the case of some United States newspaper stamps. The newspaper set of 1865 was attached to packages of newspapers, but the stamps of 1875 and following years were attached to the stubs of receipt books, the receipts being given to publishers of second-class mail matter sent through the mails at pound rates to show the amount that had been paid by them. The use of these stamps was at last judged superfluous and was discontinued. Official stamps were used by government officeholders in the United States to indicate the amount of postage that would have been paid had their mail matter been sent at the usual rates. No money, however, having been paid for these, they are in the nature of official franks, but a nominal value was given them as a means of keeping the accounts between the different departments. Their use was discontinued in 1882. It has become the practice of many

nations to celebrate important events by issuing a series of commemorative stamps. The centennial of the independence of the United States and most of the great expositions with the events they celebrate, as well as the centenary of Lincoln's birthday, were so commemorated in the United States. The centennial years of the South American republics were similarly celebrated.

The history of postage stamps begins with the issues made by Great Britain in 1840 under the administration of Sir Rowland Hill. The successful use of stamps in the postal service of Great Britain resulted in the adoption of stamps by Mauritius, an English colony, by Brazil, France, Switzerland, and the United States before 1850. The example was followed by many other countries, and since 1860 nearly all have adopted the postage stamp as the most convenient means of indicating the prepayment of postage on mail matter. The establishment of the Universal Postal Union, by means of which the rates of international postage, the colors of the stamps to be used, and the regulations for forwarding are determined, has given great impetus throughout the world to the issuing of stamps.



The earliest shape of the postage stamp is practically that which is in use to-day. The triangular, diamond-shaped, octagonal, and square have been tried as experiments by different countries, but in nearly all cases the return has been made to the rectangular form, and usually to about the same size as that of the original issue of Great Britain. Stamps have differed greatly in size, the smallest, a stamp of Bolívar, a state of the Colombian Republic, being $\frac{3}{8} \times \frac{1}{2}$ inch, and the largest the United States newspaper stamp of 1865, $2\frac{1}{4} \times 3\frac{7}{8}$ inches.

The original designs of the stamps of many countries are their finest; but there are notable cases in which the improvement both in design and in workmanship has been remarkable. A prominent example of this is found in the various issues for Uruguay. The earliest types, those of 1856–66, are of the most inferior workmanship, and the stamps are produced by the cheapest processes known. Stamps of the next decade show some improvement, while those of subsequent years contain some of the finest work of the period and also a number of specimens of poor work. The stamps since 1884, however, have been the finest possible examples that could be turned out under modern processes of engraving, and reveal from year to year the advances that have been made.

The methods of manufacture have changed greatly since postage stamps were first issued. The earliest stamps, in several countries, were each engraved separately by hand upon copper plates from which the impressions were taken. A notable example of this is the postmasters' stamps issued in St. Louis. This small plate of six stamps was engraved in two vertical rows of three stamps each, the first row of the 5-cent and the second row of the 10-cent denomination. The two upper 5-cent stamps were altered to 20-cent stamps, and later these were changed back to their original 5-cent denomination. Separate engraving was employed also in the cases of the early stamps of Mauritius, New South Wales, and the Philippine Islands.

The first adhesive stamp issued, the one-penny black of Great Britain, was made by a more advanced process. The original steel die, having been hardened, was impressed a number of times upon a softened steel roller which in turn was hardened, and under pressure rolled upon a plate from which the stamps were printed. By this means of transfer as many impressions could be made on a plate as desired, and the full sheets of these early issues contained 240 stamps. This method of engraving and transfer, with some improvements, is employed at the present time, and is utilized in the manufacture of the stamps of many countries. Another method in use has been the setting of separate electrotypes of a stamp side by side and then recasting them as a solid plate. Lithography also has been employed as a convenient and cheap method for producing stamps in quantity. Some countries have also made stamps by the use of ordinary type and rule, the design being repeated as many times as it was desired to have stamps in the sheet. Type-set stamps vary one from another. This is caused by slight differences in the type or its spacing, and in the cutting of the rule used for borders.

The common method of printing envelope stamps is by embossing, two dies being used in this case, one fitting into the other; the paper being placed between these and the flat surface of one die inked, a stamp is produced in which the raised portions are white and the level portions are inked. This method has been employed in the printing of a few adhesive stamps, notably those of Great Britain of the issue of 1841 and the first issues of Portugal and colonies.

Provisional issues of stamps have been made from time to time in different countries. This has sometimes been done for the purpose of providing a new denomination for immediate use before it was possible to obtain a new supply of the stamps from the printers. Provisional postage stamps are usually made by overprinting fiscal or telegraph stamps for postal use, or by surcharging certain values of postage stamps of which there is a surplus with a new value for which there is an urgent demand. Sometimes lithography is resorted to in countries where the regular issues are engraved, or some local printer is ordered to supply a small quantity of type-set labels.

In the earliest issues of stamps no means were provided for their easy separation. The stamps were intended to be cut apart, and in many cases were printed very close together.

The use of a machine for punching small holes between the stamps, known as a perforating machine, was begun in 1854, although there are instances, even at the present time, in which no provision is made for separation. Another method of separating stamps is by the use of the rouletting wheel, which cuts through the paper between the stamps with a series of small cuts such as would be made by brass rule, with an edge made up of alternate dashes and spaces, in printing. This rule also is sometimes used for the same purpose, and when it is inked the stamps thus treated are spoken of as rouletted in colored lines. The cuts are, in certain cases, made in zigzag or saw-tooth form, and are variously produced by rouletting wheels or by impressions with rule made for cutting.

Governments which have issued stamps sometimes reprint them after they have gone out of use. When these issues are good for postage they are called reissues. When, however, they are obsolete stamps which cannot be used for prepaying mail matter, they are known as reprints. It sometimes happens that the plates of government issues of stamps get into the hands of private individuals who reprint them for sale to collectors. These are known as private reprints, and are of much less value than government reprints because made without authority and usually in large quantities.

The processes employed in printing in many countries have been such as to encourage counterfeiting. Comparatively little trouble has been experienced by governments which have employed steel engraving for the production of their stamps. The expense and difficulty of successful imitation by the use of counterfeit steel plates has been such as to deter counterfeiters from attempting it. The lithographic process is usually employed by counterfeiters. The government of Spain changed its issues every year for a considerable period in order to defeat the aim of counterfeiters. Greece also has suffered considerably from counterfeits made to defraud the government.

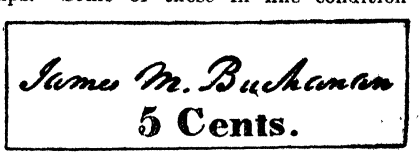
The collecting of stamps, sometimes known as philately, has several advantages over the gathering of other objects which satisfy the collecting instinct. The chief of these is the small space which is occupied by a large and valuable collection. There is also a standard of value by means of which the worth of stamps may be estimated. This is found in the standard catalogues, which, being based upon a knowledge of the number of stamps in existence and prices collectors are willing to pay for them, contain approximate valuation for most of them.

The separate engraving of stamps increases very much the interest in them. It has also led to a distinct kind of collecting known as plating. Collectors who are interested in doing this seek to restore the original plates of stamps by gathering together all the varieties that have been printed from them and placing them in their proper order in relation to one another.

Great countries are distinctly adverse to the use of the postal service in any other than its legitimate manner. There have been cases where British and French colonial authorities have arranged for special issues of stamps or have had overprints, or surcharges, placed upon them for the purpose of securing an increased sale to collectors, but these attempts have been frowned upon, and few of them are made at the present time.

All collectors of stamps collect the perforated as distinct from the imperforate issues. The rouletted varieties are quite generally collected, and those who are especially interested in the smaller varieties notice the differences in the gauge of the perforation. This is determined by the number of holes that may be counted in the space of two centimeters, and a stamp is known as perforated 11, 13, 15, etc., according to the number of perforations included in that space.

Watermarks have been used by many countries as a means of guarding against the counterfeiting of their stamps. These are produced in the paper in the same way that the watermark is made in ordinary writing paper. It sometimes appears in the centre of a sheet or pane of stamps, and again the whole watermark is found in the space covered by a single stamp. The most common and interesting varieties of watermark are those found in the stamps of Great Britain and her colonies. It is sometimes quite difficult to discern the watermark, but a stamp placed in benzine upon a black surface usually shows it clearly. Collectors who are especially interested in minor varieties of watermark collect them when found inverted or sideways in the stamp as well as in their proper position. The misplacing of a sheet in the press frequently causes a watermark to appear at one side instead of at the centre of a stamp, and in some cases it is entirely lacking for this reason, and where the margin of a sheet contains lines or large letters, these are found in the stamps.



The colors of the paper on which stamps are printed appeal strongly to all collectors, also the quality of the paper itself. Collectors who are specialists note the differences of hard and soft paper. Thin and thick paper varieties are also collected.

The value of stamps depends, not, as is commonly supposed, upon their age, but upon the number that have been issued and the number preserved. Great countries, like the United States and the principal nations of Europe, issue large numbers of every stamp that they put into circulation. The stamp which corresponds to the ordinary letter rate in any large country is always common. Very old issues of small countries whose postal service was limited attain high value. Confederate postmasters during the War of Secession issued stamps of a class similar to United States postmasters' stamps. Some of these in fine condition are

rare, bringing $500 each and upward, according to their condition. The United States Baltimore stamp of the 10-cent denomination, which differs from the 5-cent only in the numeral, is one of the rarest known. The first issue

FRENCH POSTER

published the first edition of the Syriac New Testament. His *De la république des Turcs* (1540; rev. 1560) has some historical value.

POSTELWITZ, pŏs'tel-vĭts, BARON VON. See POSADOWSKY-WEHNER, A. A., COUNT VON.

POST'ER. A sign, usually pictorial, intended to be affixed to a wall or board to convey some public announcement. The use of such signs is probably as old as civilization itself; but with the printing press came in a class of signs answering more or less to the specific modern use of the word "poster." In Paris in the seventeenth century posters printed on colored paper of one tone, such as yellow for the Opera House, green for the Comédie Française, and red for the Comédie Italienne, were generally used. The custom is continued in Paris of the nineteenth century, where white paper is reserved for governmental posters, and even the great national educational establishments have to use another color, generally yellow. In Italy the play bills were more descriptive, and in the eighteenth century they were often ornamented with cuts showing scenes and characters in the opera. In France as early as 1836 Lalance made a poster for the book *Comment meurent les femmes*, and Raffet, Grandville, C. Nanteuil, Gavarni, Gigoux, Vernet, Daumier, Tony Johannot, Frère, and Edouard Manet designed *affiches*, or posters, but not in colors. The modern colored poster was the invention of Jules Chéret, who commenced his long series of lithographs in color in 1866 and still ranks highest in the profession. By the use of few colors in strong contrast he produced the most fantastic pictorial effects. His subjects are ballet girls, clowns, or children, and his spontaneity, his engaging gayety, and the aptness of his detail make him without an equal in his restricted domain. Less suggestive, less conquering in color, but more decorative if more subdued, is the work of Eugène Grasset (1850–). Another more original poster maker is the often harshly realistic Toulouse-Lautrec, a powerful draftsman. The poster has kept pace with the impressionistic, the symbolistic, the realistic, and the romantic movements in literature and art. Willette, Forain, Guillaume, Auriol, Ibels, Steinlen, Mucha, Bonnard, Paléologue, Gossard, and Schwaebe are only a few names among the many poster designers who have worked in one or more of these styles. Another interesting phase of the poster is seen in those designs which serve also for book covers, the whole design, picture, lettering, and borders, given first as a poster 3 × 2 feet and afterward reduced to the size of an octavo page. These were first made by Chéret for Jules Lévy, the publisher. Both in the quality and the quantity of the work produced France is the leading nation in poster art. Compared with the French, English posters are rather sombre in color and conception. This note was struck in the first artistic poster in England made by Fred Walker for the dramatization of Wilkie Collins's *Woman in White* (1871). It was continued by the most original of English poster makers, Aubrey Beardsley, who influenced a crowd of imitators by his masterly exotic art. Walter Crane was the first to bring the color note into British poster art. The "Beggarstaff brothers" Pryde and Nicholson, with their grave artistic effects in black and brown, are interesting modern designers, and among others are Anning Bell, J. W. Simpson, Gordon Craig, Dudley Hardy, Greiffenhagen, J. Hassall, and Will Owen. The growth of the poster in other European countries was rapid, especially during the years from 1895 to 1900. In Germany the art culminated in the works of startling originality like those of Ludwig Hohlwein, Georg Tippel, Hans Flato, and others. In Spain posters advertising bullfights and fairs in vivid, often garish colors, were for long the only ones, but recently superior designers have appeared in Ramon Casas, "Marco," and others. In Russia the most prominent figure is Leon Bakst; in Belgium, Cassiers.

The first American posters advertised the circus and the stage, and one of the earliest of these poster makers was Matt Morgan, for some time head of a Cincinnati lithographing company. The makers of patent medicines then took it up; but practically all of this early work was crude and inartistic. The enormous proportions which bill posting has assumed in the United States and the size of the posters hinder rather than aid artistic treatment. (See ADVERTISING.) For a long time the only artistic American posters were produced for the publishers in the form of enlarged magazine covers, as stated above, together with calendars and advertisements for books. They first became popular during the early nineties in designs of Edward Penfield, whose work has been the most significant and important in the development of the American poster, and Will H. Bradley, of *Chap Book* fame. Among others who distinguished themselves were Hasenpflug, Carqueville, J. J. Gould, Louis Rhead, Maxfield Parrish, Wildhack, the Leyendecker brothers, George Brehm, Adolph Treidler, A. G. Spear, and Walter Fawcett. The demand soon spread to other trades, such as collars, soaps, railroads, and automobiles. Strangely enough, theatres were almost the last to realize the importance of artistic advertising. Among artists who have within recent years distinguished themselves in theatrical posters are Henry Mayer, F. C. Cooper, Hamilton King, Blendon Campbell, Ernest Haskell, Clarence Tilt, and others. The American school now ranks among the best.

The criterion of a good poster differs vitally from that of other pictorial art. "It is an impression—a flash of line, a snap of color, all that can be told of a tale in the passing of an instant." To be effective it should be striking and simple. The most important technical feature is the design, then the colors, few and vivid. There should be only decorative, flat surfaces, no perspective or unnecessary detail. The fad for collecting posters, so prevalent in the nineties, has almost vanished, but their importance as an advertising medium is sure to grow with the increasing artistic taste of the nation. Although as a purely artistic production, a subject for collectors and students, the poster has had its day, yet as a medium of advertisement and of political appeal it may have a future.

Bibliography. The best work on posters, with fine illustrations and special treatment of American posters, is C. M. Price, *Posters: A Critical Study of the Development of Poster Design* (New York, 1913). Others are: Ernest Maindron, *Les affiches illustrées* (3 vols., Paris, 1895); Charles Hiatt, *Picture Posters* (London, 1895); Spielman and others, *The Modern Poster* (New York, 1895); J. L. Spousel, *Das moderne Plakat* (Dresden, 1897); G. H. E. Hawkins, *Poster Advertising* (Chicago, 1910). For fine illustrations, see Maindron, *Les maîtres de l'affiche* (Paris,

1896); id., *Les affiches étrangères illustrées* (ib., 1897).

POSTERN, pōs'tẽrn. In mediæval military architecture (q.v.), a small gate or door in the inclosing wall of the outer bailey, opening upon the country; hence any small or subsidiary door. Such a door for pedestrians at the side of a main gateway or carriage door in modern buildings of any sort is sometimes called a postern.

POST EXCHANGE. In the United States army, a name given in 1895 to the institution formerly known as the canteen (q.v.), the term "canteen" being, subsequently to this date, restricted to that part of the exchange in which the sale of beer and light wines was permitted. This feature was abolished by Act of Congress, Feb. 2, 1901. Post exchanges are established and maintained under special regulations issued by the War Department. They combine various elements, such as reading and recreation rooms, coöperative stores, and restaurants. In other words, post exchanges are, sales agencies apart, substantially soldiers' clubs. Whenever practicable they are housed in public buildings, either constructed or specially set apart for the purpose. The profits, if any, from the operation of post exchanges are returned to the various troop units of the garrison in the ratio of their strength, and are taken up in the company funds. Allotments may be made from post-exchange funds for the support of regimental and post athletics. An officer, known as the post-exchange officer, is detailed to conduct the affairs of the exchange. He has various assistants, who may be civilians, and is further assisted in matters of policy and of general administration by the post-exchange council, composed of himself, ex officio, and of the commanding officers of the units sharing in the activities of the exchange.

Bibliography. Chiefly government reports. Consult especially *United States Army Regulations;* and in respect of the canteen feature, *House Document 252* (Washington, 1903) and *Senate Document 133*, Fifty-seventh Congress, and *Senate Document 527*, Fifty-ninth Congress.

POST'GATE, JOHN PERCIVAL (1853–). An English classical scholar, born at Birmingham. He was educated at Trinity College, Cambridge, where he was classical lecturer from 1884 until his appointment, in 1909, as professor of Latin in the University of Liverpool. From 1880, and while teaching at Cambridge, he also held the chair of comparative philology in University College, London. In 1899–1907 Postgate edited the *Classical Review* and in 1907–10 the *Classical Quarterly*. His publications include editions of Catullus, Propertius, Manilius, and Lucan, Book vii. In 1893 he became editor-in-chief of the *Corpus Poetarum Latinorum*. He also translated Tibullus for the Loeb Classical Library (1913).

POSTHUMOUS (pŏst'ū-mŭs) **CHILD** (Lat. *postumus, posthumus*, last, superlative of *posterus*, later; associated by popular etymology with *post*, behind, after + *humus*, ground). One born after the father's death, or delivered from the mother by the Cæsarean operation after her death. Such a child is regarded by the law, for the purposes of inheritance and taking property by will, as if it had been born before the parent's death. Where a father makes a will without making provision for a posthumous child, the child is entitled to receive the same share of the estate that he would have taken if the father had died intestate, the will being revoked *pro tanto* and the provisions for the other children or legatees being reduced proportionately to make up his share or portion. See SUCCESSION; WILL.

POSTHUMUS, pŏst'ū-mŭs. The husband of Imogen, in Shakespeare's *Cymbeline*.

POST'HYPNOT'IC SUGGESTION. See HYPNOTISM.

POSTILLON DE LONGJUMEAU, LE, *le pŏs'tē'yōN' de lōNg'zhu'mō'*. An opera by Adam (q.v.), first produced in Paris, Oct. 13, 1836.

POST-IMPRESSIONISM. In art, the development following impressionism, a term applied to various radical movements in painting and sculpture. They represent in common a reaction against the nineteenth century—against realism, the painting of things, and impressionism, the painting of light. Generally speaking, they endeavor to paint pure feeling, disassociated from representation of natural objects, in a purely abstract language of form and color. The resemblance to nature is arbitrary, in fact there is often none whatever. The pioneer of the movement was Cézanne (q.v.) in his revolt against the flat surfaces of impressionism and emphasis of the permanent as distinct from the momentary appearance of things. Other early leaders were Van Gogh, Gauguin, and Matisse (qq.v.).

Cubism is the term applied to painting in geometrical forms and lines. The founder and leading exponent of the movement is the Spanish sculptor and painter Picasso (q.v.). Others are George Braque, Jean Metzinger, Albert Gleizes, Francis Picabia, Marcel Duchamp, and Fernand Leger. Their first collective exhibition was held in Paris in 1911.

Futurism originated in Italy about 1909, the first collective exhibition being held in Paris in 1912. The founder of the school was Marinetti, a writer. The Futurists are the anarchists of art. They render what they call the dynamic sensation or the interior force of an object, i.e., its rhythm, inclination, movement, and its conflict with neighboring objects in lines and planes. Among the principal representatives are the painters Boccioni, also a sculptor, Carrà, Russolo, Balla, and Severini.

The German Post-Impressionists cling more closely to the old masters, are more imaginative, and maintain a certain beauty of decorative color. They are most powerful in Munich, where they include a strong Russian element—Jawlensky, Kandinsky, Kubin Werefkin, and Burljuk—besides Erbsloh, Kanoldt, Franz Marc, Otto Fischer, Gabrielle Fischer, and other Germans. In England Post-Impressionism is represented by the sculptors Eric Gill and Jacob Epstein (q.v.), by Augustus John (q.v.), and by the very able painter-critic Roger E. Fry (q.v.). The modern movements were first introduced to the general public of the United States in exhibitions held at New York and Chicago in 1913 by the International Association of American Sculptors and Painters. Adherents to the new movement were won among the younger men. Except in the case of Arthur Dove, American cubism, however, was not thoroughgoing; witness the productions of Arthur Davies and H. G. Dearth.

POSTL, pōs't'l, KARL. See SEALSFIELD, CHARLES.

POST MORTEM (Lat., after death). A legal term employed to denote an examination of a dead body to determine the cause of death. Usually some dissection or mutilation of the body is necessary, but this rests in the discretion of the examining physician. A coroner is required to hold a *post-mortem* examination of the body of a person dying under suspicious circumstances. Consult Sidney Perley, *Mortuary Law* (Boston, 1896). See AUTOPSY.

POST-MORTEM RIGIDITY. See RIGOR MORTIS.

POST-NASAL VEGETATION. See ADENOID, ADENOIDS.

POST-NUPTIAL CONTRACT. In its broadest sense, any contract made between husband and wife. As to their privileges and restrictions in this respect, see CONTRACT; HUSBAND AND WIFE.

POST OFFICE. A public institution for the reception and delivery of letters, newspapers, books, and such other matter as may by law of the state be intrusted to the mails for conveyance. The post office is frequently also charged with other duties than the handling of mail. Thus it issues money orders designed to facilitate the transmission of money, it conducts savings institutions, and in European countries it has a monopoly of the facilities for telegraphic communication. The postal service is at present in all civilized countries under the management and control of the government. The name originated in the posts (from Lat. *positum*, placed, fixed) placed at intervals along the roads of the Roman Empire where couriers were kept in readiness to bear dispatches and intelligence. The first letter post seems to have been established in the Hanse towns in the early part of the thirteenth century as a means of facilitating commercial intercourse. In England a system of posts for dispatching letters was early provided, Sir Brian Tuke being mentioned as the first Master of the Posts in the reign of Henry VIII. In the reign of Elizabeth a chief postmastership was established, Thomas Randolph being the first incumbent. With the accession of James I to the throne of England and the consequent increased intercourse between England and Scotland a marked improvement in the postal system followed. In the reign of Charles I a monopoly of letter carrying was established, the rates of postage being fixed at from 2d. to 6d. for a single letter, according to distance, in England, 8d. to Scotland, and 9d. to Ireland. In 1680 a penny post was established for the conveyance of letters and parcels between different parts of London and its suburbs. In the reign of Anne the existing postal statutes were repealed and the post-office establishment placed on a new basis. A general post office was instituted at London for the British dominions, with chief offices at Edinburgh, Dublin, New York, and other places in America, while the whole system was placed under the control of a postmaster-general with power to appoint deputies for the chief offices. Near the end of the eighteenth century coaches were substituted for riders on horseback. With the development of the railway system came the carriage of letters by train instead of by mail coaches.

In 1812 the rates of postage on letters were fixed at 4d. for 15 miles, with a regular increase up to 17d., which was the charge for any distance over 700 miles. In 1837 a plan of post-office reform was suggested by Mr. (afterward Sir) Rowland Hill, the adoption of which not only immensely increased the utility of the post office, but changed its whole administration. Its principal features were the adoption of a uniform and low rate of postage, a charge by weight, and prepayment. The new system came into full operation in 1840. A penny was adopted as the uniform rate for every inland letter not above half an ounce in weight. Facilities for prepayment were afforded by the introduction of postage stamps, and double postage was levied on letters not prepaid. Arrangements were made for the registration of letters, and the money-order office, by a reduction of the commission charged for orders, became available to an extent which it had never been before. Since 1897 the rates have been as follows when prepaid: not exceeding 4 ounces, 1d.; over 4 ounces and not exceeding 6 ounces, 1½d.; over 6 ounces and not exceeding 8 ounces, 2d., and so on at the rate of ½d. for every additional 2 ounces. A letter posted unpaid is charged double postage. Letters insufficiently stamped are charged double the deficiency on delivery. Redirected letters are charged additional postage at the prepaid rate, and this may either be prepaid or charged on delivery. Letters for officers, soldiers, or seamen on actual service abroad are redirected without charge. The same privilege extends, with several restrictions, to such letters redirected at home. By paying ½d. extra, letters may be posted in the boxes attached to mail trains, in which sorting is performed.

The home and foreign mail-packet service was, in the seventeenth and eighteenth centuries, in the hands of the post-office authorities, but was removed to the Board of Admiralty, under whose control it remained till 1860, when it was again restored to the post office. Steam vessels were first used for conveying the mail in 1821, and in 1833 mail contracts were introduced, the first being with the Mona Steam Company to run steamers from Liverpool to Douglas in the Isle of Man.

In 1914 there were 24,447 post offices in the United Kingdom besides 49,651 road and pillar letter boxes. The total number of letters delivered during the year was 2,986,200,000, as against 1,097,000,000 in 1879. The total number of post cards, books, newspapers, and parcels delivered through the mails amounted to 2,074,200,000. The number of money orders issued was 16,167,000, with an aggregate value of £61,474,000. The number of postal orders amounted to 152,340,000, with an aggregate value of £53,106,000. The total receipts of the post office exclusive of the income from the telegraphic service was £21,928,311, while the expenditures were £15,286,244, leaving a balance of £6,642,244.

The postal service of the United Kingdom is now under the immediate control of the Post-

master-General, assisted by the chief secretary of the post office in London, a financial secretary, and four other secretaries. There are also chief officers in Edinburgh and Dublin, with secretarial and other departmental staffs. The Postmaster-General is a member of the Privy Council and sometimes a cabinet minister. He is the only officer connected with the department who leaves office on a change of ministry.

Postal Savings Banks. See under that heading.

Post-Office Insurance. The system of post-office insurance, first established by the English government through the Government Annuities Act of 1864, like the system of postal savings banks, was primarily intended for the promotion of habits of thrift among the working people. For many years the government had sold terminable annuities for one life, two lives, or a term of years, through the Commissioners for the Reduction of the National Debt. The Act of 1864, which went into effect April 17, 1865, provided for the sale of such annuities of any amount between £4 and £50 through the Post Office Department. It further authorized the Postmaster-General to insure the lives of persons between the ages of 16 and 60 inclusive for any amount between £20 and £100. But little advantage was taken of the provisions of the Act, only 6524 contracts for life insurance having been entered into up to 1882. In that year the Act now in force was passed. By its terms annuities, either immediate or deferred, are issued to persons not less than 5 years of age for any amount between £1 and £100. Insurance, either life or endowment, may be taken out by any person between the ages of 14 and 65 inclusive. The amount of the insurance may vary from £5 to £100. Insurance for £5 may be taken out on the lives of children from 8 to 13 years of age. Insurance for £25 or less may be issued without a medical examination, provided the insured presents other satisfactory evidence of good health. Such policies provide, however, that, if the insured dies within two years of the issuance of the policy, the beneficiary shall not receive the full amount of his policy. Premiums may be paid in a lump sum in advance or in installments. In 1896 new premium rates were established, somewhat lower than those before in force. The present rates are a little higher than those of the regular life-insurance companies, but on the whole somewhat lower than those of industrial companies.

The connection between the insurance department and the savings banks is the most characteristic feature of the institution. Every policy holder must be a depositor in the postal savings bank. He must deposit the full amount of his first premium, opening an account if he has not one already. Later premiums the Postmaster-General transfers from the deposits of the insured so long as they hold out, without notice from the insured. The insured may make his deposits in the bank at any time and in any amounts, subject only to the general regulations of the bank. In the same way payments to the insured, whether arising from annuities or from endowment-insurance policies, are first credited to his account on the books of the bank. Furthermore, the deposits in the bank, and the withdrawals from it, may be made at any one of the 13,000 postal savings banks in the country.

Telegraphs. An Act of 1870 empowered the post office to acquire the existing electric telegraphs, and the telegraphic communication of the country is now in the hands of the post office. As a result of governmental control the rates charged have been greatly reduced and the number of messages sent greatly increased. Since 1885 the charges have been ½d. per word, with a minimum charge of 6d. for each telegram. About 87,000,000 telegraphic messages were sent in the year ending March 31, 1914, about 10 times the number sent in 1870. The gross revenue was £3,126,281; working expenses, £4,153,343. By an Act of 1898 the Post Office Department was further authorized to assume control of the telephone service of the United Kingdom. The expenditures of the telephone service in 1914 were £5,728,121 and the receipts £6,627,663.

A fee of 2d.—in addition to the ordinary postage—prepaid in stamps, secures careful handling of any letter, newspaper, or book packet and renders its transmission more secure by enabling it to be traced from its receipt to its delivery. Letters may be registered for a fee of 2d. to any place in the British colonies and for various rates of charge to different foreign countries. Letters containing coin, if not registered, are treated as if they were and charged on delivery with a registration fee of 8d.; the same fee is charged on letters marked "Registered" and posted in the usual way instead of being given to a post-office servant. The registration fee of 2d. entitles the sender to compensation up to £5, a fee of 3d. £10, and so on up to £120. There is a railway and express letter service by which letters may be intrusted to the railroad companies for dispatch upon payment of an additional fee.

Newspaper, Book, and Parcels Post. Newspapers and books may be sent through the mails at the rate of ½d. for every 2 ounces or fraction of 2 ounces. Newspapers to come under the definition must be published at intervals not exceeding seven days and appear in unstitched sheets. Under book post are included manuscripts, maps, prints, and circulars. In 1914 the number of newspapers carried aggregated 158,500,000, and the number of book packets, circulars, etc., was 1,000,200,000. The parcels post was established in 1883. In 1897 the rates were made 3d. for parcels not exceeding 1 pound, and 1d. for each succeeding pound up to 10 pounds. During the fiscal year ending March 31, 1914, 113,200,000 parcels were carried.

Free Delivery. Prior to the American Revolution no provision had been made for free delivery except in a few of the larger cities and towns. Since then the free-delivery system has become universal throughout the Kingdom. Corresponding to the American special delivery is the express-delivery service of the British post office, by which letters are sent out by express messengers in advance of the postman. Rural free-delivery service has been extended to all parts of England and is almost completed in Scotland and Ireland.

Money Orders. As far back as 1792 a money-order office as a private venture had been established for the transmission of small sums of money to different parts of the Kingdom. By an Act passed in 1838 this business was incorporated in the Post Office Department, but the commission charged was so high that it was

only employed to a very limited extent. Inland money orders may be obtained at any of the post offices of the United Kingdom on payment of the following commission: for orders not exceeding £3, 3d.; over £3 and not exceeding £10, 4d. Money orders may now be issued to the colonies, to most European countries, the United States, Egypt, etc., the commission being about three to four times the above rate. A money order in the United Kingdom becomes void if not presented for payment before the end of the twelfth calendar month after that in which it was issued. Orders drawn on France or Italy must be paid within three months. The lower rates for inland money orders entail a loss on each transaction. Provision was further made for the issue of 10 classes of postal notes for small fixed sums, under the Post Office Bill of 1880.

Universal Postal Union. In October, 1874, a conference of representatives from all the states of Europe, the United States, and Egypt was held at Bern and resulted in the establishment of an international postal union with a central office at Bern, which meets every three years to consider questions affecting the postal relations of the states concerned. This was followed in June, 1878, by the Treaty of Paris, signed or subsequently adhered to by all the parties to the former treaty, with the addition of British India, the colonies of France, Spain, Holland, and Portugal, various British colonies, Persia, Japan, Liberia, Brazil, Peru, Mexico, in fact every country in the world except China, the new convention receiving the name of the Universal Postal Union. Under this important treaty all the consenting nations were declared to be "a single postal territory for the reciprocal exchange of correspondence." Instead of the varying rates theretofore prevailing, equal rates, weights, and rules were established, and considerable reduction of postage followed its adoption. Except in the case of lengthy sea transit, a uniform rate of 25 centimes (5 cents) was adopted for a letter of 15 grams (½ ounce); of 10 centimes (2 cents) for post cards; of 5 centimes (1 cent) for packets of print, etc., of 50 grams (2 ounces); and of 25 centimes (5 cents) for registration in Europe, and 50 centimes (10 cents) for registration beyond Europe. Prepayment of postage is required except on letters.

United States. In the English colonies of America before 1639 such postal facilities as existed were supplied by private enterprise. Letters from abroad were delivered at the wharf to those who called for them or sent to a near-by coffeehouse for distribution. In 1639 the General Court of Massachusetts took the first step towards the establishment of a government postal system by enacting the following decree: "It is ordered, that notice be given that Richard Fairbanks, his house in Boston, is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither, to be left with him; and he is to take care that they are to be delivered or sent according to directions; and he shall be allowed for every letter a penny, and he must answer all miscarriages through his own neglect in this kind, provided that no man shall be compelled to bring his letters thither except he please." In Virginia each planter was required to convey the dispatches, as they arrived, to the next plantation, and so on. In 1672 the government of New York established a monthly mail to Boston. In 1683 and in 1693 post offices were established in Pennsylvania and New Hampshire respectively. In 1692 the Legislature of Virginia passed an Act reciting that one Thomas Neale had been empowered by letters patent from William and Mary to take charge of the postal business of the Colonies. Neale's patent authorized him "to erect, settle, and establish offices in America for the receiving and dispatching away of letters and packquettes" and to appoint the necessary persons to assist him. This patent created for the first time an American intercolonial postal service. In general its charges for carrying a letter ranged from 4d. to 15d., according to distance.

No man in America was so identified with the interests of the Colonial post office as Benjamin Franklin. In 1737 he was appointed postmaster of Philadelphia. In 1753 he received with William Hunter a royal commission as Deputy Postmaster-General for the Colonies. Franklin immediately proceeded to systematize the department and personally made a tour of inspection, in which he visited every post office in the country except that of Charleston, S. C. After four years of his administration the post office yielded the salary of the postmasters and a small revenue besides and in 1774 a clear annual revenue of £3000 to Great Britain. In 1753 the delivery of letters by the penny post was begun and also the practice of advertising letters remaining in the office in Philadelphia. In 1774 Franklin became obnoxious to the British government on account of his connection with the petition for the removal of Governor Hutchinson from Massachusetts, and on January 31 of that year he was dismissed from the deputy postmaster-generalship. By this time the patriotic movement which concluded in the Revolution was in full tide, and so great was the feeling caused by Franklin's dismissal that private arrangements were made for carrying letters, and after 1774 the American post office never again contributed a farthing to the British treasury. In fact, in 1775 the Colonies combined to establish their own post offices and to pay the necessary officials, the Continental Congress appointing a committee to devise a postal system, which went into effect July 26, 1775, when Benjamin Franklin was unanimously appointed Postmaster-General, with authority to establish a line of posts from Falmouth, Me., to Savannah, Ga., and as many cross posts as might seem to him necessary. In 1792 rates of postage were fixed which remained unaltered for nearly half a century. They were: for 30 miles and under, 6 cents; over 30 miles and not exceeding 60 miles, 8 cents; over 60 and not exceeding 100 miles, 10 cents; and so on up to 450 miles and over, for which the charge was 25 cents. In 1845 the rates were lowered, and a scale based on weight as well as distance was adopted. The postage on letters not exceeding ½ ounce in weight was fixed at 5 cents for any distance not exceeding 300 miles; over 300 miles it was 10 cents, with an increase of rate for every additional half ounce in weight. The rate on newspapers was nothing for distances under 30 miles; for over 30 miles and under 100, 1 cent was charged; over 100 miles, if beyond the borders of the State, the charge was 1½ cents. In 1851 the rate on letters not exceeding ½ ounce in weight was reduced to 3 cents for distances under 3000

miles and 6 cents for distances above 3000 miles. If not prepaid the rates were 5 and 12 cents respectively. Prior to 1851 no reduction was made for prepayment of postage. In 1855 a law was passed requiring prepayment, and this has continued to be the rule. In 1863 the element of distance as a factor in fixing the scale of rates was abolished, and a uniform rate of 3 cents was established for letters not exceeding ½ ounce in weight. In 1883 this rate was reduced to 2 cents.

Stamps. In 1847 adhesive postage stamps were first introduced into the United States, but, on account of the high rate of postage and the provision allowing optional prepayment, they did not come into general use until 1855, when the rates were reduced and prepayment required. In 1852 stamped envelopes were introduced, and in 1872 postal cards were authorized. In 1879 double or reply postal cards were authorized, and in 1898 private mailing cards were allowed to be sent through the mails at the rate of 1 cent postage, subject to certain restrictions prescribed by the Postmaster-General.

Classification of Mail Matter. Domestic mail matter is arranged into four classes. The first class includes letters, postal cards, and all matter wholly or partly in writing, whether sealed or unsealed (except manuscript and corrected proof). The rate on all matter of this class is 2 cents an ounce or fraction thereof. On postal cards it is 1 cent each, the price for which they are sold. On drop letters the rate is 2 cents an ounce at free-delivery offices and 1 cent elsewhere. The rule is prepayment except where the amount of the postage exceeds 2 cents, in which case if the weight does not exceed 4 pounds the excess of 2 cents may be called for from the addressee. Second-class matter includes newspapers and other periodical publications issued as often as four times a year, which bear a date of issue and are numbered consecutively and issue from a known office of publication and which are in the form of printed sheets without substantial binding. The rate of postage on second-class matter when sent by the publisher from the office of publication, or by a news agency to actual subscribers or to other news agents, is 1 cent a pound or fraction thereof. To actual subscribers within the county in which the paper is published postage is free except at free-delivery offices. To all other persons than publishers and newsdealers the rate of postage on second-class matter is 1 cent for 4 ounces or fraction thereof to any place in the United States, Porto Rico, Guam, Philippine Islands, Canada, and Mexico. Third-class matter includes miscellaneous printed matter (not books) weighing under 4 pounds, proof sheets, corrected proof sheets, and manuscript copy accompanying the same. All other mailable matter is included in the fourth class, or parcels post. In this class, except for parcels under 4 ounces and in case of books, seeds, cuttings, etc., under 8 ounces, rates are determined according to a zone system. There are eight zones, but for purposes of rate making the first two are treated as one. The weight limit for parcels in the first and second zones is 50 pounds; for longer distances, 20 pounds. Rates are subject to change by order of the Postmaster-General; the principle on which they are based is a combination of fixed terminal and varying distance charges.

Registered Letters. By an Act of 1855 provision was made for a system of registration by which extra precaution is taken in the transmission of valuable letters and parcels upon payment of a fee of 8 cents in addition to the regular postage. The postal officials take special care of such letters, but the government, until recently, refused to assume responsibility for such letters when lost. By an Act of 1897, however, provision was made for indemnifying persons who lose registered letters and parcels of value, but the limit of indemnity is $25 on third-class matter and $50 on first-class matter, but in no case in excess of the actual value of the article insured.

Money Orders. In 1864 the postal money order system was adopted, by which one is enabled to transmit money through the mails by making a deposit of the amount with the postmaster and receiving an order on the postmaster of the place to which the money is to be sent. No single money order for more than $100 may be issued. The fees charged range from 5 to 30 cents, according to the amount sent. For international money orders the fees range from 10 cents to $1.

Free Delivery. The system of delivering mail by carriers at the houses and offices of persons to whom it is addressed was first introduced on a small scale in 1863. In 1865 free delivery was extended to all places having a population of 50,000 and such other places as in the opinion of the Postmaster-General might seem expedient. In 1873 the system was extended to all places of 20,000 inhabitants and over and in 1887 to cities of 10,000 inhabitants or whose postal receipts amounted to $10,000. Provision was also made in 1885 for special or immediate delivery of letters within certain limits upon the payment of a fee of 10 cents in the form of a special stamp (later, any stamps of 10-cent value). In 1896 an experiment of delivering mail to inhabitants of rural districts was tried. The results were so satisfactory that the system has been largely extended. In 1914 there were 43,652 established free-delivery routes in the United States.

Franking Privilege. The privilege of sending and receiving mail free of postage was once enjoyed by the President of the United States, Vice President, heads of departments, Senators and Representatives, and other officials of the government during their official terms. For a time the privilege was conferred on all ex-presidents and widows of ex-presidents. By an Act of 1873 this privilege was abolished, but by later acts it was conferred on all officers of the government in the case of official correspondence. In 1895 the privilege was voted to members of Congress for their official correspondence.

Growth of the Postal System. The growth of the postal business in its various branches has been almost phenomenal. The table on page 117 shows by regular periods the increase in the number of offices, receipts, and expenditures from 1792 to the present.

The largest items of expenditure were for transportation of the mails on railroads, compensation of postmasters, free-delivery service, compensation of clerks, and transportation of the mails on the star routes. Of the post offices in operation in 1914, 8646 were presidential and 48,164 fourth class offices. First-class postmasters head offices with gross receipts of $40,-

000 and upward; second-class, offices with receipts of $8000 to $35,000; third-class, offices with receipts of $1900 to $7000. In the first grade salaries range from $3000 to $8000; in the second, $2000 to $2900; in the third, $1000 to $1900. Postmasters of these three grades are

YEAR	Number of offices	Receipts	Expenditures
1792	195	$67,443	$54,530
1802	1,114	327,044	269,866
1812	2,610	649,208	540,165
1822	4,709	1,117,490	1,167,572
1832	9,205	2,258,570	2,266,171
1842	13,733	4,546,849	5,674,752
1852	20,901	6,925,971	7,108,459
1862	28,875	8,299,812	11,125,364
1872	31,863	21,915,426	26,658,192
1882	46,231	41,883,005	40,482,021
1892	67,119	70,930,475	76,980,846
1905	68,131	152,826,585	167,399,169
1914	56,810	287,934,565	283,543,769

appointed by the President and confirmed by the Senate. By an executive order of May 7, 1913, fourth-class postmasters were put under the classified service.

POTASH. See POTASSIUM; SODA.

POTASHES. See PEARLASH.

POTASH SALTS. See POTASSIUM.

POTAS'SIUM (Neo-Lat., from *potassa*, potash, from Eng. *potash*, from *pot* + *ash*). A metallic chemical element first isolated by Sir Humphry Davy in 1807. The carbonates of potassium and of sodium, undistinguished from each other, were called alkali by the alchemist Geber, and they were known as fixed alkali in order to distinguish them from ammonium carbonate, known as the volatile alkali. Duhamel, in 1736, discovered that the alkali contained in common salt is different from that contained in the ashes of land plants, and thenceforth the first named was called mineral alkali and the second vegetable alkali. In 1758 Marggraf showed that the salts of the common alkali gave a violet tinge to the flame of a spirit lamp, while those derived from common salt showed a yellow color. Klaproth next pointed out that the vegetable alkali was contained also in several minerals, such as leucite, subsequent to which the special name of potash was applied to this alkali, and that of natron or soda to the mineral alkali. Both of these alkalies remained undecomposed up to the time of Davy's experiments, although their compound nature had been suspected by Lavoisier. (See CHEMISTRY.) Davy decomposed potassium hydroxide by passing the electric current from a voltaic pile of 200 plates through a piece of the hydroxide placed in a platinum dish.

Potassium is not found native, but is widely distributed, in combination, especially as the chloride and sulphate, in sea water and other natural waters; also as a constituent of many silicates, as the feldspars and micas, forming from 1.7 to 3.1 per cent of the granite composing the earth's solid crust. As sylvite (potassium chloride) and as carnallite (potassium and magnesium chloride) it occurs in the beds overlying the salt deposits of Stassfurt, Germany; and as nitre or the nitrate it is found as an efflorescence on the soil, usually with the sodium salt, in Chile, Peru, etc.; also as alunite (hydrous sulphate of potassium and aluminium), occurring in the older rocks, where its formation is attributed to the action of sulphurous gases. It is found as bitartrate in wines and as sulphate, carbonate, and chloride in molasses from beets. As chloride and carbonate, or as an organic salt, it occurs in soils and in vegetable and animal substances; wood ashes and the ash of marine plants contain much potassium carbonate. The suint from the wool of sheep contains a large proportion, sometimes as much as one-third, of an organic potassium salt which is separated as carbonate, together with the wool fat.

The most remarkable potash deposits are those found at Stassfurt, Prussia, where layers of potash and magnesia salts are found overlying the rock salt. The potash industry based on these assumed large proportions, but in addition other deposits have been discovered in Hanover, South Harz Mountain, and west Alsace. Small, partly developed deposits exist near Kaluz in Galicia, and about 1912 others were discovered near Sauria, Spain, and may in time become important producers.

The United States not only has been dependent on Germany, but has taken a large portion of its product, and its dependence on that country became keenly recognized during the German-American potash war of 1909–10.

The search for potash in the United States has drawn attention to the following possible sources: 1. Artificial brines from salt wells. Natural brines and rock-salt deposits contain from perhaps 2 to 11 parts per million of potassium, but this is not sufficient to be of commercial importance. 2. Saline lake beds, representing the site of former lakes the waters of which have disappeared by evaporation. These are common in the great basin region of the West; and since many of these lakes were saline, the presumption is that as the water evaporated the dissolved salts would be left behind, either as a surface crust or absorbed by the sediments of the lake bottom. Search over many of these areas and test borings had not in 1915 brought to light any important deposits of potash, with one exception, viz., Searles Lake, of California. In this dry lake basin there is a central area varying from 60 to 100 feet in thickness, consisting of a crystallized mass of sodium and potassium compounds immersed in strong brine. It is estimated that the 20,000 gallons of brine to be pumped daily from this deposit will yield 225 tons borax, 508 tons sodium carbonate, 1507 tons salt, 593 tons sodium sulphate, and 489 tons potassium chloride. 3. Alunite, $KAl_3(OH)_6(SO_4)_2$, may serve as a source of potash, if occurring in sufficient quantities, but the deposits thus far found in Colorado, Nevada, and Arizona

are of insufficient size. 4. Igneous rocks frequently contain a considerable quantity of the potash feldspar, orthoclase, and in some cases the silicate of potash, leucite, but the value of these rocks as a source of potash depends on a commercially practicable process of extraction. 5. Feldspar veins. These are common in some regions, but the total quantity available from such a source would not be large.

The original electrolytic method used by Davy for the preparation of metallic potassium has already been referred to. It was soon superseded by methods that had for their purpose the reduction of the carbonate by means of carbon; thus an intimate mixture of potassium carbonate with charcoal, obtained by igniting crude acid potassium tartrate in an iron crucible, yielded a porous mass which was heated to a white heat in an iron bottle connected with a receiver, into which the potassium distilled over and was condensed. The process now generally used is virtually the one invented by Castner, and consists in reducing a potassium salt, such as the hydrate, by a mixture of carbon and a metallic carbide, or a mixture of very finely divided metal and carbon, which is heated in an iron crucible with an exit tube passing through the lid. The potassium distills over into the receiver and at the end of the operation is placed under petroleum so as to prevent oxidation.

Potassium (symbol, K; atomic weight, 39.1) has, when freshly cut, a bright silvery metallic lustre and a specific gravity of 0.875 at 13° C. (55.4° F.), being lighter than any other metal except lithium. It is brittle at 0° C. (32° F.) and possesses a crystalline fracture; at 15° C. (59° F.) it becomes soft like wax, and it melts at 62.5° C. (144.5° F.), forming a liquid that closely resembles mercury in appearance. With the exception of cæsium and rubidium, it is the most electropositive element known, and it acts as a powerful reducing agent. On exposure to the air it rapidly becomes converted into the hydrate and finally into the carbonate. It decomposes water with sufficient energy to ignite the liberated hydrogen. When brought into contact with the halogens and with sulphur, selenium, tellurium, and phosphorus, it unites with them. It also alloys with most metals, usually by being heated with them, and with sodium it forms an alloy which, unlike either sodium or potassium, is liquid at ordinary temperatures. For commercial purposes its use, especially as a reducing agent, has been almost entirely superseded by that of sodium, owing to the cheapness of the latter.

With oxygen potassium combines to form two oxides, a monoxide (K_2O) and a peroxide (K_2O_2). The former is formed when potassium hydrate is heated with metallic potassium; it is a gray, brittle mass that has strong basic properties. When dissolved in water this oxide forms potassium hydroxide (KOH), or caustic potash, which, however, is usually prepared commercially by decomposing a dilute solution of potassium carbonate with slaked lime. *Potassium hydroxide* is a hard, white, brittle, powerfully caustic substance, quickly destroying many animal and vegetable substances; it finds extensive use in the manufacture of soap. *Potassium peroxide* is formed when metallic potassium is burned in the air. *Potassium arsenate*, called also Macquer's salt, is used in calico printing for the purpose of fixing the mordant on the fibre of the material. *Potassium bromide* may be made by decomposing iron bromide with potassium carbonate, and allowing the resulting liquid to crystallize. Potassium bromide crystallizes in the form of white cubes that have a strong saline taste and find extensive application in photography and medicine. *Potassium carbonate*, which was known to the ancients and is described by Aristotle as being prepared by the burning of rushes, was long obtained by burning plants in dry pits and dissolving the ashes in water, then evaporating till the sulphates, chlorides, etc., separated out by crystallization, and then boiling the mother liquor to dryness in iron pots, which was probably the origin of the name "potashes." The process subsequently introduced was similar to that used by Le Blanc for the manufacture of soda ash, and consisted in fusing potassium sulphate with calcium carbonate and coal. This salt, which is a white solid with an alkaline and caustic taste, is used largely in the manufacture of soft soap, glass, potassium chromate, and potassium ferrocyanide. *Potassium chloride*, known commercially as *muriate of potash*, is largely obtained from the Stassfurt deposits, where it occurs native as sylvite and in combination with magnesium chloride as carnallite. The last named is the principal source. The crude mineral, which contains 60 to 70 per cent of true carnallite ($KCl \cdot MgCl_2 \cdot 6H_2O$), is decomposed in a solution of magnesium chloride and common salt. Potassium chloride is a white crystalline compound with a strong saline taste. It is used chiefly in the preparation of other potassium salts, such as the carbonate and the chlorate, and in an impure state it is employed as a fertilizer. *Potassium bichromate* is prepared by heating together finely ground chromic iron ore with potassium carbonate and lime. The resulting mass is extracted with hot water and the calcium chromate precipitated out by means of potassium sulphate, leaving in solution potassium chromate, which is then converted into the bichromate by treatment with sulphuric acid. The resulting solution is evaporated to crystallization, yielding splendid garnet-red crystals. Potassium bichromate finds extensive use in the preparation of chromium (q.v.) compounds, in the manufacture of various colors, as an oxidizing agent, and in certain photo-engraving processes, owing to the fact that when mixed with gelatin it becomes insoluble when exposed to the light. This particular property has also led to its employment in the manufacture of insoluble glue. *Potassium cyanide* may be prepared by melting potassium ferrocyanide with potassium carbonate in an iron crucible. It is a white crystalline compound, exceedingly poisonous. It finds some use in photography and as a reducing agent in chemical operations, especially in metallurgy. (See HYDROCYANIC ACID.) *Potassium iodide* may be prepared by decomposing ferrous iodide with potassium carbonate, evaporating, dissolving the resulting mass, and crystallizing. This salt crystallizes in white cubes that have a sharp taste, and is used chiefly in photography and in medicine. *Potassium nitrate*, which is found native as nitre, or saltpetre, is described under SALTPETRE. *Potassium silicate* is prepared by heating potassium carbonate with white sand in a reverberatory furnace, usually with a small amount of charcoal, by means of which a compound is obtained that is put on the market as a thick solution, and is used as a substitute for

sodium silicate in the manufacture of soaps and in fresco painting. (See WATER GLASS.) *Potassium sulphate* is found in large quantities at Stassfurt, principally as kainite, which is a potassium and magnesium sulphate with magnesium chloride. It is a crystalline salt with a bitter saline taste and finds use in medicine as a purgative, while large quantities are used for the manufacture of potash alum and potassium carbonate. It was formerly called sal polychrest. The acid sulphate, or bisulphate, the sal enixum of the older chemists, may be formed by heating potassium sulphate with sulphuric acid or by heating potassium nitrate with sulphuric acid. It is a white crystalline compound, occasionally used as a flux. Other potassium salts may be found described under the names of the acids contained in them.

Physiologically the potassium salts are protoplasmic poisons when applied locally in concentrated solutions. Caustic potash, e.g. (potassium hydroxide, KHO), is used to destroy warts and similar new growths. In large doses by the mouth the potassium salts are gastro-intestinal irritants, and as compared with the salts of sodium are depressing to the circulation. Other potassium compounds used in medicine are the dichromate, an antiseptic and escharotic; Fowler's solution, a preparation of arsenic (q.v.) and a favorite medium for prescribing that drug; the acetate ($KC_2H_3O_2$), carbonate (K_2CO_3), bicarbonate ($KHCO_3$), bitartrate ($KHC_4H_4O_6$), and sulphate (K_2SO_4), diuretic and laxative; potassium citrate ($K_3C_6H_5O_7H_2O$), a diuretic and febrifuge. Potassium bromide (KBr), potassium hypophosphite, and potassium iodide (KI), are among the most useful drugs we possess; the popular Seidlitz powder (q.v.) contains potassium bitartrate, sodium bicarbonate, and tartaric acid: Rochelle salt is potassium and sodium tartrate, much used as a saline purgative; potassium ferrocyanide is used chiefly in industrial processes; potassium permanganate is a powerful disinfectant; potassium nitrate (KNO_3) is saltpetre, or nitre; potassium chlorate is a useful mouth disinfectant and almost a specific in stomatitis (q.v.); potassium cyanide (KCN; see HYDROCYANIC ACID) is one of the most active poisons known. The value of the potassium salts imported into the United States in 1913 was $10,793,913.

POTASSIUM CYANIDE. See HYDROCYANIC ACID; POTASSIUM.

POTATO (from Sp. *patata*, white potato, *batata*, sweet potato, from Haitian *batata*, sweet potato). An important cultivated plant, raised in temperate climates for its esculent tubers. It is often called Irish potato because of its general cultivation and use in Ireland. It belongs to the family Solanaceæ, or nightshade family, which also includes tobacco, belladonna, tomato, egg plant, and pepper. The potato (*Solanum tuberosum*) is a native of the mountainous districts of tropical and subtropical America, from Chile to Mexico, a form of it occurring even as far north as southern Colorado. It is difficult, however, to determine where it is really indigenous and where it has been introduced by man. Like maize, it was cultivated and its tubers were used for food before the discovery of America. It seems to have been first brought to Europe from Peru by the Spaniards early in the sixteenth century and to have spread from Spain into Holland, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity. In nearly all European countries it was called batata, by which name sweet potato is designated by English writers down to the middle of the seventeenth century. The data concerning its introduction into Europe are not very definite. It appears to have been brought to Ireland from Virginia by Hawkins, a slave trader, in 1565 and to England by Sir Francis Drake in 1585. Sir Walter Raleigh is said to have taken some tubers to England in 1586 and brought them to the attention of Queen Elizabeth. It was not until a long time after its introduction that the culture of the potato became general. Gerard in his *Herball*, published in 1597, described it under the name of *Batata virginiana*, but so little were its merits appreciated that it was not even mentioned in *The Complete Gardener*, a work published in 1719. At first it was regarded chiefly as a food for swine and cattle, but later it was thought that on account of its great yield it might be useful as food for poor people and for the prevention of famine due to failures of the grain crops. In accordance with this idea, the Royal Society of London in 1663 adopted measures for the extension of its culture. Its cultivation first became most general in Ireland, but it was not until about the middle of the eighteenth century that it acquired any real importance on the continent of Europe, and not until the end of that century did it become important as a field crop in Germany and France, which are today two of the greatest potato-producing countries of the world. In France the extension of potato culture was owing mainly to the efforts of Parmentier, a prominent agriculturist and economist. Historical data concerning the development of the potato as a crop in North America are even more meagre. In 1771 only a white and a red variety were mentioned in the most important English work on gardening, while to-day at some of the experiment stations in Europe and America tests are made of 150 to 200 varieties at one time. Apart from the abnormal development of the tubers and the very much reduced production of seed, it is believed that there have not been great changes in the potato plant since its cultivation became general.

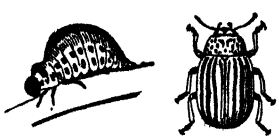
Cultivation. The potato is a perennial plant,

with smooth herbaceous stems from 1 to 3 feet high, pinnate leaves, and white or purple flowers about 1 inch wide, and producing a globular, purplish fruit or seed ball in the wild state but rarely in cultivated varieties. The tubers are distinct from the roots, being underground stems of considerable size even when the plant is in its native state; under the influence of cultivation they have become enlarged through the accumulation of starch for the use of the plants grown from the eyes, or buds. Owing to its wide distribution, from the cooler tropics to the cooler temperate zones, it is grown on a great variety of soils, but the soil best suited to the crop is a rich, sandy loam, well supplied with organic matter and well drained. It responds to liberal manuring, but, since a direct application often injures the quality of the tubers, barnyard manure is preferably applied the previous year; otherwise complete commercial fertilizers, containing nitrogen, phosphoric acid, and potash, are applied.

The land should be plowed as deeply as possible without turning up the subsoil. The tubers are usually planted in drills wide enough apart to admit of cultivation with the horse hoe or the cultivator and from 12 to 16 inches apart in the row. The pieces of the tuber used for planting, called sets, cuttings, or seed pieces, are covered about 4 inches deep. Planting is usually done by hand, but where the crop is grown on a large scale potato planters are used. The crop is planted in spring when danger of injury by frost has passed. After planting, the soil is harrowed frequently until the plants are all up, when the cultivator is used until the vines shade the ground. The results of experiments at different experiment stations in the United States indicate that the use of half the tuber as a seed piece is preferable to using smaller cuttings or the whole tuber. The total production of potatoes in the United States is about 350,000,000 bushels annually, and the average acre yields about 95 bushels.

Potato Diseases. Until comparatively recently the potato blight or rot was believed to be all caused by a single fungus. Two distinct forms are now held accountable—the leaf or early blight, and the late blight or rot. The early blight (*Alternaria solani*) appears upon the leaves as grayish-brown spots, which, about the time the tubers are beginning to form, enlarge and in 10 days or two weeks involve half the leaf. In about a month all the foliage may have succumbed. The late blight or rot (*Phytophthora infestans*) appears in August or September, attacking leaves, stems, and tubers. The leaves are first to appear to be injured. They show brown or black areas, which soon become soft and foul-smelling. Moisture and a fairly warm but not hot temperature is most favorable to its rapid development, and a few dry hot days will check its spread. The tubers also become blotched or discolored on the surface and streaked within with brown or black. Since they are then likely to rot, the crop is virtually worthless. Both these diseases can be prevented by spraying with Bordeaux mixture, beginning when the plants are 4 to 6 inches high and continuing through the season at intervals of 10 days to 2 weeks. Brown rot, believed to be caused by *Bacillus solanacearum*, is sometimes troublesome in the Southern States. The foliage usually wilts, shrivels, and turns brown or black. Since leaf-eating insects are held accountable for the spread of this trouble, they are combated with insecticides. Rotation of crops is recommended as a means of prevention, and care in the selection of seed tubers that they do not come from infested regions. Scab (*Oospora scabies*, now called *Actinomyes chromogenus*) appears as rough, dark patches of varying depth upon the tubers, rendering them unsightly and destroying the outer portions. Scabby potatoes and infested soil should be avoided. Many growers soak the seed in a solution of 2½ ounces of corrosive sublimate in 15 gallons of water, or 8 fluid ounces of formalin, or formaldehyde, in 15 gallons of water, after which the tubers are spread to dry. These are considered preventive measures. Several potato diseases have become prominent within a few years, and on account of the presence of some of them in parts of Europe a quarantine was established by the United States against the importation of potatoes from those countries. The most serious of the diseases are the black wart, attributed to *Synchytrium* (*Chrysophlyctis*) *endobioticum*, which transforms the tubers into a black worthless mass, and the powdery scab caused by *Spongospora subterranea*, which forms deeper scabs than those described above, nearly or quite eating the tuber away. This disease has recently appeared in a number of places in the United States, but it has not proved so destructive as in Europe. Other little-known diseases are black leg, leaf curl, rosette, and wilt.

Food and Feeding Value. When a section of the potato is carefully examined, it will be seen to consist of three more or less well-defined portions, viz., the skin, cortical or fibrovascular layer, and the flesh, which is made up of the outer and inner medullary layers. The cortical layer, immediately beneath the true skin and sometimes designated the inner skin, is slightly colored, containing practically all the coloring matter normally present in the potato. As shown by recent analyses, the skin of the potato constitutes on an average 2.5 per cent of the whole, and the cortical layer 8.5 per cent. It is difficult to peel potatoes so that the skin only is removed. The amount of refuse and edible portion lost by peeling is estimated at 20 per cent. Doubtless in many cases the rejected portion is very much larger.



The edible portion is made up of 78.3 per cent water, 2.2 per cent protein (total nitrogenous matter), 0.1 per cent fat, 18.4 per cent carbohydrates (principally starch), and 1 per cent ash or mineral matter. Of the carbohydrates, 0.4 per cent is made up of crude fibre and materials which in some of their modifications constitute the cell walls of plants and give them a rigid structure. The fuel value is 385 calories per pound. The above figures, like others for composition of food materials, represent general averages, from which there are wide variations in individual specimens. Though the skin, cortical layer, and flesh differ somewhat in composition, they all resemble more or less closely that of the whole tuber. When potatoes are stored they shrink about 12 per cent in 7 months.

Although the potato contains some protein, it is chiefly valuable as a carbohydrate food, and, like all such food, is useful for supplying the body with energy. Just why cooking changes the flavor as it does has apparently never been

determined with certainty. The physical condition of the potato is much affected by heat. In the raw potato the separate starch grains are inclosed in cells with walls composed of crude fibre, a material resistant to digestive juices. Heat expands the water present, ruptures the cells, and breaks up the starch, expanding the granules, which when raw consist of tightly packed concentric layers. Over 90 per cent of the total nutritive material of potatoes is digestible. According to statistics obtained in the large number of dietary studies made in the United States, potatoes constitute about 13.7 per cent of the total food consumed by the average family and furnish not far from 3.9 per cent of the total protein and 10 per cent of the total carbohydrates. The universality and extent of its consumption seem sufficient to prove it a wholesome and nutritious food. Scientific investigation shows that the practice, which has become so general, of serving potatoes with meat and other similar foods which contain liberal amounts of protein is based upon correct principles, one food supplying the deficiencies of the other.

Evaporated potatoes are on the market, being especially recommended for provisioning camps and expeditions. As compared with fresh, the evaporated potatoes have a high nutritive value in proportion to their weight. Large quantities of potatoes are used for the manufacture of starch. Potatoes either raw or cooked are sometimes fed to pigs, milch cows, and other farm animals. When fed to pigs it has been found that 4½ bushels of cooked potatoes (fed with corn meal) is equivalent to one bushel of corn. The world's production of potatoes is about 6 billion bushels annually, having increased nearly 50 per cent since 1900. Germany is the largest producer, her product in 1913 amounting to nearly 2 billion bushels. Russia produced, in 1913, 1½ billion bushels. Consult A. W. Gilbert, *The Potato* (New York, 1915); E. H. Grubb and W. S. Guilford, *The Potato* (ib., 1912); T. Remy, *Der Kartoffelbau* (Berlin, 1909); and publications of the United States Department of Agriculture and of State Agricultural Experiment stations.

POTATO INSECTS. The principal enemy of the common field potato (*Solanum tuberosum*) of the United States is the famous potato bug, or, more exactly, the Colorado potato beetle (*Dorophora decemlineata*). This insect, originally confined to the Rocky Mountain region, where it fed upon the sand bur (*Solanum rostratum*), readily attacked cultivated potatoes as soon as civilization advanced to its native region. In 1859 it had spread eastward and reached a point 100 miles west of Omaha; in 1861 it invaded Iowa; in 1864 and 1865 it crossed the Mississippi, reaching Illinois both from northern Missouri and Iowa; in 1867 it had crossed Illinois into western Indiana, and in 1869 had spread across the State and had made its way into Ohio, appearing almost simultaneously in the northern and southwestern portions; in July, 1870, it invaded the Province of Ontario; in 1872 it reached western New York and spread into Pennsylvania, and in 1873 had reached eastern New York and the District of Columbia; in 1874 the Atlantic Seaboard was gained at several points. Its southern spread was much more slow than in the North, and in 1871 it had not touched the extreme southern counties of Missouri. In fact, it was not until 1897 that it succeeded in establishing itself in portions of Mississippi and Georgia. Although accidentally introduced into Europe on several occasions, the species has not established itself outside of North America. The female beetles, which have overwintered beneath the surface of the ground or under any shelter, lay their eggs on young potato plants as soon as they appear above ground and will even work into the ground to feed on the young leaves before these have fairly shown themselves. The dark-reddish larvæ hatch in less than a week and reach full growth in from two to three weeks, after which they enter the earth to pupate, becoming beetles about a month after the time of hatching. There are three or four generations each year. This insect is readily controlled by the application of Paris green or some other arsenical poison, either as a spray or dusted dry upon the plants. The potato bug is destroyed also by the potato-bug enemy (*Lebia grandis*). See Colored Plate of INSECTS.

COLORADO POTATO BUG AND ITS FEEDING LARVA.

The potato crop is sometimes damaged by the so-called stalk borer (*Gortyna nitela*), an owlet moth which lays its eggs on the stalks not only of potato but also of tomato and of certain ornamental plants. The larva bores into the stalk and causes the plant to wilt. The potato-stalk weevil (*Trichobaris trinotatus*) is very common in the Mississippi valley. The bluish or ash-gray beetle deposits a single egg in a slit which she has made with her beak in the stalk of the potato. The larva bores into the heart of the stalk and proceeds downward towards the root, pupating within the stalk, issuing as an adult about the last of August. In both cases all wilting vines should be pulled and burned.

The tomato worm (*Sphinx 5-maculata*) also feeds occasionally upon potato, but is not an important enemy of this crop. Potatoes suffer, however, sometimes severely, from the attacks of blister beetles, and a leaf beetle called the three-lined potato beetle (*Lema trilineata*) occasionally damages the leaves. The cucumber flea beetle (*Haltica cucumeris*) also preys upon the leaves, as does one of the tortoise beetles.

Consult C. V. Riley, *Potato Pests* (New York, 1876), and J. B. Smith, *Manual of Economic Entomology* (Philadelphia, 1896).

POTATO ROT, SCAB, ETC. See MILDEW; POTATO, *Potato, Diseases;* PHYTOPHTHORA.

POTATO STONE. See GEODES.

POTAWATAMI, pŏt'ȧ-wŏt'ȧ-mĭ (properly *Potewatmik*, fire makers, in allusion to their traditional making of a separate council fire for themselves). A prominent Algonquian tribe, formerly holding the lower end of Lake Michigan, extending southward to the Wabash River and westward into central Illinois. They were closely related to the Ojibwa and Ottawa (qq.v.). When first known the Potawatami were settled about the mouth of Green Bay, Wis., and were early brought under the influence of the Jesuit mission established at that point. They were then moving southward and 30 years later had fixed themselves at Chicago and on the St. Joseph River, on former Miami territory. After the conquest of the Illinois (q.v.) about 1765 they took possession of a great part of Illinois

as well as of lower Michigan. At the Greenville Treaty of 1795 they notified the Miami that they intended to move down the Wabash, which they soon afterward did, despite the protests of the Miami, who claimed the whole region. By the year 1800 they were in possession of the whole territory around Lake Michigan from Milwaukee River, Wis., to Grand River, Mich., with much of northern Indiana and Illinois.

They took part with the French in all the Colonial wars and were active also in the rising under Pontiac. They sided with England in the Revolution and, with the other tribes, continued the struggle until the Treaty of Greenville in 1795. In the War of 1812 they again took up arms, under Tecumseh, on the English side and later joined in the final treaty of peace in 1815. Under the systematic plan of removal soon after inaugurated by the government they sold their lands by successive treaties, so that by 1841 virtually the whole tribe had been transported beyond the Mississippi. A large part of those residing in Indiana refused to leave their homes until driven out by military force. Some escaped to Canada and are now settled on Walpole Island, in Lake St. Clair. Those who went west were settled, partly in Iowa and partly in Kansas, but in 1846 both bodies were united on a reservation in southern Kansas. In 1868 a part of these, known as Citizen Potawatami, were again removed to Oklahoma. A considerable part of the tribe is still in Wisconsin, and another small band known as Potawatami of Huron is in lower Michigan, in addition to the small band on Walpole Island, Ontario. The most reliable early estimates give them from 2500 to 3000 souls at their greatest strength. In 1915 they numbered about 2500 in all, viz., Citizen Potawatami, Oklahoma, 866; Prairie Band, Kansas, 819; Potawatami of Huron, Michigan, 461; Wisconsin, 245; scattered in Oklahoma, Indiana, etc., perhaps 49; Walpole Island and Aux Sables, Ontario, mixed Potawatami and Ojibwa, 150. Consult H. R. Schoolcraft, *Indian Tribes of the United States* (Philadelphia, 1851).

POT BOUILLE, pō bōō'y'. One of Zola's Rougon-Macquart series of novels (1883).

POTCHEFSTROOM, pŏch'ĕf-strōm. A gold-mining town in the southern part of the Transvaal Province, South Africa, 105 miles southwest of Pretoria (Map: Cape of Good Hope, H 6). Pop., 1911, 10,765, of whom 7053 were whites.

POTEKHIN, pŏt-yĕK'ĭn, ALEXEI ANTIPOVITCH (1829–1908). A Russian dramatist and novelist. He was born at Kineshma (Government of Kostroma), studied at Yaroslav, saw some military service, and settled in St. Petersburg. His literary work began in 1852 with a comedy of provincial life. Then followed a series of novels and short stories dealing with peasants. As a novelist he is a Realist of much the same school as Pisemski and Grigorovitch (qq.v.), especially successful in his portrayal of dismal village life. His earlier dramas were slow in getting to the stage, having come under the ban of the censors for their attacks on existing conditions. They include: *Human Justice not Divine* (1853); *Ill-Gotten Gains Bring No Good* (1854); *Tinsel* (1858); *The Severed Limb* (1865); *A Vacant Place* (1870). His novels and tales of peasant life include: *The Poor Nobles* (1859), his best novel; *The Sick Woman* (1876); *Under the Spell of Money* (1876); *Before the Community* (1877); *Young Inclinations* (1879); *Village Vampires* (1880). A complete edition of his works, in 12 volumes, was published at St. Petersburg in 1903.

PÓTEM'KIN, *Russ. pron.* pŏt-yąm'kĭn, GREGOR ALEXANDROVITCH, PRINCE OF TAURIDA (1739–91). A Russian politician, born in the Government of Smolensk. In 1755 he became an ensign in the Imperial Horse Guards and took part in the conspiracy to dethrone Peter III in favor of Catharine II. This won him the favor of the Empress, and he was rewarded with 400 serfs and made an officer of the Imperial household, succeeding in time Orloff as the recognized favorite of the Empress. When, in his turn, he was superseded as a lover, he retained his ascendancy in affairs of state, being made general in chief of the army, field marshal, and governor of important provinces. As the principal representative of the Russian foreign policy, his influence was courted by the foreign rulers, and, in spite of a lack of the real gifts of statesmanship, he displayed a certain amount of skill in the conduct of affairs. He zealously furthered the process of southern expansion at the expense of the Turks, was instrumental in annexing the Crimea to Russia (1783), and for this service received the title of Prince of Taurida together with the governorship of the newly acquired territory. He devoted himself to the economic development of the southern provinces of Russia, founded the towns of Kherson, Kertch, Nikolaev, and Sebastopol, and strengthened Russia's power in the Black Sea. It is told, as an illustration of the methods by which he preserved the Imperial favor, that in 1787, when Catharine visited his government, he caused a large number of villages to be constructed along her route, with hirelings to play the part of contented peasants and well-fed citizens, all of which pleased her Majesty and brought Potemkin increased honors. He died near Nikolaev in Bessarabia during the course of Catharine's second war against the Turks, Oct. 16, 1791.

Consult: De Cerenville, *Vie du Prince Potemkin* (Paris, 1808); Saint-Jean (Potemkin's secretary), *Lebensbeschreibung des Gregor Alexandrovitsch Potemkin des Tauriers*, edited by Rothermel (Karlsruhe, 1888); and lives in Russian by Levshin (2 vols., St. Petersburg, 1808) and Alexander Brückner (Berlin, 1892); also *Cambridge Modern History*, vols. vi, viii (New York, 1904–09).

POTENT. The name of a fur used in heraldry (q.v.).

POTEN'TIAL (OF. *potential, potentiel*, Fr. *potentiel*, from Lat. *potentia*, power, from *posse*, to be able). A mathematical term used to express that property of a field of force (see FORCE) which determines in which direction motion will take place if there are no restraints. In an electrical field of force the potential at a point is defined as the work required to carry a particle with a unit positive charge up to that point from an infinite distance away. If left to itself a positive charge will, therefore, always move from points of high to those of low potentials. In a magnetic field of force, the potential at a point is defined as the work required to bring up from an infinite distance to that point a unit north pole. If free to move, a north pole of a magnet will move from points of high to those of low potential.

In a gravitational field of force the potential

at a point is defined as the work required to carry a unit mass of matter from that point to an infinite distance. Portions of matter, if free to move, do so from points of low to those of high potential.

In the application of thermodynamics to chemical phenomena a potential is such a function of the variable qualities that for all allowable changes it has the lowest possible value—it is a minimum.

POTENTIAL ENERGY. See MECHANICS.

PO'TENTIL'LA (Neo-Lat., from Lat. *potens*, powerful; so called on account of properties ascribed to it in mediæval medicine), CINQUEFOIL. A genus of numerous species of mostly perennial herbs of the family Rosaceæ, widely distributed in the Northern Hemisphere. The genus differs from *Fragaria* (strawberry), which it otherwise resembles, in having dry instead of succulent receptacles of the fruit. The flowers are yellow, white, red, or purple, the leaves pinnate, digitate, or ternate. One species (*Potentilla fruticosa*), often planted in shrubberies, is abundant in North America from Pennsylvania to Iowa and northward, and forms a profusion of yellow flowers. *Potentilla anserina*, silverweed, a European species also common in America, has creeping stems, yellow flowers, beautiful silky and silvery leaves, and edible, parsnip-flavored roots, which are much relished by swine and were formerly used as human food.

SHRUBBY CINQUEFOIL (*Potentilla fruticosa*).

POTENTITE. See EXPLOSIVES.

POTENZA, pō-tĕn'tsȧ. The capital of the Province of Potenza, Italy, situated on a hill near the Basento, 55 miles east of Salerno (Map: Italy, E 4). It is surrounded by a wall; it has a Doric cathedral, a Gymnasium, lyceum, a seminary, and an industrial school. The industries are the cultivation of the vine and the manufacture of bricks. Potenza has been largely rebuilt since the earthquake in 1857. Remains of several ancient cities, including Potentia, are in the vicinity. Pop. (commune), 1901, 16,186; 1911, 16,672.

POTGIETER, pŏt'gē-tĕr, EVERHARDUS JOHANNES (1808–75). A Dutch critic and poet, born at Zwolle. He was engaged in business in Antwerp for a time, then settled in Amsterdam, where he became one of the circle of younger authors, and in 1837 founded *De Gids*, in which he made himself a name by clever criticism and excellent fiction and verse. These papers were collected partly by himself (1864–69 and in many editions) and partly by Zimmermann (1875 et seq.). Potgieter's further works are: *Het Noorden in omtrekken en tafereelen* (1836–40); *Liedekens van Bontekoe* (1840); a poem, *Florence* (1868), his masterpiece, though obscure in places; and a biography of Bakhuizen van den Brink (1870; 2d ed., 1890). A new edition of his works in 18 volumes was issued in 1901 (Haarlem). Consult: Groenewegen, *E. J. Potgieter* (Haarlem, 1893); Beets, *Persoonlijke-herinneringen* (ib., 1892); Verweg, *Het leven van Potgieter* (ib., 1903).

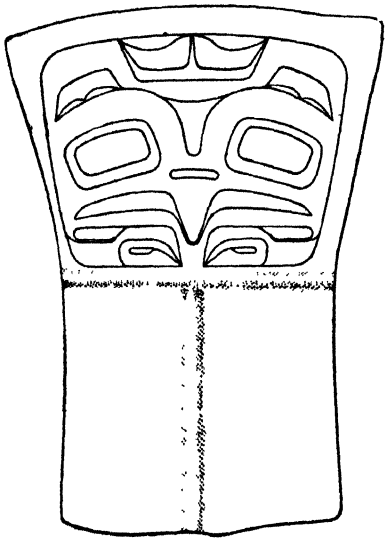
POTHIER, pō'tyȧ', ROBERT JOSEPH (1699–1772). A French law writer. He was born at Orléans, was educated in a denominational school, studied law at the University of Orléans, and after his admission to practice was made a judge of a local court. In 1749 he was made a professor of law in the University of Orléans. Perhaps his most important work was *Pandectæ Justinianeæ in Novum Ordinem Digestæ* (1818–20). In English translation appeared *Maritime Contracts* (1821); *Treatise on Obligations* (3d ed., 1853); *Contract of Sale* (1839). Much of the Civil Code of France was compiled from his works.

POT-HOLES, or GIANT'S KETTLES. The erosional effect of falling water is often manifested in the production of circular depressions in the rock surface at the foot of falls and rapids wherever the current gives a gyratory motion to the sediment and stones which it sweeps along. These depressions vary in size from cuplike holes to great caldrons 40 or 50 feet in diameter and as many in depth. They are frequently filled with the well-rounded pebbles which acted as the abrasive agents in their excavation. In some stream valleys they occur not only along the present river channels but also high up on the sides, marking the various stages in the lowering of the valleys.

POTI, pō'tyē. A seaport on the west coast of the Caucasus, Russia, situated in a marshy and unhealthful region at the mouth of the Rion and 60 miles west of Kutais (Map: Russia, F 6). Although it has only a small harbor, Poti is one of the chief seaports of the Caucasus and the terminus of one of the principal railway lines. Its chief exports are corn, manganese, palm wood, and grain. The imports are insignificant. Pop., 1911, 17,543.

PO'TIDÆ'A (Lat., from Gk. Ποτίδαια, *Potidaia*). An important town of Macedonian Chalcidice (Map: Greece, Ancient, C 1). Originally a colony of Corinth, it became tributary to Athens. Its revolt from the latter city in 432 B.C. was one of the causes of outbreak of the Peloponnesian War. In 429 B.C. the town was forced to surrender to the Athenians. A century later it was rebuilt by Cassander and renamed Cassandria.

POTIER, pō'tyȧ', ALFRED (1840–1905). A French physicist and engineer, born at Paris. He studied at the Polytechnique and the Ecole des Mines, was appointed engineer in 1863, engineer in chief in 1881, in the latter year became professor of physics in the Polytechnique, in 1891 was elected a member of the Academy of Sciences, and in 1893 professor at the Ecole des Mines. His researches include interesting studies in geology and investigations, with Joubert, Allard, and others, to determine a means of measuring the energy dispensed by magneto and dynamo-electric machines and instruments. His published writings consist of papers contributed to the *Comptes Rendus* of the Academy of Sciences, the *Journal de Physique*, the *Annales de Physique et de Chimie*, and other periodicals.



POTIPHAR PAPERS, THE. A series of satires by George William Curtis, contributed to *Putnam's Magazine* (1853).

POTITII, pō-tish'ĭ-ī. See PINARIA GENS.

POTLATCH. A ceremonial distribution of gifts on a large scale. The word belongs to the Chinook jargon, into which it was adopted from the Nootka word *patshatl*, giving, or a gift. The potlatch occurs among the Indian tribes of the Pacific coast from Oregon to Alaska. The custom has been known to ethnologists for a long time, but was thoroughly misunderstood, having been represented as a sort of idealistic attempt on the part of the rich men of the tribe to distribute their surplus wealth among the less fortunate tribesmen. The real principle at the root of the potlatch is an investment of capital at an exceedingly high rate of interest. The unit of value at such transactions was a woven blanket, worth about 50 cents, which in recent times has been replaced by a woolen blanket secured from white traders.

Although potlatching brings with it considerable accumulation of wealth in the hands of single individuals, it is not wealth, economically considered, which counts with these people, but the social prestige achieved by giving sumptuous feasts at which large quantities of valuable materials are consumed, distributed, and even destroyed. A gift offered on such an occasion may not be refused, but must be returned within an appointed time, often with 100 per cent interest. Feasts are given to lower the social standing of a rival ("rivals fight with property alone," says the Kwakiutl), or to enhance one's social prestige, or a feast may be given for the benefit of another man who, if that is the case, must stand next to the giver of the feast.

As the values which thus change hands are often considerable, certain objects known as coppers (see figure) are used, which, while of small intrinsic value, often represent a large

A POTLATCH COPPER.

number of blankets, and may thus be compared to our bank notes of high denomination. The larger the number of blankets given away with a copper, the greater becomes the value of the copper. Thus, a copper may be worth as many as 7500 blankets, and will be called "all other coppers are ashamed to look at it"; another, worth 5000 blankets, will be called "making the house empty of blankets."

The rivalry between chiefs expresses itself in the destruction of property on a tremendous scale. A chief will burn blankets, or destroy a canoe, or break a copper, and will thus show his superiority over the rival. Unless the latter can do the same or better, his name will be "broken."

Sometimes a chief will break a copper and give the broken parts to his rival. The latter, if he wants to keep his prestige, must break a copper of equal value and give the pieces to the first chief together with the fragments of the original copper. The first chief may then pay for all the fragments received. But the second chief, on receipt of the original copper, may also break a copper of equal value, but instead of giving them to the first chief, he may throw the fragments of both coppers into the sea. According to the Indians the second chief would thus show himself superior to his rival, who may have counted on receiving the fragments of both coppers in return, thus avoiding actual loss.

Consult Franz Boas, "The Social Organization and the Secret Societies of the Kwakiutl Indians," in *United States National Museum, Report, 1895* (Washington, 1896), and C. M. Barbeau, "Du Potlatch en Colombie Britannique," in *Société de Géographie de Quebec, Bulletin*, vols. v, vi (Quebec, 1911–12).

POTOCKA, pō-tōts'kȧ, ANNA (*née* Tyczkiewicz), COUNTESS (1776–1867). A Polish writer. She was the niece of Marshal Joseph Antony Poniatowski (see PONIATOWSKI), and was married first to Count Alexander Potocki and later to Count Wonsowicz. Her *Mémoires* of the years 1794 to 1820, giving an account of Napoleon's residence at Warsaw in 1806–07, were published at Paris in 1897 (8th ed., 1902). Her later years were spent for the most part in Paris, where she died. An edition of her *Un voyage d'Italie 1826–1827* appeared in 1898.

POTOCKA, SOPHIE DE WITT, COUNTESS (1766–1822). A famous beauty, known chiefly from Anton Graff's pastel portrait of her, made at Berlin, where she lived for some time and where she died. The portrait is familiar in print form. The Countess Potocka was of humble birth—the daughter of a Greek shoemaker at Constantinople—but she became the wife of a Russian general, and after her divorce from him she was married in 1795 to Count Stanislas Felix Potocki. See POTOCKI.

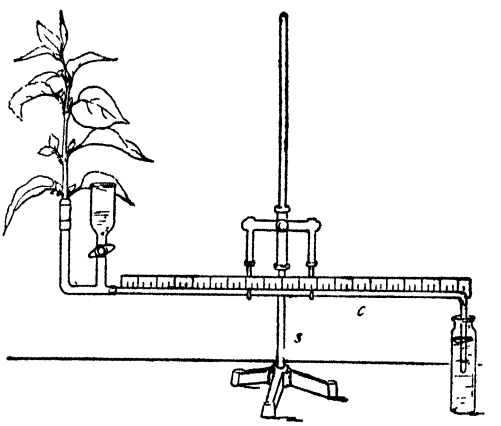
POTOCKI, pō-tōts'kē. The name of a Polish family of high rank, possessing large estates in Galicia and the Ukraine. After the sixteenth century several members of the family held important places in state and church. Among the most noteworthy may be mentioned: 1. COUNT STANISLAS FELIX POTOCKI (1745–1805), chief of the Polish artillery. In 1792 he joined Branicki and Rzewuski in issuing the manifesto of the confederation of Targovitza (q.v.). The next year he attempted, with the aid of Catharine II of Russia, to carry out the objects of the confederation. The insurrection of 1794 forced him to leave Poland, and he fled to Russia. In his absence he was sentenced to death for treason, but the success of Suvarov enabled him to return to Poland. He was appointed Russian field marshal by Catharine in 1795. He married Sophie de Witt (see POTOCKA, SOPHIE).

2. COUNT IGNAZY POTOCKI (1741–1809), grand marshal of Lithuania, a cousin of Stan-

islas Felix. He helped to form the constitution of 1791; fled to Prussia upon the invasion of Poland by the Russians, but returned after the success of Kosciuszko, and became a member of the new government. He was made prisoner by Suvarov and was confined in Schlüsselburg. Released in 1796, he lived in Galicia till the approach of Napoleon's army in 1806, when he was again imprisoned for a short time. In 1807 he again returned to Warsaw and worked in behalf of the newly founded Duchy. In 1809 he was at the head of a deputation which was sent by the Grand Duchy of Warsaw to Napoleon in Vienna. There Count Potocki died. The best known of his literary works is that entitled *Vom Entstehen und Untergange der polnischen Konstitutionen vom 3ten Mai 1791.*

3. COUNT STANISLAS KOSTKA POTOCKI (1752–1821), brother of Ignazy, was prominent in drawing up the constitution of 1791, and after the second partition of Poland was for a short time under arrest. After his release he became a devoted patron of science and literature. In 1807 he became head of the educational system in the Duchy of Warsaw, and, after the Kingdom of Poland was reorganized (1815), became Minister of Public Instruction. He wrote a treatise on *The Art of the Ancients* and *On Eloquence and Style* (1815).

4. COUNT JAN POTOCKI (1761–1816) was eminent as a student of Slavic antiquities and wrote several historical works, among them *Fragments historiques et géographiques sur la Scythie, la Sarmatie et les Slaves* (4 vols., Brunswick, 1795); *Histoire primitive des peuples de Russie* (St. Petersburg, 1802). He also wrote memoirs upon Egyptian antiquities and *Voyage dans l'Empire de Maroc* (Warsaw, 1792). These works of Count Jan Potocki were printed in editions of but 100 copies, and are therefore very rare. They have some value as collections of material.



5. COUNT ALFRED POTOCKI (1817–89) rose to prominence as a member of the Galician Diet and the Austrian House of Peers. From 1867 to 1870 he was Austrian Minister of Agriculture, and from April, 1870, to February, 1871, head of the cabinet.

POTOCKI, WACLAW (c.1622–97). The most prolific of Polish poets. He served in the army, fighting in the war against the Cossacks (1653); in 1683 was appointed commissioner to map the boundary of Silesia; and lived his last years on his hereditary estate of Luzna. Potocki is known in our time for an epic, *Wojna Chocimska*, on the victory over the Turks at Chocim in 1621, a poem which received no recognition from his contemporaries and was lost until 1850. It is an epic of much merit, with many satiric contrasts between the heroic simplicity of old times and the luxury of the new. Potocki's contemporary fame rested on *Poczet herbów* (1696), a heraldry in verse. Some devotional poems (1690); *Jovialitates* (1747), consisting of witty epigrams; *Syloret* (1764), a tale; and a version of Barclay's *Argenis* (1697) also came from his pen.

POTO'MAC RIVER. One of the most important rivers of the eastern United States, forming throughout its course the boundary between Maryland on the north and east and West Virginia and Virginia on the south and west (Map: Maryland, E 3). Its chief headwaters are the North Branch, about 110 miles long, which rises in the northeast part of West Virginia, and the South Branch, which rises in Highland Co., Va., and Pendleton Co., W. Va., and flows northeast about 140 miles to its confluence with the North Branch about 15 miles below Cumberland, Md. Thence the main stream flows in a winding southeast course till it empties into Chesapeake Bay, 75 miles from the Atlantic Ocean. Its total length is about 450 miles, and its chief tributaries, besides the South Branch, are the Shenandoah from the south and the Monocacy from the north. The scenery along its upper course is picturesque, especially where it breaks through the Blue Ridge at Harper's Ferry. There are several falls in its passage through the mountains and through the piedmont plain below, the Great Falls (which include about a mile of rapids and a cataract about 35 feet high) being about 15 miles above Washington. At that city, 125 miles from its mouth, the river becomes a tidal stream, navigable for large ships, and for the last 100 miles it is a magnificent estuary from 2 to 7 miles wide. The Chesapeake and Ohio Canal follows its course from Georgetown to Cumberland. The whole region through which the river flows is full of historic landmarks. Opposite Washington is Arlington (q.v.), and a short distance below are Alexandria and Mount Vernon. The river drains an area of about 14,500 square miles. Consult H. N. Parker and others, *Potomac River Basin* (Washington, 1907), and J. P. Farley, *Three Rivers* (ib., 1910).

POTOMAC FORMATION. A name applied to a series of deposits which are chiefly of Lower Cretaceous age, but may be also partly Jurassic. The formation is found along the Atlantic border of the United States from Marthas Vineyard to Georgia, and also up the Mississippi valley to Tennessee. It consists of a series of sands, gravels, and clays. The latter are worked at many points, notably in New Jersey, and certain members of the series supply iron ore and glass sand. Consult White, "Correlation Papers, Cretaceous," in *United States Geological Survey, Bulletin No. 82* (Washington, 1893). See CRETACEOUS SYSTEM.

POTOM'ETER (from Gk. *ποτόν, poton,* drink + *μέτρον, metron,* measure). An instrument for observing the rate at which plants evaporate

POTOMETER.

water. The simple form used in physiological laboratories consists essentially of a graduated capillary glass tube (*c* in the figure), to which

is connected a transpiring shoot. The tube is filled with water and the lower end dipped into water. As evaporation from the leaf surface proceeds water is drawn up the tube, the narrow bore of which accelerates the rate of flow. This may be made evident by lifting the end of the tube for an instant and allowing air to enter. On replacing the tube water again enters, and as the short bubble travels along the tube its rate may be observed and recorded. By exposing the leaves to varying conditions of light, heat, wind, and moisture in the air, the effect of external conditions upon transpiration may be easily shown. Somewhat complex self-registering instruments have been made. See TRANSPIRATION.

POTOO, pō-tōō′, or GRAND POTOO. A name given by the Creoles in the West Indies to one of the large nightjars (*Nyctibius jamaicensis*), especially common in Jamaica. It represents a small group confined to South America and the Antilles, remarkable for the tooth of the upper mandible.

POTOSÍ, pō′tō-sē′. A department of southwest Bolivia (Map: Bolivia, D 8). Area (est.), 48,799 square miles. The surface is very mountainous, and at the northwestern end is situated an extensive saline marsh known as the Grandes Salinas. The region is drained chiefly by the headstreams of the Pilcomayo. On account of the rigorous climate, which is subject to sudden changes, agriculture is of slight importance, although some barley, maize, and potatoes are grown in the more protected localities. The chief industry is the exploitation of the silver mines, which are supposed to be the richest in Bolivia. Besides silver there are also found gold, tin, and copper. Pop., 1900, 325,615, the bulk of whom were Indians. Estimates since 1912 vary from 320,000 to 365,000. Capital, Potosí (q.v.).

POTOSÍ. The capital of the Department of Potosí, Bolivia. It is situated on the Cerro de Potosí at an altitude of 13,325 feet, being probably the highest town in the world (Map: Bolivia, D 7). It lies several hundred feet above what has been considered the highest inhabitable altitude, and, owing to the rarity of the atmosphere, infant mortality is so great that the population can be kept up only by immigration. A large part of the city lies in ruins, through which passes the now deserted Prado, lined with statues and other evidences of former grandeur. There are several fine and solid buildings, such as the great granite cathedral and the mint, the latter built in 1562 at a cost of over $1,000,000, but no longer used. Potosí has a library, a museum of mineralogy, a theatre, and a school of typography for girls, established in 1912. The city owes its origin to the silver lodes which were discovered in the Cerro in 1546 and which for a long time remained the richest silver mines in the world. The total output up to 1850 is estimated at over $5,000,000 per year. The city itself grew rapidly, and in the seventeenth and eighteenth centuries was the largest city in the New World, its population being then estimated as high as 170,000. The mines are now almost abandoned, only a few of the 2000 shafts being worked. Pop. (est.), 25,000. Consult Contzen, *Potosí* (Hamburg, 1893).

POTOTAN, pō-tō′tän. A town of Panay, Philippines, in the Province of Iloilo, situated on the Jalaur River, 16 miles north of Iloilo (Map: Philippine Islands, D 5). It is well laid out and has a large church. Pop., 1903, 37,373, including the suburbs of Dingle and Mina.

POT-POURRI, pō′pōō′rē′ (Fr., rotten pot). In music, a selection of favorite pieces strung together without much connection, so as to form a sort of medley. Such arrangements usually have very little artistic value.

POTSDAM, pōts′dȧm. The capital of a government district of the same name, a royal residence and the seat of the administration of the Prussian Province of Brandenburg, situated on the right bank of the Havel River opposite the influx of the Nuthe, 16 miles southwest of Berlin, with which it is connected by three railway lines (Map: Germany, E 2). The town is celebrated for its beautiful situation amid the numerous lakes of the Havel, as well as for its picturesque environs embellished by luxurious gardens, royal palaces, fountains, statues, etc. The city proper consists of the old town and four suburbs. Of the suburbs the Teltower, on the south, is connected with the old town by a fine stone bridge crossing the intervening Freundschaftsinsel. Potsdam is laid out in regular, broad and shaded streets, which form a number of fine squares. The Wilhelmsplatz has a statue of Frederick William III, and the Lustgarten, opposite the palace, is adorned with a number of statues and busts, including a statue of Frederick William I. The principal churches are the Garrison Church, built in 1731–35, with a high tower, and containing the remains of Frederick the Great and his father in a vault under the chancel; the church of St. Nicholas (1830–37), built from designs by Schinkel, with a fine dome; and the Friedenskirche (1845–50), in the style of an early Christian basilica, at the entrance to the park of Sans Souci (q.v.).

Of the many secular edifices of note may be mentioned the royal palace, a large quadrangular building with a colonnade, originally erected in 1670 and rebuilt in 1750, and containing the apartments of Frederick the Great; the town hall (1754), with a gilded figure of Atlas on its gable; the military orphan asylum; the theatre; the large barracks, etc. Potsdam has a number of fine gates, of which the Brandenburg Gate, in the west, built in 1770 in the style of a Roman triumphal arch, leads from the city to the park of Sans Souci. The park contains, besides the famous residence of Frederick the Great, the palace of Charlottenhof, with reliefs by Thorvaldsen, and the new palace (1763–69), at the west end of the park, founded by Frederick the Great and used as a summer residence by Emperor William II.

Potsdam is not an industrial city, but has a few manufactures, including sugar, beer, and optical instruments. The Geodetic Institute is located here. Of the noted places in the vicinity may be mentioned the Russian settlement of Alexandrovka, north of the city, founded by Frederick William III in 1826; the Neu-Garten, stretching along the Heilige See, with the Marble Palace on the lake; the Pfingstberg, in the north, with a fine Belvedere; the Klein-Glienicke, on the left bank of the Havel, with the palace of Prince Frederick Leopold, surrounded by a splendid park; the palace of Babelsberg, with its fine art collections and beautiful fountains; the Brauhausberg, commanding a fine view of the surrounding country; and the Telegraphenberg, with an astrophysical

observatory. Pop., 1900, 59,814; 1910, 62,243, chiefly Protestants.

The importance of Potsdam dates from the second half of the seventeenth century, when the Great Elector Frederick William built there a palace and laid out the Lustgarten. It was, however, during the reign of Frederick the Great that Potsdam attained its full development and fame. Consult: *Geschichte der koniglichen Residenzstadt Potsdam*, edited by A. R. (Potsdam, 1883); Sello, *Potsdam und Sans Souci* (Breslau, 1888); Kurt Kuhlow, *Das königliche Schloss Charlottenhof bei Potsdam* (Berlin, 1911).

POTSDAM, pŏts'dăm. A village in St. Lawrence Co., N. Y., 25 miles east of Ogdensburg, on the Raquette River and on the New York Central Railroad (Map: New York, E 1). It is the seat of a State normal school and of the Thomas S. Clarkson Memorial College of Technology, founded in 1895. Potsdam sandstone (q.v.) is quarried extensively in the vicinity. Other industries are agriculture and lumbering. The principal manufactures include paper, flour, lumber products, farm implements, and machinery, the industrial interests of the village being favored by the excellent water power of the Raquette River. Potsdam was settled in 1803 and incorporated as a town in 1806. The village of Potsdam was incorporated in 1831. Pop., 1900, 3843; 1910, 4036.

POTSDAM SANDSTONE. A formation of Upper Cambrian age, so called from the type locality at Potsdam, N. Y. The rock is a red or yellow sandstone, sometimes altered to quartzite, and of great hardness. It is employed extensively as a building stone. The formation is developed on the borders of the Adirondack Mountains and in Virginia, Michigan, and Wisconsin. See CAMBRIAN SYSTEM.

POT'STONE (translation of its Latin name, *lapis ollaris*). An impure variety of talc containing chlorite. It is usually greenish gray to dark green in color, and occurs massive or in granular concretions. Being easily cut when newly mined, it was made into pots and other household utensils by the ancients.

POTT, AUGUST FRIEDRICH (1802–87). A German philologist, the founder of modern scientific etymology. He was born at Nettelrede, Hanover, Nov. 14, 1802, and was educated in the lyceum at Hanover, studied theology, philology, and natural sciences at Göttingen (1821–25), then was assistant at the Gymnasium in Celle until 1827, when he went to Berlin to become a pupil of Bopp. In 1830 he became privatdocent there, and in 1833 was appointed professor of comparative philology at the University of Halle, which position he occupied until his death, July 5, 1887. The work that established his reputation was the *Etymologische Forschungen auf dem Gebiet der indogermanischen Sprachen* (2 vols., 1830–36), published afterward in a revised and much enlarged edition under the title *Wurzelwörterbuch der indogermanischen Sprachen* (6 vols., 1859–76). Pott was author of numerous other works in the same field, of many essays and critical reviews, and of important treatises in Ersch and Gruber's *Allgemeine Encyclopädie*. He also edited Wilhelm von Humboldt's *Ueber die Verschiedenheit des menschlichen Sprachbaues*, with an introductory essay (2 vols., 1876; 2d ed., 1880). Consult Von der Gabelentz, in *Allgemeine deutsche Biographie*, vol. xxvi (Leipzig, 1888), and Horn, in Bezzenberger's *Beiträge zur Kunde der indogermanischen Sprachen*, vol. xiii (Göttingen, 1888).

POTT, PERCIVAL (1713–88). An English surgeon. He was born in London, where he served as assistant surgeon in St. Bartholomew's Hospital (1745–49) and as surgeon (1749–87). He was distinguished for his investigation of angular curvature of the spine, the consequence of disease of the bones of the spinal column, on which account the affection is known as Pott's disease (q.v.). His principal works are: *A Treatise on Ruptures* (1756; 4th ed., 1775); *Observations on the Nature and Consequences of Wounds and Contusions of the Head, etc.* (1760); *Remarks on the Disease Commonly Called Fistula in Ano* (1765; 4th ed., 1775); *Some Few General Remarks on Fractures and Dislocations* (1769; 2d ed., 1773; Fr. ed., Paris, 1788; It. ed., Venice, 1784); *Remarks on That Kind of Palsy of the Lower Limbs Which is Frequently Found to Accompany a Curvature of the Spine* (1779; Dutch and French translations).

POT'TER, ALONZO (1800–65). An American Protestant Episcopal bishop, brother of Horatio Potter and father of C. N., E. N., H. C., and R. B. Potter (qq.v.). He was born at Beekman (now La Grange), Dutchess Co., N. Y., of Quaker parentage, July 6, 1800. In 1818 he graduated at Union College, where afterward he served as tutor, and in 1821 was appointed professor of mathematics and natural philosophy. Meanwhile he studied theology, and was ordained in 1824. The same year he married a daughter of President Eliphalet Nott of Union College. From 1826 to 1831 he was rector of St. Paul's Church, Boston. In 1832 he returned to Union as professor of philosophy and political economy; in 1838 he was made vice president of the college, and was virtually president until 1845, when he was chosen Bishop of Pennsylvania. As bishop he showed great administrative ability; many new churches were built in his diocese, and an Episcopal hospital, academy, and theological school were founded and endowed in Philadelphia. He was a friend of the negro and active in work for young men. For his health Bishop Potter went to California, by sea, and he died at San Francisco, July 14, 1865. He published several textbooks, also a volume of *Discourses, Charges, Addresses, and Pastoral Letters* (1858) and *Religious Philosophy* (1870), and edited *Lectures on the Evidences of Christianity* (1855).

POTTER, CLARKSON NOTT (1825–82). An American lawyer and legislator, son of Bishop Alonzo Potter. He was born at Schenectady, N. Y., graduated at Union College in 1842, then spent a year at the Rensselaer Polytechnic Institute, Troy, and in 1854 became a surveyor in Wisconsin. Later he studied law, and in 1848 settled in New York, where he became one of the most eminent members of the bar. In 1869–75 and 1877–81 he was a Democratic member of Congress. Potter served as president of the American Bar Association in 1881.

POTTER, EDWARD CLARK (1857–). An American sculptor. He was born at New London, Conn., and studied under Mercié and Fremiet in Paris. With D. C. French he modeled the Columbus quadriga and groups of draft horses and cattle for the Chicago Exposition, the horses for equestrian statues of General Grant (Fairmount Park, Philadelphia), Wash-

PAUL POTTER

"THE BULL," FROM THE PAINTING IN THE GALLERY AT THE HAGUE

produced a large number of pictures—177 according to De Groot. He rendered the character of animals with great power and truth; his drawing was usually correct, imparting an almost plastic effect, and his color was delicate. Although he painted with great care and often with overemphasized detail, he did not lose the ensemble. His backgrounds—the flat Dutch landscape, sometimes with a few trees—are true in color and perspective. His best-known picture is the life-size "Bull" (Hague Museum), of which the chief figure is a fine piece of realistic animal characterization; but neither this nor his "Bear Hunt" (Amsterdam, Rijks-Museum) equals his smaller pieces. The Hermitage at St. Petersburg possesses 11, including the famous "Cow," refused by the stadholder's wife, and the "Judgment of the Animals over the Hunter"; others are in the museums of The Hague, Amsterdam, Paris, Berlin, Dresden, and especially in English private collections. Potter was also an etcher of note, simple and direct in his treatment. He left no school, but exercised considerable influence on contemporaries, whose work has been confounded with his —such men as Du Jardin, Albert Klomp, Camphuysen, and Murant. Consult Emile Michel (Paris, 1907); also Hofstede de Groot, *Catalogue of Dutch Painters* (London, 1908), and Grattel Duplessis, *Eauxfortes de Paul Potter* (Paris, 1876).

POTTER, PAUL MEREDITH (1853–). An American dramatist, born at Brighton, England. He served as foreign editor (1876–83), London correspondent (1883–84), and dramatic critic (1885–87) of the New York *Herald*, and in 1888 joined the staff of the Chicago *Tribune*. One of his most successful plays was the dramatization of Du Maurier's novel, *Trilby* (1895; revived with some members of the original cast and with Phyllis Terry in the title rôle, 1915). Others of his plays include: *The Ugly Duckling* (1890); *Our Country Cousins* (1893); *The Pacific Mail* (1894); *The Conquerors* (1898); *Notre Dame* (1903); *Nancy Stair* (1905); *The Honor of the Family* (1907); *Arsène Lupin* (1909); *Parasites* (1910); *The Zebra* (1911); *Faithless Eckhart* (1915).

POTTER, ROBERT BROWN (1829–87). An American soldier, born in Boston, a son of Bishop Alonzo Potter. He studied at Union College and was admitted to the bar, but in 1861 withdrew from practice in order to enter the Federal army. He was commissioned major of the Fifty-first New York Volunteers, led three companies in the assault at Roanoke Island, was wounded at Newbern, fought in the second Bull Run campaign and at South Mountain, and distinguished himself by making a spirited charge at the head of his regiment at Antietam, where he was again wounded. He was made a brigadier general of volunteers in 1863, commanded a division in the Knoxville campaign, served with Grant in the Wilderness, and was a third time wounded in the last assault made on Petersburg after the explosion of the mine. He was commissioned major general of volunteers in 1865 and resigned in 1866. In 1866–69 he was receiver of the Atlantic and Great Western Railway. He afterward lived for some time in England, but returned to Newport, R. I., where he died.

POTTER-BEE. A mason bee of the genus *Osmia* and its allies, which constructs small globular cells of earth and attaches them to the stem of a plant in much the same manner as do the potter wasps (q.v.) of the family Eumenidæ.

POTTER'S CLAY. A term commonly applied to any fine-grained, plastic clay that can be used in the manufacture of pottery. Clays employed for the making of pottery must have sufficient plasticity, and must also burn to the proper body without warping or cracking in the firing process. In order to produce these results it is sometimes necessary to mix two or more kinds of clay together. Potter's clays are found in many localities and also in many different geological formations; those found in the recent surface deposits are commonly too impure to permit their use for anything except the cheaper grades of ware. The higher grades of pottery are always molded from a mixture of at least three kinds of clay, and in this case the raw material is sometimes freed from gritty particles by a preliminary washing. After mixing it is sometimes stored in damp cellars for a year or more, with the idea that its plasticity will thereby be improved. The value of potter's clay ranges from a few cents a ton for common earthenware clays up to $10 or $12 a ton for china clays. In the United States the lower and medium grades of potter's clays are abundant, but the demand for the higher grades is greater than the supply, and therefore large quantities are annually imported from England. Considerable ball clay is now obtained in the United States. The following are analyses of some well-known American potter's clays:

ANALYSES OF POTTER'S CLAYS

COMPONENTS	1	2	3	4
Silica	45.70	70.26	56.44	45.39

1, washed kaolin, Webster, N. C.; used in porcelain manufacture. 2, stoneware clay, Greentown, Ohio. 3, yellow-ware clay, East Palestine, Ohio. 4, Florida ball clay, used in whiteware manufacture.

The following varieties of potter's clay are commonly recognized:

Kaolin, or China Clay.—A white-burning residual clay used in the manufacture of china.

Ball Clay.—A plastic, white-burning clay used as an ingredient of white earthenware and porcelain bodies and added on account of its plasticity and bonding power.

Earthenware Clay.—Any plastic clay suitable for common earthenware.

Stoneware Clay.—A plastic potter's clay which burns to a dense impervious body. The clays employed for this purpose are commonly semi-refractory.

Yellow-Ware Clay.—A semirefractory clay employed for making yellow ware. It is not burned to a vitrified body.

Retort Clay.—A dense-burning fire clay much used in some districts for the manufacture of stoneware.

The value of potter's clay produced in the United States in 1913 was as follows: kaolin,

molded separately and cemented with moist clay before the pieces dry.

Casting is employed in making very fine ware. The plaster-of-Paris mold is filled with liquid clay which is allowed to stand until a thin shell is formed around the surface of the mold, after which the rest of the clay is poured out; this process is used for egg-shell porcelain, such as Parian and Belleek china. The making of these plaster-of-Paris molds is a matter of great delicacy. The model having been designed, a mold is made from it which is divided so that it may be easily removed from the clay. This is called the block mold. From this there is made a cast which is, of course, a replica in plaster of the original model, and from this the working molds are made. After the pieces of pottery have been formed, they are taken to the drying stove, where they are exposed to a heat of about 85° F. When considered dry they are placed in great earthenware vessels, called seggars or saggars, which are so shaped that they can be piled one upon another to a great height. The seggars are often made large enough to hold each a number of pieces of the unbaked pottery, and, as these would adhere if they touched one another, a number of curiously shaped pieces of baked clay are used, upon which they rest: these are called cockspurs, triangles, stilts, etc. Thus, each seggar forms a small oven by itself, and by this means the unequal heating of the pieces is prevented, and they are also protected from smoke. A pile of seggars is called a bung, and there may be 48 or 50 bungs in the charge of a kiln. When all this is arranged the furnaces, of which there are several to each kiln, are lighted. The firing requires from 24 to 50 hours, after which the ware is allowed to cool very slowly. See KILN.

The articles are now in the state called biscuit and still require glazing and perhaps decorative painting and gilding. (For the various kinds of glazing, see STONEWARE; FAÏENCE; MAJOLICA; ETC.) Many mixtures are used, the essential thing being that the glaze and the body shall be of the same general nature in order that they may contract evenly during the firing. The result of uneven shrinking is seen in the cracking of the surface, called crazing, and the crackle of Oriental porcelain and pottery is deliberately produced in the same way. The different glazes are composed of litharge, flint, feldspar, etc., mixed with white clay, applied in the form of slip. The glazing materials are triturated with water, with the same care and by similar means to those employed in forming paste, and are reduced with water to the same milklike liquidity. Each workman has a tub of the glaze before him; and as the articles of biscuit ware, either with or without decorations, are brought to him, he dips them in the glaze so as to insure a uniform coating over them, and by nice management he prevents any large drops or accumulations on one part more than another. The porous biscuit ware rapidly absorbs the moisture and dries up the thin film of glaze on the surface of the articles, which are again placed in seggars and carried to the glaze kiln, where they undergo another firing, which melts the glaze and converts it into a perfectly transparent glass, and, except when tin enters into the composition, renders any pattern previously printed upon the biscuit very plain. The temperature in the glaze or enamel kiln is increased very gradually and is kept up for about 14 hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far this description has applied to the manufacture of pottery for general purposes, but when it is applied to more costly and artistic works very special arrangements are required.

Decoration by means of painting may be applied to pottery on the biscuit, or on the unfired enamel, or on the already fired enamel or glaze. The method is limited in its scope, but very permanent. The difficulty is to find colors that will stand the great heat required for firing the glaze. Practically the only color used under the glaze for a hard glazed ware is cobalt blue, but for the softer glazes the oxides of many metals, as copper, iron, and gold, may be used.

Painting on the unfired enamel produces some of the brilliant varieties of faïence. Painting upon the glaze, allowing of almost any combination of colors, is the more common practice in ceramic art generally. Painting under glaze requires great skill and experience, for the appearance of the pigments as they are laid by the painter is altogether different from the resulting effect after the firing. The decoration may be applied with a brush or by a transfer of printing. In the latter process the designs are engraved on copper plates; the colors are specially prepared with a printing oil, and the designs printed on a wet tissue paper, which in turn is laid upon the ware and transfers its pattern to the surface of the clay. After the paper has been washed off, the decoration may be touched up with a brush, if necessary.

History. 1. Unglazed pottery includes the rude, slightly fired wares of primitive races. In general, primitive pottery is made from surface soil rather than from the finer and purer grades of clay. Naturally the ware produced from such material is coarse and thick-walled. Some of the crudest types of ware are molded in baskets—indeed, archæologists find good reason for supposing that some of the earliest pottery was nothing more than an earthen lining for a basket in which corn or other grains were parched by shaking them with live coals until the material was more or less completely baked. Sometimes the frames of wicker or basketry were burnt off in the firing in such manner as to leave permanent impressions of the framework. This type abounds in mounds and on other prehistoric sites in the central and southeastern United States. In the arid regions, not only in the United States and Mexico but in South America and on other continents, the early ware was improved far beyond this primitive type, in form and finish as well as in material and manufacture. Some of the aboriginal American ware is graceful in form, elaborate in decoration, and perhaps finished with a more or less siliceous slip; though neither the true clays nor the potter's wheel were known to the pre-Columbian natives. Frequently the forms were fantastic, the utensils grading into elaborate symbolic moldings and votive effigies. In beauty of form and color effects, as well as in elaborateness and delicacy of the symbolic designs, aboriginal American pottery may be said to have culminated in the Pueblo region in the southwestern United States and northern Mexico; some of the pieces from this region (as shown in the accompanying plate) attest a fairly advanced stage in artistic development. The primitive methods of firing are extremely simple. Ordinarily either a single piece or a small lot is

fired outdoors in a shallow pit with the commonest fuel.

The rough red dishes and pots made by peoples of prehistoric time and by tribes of low civilization all over the world are usually of a substance similar to common flower pots even when they are prettily modeled as to form and painted with circles and lines. The coarse terracotta vessels of Egypt, Greece, Rome, Crete, and Cyprus, the sizes of which vary from lamps and toys weighing an ounce or two up to huge vases intended evidently for the storage of grain, oil, wine, etc., which may sometimes contain 100 gallons; the black earthenware with relief decorations imitating metal work, as produced by the ancient Etrurians, from about the seventh to the fifth century B.C.; the finely modeled figurines of Tanagra, Greece; the grotesque pottery of the ancient Peruvians and Mexicans—may all be placed in this group.

2. Varnished or lustrous pottery was produced in Greece from about the fifth to the third century B.C. Instead of being covered with a true glaze or enamel, it possesses a lustrous or glossy black surface of considerable hardness, the exact nature of which is not definitely known. Greek vases, other than archaic wares, are of two kinds, viz., those painted with black figures on the red ground of the ware, and those with red figures reserved in a painted black ground. One variety of lekythi, or oil cruets, is coated with a white engobe, upon which the decoration has been painted in red and black, which at one time was probably firmly fixed, but which to-day is very perishable, having a marked tendency to flake off.

To this group of pottery may be assigned the fine-grained polished ware, of sealing-wax-red color, decorated with embossed designs, known as Samian or Aretine ware, which dates from about the second century B.C. to the third century A.D. This fictile fabric was believed to have been first made on the island of Samos and also at Arezzo, Italy, and elsewhere, and has been found on many Roman sites, particularly in Gaul, Great Britain, and Germany.

3. Glass-glazed pottery was produced in Egypt, Babylonia, Persia, and countries bordering on the Mediterranean Sea. The ware consists of a soft, gritty white body, covered with a transparent siliceous or glassy glaze of great hardness. In Egypt the glaze was colored with metallic oxides, which rendered it opaque when applied thickly, which led the early ceramic writers to the erroneous conclusion that it was of a stanniferous nature. A true glass glaze was also used by the Babylonians for many centuries previous to the Christian era. A similar glaze has been employed by the Persian potters from about the ninth century or earlier to the present time. The pottery and tiles of Syria, Turkey, Asia Minor, and Rhodes present the same characteristics, but are also distinguished by decorations in a peculiar dark-red enamel, which has been applied thickly and appears to be slightly in relief. A variety of pottery from Rakka, Mesopotamia, which in recent years has become well known to collectors, is ornamented with black designs and frequently inscribed on a greenish ground, the glass glaze having become iridescent through long burial in the earth. In Spain the art of glazing with glass was practiced to some extent as early as the fifteenth century, having probably been introduced from Persia. At Seville and perhaps other centres, in the sixteenth century and later, vast quantities of tiles, in the so-called *cuerda seca* and *cuenca* styles, were manufactured for architectural purposes, the raised or sunken designs being covered or filled with colored glass, in combination with stanniferous white enamel, which was used as a background. Plates and large plaques, decorated in the same manner, with human heads, animals, fabulous monsters, and leaf patterns, were at one time thought to have been produced at Puente del Arzobispo, and were known by that name, but are now generally attributed to Seville and to the fifteenth century.

4. Tin-enameled pottery was, it is now generally conceded, first produced by the Saracens, who were making tin-enameled and lustred ware in Egypt as early as the eleventh century. A little later they introduced the art into Persia, as is proved by the discoveries of pottery vessels and star-shaped and cruciform tiles at Rhages, Sultanabad, and Veramin, many of which bear dates of the twelfth and thirteenth centuries. These wares reveal in their forms and decorative treatment a strong Saracenic influence and are entirely different from the glass-glazed wares of undoubted Persian origin. Wherever the Saracens penetrated they carried with them the arts of enameling with tin and decorating with metallic lustres. After these arts had been taken into northern Africa they were carried into Spain by the Moors in the fourteenth century. The enameled pottery of Malaga at that time was purely Moorish in spirit and was coated with an exceedingly hard opaque white enamel of which oxide of tin was an important constituent, while the decorations were in blue, heightened by iridescent lustres. Of this purely Moorish product the Alhambra vase at Granada is the most celebrated example. In the fifteenth century the influence of the native Spanish potters began to assert itself, and mock-Arabic and Christian inscriptions, Christian symbolism, and heraldic shields of noble families were introduced, which resulted in the development of Hispano-Moresco pottery. Gradually, as the Saracenic influence waned, the glaze of this ware became modified by the decrease of tin and the increase of lead, which latter was applied over white slip.

From Spain the art of enameling with tin was taken to Italy, where was made a highly decorative pottery, known as majolica, from the name of Majorca, an island lying between Spain and Italy, where the ware was believed to have originated. This artistic product was manufactured at many places, but at only three (Gubbio, Pesaro, and Diruta) was lustring attempted. Lucca della Robbia was the first to bring tin enamel to perfection in Italy, using it on his altarpieces and figure panels in the fifteenth century (about 1438).

From Italy the use of stanniferous enamel spread to France; to Holland, where the ware was called Delft, from the name of the town where it was made; to England, where it was known by the same name; to Sweden, Denmark, Belgium, and Hungary, and to other parts of Europe. In the seventeenth and eighteenth centuries majolica was also produced extensively in Mexico, under Spanish influence.

5. Lead-glazed pottery is perhaps the largest division of ceramic manufactures, its production having extended into almost every country of the civilized world. Lead, in various forms, produces a glasslike, transparent glaze, which in

its simpler combinations is extremely fusible and so soft that it can be easily scratched. It has been used in the Orient, the nearer East, and throughout Europe and the United States. A green pottery was made in China during the Han dynasty (202 B.C.–220 A.D.), which was the earliest lead-glazed ware of which we have knowledge. Lead glaze is applied to the most ordinary earthenware, such as red clay cooking utensils, and to the most elaborate examples of the potter's skill. Of the coarser kinds of lead-glazed pottery the slip-decorated and sgraffito red wares of England, Germany, Switzerland, and Holland are the most pretentious, the first variety being ornamented by pouring liquid slip through a quill attached to a cup and tracing the designs in white on the red ware; the second being decorated by covering the red surface with a thin layer of white slip and scratching the designs through to expose the red clay beneath, a covering of lead glaze being afterward in each case applied. The large circular dishes of Staffordshire, with slip-traced figures, animals, and dates, are popularly known as Toft ware, since the names of Thomas and Ralph Toft frequently occur on the best examples. Earthenware of a similar character, with figures, tulip designs, inscriptions, and dates, was extensively produced in eastern Pennsylvania by the German settlers between 1730 and 1850.

In the sixteenth century (c.1520–50) a lead-glazed pottery of the highest artistic excellence was made in France, known to-day as Henri Deux ware, for the reason that many of the pieces are embellished with the cipher of Henry II, and as faïence d'Oiron, because it was thought to have been produced at the castle of Oiron, near Thouars. Its principal characteristics are a fine white body, intricate strapwork patterns, composed of inlaid clays of different colors, and graceful modeling of forms and their adjuncts. A little later (c.1560–80) Bernard Palissy, of Saintes, France, was producing his celebrated *rustiques figulines*, as the plaques and dishes enriched with casts of reptiles, fishes, and shells were termed. This ware was made of white clay and glazed with lead.

Mezza majolica is of an entirely different character from true majolica, since it possesses a soft lead glaze applied over a wash of white slip, instead of being enameled with tin. It was the prototype of the sgraffito wares which later were manufactured throughout the greater part of Europe and in the United States.

Another variety of lead-glazed pottery, variously known as cream-colored ware, creamware, and Queen's ware, has been produced extensively in England and to a lesser extent by English potters in France. To this group belong the tortoise-shell or Whieldon ware; the melon, cauliflower, and pineapple wares; copper, silver, and rose lustred wares; Staffordshire figures; Liverpool and Staffordshire print-decorated pottery; "mocha" and green glazed wares, the open-work, and basketry designs of Wedgwood, the Leeds pottery, and many other establishments.

In carrying out the classification here employed, a difficulty is sometimes encountered when the exact composition of the glaze is unknown, since special preparations have been used by different potters, which vary greatly in materials and their proportions. In the division of lead-glazed pottery we are justified in grouping those wares whose glazes, while possessing the principal characteristics of ordinary lead glaze, have been rendered exceedingly hard by the addition of borax, flint, or feldspar. To this class belong many of the brown glazed potteries of Japan; the slip-decorated dishes of Brislington and Shropshire, England, and the Flint enameled pottery of Bennington, Vt., and Baltimore, Md., to which may be added the artistic wares of the Rookwood Pottery of Cincinnati and the green-glazed Grueby faïence of Boston. These American achievements, having more or less vitrified bodies, form in reality a connecting link between soft pottery and unglazed stonewares.

Bibliography. A very great number of books have been devoted to the general subject of ceramic art. The bibliographies given under all the special terms, for which see the first paragraph of the above article, should be examined. In this place will be named some general treatises, and works especially devoted to ancient potteries, Egyptian and Greek, and to the wares of various countries.

Of general treatises, Jacquemart, *History of the Ceramic Art* (Eng. ed., London, 1877), which is often cited; Friedrich Jaennicke, *Grundriss der Keramik* (Stuttgart, 1879), with illustrations and reproductions of makers' marks; Marryat, *Pottery and Porcelain* (3d ed., London, 1868), a general treatise on modern ware. For ancient pottery, see Samuel Birch, *History of Ancient Pottery, Egyptian, Assyrian, Greek, Etruscan, and Roman* (London, 1873); Ris Paquot, *Histoire général de la faience ancienne française et étrangère* (Paris, 1876); H. B. Walters, *History of Ancient Pottery, Greek, Etruscan, and Roman, Based on the Work of Samuel Birch* (New York, 1905). Among the costly books especially devoted to the Greek painted vases are: Bendorf, *Griechische und sizilische Vasenbilder* (Berlin, 1868); Lau, *Die griechischen Vasen* (Leipzig, 1877); Dumont and Chaplain, *Les céramiques de la Grèce propre* (Paris, 1888 et seq.). See also Morse, *Catalogue of the Morse Collection of Japanese Pottery* (Cambridge, 1901); Solon, *French Faience* (London, 1903); Burton, *English Earthenware and Stoneware* (ib., 1904); E. A. Barber, *The Maiolica of Mexico* (Philadelphia, 1908); id., *Pottery and Porcelain of the United States* (3d ed., New York, 1909); Solon, *Ceramic Literature* (London, 1910); Van de Put, *Hispano-Moresque Ware of the XV Century* (2d ed., ib., 1911); E. A. Barber, *Ceramic Collector's Glossary* (New York, 1914).

POTTHAST, EDWARD HENRY (1857–). An American landscape painter. He was born in Cincinnati and studied at the academy there and in Antwerp, Munich, and Paris. His landscapes are realistically and solidly painted, with a broad and sincere presentation of nature. Notable among them are: "Winter in the Suburbs" and "A Hazy Day" (1907); "Grand Canyon" (1911); "Sunlight and Shadow" (1913); "A Holiday" and "A Day at the Seashore" (1915). His "Dutch Interior" is in the Cincinnati Museum. Potthast was elected in 1906 to the National Academy, from which he had received the Clark prize in 1899. Silver medals were awarded him at the St. Louis (1904) and San Francisco (1915) expositions, and he was honored by membership in the National Institute of Arts and Letters.

POTTIER, pô'tyā', EDMOND (1855–). A French archæologist, born at Saarbrücken, Prussia, and educated at the Ecole Normale, Paris, and (1877–80) at the French School of Classical

Studies in Athens. Then he assisted Veyries and Reinach in the excavations at Myrina in Asia Minor and began to specialize in Greek terra cottas. He taught at Rennes and at Toulouse for two years (1884–86), had a course in archæology at the Beaux-Arts, and became adjunct curator and assistant instructor in Oriental archæology and antique ceramics at the Louvre. He was elected to the Académie des Inscriptions et Belles-Lettres in 1899. Besides many contributions to archæological journals and to the Daremberg and Saglio *Dictionnaire des antiquités*, Pottier published catalogues of the ceramic collections in the Louvre; *La nécropole de Myrina* (1886), with Reinach; *Les statuettes de terre cuite dans l'antiquité* (1890); *La peinture industrielle chez les Grecs* (1898); *Douris et les peintures de vases grecs: étude critique* (1905). His later literary work was done largely for periodicals.

POTTINGER, SIR HENRY (1789–1856). A British diplomat, administrator, and soldier, born at Mount Pottinger, County Down, Ireland. Becoming a cadet in 1804 in the East India Company's military service, five years later he was commissioned to explore the region between their frontier and Persia. As a result he published *Travels in Beloochistan and Sinde* (1816). He served during the Mahratta War, had charge of a mission to Sind in 1831, in 1836–40 was political agent there, and was made Baronet in 1840. In 1841, during the Opium War between Great Britain and China, he was sent as Ambassador to the latter country, and after the capture of Amoy and several other important towns he in 1842 concluded a peace which opened five of the principal Chinese ports to British merchants. He was appointed the first British Governor of Hongkong, and on his return to England the next year was made an Imperial Privy Councilor and was granted a pension of £1500. In 1846 he was Governor of the Cape of Good Hope, and in 1846–54 Governor of Madras.

POTTO (African name). A small brownish-gray West African lemur (*Perodicticus potto*) of the loris group, remarkable for having a distinct though rudimentary tail and distinct index fingers. Its body is 6 inches long, and it has the sluggish habits of its relatives. The name has been transported to South America by the negroes and there applied to the kinkajou, a small relative of the raccoons.

POTTS, JAMES HENRY (1848–). An American Methodist Episcopal clergyman and editor, born in Woodhouse, Norfolk County, Ontario. He graduated from the Mayhew Business College (Albion, Mich.) in 1866, having as a boy served in the Civil War for two years. In 1869 he entered the ministry, but his main work was in religious journalism—from 1877 to 1885 as assistant editor of the *Michigan Christian Advocate* of Detroit and thereafter as editor in chief. He was a member of various conferences of his denomination. His principal writings are *Living Thoughts of John Wesley* (1891) and *Black and White, or the Saloon v. Temperance* (1908).

POTTS, JOHN (1838–1907). A Canadian clergyman. He was born in County Fermanagh, Ireland, and emigrated to the United States in 1855. After a few years' residence in the South he went to Ontario and engaged in business, then studied for the Methodist ministry and was ordained in 1861. He filled prominent pulpits in London, Hamilton, Montreal, and Toronto, but in 1886 retired from regular pastoral work on being appointed General Secretary of Education for the Methodist Church. Potts was an eloquent preacher, strongly evangelical in sympathy and doctrine, and highly popular in his own and other Protestant denominations in Canada. He was influential in effecting the union of the five different bodies which now constitute the Methodist Church of the Dominion, and took part also in federating Victoria University (Methodist) with the Provincial University at Toronto.

POTT'S DISEASE, or SPINAL CARIES. Tuberculosis of the bodies of the spinal vertebræ, named after Dr. Percival Pott (q.v.), who first accurately described the condition and its nature. In this affection as the tuberculous tissue replaces the normal bone tissue of the vertebræ, softening results together with marked deformity of the spine. This deformity is usually seen as an angular projection or hump in the upper part of the back. It is caused from absorption or erosion of the bodies of the vertebræ, allowing them to be pressed more closely together, which in turn causes their sharp spinous processes to project posteriorly beyond the line of the spines above and below the affected area. Pott's disease develops in childhood and youth, while the body is undergoing rapid growth. The formation of pus is a not infrequent accompaniment of tuberculosis in the spinal region, as in other localities, and this pus often collects into an abscess, known as *cold abscess* (see ABSCESS), from the fact that the pus is sterile and produces no inflammatory reaction. These abscesses sometimes point in the back adjacent to the vertebræ and often occupy the posterior mediastinal space (see CHEST and PLEURA), where they are known as *mediastinal abscesses.* Occasionally the pus in spinal caries burrows downward beneath the muscles of the back and may appear in the lumbar region, constituting a *lumbar abscess,* or following the psoas muscle it may pass forward through the pelvis and appear near the attachment of that muscle in the groin—*psoas abscess.* When the disease is located in the cervical vertebræ and an abscess forms, it may point to the pharynx. After recovery takes place in tuberculosis of the vertebræ, ankylosis is present. In the treatment of Pott's disease constitutional measures must receive the most thorough consideration. General hygienic measures must be combined with abundance of fresh air, nutritious food, tonics, massage, and as great amount of exercise as the conditions permit. The surgical treatment consists of immobilization of the spinal column by means of frames, the plaster-of-Paris jacket, the jury mast, etc. Such measures attain their results by giving rest to the diseased parts, allaying irritation, preventing attrition and crushing of softened bones, and in limiting the amount of deformity after the disease process has become quiescent. See ORTHOPEDICS.

POTT'S FRACTURE. An injury to the ankle consisting in a fracture of the fibula just above the malleolus, together with a rupture of the internal lateral ligament, named after Dr. Percival Pott (q.v.). The tip of the internal malleolus may also be broken. Pott's fracture is a very serious injury even when uncomplicated, since the structures involved take part in the formation of the ankle joint, which has to bear the entire weight of the body. The fracture usually results from excessive eversion of the foot, in circumstances where this member is

caught or wedged tightly and the body falls to the injured side.

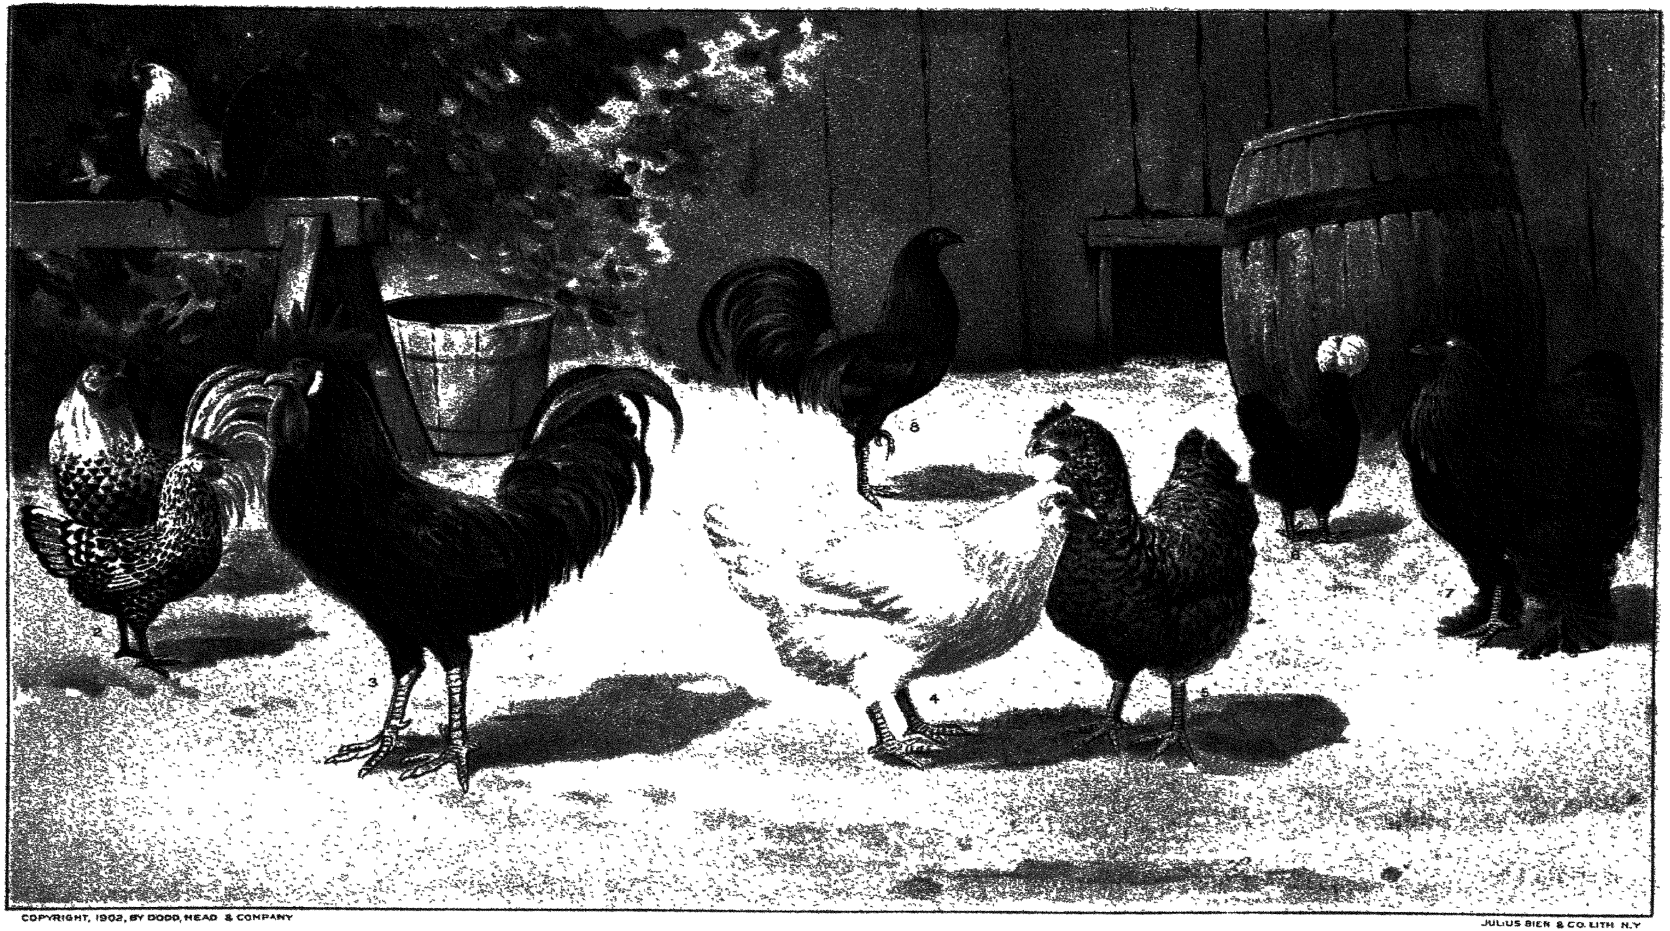
POTTSTOWN. A borough in Montgomery Co., Pa., 40 miles by rail northwest of Philadelphia, on the Schuylkill River and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, K 7). It has two parks, the well-known Hill School, a public high-school library, and two public hospitals. The centre of a productive farming and dairying country with considerable mineral wealth, Pottstown is an important manufacturing borough, its iron and steel interests being very extensive. There are large rolling mills, furnaces, nail works, textile mills, bridge works, agricultural-implement works, boiler and machine shops, foundries, and manufactories of bricks, silks, shirts, hosiery, etc. The various industries, according to the census of 1909, represented an aggregate invested capital of $9,961,000, and had a production valued at $12,505,000. Pottstown was laid out in 1752–53 and named Pottsgrove in honor of its founder, a name that was retained until the incorporation of the borough in 1815, when its present name was adopted. In 1888 the limits of the borough were considerably extended. Pop., 1900, 13,696; 1910, 15,599; 1915 (U. S. est.), 16,601.

POTTSVILLE. A city and the county seat of Schuylkill Co., Pa., 36 miles north by west of Reading, on the Schuylkill River and on the Philadelphia and Reading, the Pennsylvania, the People's, and the Lehigh Valley railroads (Map: Pennsylvania, J 6). It is situated in a remarkably picturesque region, which is much frequented by tourists. The county courthouse is the most prominent building in the city, and there are also the county jail, a public library, a beautiful park, and a public hospital. Pottsville is surrounded by the productive anthracite fields of the Schuylkill coal basin and is an important coal mining and shipping centre. Its mechanical industries, too, have been developed to a considerable extent, having, according to the census of 1909, invested capital to the amount of $13,982,000, with products valued at $9,138,000. The more important establishments include a large steel plant, shops of the Pennsylvania and the Philadelphia and Reading railroads, manufactories of wood-working machinery, shirts and shoes, knitting mills, textile and silk mills, etc. The commission form of government has been adopted. Pottsville was settled about 1800, was laid out as a town by John Pott in 1816, and in 1828 was incorporated as a borough. It became the county seat in 1851. Pop., 1900, 15,710; 1910, 20,236; 1915 (U. S. est.), 22,028.

POTTSVILLE CONGLOMERATE. The name given to a hard, siliceous conglomerate composed of quartz pebbles and sand and occurring at the base of the lower coal measures. In the central portion of the Pennsylvania anthracite region it has a thickness of 800 to 1700 feet, but is less than 300 to the northward and westward. In New York it is known as the Olean conglomerate. See CARBONIFEROUS SYSTEM; COAL.

POTVIN, pô'văn', CHARLES (1818–1902). A Belgian author, born in Mons. He studied at Liége, entered political journalism as an editor of *La Nation*, and founded *La Belgique Démocratique* (1849) and *Revue de Belgique* (1862). Potvin lectured on the history of literature in the Royal Industrial Museum for some time, was elected to the Belgian Academy in 1881, and in 1883 became curator of the Wiertz Museum in Brussels. He wrote such poems as *Poésies et amours* (1838), *Le chansonnier belge* (1850), *La Belgique* (1859); on politics: *L'Église et la morale* (1858, under the pseudonym Dom Jacobus), and *La nationalité belge* (1859); on history: *Albert et Isabelle* (1861), *Le Jubilé d'un faux miracle* (1874, under the pseudonym Dom Liber), and *De la civilisation en Belgique* (1885); in literary criticism: *De la corruption littéraire en France* (1873) and *Histoire des lettres en Belgique* (1882); in Old French: *Baudouin de Condé* (1863) and *Perceval le Gallois* (1866–72); and *Le Roman de Renard* in modern French verse (1860).

POUCHED DOG. See DASYURE.



POUCHED MOUSE, or POUCHED RAT. Any small rodent with well-developed cheek pouches, especially in America a pouched or pocket gopher (q.v.), or one of the smaller mouselike animals of the family Saccomyidæ. In Australia the name is applied to a marsupial (genus *Thascologale*). It occurs over the whole of Australia and New Guinea, together with the adjacent islands. It is completely arboreal and insectivorous in its habits. It appears in the Australasian region to occupy the place held in India and adjacent countries by the tree shrews (*Tupaia*) and in South America by the smaller kinds of opossum. The largest of the 13 known species does not exceed a common rat in size. Whereas in all the Australian species the fur of the back is not striped, the majority of the Papuan representatives of the genus have striped backs. See GOPHER; POCKET GOPHER; and Plate of GOPHERS, LEMMINGS, AND MARMOT.

POUDRE BARYTIQUE. See EXPLOSIVES.

POUDRETTE, pōō'drĕt' (Fr., small, fine powder). A name apparently first applied to a dry pulverulent manure prepared from the sediment from sewage-settling basins at Montfaucon, near Paris. The term is now applied to any dry mixture of night soil or sewage sludge with absorbent substances, such as charcoal, peat, gypsum, etc. It contains comparatively small amounts of the actual fertilizing constituents, unless, as is sometimes done, it is mixed with more concentrated fertilizing materials, such as dried blood, phosphates, potash salts, etc. See FÆCES.

POUGHKEEPSIE, po-kĭp'sĭ. A city and the county seat of Dutchess Co., N. Y., 74 miles north of New York City, on the east bank of the Hudson River, on the New York Central and Hudson River and the Central New England railroads, and connected by ferry with the West Shore Railroad (Map: New York, B 1). A cantilever bridge, completed in 1889 and rebuilt in 1904, bears the New Haven road over the Hudson. The city lies on a plateau about 200 feet above the river and on the slope to the river. It is well known as the seat of Vassar College (q.v.), whose fine buildings and grounds are east of the city. It has also a number of schools for secondary education and the Eastman Business College. The Adriance Memorial Library contains more than 40,000 volumes. Besides the Hudson River State Hospital for the Insane, 2 miles north of Poughkeepsie, there are the Vassar Brothers Institute, Pringle Memorial Home, Vassar Brothers' and St. Francis hospitals, the Riverview Military Academy, a high school, and Columbus Institute. College Hill Park contains 100 acres and commands a fine view. The annual intercollegiate

DOMESTIC FOWLS

5 BARRED PLYMOUTH ROCK HEN
6 WHITE-CRESTED BLACK POLISH HEN

established by the company. In 1910 Poulson gave $100,000 to provide for an interchange of students and of lecturers between the United States and the Scandinavian countries. Scholarships for Scandinavian students were established at the Massachusetts Institute of Technology and at Harvard, Yale, and Columbia, and for American students at the universities of Copenhagen, Christiania, and Upsala. Poulson left his fortune of $500,000 to the cause of education. To administer this sum the American-Scandinavian Foundation and the American Scandinavian Society were established. Consult Dahlerup and Groth, in the *American Scandinavian Review*, vol. iii, no. 5 (New York, September–October, 1915).

POUL'TICE (from Lat. *puls*, Gk. *πόλτος*, *poltos*, porridge), or CATAPLASM. A soft mass composed of substances such as slippery elm bark, meal, flaxseed, bread, herbs, or mustard, for application to the surface of the body. The mass is mixed with hot water and spread to the thickness of about ½ inch upon linen, cheesecloth, or even paper. Poultices may be employed for their heat alone or as vehicles for some therapeutic agent. In the early stages of an inflammation a poultice will assist nature in softening and absorbing inflammatory products, and when the inflammatory process has advanced they will hasten pus formation. Poultices of green soap are often employed before surgical operations to soften and sterilize the skin. Cold poultices, as those of layers of gauze, steeped in water and covered with rubber tissue or oiled silk, are sometimes applied to prevent inflammation and mitigate pain. One of the most satisfactory and cleanly poultices now in general use is the *cataplasma kaolini* of the United States Pharmacopœia; it consists of kaolin mixed with glycerine and antiseptics.

POULTNEY, pōlt'nĭ. A town in Rutland Co., Vt., 19 miles west-southwest of Rutland, on the Delaware and Hudson Railroad (Map: Vermont, A 5). It is the seat of the Troy Conference Academy (Methodist), and has slate quarries, shirt and farm-implement factories, and a machine shop. The water works are owned by the town. Pop., 1900, 3108; 1910, 3644.

POUL'TON, EDWARD BAGNALL (1856–). An English zoölogist, born at Reading. He was educated at Jesus College, Oxford, in 1877–79 was demonstrator under Professor Rolleston in the anatomical department of the University Museum, and from 1880 to 1889 was lecturer in natural science and tutor in Keble College. He was also lecturer in natural science in Jesus College from 1880 to 1888. In 1893 he became Hope professor of zoölogy at Oxford. He was elected fellow of the Royal Society in 1889, and was president of the Entomological Society of London in 1903–04 and of the Linnean Society in 1912–13. In 1894 he delivered at Boston, Mass., a course of Lowell lectures on "The Meaning and Use of the Colors of Animals." Besides valuable special contributions his publications include: *The Colors of Animals* (1890), in the "International Scientific Series"; *Charles Darwin and the Theory of Natural Selection* (1896); *Essays on Evolution* (1908); *Charles Darwin and the Origin of Species* (1909); *Viriamu Jones and Other Oxford Memories* (1911).

POUL'TRY (OF. *pouleterie*, from *poulet*, *poulette*, *polete*, Fr. *poulette*, pullet, fowl, dim. of *poule*, from ML. *pulla*, hen, fem. of Lat. *pullus*, young animal, chicken). A collective name for useful domestic birds. It is sometimes limited to the domesticated gallinaceous birds—chickens, peafowl, guinea fowl, turkey, guan, and pigeon—but its ordinary use includes ducks, geese, swans, and all other birds reared for purposes of domestic economy. Under the influence of domestication the group has exhibited a great capacity for variation in externals, as color, combs, etc., and especially in size, as appears when the diminutive bantams are compared with great shanghais, and to this capacity for adaptation the usefulness of fowls is largely due. Consult: H. W. Weir, *The Poultry Book* (New York, 1905; new ed., ib., 1909); C. B. Davenport, *Inheritance of Characteristics in Domestic Fowl*, published by the Carnegie Institution (Washington, 1909); W. A. Lippincott, *Poultry Production* (Philadelphia, 1914); Edward Brown, *Poultry Husbandry* (New York, 1915); Raymond Pearl and others, *Diseases of Poultry: Etiology, Diagnosis, Treatment, and Prevention* (ib., 1915). See FOWL; GALLINÆ; and the names of the various birds, as DUCK, TURKEY, ETC.

POUND. See WEIGHTS AND MEASURES.

POUND (variant of *pond*, from AS. *ge-pyndan*, to shut up, impound). An inclosure for the temporary confinement of stray animals. Where domestic animals stray upon the public highways, or upon the land of individuals, any person injured thereby may take possession of and impound them, i.e., detain them in a pound until the owner pays him for any damage they may have caused. A pound may be one established by law, known as a public or common pound; or, where there is no public pound, a person on whose land cattle or other domestic beasts stray may confine them in an inclosure on his own land, with the intention of thereby impounding them. In the latter case, the person so confining the animals is responsible for them. To obtain a release of the beasts the owner must pay him for their keep, as well as for the damage they have done.

Where cattle are taken to a public pound the person taking them should leave with the poundkeeper a certificate containing a brief statement of the cause of impounding and the amount of damages he claims. The poundkeeper then becomes responsible for the keep of the animals. The compensation of the poundkeeper is usually derived from fees, which must be paid by the owner before the poundkeeper is obliged to release them. In most of the United States either the poundkeeper or the person impounding the animals must give notice to their owner if he can be ascertained and found. If the owner does not redeem his animals within a time fixed by statute or, in absence of such provision, within a reasonable time after notice, the poundkeeper may advertise and sell the beasts, satisfy all charges against them, and hold the balance to the credit of the owner. Consult J. H. Ingham, *Law of Animals* (Philadelphia, 1900). See IMPOUNDING.

POUND, EZRA (1885–). An author of American birth who settled in England in 1907. He was educated at Hamilton College, from which he graduated in 1905, and at the University of Pennsylvania, where he specialized in Romance languages. In 1906–07 he traveled in Spain, Provence, and Italy. Pound became literary executor of Ernest Fenollosa. In prose he

wrote *The Spirit of Romance* (1910) and he translated Guido Cavalcanti's *Sonnets and Ballate* (1912–13) and the *Canzoni of Arnaut Daniel* (1914). But he became best known for several volumes of poetry in a cubist or imagist—or, as the author prefers to call it, vorticist—style; *Personæ* (1909), *Exultations* (1909), *Provença* (1910), *Canzoni* (1911), *Ripostes* (1913), *Cathay* (1915).

POUND, ROSCOE (1870–). An American law scholar and publicist; also a botanist. He was born at Lincoln, Neb., and was educated at the University of Nebraska (A.B., 1888; A.M., 1889; Ph.D., 1897) and at Harvard Law School. Admitted to the bar in 1890, he practiced in Lincoln. He was assistant professor of law at the University of Nebraska from 1898 to 1903 and professor and dean (1903–07), professor at Northwestern University (1907–09), at Chicago (1909–10), and then Story professor at Harvard till 1913, when he was appointed Carter professor. As lawyer, teacher, and publicist he became widely known for his scholarship and fresh interpretations of old statutes. From 1904 until 1907 Pound was a member of a commission to make uniform the laws of Nebraska, and in published articles he advocated general uniformity of law. In 1913, with Charles W. Eliot and L. D. Brandeis, he served on a committee which investigated the administration of justice in the United States, with a view to improved efficiency. In 1911 he held the presidency of the Association of American Law Schools. His writings include: *Phytogeography of Nebraska* (1898–1900); *Readings on the History and System of the Common Law* (2d ed., 1913); *Justice according to Law* (1914).

POUNDAGE. See TONNAGE AND POUNDAGE.

POURBUS, pōōr'bụ′. A family of Flemish painters.—PIETER (c.1510–84) was born at Gouda, settled at Bruges, and became a member of the Guild of St. Luke in 1543. He made some interesting maps and plans of Bruges, and painted single portraits, such as those of Jean Fernagant and his wife (1551, Bruges Museum), which are excellent in characterization and color. His portrait groups and religious compositions, however, are tiresome. In the academy and churches of Bruges there are a number of good works by him.—FRANS THE ELDER (c.1545–c.1581) was born in Bruges. He was the son and pupil of Pieter, and also studied under Frans Floris. He lived principally in Antwerp, where he became a member of the Guild in 1569. His portraits, which include those of Queen Elizabeth (Rijks-Museum, Amsterdam), and Alexander Farnese (Antwerp Museum), are notable for their fine, mellow color. There are also religious pictures by him in Ghent Cathedral, including his masterpiece, "Christ among the Doctors"; in the Ghent Museum, the Antwerp Academy, and elsewhere. Though different in style his works are frequently confounded with those of his son and pupil, FRANS THE YOUNGER (c.1569–1622), born in Antwerp. He became court painter to the Duke of Mantua about 1600, and afterward worked at the court of France, and died in Paris. In the Louvre, Paris, are portraits by him of Henry IV of France (a small version in the collection of the New York Historical Society) and of Maria de' Medici and portraits of the latter also in the Rijks-Museum, Amsterdam, and the Madrid Gallery. His "Henry IV Lying in State" is in the Berlin Gallery, and his two finest religious canvases, "The Last Supper" and "St. Francis of Assisi," are in the collection of the Louvre. By some critics Frans the Younger is considered a better colorist than his father.

POURCEAUGNAC, pōōr'sō'nyȧk′, MONSIEUR DE. A prose comedy by Molière (1669).

POUR LE MÉRITE, pōōr le mā'rēt′ (Fr., for merit). A Prussian order conferred for military and civil distinction. It originated in the Order of Generosity, founded in 1667, and in 1740 was reorganized by Frederick II into an order of merit. In 1810 it was expressly made a reward for distinction in battle. The decoration is a blue cross of eight points, the arms separated by golden eagles and bearing the inscription, "Pour le mérite." A civil class was established in 1842 by Frederick William IV. Its decoration is a blue band with the name of the order, inclosing a central gold medallion with the Prussian eagle. See Plate of ORDERS.

POURPOINT, pōōr'point, *Fr. pron.* pōōr'-pwăN′ (OF., Fr., *pourpoint*, from ML. *perpunctum*, quilted garment, from Lat. *perpungere*, to pierce through, from *per*, through + *pungere*, to pierce). A doublet made of quilted cloth, worn for defense by both soldiers and civilians in the fourteenth, fifteenth, and sixteenth centuries. See GAMBESON.

POURTALES, pōōr'tȧ'lēs′, LOUIS FRANÇOIS DE (1824–80). An American naturalist, born at Neuchâtel, Switzerland. He was a pupil of Agassiz, whom he accompanied in 1840 on glacial expeditions in the Alps and in 1847 to the United States, where in 1848 he entered the government Coast Survey. In 1851 he assisted in the triangulation of the Florida reef, and from 1854 until his resignation in 1873 had special charge of the office and field work of the tidal department of the Coast Survey. In 1873 he became custodian of the Harvard Museum of Comparative Zoölogy, in which he had previously been assistant in zoölogy. He was the first in the United States to undertake deep-sea dredging, and was an authority on marine zoölogy. The name Pourtalesia was given to a variety of sea urchin. Pourtales presented his extensive collections to the Harvard Museum. He was a member of the National Academy of Sciences and wrote various contributions to the Coast Survey reports, to Silliman's *Journal*, and to the *Proceedings* of the American Association for the Advancement of Science. He published, under the auspices of the museum, several works, including: *Contributions to the Fauna of the Gulf Stream at Great Depths* (1867–68); *Deep-Sea Corals* (1871); *Corals and Crinoids* (1878); *Report on the Corals and Antipatharia* (1880).

POUSSIN, pōō'sĂN′, GASPAR (1613–75). An Italian landscape painter, the son of a Frenchman settled in Rome. He was the pupil of his brother-in-law, Nicolas Poussin, whose name he adopted in place of his own, which was Dughet. He was called by the Italians Gasparo Duche, and he inscribed his etchings (eight in number) in that way. He never left Italy, and lived chiefly in Rome, where he died May 27, 1675. His landscapes are composed in general from studies in the Campagna of Rome and the surrounding country. His treatment of form and line is peculiarly effective, and he excelled in the portrayal of the wind and the storm, the sombre effects of his paintings being increased

by the influence of time in darkening the colors. He was a very facile painter. Many European galleries possess examples of his works, which are especially numerous at Rome, Vienna, and London. His most ambitious labors were undertaken in Rome—the series of frescoes of the life of Elias, in the church of San Martino; the cycle of 12 tempera landscapes in the Colonna Palace; and another of 25 large landscapes in oil in the Doria Pamfili Palace. A typical landscape by him is in the Metropolitan Museum, New York.

POUSSIN, NICOLAS (1593 or 1594–1665). A French painter, the originator of the classic and academic element in French painting. He was born at Villers, near Grand Andely (Normandy), the son of a gentleman of Picardy who had fought under Henry IV. Placed with a Latin master, he preferred design, and having studied, against the wishes of his parents, at Les Andelys under Quentin Varin, he went to Paris. There, under great privations, he worked with Ferdinand Elle and Georges Lallemand. His association with the mathematician Courtois, whose collection of engravings he studied, filled his mind with the fixed determination to reach Rome. After two vain attempts he succeeded, through the aid of an Italian friend, Marini, arriving in Rome in the spring of 1624. Together with the Flemish sculptor Duquesnoy, who had been his friend in Paris, and with Algardi, afterward one of the greatest baroque sculptors, Poussin studied antique statues. He also dissected with the surgeon Larchi, sketched after Raphael and Giulio Romano, and made a thorough study of landscape in wanderings about the Campagna. A great admirer of Domenichino, he was admitted to that master's studio and was much influenced by him in composition.

He was at first unsuccessful in Rome, and during a serious illness was taken care of by a countryman, Dughet, whose daughter he married. But through the pictures executed under the patronage of Cardinal Barberini he became famous, winning in especial the favor of Richelieu, who was the means, after two years of persuasion, of inducing him in 1640 to return to Paris. He was received with high honor, made first painter to the King, and allotted an income of 3000 livres a year. Besides a number of other paintings he produced eight cartoons for the Gobelins and the designs for a scheme of decoration, representing the "Labors of Hercules," for the Louvre. But, ever homesick for Rome, and disgusted with the intrigues of Vouet and others, he returned in September, 1642, passed the remainder of his life there in quiet, unremitting activity, and died there Nov. 19, 1665.

Although Poussin learned his art and passed the best part of his life in Italy, he may properly be classed with the French school, into which he introduced the classical element, which even now forms one of its chief characteristics. He exercised the greatest influence upon the French painters who studied at Rome—Claude Lorrain, Lebrun, Mignard, Bourdon, etc. His art may be divided into two periods, the dividing point of which is his sojourn in France in 1640–42. His early manner is more brilliant and facile and better in color; afterward his art is more dominated by classic ideals and rigid in execution. His composition is symmetrical, though not always free; his drawing correct; his color, which has suffered much from the dissipation of surface pigments, now seems hard. In his figure compositions he rendered the feeling of the antique as had no man before him; besides which he was, more than any one else, the creator of the classic or heroic landscape, later developed by Claude Lorrain.

Nearly all the galleries of Europe possess examples of Poussin's works. The Louvre is richest, with 39, among the best known of which are the "Triumph of Flora" (1630); "Philistines Stricken by the Pestilence"; "Eleazar and Rebecca"; two "Bacchanals"; the "Last Supper"; "Orpheus and Eurydice"; "The Shepherds of Arcady," celebrated for its curious inscription *Et in Arcadia ego;* and his own portrait. In the Vatican is his "Martyrdom of St. Erasmus"; in the Barberini Palace (Rome) the "Death of Germanicus." Other examples are in the galleries of Berlin, Dresden, Vienna, Madrid (21), Dulwich, and the National Gallery, London. The well-known series of the "Seven Sacraments" is in the Belvoir Castle. His works were engraved by the most celebrated engravers of the day, including Audran, Pesne, and Stella. Consult: Poussin's *Letters* (Paris, 1824); his *Œuvres complètes* (ib., 1845); and his *Life* by Gault de St. Germain (ib., 1806) and E. H. Denis (London, 1899); also Victor Advielle, *Recherches sur Nicolas Poussin* (Paris, 1902).

POUT, or HORNED POUT. See BULLHEAD.

POUTER PIGEON. A breed of domestic pigeons capable of puffing out the throat and chest enormously by inflating the crop, which it does frequently. See PIGEON, and Colored Plate of PIGEONS.

POUTRINCOURT, pōō'trăn'kōōr', JEAN DE BIENCOURT (1557–1615). A French colonizer. He went to Canada in 1603, under the leadership of De Monts, and in 1604 received a grant of Port Royal. He busied himself principally, however, in trading with the Indians, and his colony suffered in consequence. In 1606 he fortified Port Royal and joined Champlain on an exploring expedition as far as Point Fortune, now the town of Chatham, in the Province of Ontario. His opposition to the Jesuits prevented him from carrying out the French King's wishes in regard to missionary work among the Indians. He returned to France in 1612, sailed again for Acadia after its desertion by the English in 1614, but did nothing for his Port Royal colony and finally returned to France the same year.

POUVILLON, pōō'vē'yôn', EMILE (1840–1906). A French novelist, born at Montaubon. His writings, describing life in the South of France, are simple and charming in style. They brought him the Vitet prize. He wrote: *Nouvelles réalistes* (1878); *Césette,* crowned by the French Academy in 1881; *L'Innocent* (1884); *Le cheval bleu* (1888); *Chante-pleure* (1890); *Petites âmes* (1893); *Pays et paysages* (1895); *L'Image* (1897); *Le vœu d'une chaste* and *Jep* (1900); *Petites gens* (1905). In 1899, in collaboration with D'Artois, he published *Le roi de Rome* and *Les Antibel.*

PÓVOA DE VARZIM, pō'vô-ä dâ văr-zēn'. A seaport of Portugal, in the Province of Entre-Minho-e-Douro, 18 miles north of Oporto (Map: Portugal, A 2). A bright, lively town and a favorite bathing resort for the people of north Portugal and Spain, its permanent population, consisting chiefly of fishermen, numbered, in 1900, 12,623; in 1911, 12,115.

POWDER. See EXPLOSIVES; GUNPOWDER; SMOKELESS POWDER.

POW'DERLY, TERENCE VINCENT (1849–). An American labor leader, born at Carbondale, Lackawanna Co., Pa. He received a common-school education, and after 1862 was in turn a switchman, car repairer, and machinist. He became president of the Machinists' and Blacksmiths' National Union, held several offices in the local and district assemblies of the Knights of Labor (q.v.), and in 1879 was elected General Master Workman of the latter organization. He reorganized the order and greatly furthered its interests, but in 1893 resigned owing to internal differences arising from opposition to his policy. In 1878, 1880, and 1882 he was elected mayor of Scranton as candidate of the Labor Greenback party. He was admitted to the bar of Lackawanna Co., Pa., in 1894, and to that of the United States Supreme Court in 1901. From 1897 until his resignation in 1902 he was United States Commissioner General of Immigration, and in 1907 he became chief of the Division of Information in the Bureau of Immigration, Washington. He assisted in establishing the *Labor Advocate* at Scranton in 1877, regularly contributed to the *Journal of United Labor*, and wrote on economic subjects for various periodicals of the United States and Canada. He was known also as a lecturer and published *Thirty Years of Labor: 1859–89* (1889); *The Labor Movement: The Problem of To-Day* (1890), with James and others; *Trusts* (1892), with Dodd.

POWDERY MILDEW. See GRAPE, *Diseases.*

POWELL, pou'ĕl, BADEN (1796–1860). An English mathematician and divine, born at Stamford Hill. He was educated at Oriel College, Oxford, and graduated in 1817 with highest honors in mathematics. He was ordained in 1820 and appointed vicar at Plumstead in Kent, 1821, but devoted his leisure time to mathematics. In 1824 he was elected a fellow of the Royal Society, and in 1827 Savilian professor of geometry at Oxford, which chair he held till his death. He was involved in various theological controversies and wrote some works on religious subjects. He was the father of Sir George and Sir Robert Baden-Powell. Among his works may be mentioned: *A Short Elementary Treatise on Experimental and Mathematical Optics* (1833); *Revelation and Science* (1833); *A Historical View of the Progress of the Physical and Mathematical Sciences* (1834); *The Connection of Natural and Divine Truth* (1838); *A General and Elementary View of the Undulatory Theory as Applied to the Dispersion of Light* (1841); *Essays on the Spirit of the Inductive Philosophy* (1855); *Christianity without Judaism* (1857); *The Order of Nature Considered with Reference to the Claims of Revelation* (1859); *On the Study and Evidences of Christianity* (1860).

POWELL, FREDERICK YORK (1850–1904). An English historian, Icelandic scholar, and Socialist. He studied at Rugby and at Christ Church, Oxford, where he was law lecturer, tutor, and senior student, later becoming fellow of Oriel College. But he is better known as an author and a contributor to the *Encyclopædia Britannica* and the *English Historical Review.* With Vigfusson he edited and translated the *Corpus Poeticum Boreale* (2 vols., 1881) and an *Icelandic Reader* (1879). Alone Powell wrote: *Early England up to the Norman Conquest* (1876); a history of *England to Death of Henry VII* (1885); *Old Stories from British History* (1894); and, with Vigfusson, *Origines Islandicæ* (posthumous, 1905). Consult *Life and Letters* edited by O. Elton (2 vols., 1906).

POWELL, JOHN WESLEY (1834–1902). An American soldier, explorer, geologist, and anthropologist, born March 24, 1834, at Mount Morris, N. Y. His parents had come to the United States from England a short time before his birth, and his early childhood was passed in Ohio, Wisconsin, and Illinois. He studied in the preparatory departments of the Wesleyan College at Wheaton, Ill., and of Illinois College, and during 1857–58 at Oberlin College, where he discovered his bent towards natural science. When the Civil War broke out he at once enlisted as a private in the Union army; after short service he rose to the rank of major, and was subsequently offered the commission of colonel, but declined. While serving as major at the battle of Shiloh he lost his right arm. At the close of the war he accepted an appointment as professor of geology in Illinois Wesleyan University, at Bloomington, in 1867 resigning this to take a similar position in Illinois Normal University. In the summer of the latter year Major Powell visited the Rocky Mountains of Colorado for exploration and research. The following year he organized a party of mountaineers and explored a portion of the Colorado River region, finally going into winter quarters on the White River. On May 24, 1869, the party of 10 set out on a voyage through the cañon which lasted more than three months and was fraught with great dangers and hardships. The result of this daring expedition brought Major Powell into prominence before the scientific world, and from that time until his death he was an active and conspicuous personage among American scientists. In 1869 he induced Congress to establish a geological and topographical survey of the Colorado River and its tributaries, an undertaking which consumed the following 10 years. Meanwhile, to enable Powell to make further explorations, Congress voted $10,000, and during 1871–73 he made his second expedition down the Colorado River. The establishment between 1865 and 1875 of many surveys of the Western country, which acted independently and often in competition with one another, led Powell to attempt a satisfactory adjustment of these surveys under some combined system of operation. As a result of this, Congress, in March, 1879, discontinued the separate surveys and established the United States Geological and Geographical Survey, which had Clarence King as its first director. During Powell's Western work he gathered for the Smithsonian Institution much valuable ethnological and anthropological material regarding the American Indians, and in 1876 this was published as *Contributions to North American Ethnology.* On the retirement of King from the directorship of the Geological Survey in 1881, Powell was appointed his successor. In 1894 he resigned this office to devote himself to the directorship of the Bureau of Ethnology, and to psychological and philosophical studies, in which field he published *Truth and Error* (1899). He died at Haven, Me., Sept. 23, 1902.

Major Powell was a member of most of the important scientific societies of the United States, and served as president of the Anthropo-

logical Society of Washington and (1888) of the American Association for the Advancement of Science. He was the recipient of many honors from foreign societies, among which was the Cuvier prize, awarded to him and his associates on the Survey in 1891. In 1915 a monument to him (a great seat with a bronze tablet) was about to be erected by the government on Hope Point, Colorado River. His important contributions to scientific literature include the following: *Exploration of the Colorado River of the West and its Tributaries* (1875); *Report on the Geology of the Uinta Mountains* (1876); *Report on the Arid Region of the United States* (1879); *Introduction to the Study of Indian Languages* (1880); *Studies in Sociology* (1887); *Canyons of the Colorado* (1893); *Physiographic Processes, Physiographic Features, and Physiographic Regions of the United States* (1895). Consult: G. K. Gilbert (ed.), *John Wesley Powell: A Memorial* (Chicago, 1903); F. S. Dellenbaugh, *A Canyon Voyage: The Narrative of the Second Powell Expedition* (New York, 1908); id., *The Romance of the Colorado River* (3d ed., ib., 1909); W. M. Davis, in the *National Academy of Sciences, Biographical Memoirs* (Washington, 1915).

POWELL, LYMAN PIERSON (1866–). An American Protestant Episcopal clergyman and college president, born at Farmington, Del. He graduated from Johns Hopkins in 1890, studied at the universities of Wisconsin (1892–93) and Pennsylvania (1893–95), and in 1897 completed the course of the Philadelphia Divinity School. Ordained a priest in 1898, he had several charges (at Ambler and Lansdowne, Pa., and at Northampton, Mass.) until 1912. After a year as professor of business ethics at New York University, he became president of Hobart College and of William Smith College (Geneva, N. Y.) in 1913. Dr. Powell is author of *The History of Education in Delaware* (1893); *Family Prayers* (1905); *Christian Science: The Faith and its Founder* (1907); *The Art of Natural Sleep* (1908); *The Emmanuel Movement in a New England Town* (1909); *Heavenly Heretics* (1909). He edited: *American Historic Towns* (4 vols., 1898–1902); *Current Religious Literature* (1902); *Devotional Series* (3 vols., 1905–07); *Religion in our Colleges and Universities* (1912).

POWELL, MAUD (1868–). An American violinist, born in Peru, Ill. Her first teacher was W. Lewis, of Chicago. In 1880 she entered the Leipzig Conservatory as a pupil of Schradieck. After a year with Dancla in Paris she went to Berlin to Joachim in 1884, and made her début, in 1885, with pronounced success, at a concert of the Berlin Philharmonic Society. On her return to her native land she met with instant recognition, and thereafter was held in the highest esteem. She made extensive tours of Europe, South Africa, and the United States. She was tireless in bringing out new works for the violin; indeed no other American musical artist ever introduced so many programme novelties. The American composer found in Maud Powell a most energetic and intelligent champion. In 1904 she was married to H. G. Turner.

POWELL, SIR ROBERT STEPHENSON SMYTH BADEN-. See BADEN-POWELL, SIR R. S. S.

POWER (OF. *povoir, pouoir, poer,* Fr. *pouvoir,* It. *potere,* power, from ML. *potere,* for Lat. *posse,* to be able). In the English and American law of real property, an authority vested in one or more persons enabling them to make valid conveyances of land irrespective of their having any interest therein themselves. Such a power may be created by any instrument capable of transferring real estate, but it is most frequently conferred by will. It may be general, authorizing the person in whom the power is vested (known as the donee of the power) to convey to any person whatsoever, including himself; or special, where the exercise of the power is restricted to certain persons or classes of persons. The latter is its more usual form.

The will of the person creating the power (known as the donor) must be strictly observed, not only as to the persons in whose favor it may be exercised, but also as to the time and mode of its execution, whether during the lifetime of the donee, by deed, or at his death, by last will and testament. The power when duly executed is operative to divest the estate of the person by whom the land is then held and to vest it in one or more others according to its terms. But the deed or will by which this result is produced is regarded not as that of the donee executing the power, but as that of the donor by whom it was created, and it derives its efficacy from the instrument by which the power was created. Its operation, therefore, is to invalidate (or, more properly, to revoke) the previous existing title and to substitute the title of the new appointee in its stead. Accordingly, where, as in the ordinary case, the real property is vested in one person and the power of appointment, as it is more fully described, in another, the legal title of the former is held in strict subordination to the power held by the latter, and the due execution of the power will invalidate any conveyance or incumbrance of the property by such owner.

Powers are described as owing their efficacy to the Statute of Uses, which had the effect of transforming into legal estates the equitable interests in land, which, under the former practice of conveying property to one person to the use of another, might have been created by parol appointment. Thus, the owner of land might give to another the use thereof, reserving to himself or giving to another the right or power of revoking such use or trust and appointing another in lieu thereof. It will be seen that it needed only the touch of the statute, converting these uses into legal estates, to put into effect the elaborate system of powers above described. This system forms an important and intricate chapter in the law of real property. It has, however, been greatly modified by statute in many of the United States. Consult E. B. Sugden, on *Powers* (8th ed., London, 1861), and H. T. Tiffany, *The Law of Real Property and Other Interests in Land* (2 vols., St. Paul, 1903).

POWER, IN MATHEMATICS. See EXPONENT.

POWER, IN PHYSICS. The work done by a machine or any agency in a unit of time. In the C. G. S. system the unit of power is one erg per second. Other units are, however, in practical use. Such are the watt, or 10^7 ergs per second, and the horse power, or 33,000 foot pounds per minute (this equals 746 watts approximately).

POWER, TRANSMISSION OF. The processes and methods of transmitting the power generated by prime motors to the machines and mech-

anisms operated in performing useful functions are among the most important problems of modern engineering. In practically all cases the power generated by a prime motor (steam engine, water wheel, or windmill) has to be transmitted through an appreciable distance to be applied to the machine which utilizes it in performing work. The means by which this is accomplished are various and may be classed as gears or gearing, belts, chains and ropes, compressed air, hydraulic pressure, and electricity.

Gearing is one of the oldest and most extensively used methods of power transmission for short distances. If two cylinders with parallel axes are pressed together and one of them is rotated on its axis, it will drive the other by means of the friction between the surfaces. If actual teeth are formed upon the two cylinders, we have a pair of gear wheels which drive each other by pressure upon the faces of the teeth if the teeth are properly shaped. If the driving gear and the driven gear are of equal diameter, they have the same speed of rotation; if the driven wheel is smaller than the driving gear, it rotates faster, and if it is larger it rotates slower. Intermediate gear wheels are commonly introduced between the driving gear wheel and the driven gear wheel, which may be of the same or of different diameters. By the suitable arrangement of gear wheels and proper variations of their relative size and form, the motor-shaft speed may be either increased or diminished and the direction of rotation may be changed to any angle with the driving shaft. See illustration under GEAR WHEEL.

Belts. Next to gear wheels the most familiar means of power transmission are belts. (See BELT.) If two cylinders mounted on parallel shafts are set so far away from each other that their surfaces do not touch, one may be driven from the other by encircling both with an endless flat belt of flexible material. The driving power from the motor shaft is transmitted to the driven shaft by means of the friction or adhesion between the surface of the belt and that of the two pulleys. Change of speed is accomplished by increasing or decreasing the diameter of the driven pulley as compared with the driving pulley. Change in the direction of rotation is accomplished by crossing the belt; thus, a horizontal or an oblique pulley can be driven from a vertical pulley. Belt transmission is particularly an American development and is more extensively used in this country than elsewhere. In English practice for many years gearing was preferred to belts, and at present rope drives are used in England in preference to belts. Rope transmission is similar to belt transmission in principle and operation, but in place of flat belts embracing smooth-faced pulleys, one or more parallel endless ropes embracing groove-faced pulleys are used. Rope transmission, like belt transmission and transmission by gearing, involves the use of shafting as a part of the transmission system. See SHAFTING.

The dynamic or wire-rope transmission is a special development of rope transmission, the most familiar example of which, perhaps, is the cable railway. The dynamic transmission is best suited to distances up to about 1 mile.

Chain Drives consist of an endless chain of flat links which embraces toothed wheels, into the spaces between the teeth of which the alternate links of the chain fall and fit. The links are often made of special edge profile so as to engage the teeth with the least sliding action. This makes such drives more silent. The toothed wheel is often called a sprocket wheel. Chain drives are much used where the distance between the shafts is too short for satisfactory belt drive and where slipping under the belt would be objectionable, as in motor vehicles, pumping, and electric drives.

Water under high pressure (700 to 2000 pounds per square inch and upward) affords a very satisfactory method of transmitting power to a distance, especially for the movement of heavy loads at small velocities, as by cranes and elevators. The system usually consists of one or more pumps capable of developing the required pressure (see PUMPS AND PUMPING MACHINERY); one or more accumulators by which a quantity of water may be accumulated at the required pressure (see ACCUMULATORS); the distributing pipes, and the presses, cranes, or other machinery operated. (See HYDRAULIC PRESS; HYDRAULIC-PRESSURE ENGINE.) Systems of hydraulic transmission for general industrial purposes exist in various European cities.

Air under pressure is extensively employed in transmissions for limited distances. (See AIR BRAKE; AIR COMPRESSOR; COMPRESSED-AIR LOCOMOTIVE; DRILL; HAMMER; PNEUMATIC DISPATCH; PNEUMATIC TOOLS.) Especially in mining compressed air is extensively used and may be transmitted over considerable distances. In Paris, France, air for power purposes is distributed through mains.

The most modern and most important means of power transmission is electricity, which is universally used for lighting, street-railway, and power service. The use of high-potential alternating currents has made the possibilities of this form of transmission far superior to any other for long distances. Such transmission as well as that over more limited distances will be found discussed under TRANSMISSION OF POWER, to which reference should be made.

King, *Elements of Mechanics of Material and of Power of Transmission* (ib., 1911); E. W. Kerr, *Power and Power Transmission* (3d ed., ib., 1914).

POW'ER, D'ARCY (1855–). An English surgeon, born in London. He was educated at New and Exeter colleges, Oxford, graduating from the latter in 1878. Four years later he took his degree of M.B. Settling in London, he became connected with several hospitals, at St. Bartholomew's serving as surgeon and lecturer. In 1883 he was admitted a fellow of the Royal College of Surgeons of England, in which he held the posts of examiner and Hunterian professor of surgery and pathology. His writings are on cancer, intestinal obstruction, and other medical subjects; *Memorials of the Craft of Surgery* (1886); a *Life of William Harvey* (1897); and biographies of eminent surgeons contributed to the *Dictionary of National Biography.*

POWER, FREDERICK BELDING (1853–). An American chemist, born at Hudson, N. Y. He

graduated from the Philadelphia College of Pharmacy in 1874 and from the University of Strassburg (Ph.D.) in 1880. After serving as professor of analytical chemistry at the former institution (1881–83) and as professor of pharmacy and materia medica at the University of Wisconsin (1883–92), he was director of the laboratories of Fritzsche Brothers in 1892–96 and thereafter till 1914 of the Wellcome Chemical Research Laboratories in London, England. Power received the Ebert prize of the American Pharmaceutical Association in 1877, 1902, and 1906, and was awarded gold medals at the St. Louis Exposition (1904), at Milan (1906), at the Franco-British Exhibition (1908), at Turin (1911), and the Hanbury gold medal (1913). At Liége (1905) he received a silver medal and at Brussels (1910) the grand prize. He made valuable original contributions to the chemistry of plant products, especially to our knowledge of both volatile and fatty oils. With Frederick Hoffmann he edited a *Manual of Chemical Analysis* (1883), and he translated several works. He became honorary member of various foreign societies.

POWER, (WILLIAM GRATTAN) TYRONE (1797–1841). An Irish comedian, born near Kilmacthomas, County Waterford. He was taken to Wales while a child, and there about 1813 made his first appearance on the stage. He met with little success, however, and for some time filled only minor rôles. In London he made his first success in the part of Larry Hoolagan O'Halloran in 1824, and from that time confined himself almost exclusively to the portrayal of Irish characters. His acting was distinguished by its rollicking humor. He made four successful tours in the United States. Power was lost at sea. In addition to several plays he wrote three romances and *Impressions of America* (2 vols., 1836). His grandson of the same name (q.v.) was also an actor.

POWER, TYRONE (1869–). An American actor, grandson of the actor of the same name. He was born in London, England. His first appearance on the stage was at St. Augustine, Fla., in 1886 in *The Private Secretary.* He played in *The Lion and the Lamb* at New York in 1889, starred in his own play, *The Texan,* in London in 1894, subsequently toured with Beerbohm Tree, then joined Mrs. Fiske's company in America, toured Australia in 1900–02, appeared in the title rôle of *Ulysses* (1903) in New York, and toured with Julia Marlowe in *When Knighthood Was in Flower* (1904). Subsequently Power played in *Yvette* (1904); *Adrea* (1905); *The Redskin* (1906); *The Christian Pilgrim* (1907); *The Servant in the House* (1908); *Thaïs* (1911); *Julius Cæsar* (1912); and *Mark Antony.*

POWER FACTOR. See ELECTRICITY.

POWER OF APPOINTMENT. An authority or power vested in a person, whether himself the owner of the premises affected or not, to create a new interest or estate in property in favor of some one whom he may select. For example, A may convey land to B for life, with power to appoint some person to whom the property shall go on B's death. Inasmuch as the power to appoint always involves the power to divest or revoke an estate already vested in some one, it is sometimes referred to as a power of revocation and appointment. See POWER, and consult Sugden, *Powers.*

POWER OF ATTORNEY. See ATTORNEY.

POWER OF THE KEYS. See KEYS, POWER OF THE.

POW'ERS, HIRAM (1805–73). An American sculptor. He was born July 29, 1805, on a small farm near Woodstock, Vt. As the farm proved insufficient for its support, his family moved to Ohio, where the boy first worked in a clock factory. Later he was employed for seven years to model and repair wax figures in a dime museum in Cincinnati. This occupation led to his moving to Washington, where he made wax portrait busts of leading men of the time, General Jackson, Daniel Webster, John C. Calhoun, Chief Justice Marshall, and others, which, being modeled from life, brought him into intimate relations with his famous subjects. In 1837 he carried the plaster casts of his busts to Italy, and to superintend their execution in marble he established a studio in Florence, where he spent the rest of his life. Within a year he had completed a statue, "Eve Tempted." His bust of Webster met with the approval of Thorvaldsen, and in 1843 he finished the well-known nude female statue, the "Greek Slave," of which many replicas were made, one being in the Corcoran Gallery, Washington. It had enormous success, especially in England, by reason of the beauty and chastity of its conception. A bust of "Proserpine," a statue of a "Fisher Boy" (Metropolitan Museum, New York), "America" (1854), "California" (1858, ib.), and "Eve Disconsolate" (Cincinnati Museum), are in the same style as the "Greek Slave." He made also statues of Franklin and Jefferson (1862, in the Capitol at Washington), of Washington for Louisiana, Webster for Boston, and Calhoun for South Carolina (1850). His best work, however, is in portrait busts of men. These include those of John Quincy Adams, Martin Van Buren (1835), Longfellow and General Sheridan (1865), and William J. Stone (Corcoran Gallery). Powers was a realist of strong convictions, but was lacking in skill and originality. Consult H. T. Tuckerman, *Book of the Artists* (New York, 1867), and Lorado Taft, *American Sculpture* (ib., 1903).

POWERS, JAMES T. (1862–). An American actor and vocalist. He was born in New York City, first appeared as Chip in *Dreams of Fun in a Photograph Gallery* (1880) in Boston, later played comedy rôles at Drury Lane and the Empire in London, and appeared as Rats in *A Tin Soldier* in New York. Powers played comedy parts in *Erminie, Nadjy,* and other operas, after 1891 starred in various farce comedies and operas, and later appeared in *The Blue Moon* (1906); *Havana* (1909); *Two Little Brides* (1912). In 1913 he reappeared as Wun-Hi in *The Geisha,* one of his old successes.

POWHATAN, pou'ȧ-tăn' (c.1550–1618). A famous Indian sachem. His real name was Wahunsonacook, Powhatan being the name of his tribe. He was originally a chief, or *werowance,* of 8 tribes, but gradually gained control over at least 34 tribes in the surrounding country and, for an Indian, lived with the greatest pomp and ceremony. He lived part of the time at a village, Powhata, near the site of the present Richmond, and part of the time at another village, Werowocomoco, in the present Gloucester County, Virginia, about 15 miles from Jamestown. Powhatan's dominions extended from the Roanoke River, in North Carolina, to the head of Chesapeake Bay, and in

all this country his will was despotic. In 1607 he held Captain John Smith as a prisoner for a time, and was said to have condemned him to death and to have spared him on the intercession of Pocahontas (q.v.), his daughter. In 1609 Smith and Capt. Christopher Newport visited him to secure provisions, and formally crowned him, with much ceremony, as the Emperor of the Indies. Since Captain Smith had attempted to capture Powhatan, he planned, in retaliation, the destruction of the English, who were saved by the timely warning of Pocahontas. For the most part he was very suspicious of the colonists, but during his later years lived on terms of peace with them. Powhatan died in April, 1618, and was succeeded by his brother Opechancano.

POWHATAN CONFEDERACY. A confederacy of Algonquian tribes of eastern Virginia, deriving its name from its organizer and ruling chief, Powhatan (q.v.). The territory of the confederacy comprised all of tidewater Virginia from Chesapeake Bay inland to the falls of the principal rivers, or just west of a line drawn through Fredericksburg, Richmond, and Petersburg, and may possibly have included also the Virginia counties on the eastern shore, although this may be considered doubtful. The tribes included within the confederacy numbered about 30, of which the Pamunkey, Chickahominy, Nansemond, Nantaughtacund, Potomac, and Wicocomoco were the largest. Their total population was estimated by Smith in 1607 at 2400 warriors, possibly 8000 souls, occupying about 200 villages and small settlements along the streams. The confederacy as it then existed was of recent extension, all, excepting those tribes adjoining the site of Richmond and upon the Pamunkey and its branches, having been conquered and annexed by Powhatan during his lifetime. It was not until the settlement of Jamestown in 1607 that continuous intercourse between the whites and the Powhatan tribes began. The first contact was generally friendly, but a hostile feeling soon sprang up between the two races, which was fast leading to open warfare when, on account of the marriage of Pocahontas to John Rolfe, Powhatan was induced to make a treaty of peace and friendship with the English. This peace lasted until after his death in 1618, when his successor, Opechancano, organized a conspiracy to drive the whites from the country. On March 22, 1622, the war began with a general massacre, in which 347 persons perished and the majority of the scattered settlements were destroyed.

A war of 14 years' duration ensued, until both sides were exhausted, when peace was made in 1636. The greatest event of this war was the battle of Pamunkey in 1625, when Governor Wyatt engaged and defeated nearly 1000 Indian warriors and destroyed the principal town of the confederacy. In 1644 Opechancano organized a second conspiracy, which began with a general attack upon the settlements, resulting in the death of about 300 settlers, but the Indians were already decimated and impoverished and unable to follow up their temporary advantage. Within a year the war was ended by the capture and death of the old chief; each remaining tribe made what terms it could for itself, and the confederacy came to an end. In 1669 a census showed that the 2400 warriors of 60 years ago had been reduced to 528, a diminution from perhaps 8000 to about 1600 souls, or hardly one-fifth the original number. In the war of Bacon's rebellion, 1675–76, they were again hunted down like wild animals until the fugitives took refuge in a palisaded fort near the site of Richmond. The fort was stormed and men, women, and children were massacred by the whites. Those who escaped were allowed to live on condition of an annual tribute from each village. In 1684 four chiefs attended as delegates at the making of a treaty at Albany by which the Iroquois agreed to cease their attacks upon the Virginia remnants. This is their last prominent appearance in history. In 1705 they had four towns, the largest being Pamunkey, with about 200 souls. There were in 1915 about 200 representatives of the old stock.

All the typical Indian customs of scalping, tattooing, dancing, and medicine men were found among the Powhatan tribes when first known to the whites. They wore very little clothing beyond the G string for men and a short skirt for women, with a robe for state occasions or in very cold weather. The men commonly shaved the hair on one side and left it flowing loosely on the other. Their houses were wigwams of wagon-top shape, with framework of poles covered by bark or mats, sometimes built closely together and surrounded by stout palisades. They cultivated corn, beans, squashes, and tobacco, which, with fish, game, and wild fruits, gave them an abundant subsistence. They were expert at shaping dugout canoes and weaving fish nets and baskets. The dead were buried in the ground or preserved in a mummified condition in houses built for the purpose. They had an elaborate mythology and ceremonial, of which very little is now known, with sacred temples guarded by priests. Tribal government was based on the clan system, with descent in the female line. Their history proves that they were brave and expert warriors. Their modern mixed-blood representatives are either fishermen or farmers. See OPECHANCANO; POCAHONTAS; POWHATAN; VIRGINIA.

POWN'ALL, THOMAS (1722–1805). An English statesman and Colonial official. He was born at Saltfleetby, Lincolnshire, graduated at Trinity College, Cambridge, in 1743, and soon afterward obtained a place in the office of the Board of Trade and Plantations. In 1753 he removed to New York as private secretary to Governor Osborn. The next year he was present at the Albany Congress and while there became convinced of the desirability of intercolonial union. About this time he made the acquaintance of Benjamin Franklin, and the friendship then formed lasted until Franklin's death. In 1757 Pownall became Governor of Massachusetts and shortly afterward of New Jersey also, but soon resigned the latter office. He was very active in raising troops to fight against the French. Having grown tired of his office and applied for his recall, he was in 1759 appointed Governor of South Carolina, but he returned to England without visiting that Colony. In England he proved himself a stanch friend of the colonists. He contended that they were entitled to the same rights as Englishmen and proposed a scheme for what would now be called Imperial federation. From 1768 to 1780 he was a member of Parliament and as such denounced the oppressive acts directed at the Americans; but when war broke out he gave some support to Lord North and opposed Burke's conciliatory

bill of November, 1775. Soon afterward, however, he declared that the Colonies were lost forever, urged that to circumvent the French a commercial treaty should be negotiated with the colonists, and in 1780 brought in a bill for making peace. By most of his contemporaries Pownall was regarded as a visionary on political matters, but he really possessed profound insight, and he foresaw, among other things, the future preponderance of the English race in America. As a scientist, antiquary, and man of letters he was better appreciated and was a member of the Society of Antiquaries and of the Royal Society. He wrote on a great variety of subjects. His works include: *Administration of the Colonies* (1764); *Topographical Description of the Middle Colonies* (1776); *Memorial to the Sovereigns of America* (1783); *Hydraulic and Nautical Observations on the Currents of the Atlantic Ocean* (1787), with notes by Dr. Franklin; *Memorial to the Sovereigns of Europe and the Atlantic* (1803). Consult C. A. W. Pownall, *Thomas Pownall* (London, 1908).

POX, THE. See SYPHILIS.

POYN'INGS, SIR EDWARD (1459–1521). An English statesman. In 1483 he took a prominent part in the Kentish uprising in behalf of Buckingham in the insurrection of the latter against Richard III. His name having appeared in Richard's proclamation, he fled to the Continent, identified himself with the fortunes of Henry, Earl of Richmond (later Henry VII), and landed in England with the Earl in 1485. In that year he became Privy Councilor, and in 1492 was sent with a force of 1500 men to reenforce Maximilian I in the contest with his rebellious subjects in the Netherlands. He effectually did away with rebel privateering and with the Duke of Saxony captured Sluis. In 1494 he was sent with an army to Ireland as Lord Deputy, with the purpose of completely subjugating the country, and in the same year convoked a Parliament which, under his direction, passed various acts that crushed the Yorkist party in Ireland and placed the administration of Irish affairs under the direct control of the English crown and Privy Council. (See IRELAND.) He made two expeditions to Ulster, drove the Pretender, Perkin Warbeck, to Scotland, and was recalled in 1496.

POYNINGS LAW. A statute enacted by the Irish Parliament at Drogheda in 1494. See IRELAND, *History;* POYNINGS.

POYNTER, SIR EDWARD JOHN (1836–). An English historical and decorative painter and author. He was born in Paris, the son of Ambrose Poynter, an architect. He studied in London at Leigh's Art School and at the Royal Academy and under Gleyre in Paris. Returning to London, he served as Slade professor of fine arts at University College from 1871 to 1875, when he became director of the art schools at South Kensington Museum. From 1894 to 1905 he was director of the National Gallery. Elected Royal Academician in 1876, in 1896 he succeeded Millais as president of the Academy. He was made Baronet in 1902. His art, based upon classic models, is decorative and scholarly. A careful technician, he evinces talent for design and a sense of style. His work includes designs for frescoes, mosaics, stained glass, and tile work, notably in London in St. Paul's Cathedral, Westminster Palace, and South Kensington Museum, and in St. Stephens, Dulwich. For the English coinage of 1894 he made two sets of designs. His water-color landscapes and portraits are strong and simple. Among the classic oil paintings by which he is best known are: "Israel in Egypt" (1867); "Perseus and Andromeda" (1872); "Atalanta's Race" (1876); "The Ides of March" (1883, Manchester Gallery); "Idle Fears" (1894); the "Ionian Dance" (1899); "Lesbia and her Sparrow" (1907); "A Naval Disaster" (1912); and "A Visit to Æsculapius" (Tate Gallery), which is considered in point of technique one of the best products of English classicism. Poynter published *Ten Lectures on Art* (1879) and edited the *Illustrated Catalogue of the National Gallery* (1889–1900). Consult Cosmo Monkhouse, in the *Art Annual* (London, 1897).

POYN'TING, JOHN HENRY (1852–1914). An English scientist, born at Monton, Lancashire. He was educated at Owens College, Manchester, and at Trinity College, Cambridge, of which he became fellow in 1878, and in 1880 was appointed professor of physics at Mason College, Birmingham (now the University of Birmingham). He served as president of the Physical Society in 1905. His writings include contributions to the *Philosophical Transactions* and to the *Proceedings* of the Royal Society on the transfer of energy in the electromagnetic field, the mean density of the earth, the connection between the electric current and the electric and magnetic induction in the surrounding field, and other topics. His Adams prize essay (Cambridge, 1893), *On the Mean Density of the Earth,* was published in 1894. Poynting collaborated with Sir J. J. Thomson (q.v.) on a *Text-Book of Physics,* issued in parts between 1899 and 1914, the subjects treated being: *Sound, Properties of Matter, Heat, Electricity and Magnetism.* He published also *The Pressure of Light* (1910) and *The Earth: Its Shape, Size, Weight, and Spin* (1913).

POYNTZ, JOHN. See SPENCER, EARL.

POZARÉVATZ, pō'zhȧ-rĕ-vȧts, or **PASSAROWITZ,** pȧs-sä'rō-vĭts (Serv. *Pozarevac*). A town of Servia, situated about 35 miles southeast of Belgrade (Map: Balkan Peninsula, C 2). It has a considerable trade in agricultural products. It is noteworthy for the treaty concluded here on July 21, 1718, between Turkey on one side and Austria and Venice on the other. Turkey ceded the Banat, part of Servia (including Belgrade), and parts of Bosnia and Wallachia to Austria. She retained the Morea, which had been reconquered from the Venetians in 1715. Pop., 1900, 12,957; 1911, 13,411. Pozarévatz was captured by the Teutonic forces in 1915. See WAR IN EUROPE.

POZHARSKI, pō-zhär'skĕ, DMITRI MIKHAILOVITCH, PRINCE (1578–1642). A Russian patriot, liberator of Moscow from the Polish domination (1610–12). He fought against the Polish invaders, who had helped to place a pseudo-Demetrius upon the Russian throne, and for his successes was appointed voivode, or administrative official, of Zaraisk. In 1611 he marched upon Moscow against stubborn resistance, but was severely wounded and was compelled to retreat. Subsequently he assumed command of the volunteer forces assembled by Minin, a butcher of Nizhni Novgorod. With these he succeeded in expelling the Poles from Moscow, which they had held for two and a half years. He conducted further campaigns, was appointed boyar in 1613, and sent to Sweden on a diplomatic mission.

PÖZL, pĕts'l, JOSEPH VON (1814–81). A Bavarian jurist, born at Pechtnersreuth. He studied at the University of Munich, and became professor of law at Würzburg in 1845. Two years afterward, on the appearance of his *Kompendium des bayrischen Staatsverfassungsrechts* (1847), which was in direct opposition to the practices of the ministry, he was called to the chair of constitutional law at Munich. A member of the Frankfort Parliament of 1848, in 1858 he entered the Bavarian Lower Chamber, of which he became first president in 1865. His works on Bavarian law are many and valuable; especially important are the *Lehrbuch des bayrischen Verfassungsrechts* (1851; 5th ed., 1877); *Sammlung der bayrischen Verfassungsgesetze* (1852; 2d ed., 1868–69); *Die Gesetzgebung des Königsreichs Bayern seit Maximilian II* (1852 et seq.), with Dollmann.

POZZI, pô'tsē', SAMUEL JEAN (1846–). A French anthropologist and surgeon, born at Bergerac. He studied medicine under Broca in Paris, and in 1883 became head of the Hôpital de Lourcine (afterward called Broca). Devoting himself to gynæcology and the reform of its methods, Pozzi was commissioned by the Ministry of Education to study medical schools in Germany, England, Austria, Italy, and the United States. He founded the French surgical congress, was president of the Surgical Society of Paris, and in 1898 entirely remodeled the Hôpital Broca, making it one of the best-equipped hospitals in the world. Pozzi became professor of clinical gynæcology in the University of Paris. He wrote on anthropology and comparative anatomy, and was chosen president of the French Anthropological Society. On his medical specialty he published, among other valuable works, *Traité de gynécologie clinique et opératoire* (1890; 3d ed., 1897; trans. into German, English, Spanish, Italian, and Russian). From 1897 to 1902 Pozzi was Senator from Dordogne.

POZZO DI BORGO, pôt'sô dē bôr'gô, CARLO ANDREA, COUNT (1764–1842). A diplomat in the Russian service. He was born at Alata, Corsica, March 8, 1764, studied law at the University of Pisa, was an advocate in Corsica, and won high reputation for eloquence. Pozzo represented Corsica in the French National Assembly (1791–92) and was one of the Moderates. He returned to Corsica, where he attached himself to Paoli's party, and on the failure of that chief's plans retired to London. Here he became agent of the French émigrés, and in 1798 went to Vienna to promote an alliance of Austria and Russia against France, and accompanied the Russian army in the campaign of 1799. In 1804 he entered the Russian service as a Councilor of State. He was concerned in the Russo-Austrian alliance, which was dissolved by the battle of Austerlitz (1805); but after the Treaty of Tilsit he retired to Austria, from which Napoleon in 1809 demanded him. Pozzo fled to England (1810), stayed for some time, and then returned to Russia. He helped to bring about the rupture between Alexander I and Napoleon (1812). He also caused the defection of Murat and Bernadotte from Napoleon, and after the victorious allies had repulsed Bonaparte, Pozzo, at the Congress of Frankfort-on-the-Main, drew up the declaration "that the allies made war not on France, but on Napoleon." After Bonaparte's downfall he exerted himself with vigor at Paris (where he signed the Treaty of 1815 as Russian Ambassador) and at the Congress of Aix-la-Chapelle (1818) to ameliorate somewhat the hard conditions imposed upon France. He retired from public life in 1839, and settled in Paris, where he died, Feb. 15, 1842. His correspondence with Nesselrode (1814–18) appeared at Paris in 1890–97. Consult Vuhrer, *Notice biographique sur le comte Pozzo di Borgo* (Paris, 1842), and Maggiolo, *Pozzo di Borgo* (ib., 1890).

POZZUOLANA, pôt'swô-lä'nà, **POZZUOLANO, POZZOLANA, PUZZUOLANA.** A volcanic rock, or powder, which has hydraulic properties when ground and mixed with lime. It is named from its occurrence at Pozzuoli (the ancient Puteoli), near Naples. It is earthy in character, consisting of particles in a very loose state of aggregation, but its chemical composition may agree very closely with that of basalt (q.v.). Trass is a volcanic ash of similar properties found in the Rhine district of Germany, and santorin earth is still another volcanic ash used as a cement, which is found on the island of Santorin in the Greek Archipelago. Trass is much used in Holland in fresh-water and marine engineering work. Artificial pozzuolanas may be made from slag, brick dust, or ashes. The use of pozzuolana as a hydraulic agent was known to the ancients, and is mentioned by both Seneca and Pliny. It was obtained from in and near Rome and from many other places besides Puteoli. It forms the basis of the Roman mortar, for which its hydraulic qualities rendered it invaluable. Consult A. H. Heath, *A Manual on Lime and Cement* (London, 1893), and C. E. Eckel, *Cements, Limes, and Plasters* (New York, 1907). See CEMENT; CONCRETE; ROMAN ART.

POZZUOLI, pôt-swō'lē (Lat. *Putcoli*). A port in the Province of Naples, Italy, situated on the gulf of the same name, 6 miles west of Naples, with which it is connected by rail and by tramway (Map: Italy, F 1). It lies on a hill in a volcanic district, which is exceptionally rich in old Roman ruins of every description, including ancient piers and a few fragments of Cicero's famous villa. The Roman amphitheatre rises on three rows of arches, around which extends an exterior court. The arena is 369 feet long and 216 feet broad, and could be flooded with water for naval contests. Nero entertained guests here with gladiatorial combats, and here St. Januarius (q.v.) was in vain cast before wild beasts. The so-called Serapeum, in reality a market hall, was a square court with numerous small apartments surrounding it. It had 48 huge columns and its portico was graced by a frieze. In the court rose a round temple, with columns. The lower sections of the ruin are below sea level. The famous Solfatara in the immediate vicinity is the oblong crater of a semiextinct volcano. Sulphurous gases rise in it constantly, and the ground is hollow. Pozzuoli has mineral baths. An excellent cement is made from a peculiar earth found here. (See POZZUOLANA.) Near Pozzuoli is an important branch of the manufacturing firm of Armstrong & Co. It manufactures cannon and armor plate for the Italian navy, and is fostered by the government. The harbor has of late been improved by the government. The population in 1912, according to Baedeker, was 17,000.

The foundation of Pozzuoli is ascribed to fugitives from Samos (q.v.) in 528 B.C., who called their new town Dicæarchia, which Greek

name later gave place to the Latin name Puteoli. At first under the sway of Cumæ and later of Capua, it fell into the hands of the Romans, along with the latter city, in 338 B.C., and was fortified and held by them against Hannibal. After the conclusion of the Second Punic War the Romans planted a colony there, and the great prosperity of the city began and continued throughout the Empire. A mole was built, and Puteoli became the great emporium of trade with Alexandria and the Orient. It was also one of the most important cities of Italy for manufactures, and the beauty of its coast and the healing qualities of its sulphur springs enabled it to vie with its neighbors, Baiæ and Cumæ, as a fashionable watering place. Consult "Puteoli," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

PRAAM. See PRAM.

PRABODHA-CANDRODAYA, prä-bōd'hä-chän-drō'dä-yä (Skt., rise of the moon of intellect). A Sanskrit drama of the eleventh century by Krishna Misra, who wrote it for Kirtivarman the Chandella (1056–1116). The drama is in six acts and is an ardent defense of Vishnuitic Vedantism (see VEDANTA) against infidelity, Jainism (q.v.), and Buddhism (q.v.). The *dramatis personæ* are 44 in number, all of them abstract in character. The action of the drama, while not rapid, does not drag, and the play closes with the overthrow of the hosts of Passion and the triumph of Reason, which, by union with Revelation, will produce True Knowledge and annihilate the reign of Error. The Prabodha-Candrodaya has been edited by Brockhaus (Leipzig, 1845) and again at Bombay (1898), and it has been translated into German by Goldstücker (Königsberg, 1842) and Hirzel (Zurich, 1846) and into English by Taylor (Bombay, 1811; reprinted, ib., 1893). Consult: Lévi, *Théâtre Indien* (Paris, 1890); Boissevain, *Het indische tooneelstuk Prabodhacandrodaya: I, toelichting en beoordeeling* (Amsterdam, 1905); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

PRACTICE (from OF. *practiser, pratiser, practiquer, pratiquer*, Fr. *pratiquer*, to practice, from ML. *practicare, praticare*, to perform, from *practica*, business, fem. sing. of Lat. *practicus*, from Gk. πρακτικός, *praktikos*, practical, from πράσσειν, *prassein*, to do). In general, the acquisition of a special skill or dexterity by frequent performance of an action, or of a special experience by long familiarity with a subject. Psychologically regarded, it is a state of consciousness varying in degree with the amount of time and attention devoted to a problem and characterized in its higher stages by a maximal concentration of attention (together with all the advantages for observation that this insures) and by a maximal capacity for reproduction (extent and accuracy of memory). It is thus the converse of fatigue (q.v.). The determination of the stage of practice at which one is working is, therefore, of extreme importance in experimental psychology, especially in work of such fineness as, e.g., the comparison of short intervals of time. (See DURATION.) Thorkelson, in an investigation of the time sense, distinguishes no less than six degrees of practice, the characteristic difference limens of which vary from one-tenth to one-twenty-fifth or less. See DISCRIMINATION, SENSIBLE.

The distinction between general and special practice is important. General practice implies a familiarity with problems or actions of the same class or kind as those in hand; thus, any student who has worked in a psychological laboratory may be regarded as generally practiced in experimental psychology, whereas on entering the laboratory he was wholly unpracticed. So any one who has had piano lessons in childhood may be said to be generally practiced in musical appreciation and rendition. General practice furthers accuracy of observation and power of judgment at large. It does not imply, as special practice does, a peculiar facility for work of a special kind. General practice in piano playing does not assist one, in more than a general way, towards facility in rendering new compositions at sight; this facility must be gained by special practice with such compositions. Hence "general practice increases in direct proportion to special, but the reverse is not necessarily true."

The characteristics which we have assigned to the practiced consciousness—maximal degree and constant direction of attention, delicacy of perception, extent and accuracy of memory, confidence of judgment—are evidently of a functional nature; they tell us nothing of the contents or structure of consciousness. Practice introduces no new contents. It has, however, the effect of narrowing consciousness. The practiced observer is able, by the very fact of practice, to hold himself exclusively to the practiced subject matter and to ignore distracting influences. In this respect the practiced consciousness resembles the state of secondary passive attention (see ATTENTION), and differs in structure considerably from the unpracticed, in which attention is discursive and contents are more numerous and disconnected.

For the relation of practice to fatigue and for change of performance under practice, see FATIGUE; LEARNING.

Bibliography. E. L. Thorndike, *Psychology of Learning* (New York, 1913); E. B. Titchener, *Experimental Psychology*, i (ib., 1901); E. Kraepelin, *Die Arbeitskurve* (Leipzig, 1902); W. PRACTICE. In its strict legal sense, the manner or order of conducting civil or criminal actions with reference to the successive steps necessary to be taken in order to bring the proper parties before the court and to bring the action or proceeding to a final determination. It is less comprehensive than the term "procedure," which includes the greater part of the adjective law, i.e., the law relating to remedies, as opposed to substantive law, which defines rights. Consult: Tidd, *Practice of the Court of King's Bench* (4th Amer. ed., Philadelphia, 1856); Beach, *Treatise on the Modern Practice in Equity* (Cincinnati, 1894); E. R. Daniell, *Pleading and Practice of the High Court of Chancery* (6th Amer. ed., 3 vols., Boston, 1894); F. A. Stringer, *A B C Guide to the Practice of the Supreme Court* (London, 1903). See CODE; PLEADING; PROCEDURE.

PRADIER, prä'dyā', JAMES (1792–1862). A French sculptor. He was born in Geneva, of a family of French Protestant refugees, studied under Gérard and Lemot, and won the Grand Prix de Rome in 1813. He made his début in the Salon of 1819 with a statue of a

"Centaur and Bacchante," now in the museum at Rouen. Similar works are the "Toilette d'Atalante" (Louvre), the "Odalisque" (Museum of Lyons), "Poetry" (1846), the "Three Graces" (Château of Versailles), and "Sappho" and "Psyche" (both in the Louvre). His most important works, however, are the decorative figures of the Fontaine Molière, the figures in the spandrels of the Arc de Triomphe, the twelve Victories surrounding the tomb of Napoleon at the Invalides, and the statues of the cities of Lille and Strassburg in the Place de la Concorde, all in Paris. He made also the figures of the Fontaine Louvois; statues of Sts. Andrew and Augustine, in the church of St. Roch; the statue of St. Peter in St. Sulpice; a group of the "Marriage of the Virgin," in the Madeleine; and statues of Baron Gérard (Versailles), Jean Jacques Rousseau (Geneva), and Marshal Soult (Versailles).

Pradier's quiet, elegant, and graceful yet sensuous manner had many imitators, and created what may be called the style Louis-Philippe; but his influence disappeared under the romanticism of the following period. He was made a member of the Institut and professor at the Ecole des Beaux-Arts in 1827. For his biography, consult Etex (Paris, 1859).

PRADIER-FODÉRÉ, fō'dā'rā', PAUL LOUIS ERNEST (1827–). A French law scholar, especially known for his writings on international law. He was born and educated at Strassburg and was admitted to the bar in Paris, where subsequently he occupied the chair of public law in the Armenian College. In 1874 he went to Lima on the invitation of the Peruvian government to reorganize the department of law. Returning after the war with Chile, he became judge in the Court of Appeals at Lyons (1882). Among his works are: *Précis de droit administratif* (1853; 7th ed., 1876); *Principes généraux de droit, de politique, et de législation* (1869); *La question de l'Alabama et le droit des gens* (1872); *Cours de droit diplomatique* (1881; 2d ed., 1900); *Traité de droit international public européen et américain* (1885–1906).

PRADILLA, prä-dē'lyä, FRANCISCO (1847–). A Spanish historical and genre painter, born at Villanueva de Gallego, Province of Saragossa. He studied art under distressing privations, first at Saragossa, then at the Madrid Academy until success in a competition enabled him to attend the Spanish Academy in Rome, of which afterward he was director (1881). The second of his more important works, "Joanna the Mad Following her Husband's Coffin" (1878, Madrid Museum), received the medal of honor at the Paris Exposition of 1878, and with "The Surrender of Granada, 1492" (1882, Senate Chamber, Madrid), he won a gold medal at Munich in 1883. But although well composed and drawn, his large historical pictures are lifeless and artistically less interesting than his well-colored genre scenes from popular life, such as: "Market Day Near Vigo" (1892); "Washerwomen at the Brook" (Breslau Museum); "The Road to the Sanctuary" (1895); "Festivity at the End of Harvest" (1902); and "Near the Rivulet" (1905). He painted also good decorations, notably in the Murga Palace, Madrid. He won gold medals also in Vienna and Berlin, and was appointed director of the Prado, Madrid, in 1897.

PRADO, prä'dō. The national museum of painting and sculpture in Spain, situated at Madrid. The palace containing the museum was begun in the eighteenth century as a museum of natural history, and was completed early in the nineteenth century. The collection of 2500 paintings is one of the finest in the world. It originated in the collection of the Emperor Charles V, whose acquisitions were added to by Philip IV and Philip V. In the early nineteenth century Ferdinand VII combined in the Prado all the royal collections except that of the Escorial, and to these, in 1840, a collection of Flemish and Spanish primitives was added on the dissolution of the religious houses of Spain. It is a connoisseur's collection rather than that of a student. The paintings have been neglected, and many have been damaged by restoration.

The collection is especially rich in works of the Spanish school, of the early as well as the late period. There are 46 examples of Velazquez, most of them masterpieces, including the celebrated equestrian portraits of Philip IV, Prince Balthezar, and Olivarez's "The Surrender of Breda," "Las Meninas," "The Tapestry Weavers." There are many El Grecos, several Murillos, and rooms filled with Goyas. The Italian school is represented by painters of the golden age exclusively. There are nine Raphaels, some of them executed by pupils, including the celebrated "Cardinal Alidisio," the small "Holy Family," and "The Madonna with the Fish." Titian is magnificently represented by 38 canvases, including the celebrated equestrian portrait of Charles V, the standing portraits of Charles V and Philip II, and "The Worship of Venus." There are fine examples also of Tintoretto, Veronese, and Tiepolo. The early Flemish school is well represented. There are 65 Rubenses, some of them masterpieces, and 21 Van Dycks. Among the few early German subjects are two fine Dürers, while French painting of the seventeenth century is better represented than anywhere except in the Louvre. The collection of sculptures includes some masterpieces of ancient Greek art. Consult: C. S. Ricketts, *The Prado and its Masterpieces* (New York, 1904); Calvert and Gallichan, *The Prado* (ib., 1907); C. S. Ricketts, *Art of the Prado* (Boston, 1907); A. F. Calvaert, *The Prado* (London, 1907); J. C. Van Dyke, *New Guides to Old Masters: Madrid* (New York, 1914); also the official catalogue, edited by Madrazo (Madrid, 1907).

PRADO, prä'dō, MARIANO IGNACIO (1826–1902). A Peruvian-Chilean soldier and politician, born at Huánaco. In 1854 he took a prominent part in the revolution that overthrew General Echenique, and again in 1865 was a leader in the movement against President Pezet, whose temporizing attitude towards Spain he strongly opposed. He forced Pezet to resign, and assumed control of the government. Having formed an offensive and defensive alliance with Chile, he declared war against Spain, and defended Callao against bombardment by the Spanish fleet (May 2, 1866). He then reformed the constitution, and was President in 1867, but the next year he was forced by a revolt to flee to Chile. Again President in 1875–79, he had a troublous administration. When outgeneraled in a war with Chile he resigned in favor of the Vice President and sailed for Europe. Prado was permitted in 1886 to return to Lima, where he took no further noteworthy part in politics. He died in Paris.

PRADON, prȧ'dôn', NICOLAS (1632–98). A French dramatic poet, born at Rouen. He came to Paris at an early age and devoted himself to play writing. His *Phèdre et Hippolyte* (1677) he was ordered to write by the Duchess de Bouillon and her brother, the Duke de Nevers, who were at the head of the plot against the *Phèdre* of Racine. A claque was hired to applaud the worse than mediocre play of Pradon at the cost of Racine's, and such was its success that it may well have been one reason why Racine wrote no more dramas for 12 years. Other works by Pradon are *Pyrame et Thisbé* (1674); *Tamerlan* (1675); *Regulus* (1688). Collections of his works were published in 1679, 1682, and 1700.

PRADT, prȧt, DOMINIQUE DE (1759–1837). A French prelate and diplomat. He was born at Allanche (Auvergne), studied first in a military school, was ordained priest in 1783, and became doctor of theology at the Sorbonne in 1785. As vicar-general of the diocese of Rouen he represented it in the States-General of 1789, and, siding with the Clerical party, was forced to number himself among the *émigrés* (q.v.) in 1791. After the 18th Brumaire (Nov. 9, 1799) he returned to Paris and later became chaplain to Napoleon and Bishop of Poitiers. For his part in negotiating the Treaty of Bayonne, in 1808, by which Napoleon dethroned the house of Bourbon in Spain, he received as a reward the archbishopric of Mechlin. But his failure on a mission to Warsaw in 1812 resulted in his being retired to his diocese. Now openly embracing the cause of the Bourbons, Pradt was nominated by Louis XVIII Grand Chancellor of the Legion of Honor. Within a year, however, he was replaced by Marshal Macdonald. He was also relieved of his archbishopric of Mechlin, but received a pension of 12,000 francs from the King of the Netherlands. Retiring to his estate in Auvergne, he devoted himself to literary work. Pradt was elected Deputy from Clermont in 1827 and sided with the opposition, but after the revolution of July he renewed his Royalist allegiance. Among his numerous works are: *Histoire de l'ambassade dans le grand-duché de Varsovie en 1812* (1815; 9th ed., 1826); *Du congrès de Vienne* (1815); *Mémoires historiques sur la révolution d'Espagne* (1816); *Des colonies et de la révolution actuelle de l'Amérique* (1817); *L'Europe et les colonies depuis le congrès d'Aix-la-Chapelle* (1821). Consult De Lastic-Rochegonde, *Dominique de Pradt* (Saint-Armand, 1897).

PRADYUMNA. See KAMA.

PRÆCOCES, prē'kō-sēz (Lat. nom. pl., premature, precocious). Those birds which, like the domestic fowl, run about and look after themselves, picking up their own food as soon as they are hatched; opposed to altrices. See BIRD; NIDIFICATION.

PRAED, prād, ROSA CAROLINE MACKWORTH (MRS. CAMPBELL PRAED). See AUSTRALIAN LITERATURE.

PRAED, WINTHROP MACKWORTH (1802–39). An English poet, born in London. He was educated at Eton and at Trinity College, Cambridge, of which he became a fellow in 1827, was called to the bar (1829), sat in Parliament (1830, 1834, 1837), became secretary to the board of control (1834) and afterward deputy high steward to the University of Cambridge. Praed was one of the prime movers in establishing a national system of education. His light essays and poems were contributed to various periodicals. As a writer of society verse Praed stands in the first rank. "Araminta," "The Vicar," and "My Little Cousins" well represent his range. Consult: *Poems*, edited, with memoir, by Derwent Coleridge (2 vols., London, 1864); selections from the poems, edited by Cooper in the "Canterbury Poets Series" (ib., 1886); *Political and Occasional Poems* (ib., 1888); and a collection of his essays published in Morley's *Universal Library* (ib., 1887).

PRÆMUNIRE (Lat., to forewarn). In English law, an offense of the nature of a contempt against the sovereign and his government and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire*, or *præmonere*, *facias*) of a writ originally introduced for the purpose of repressing papal encroachments on the power of the crown. The first statute of præmunire was passed in the reign of Edward I. The assertion by the Pope of the right to name the incumbents of vacant benefices in disparagement of the authority of the bishop, the crown, or other persons entitled by English law to fill the same was the immediate cause of various subsequent statutes of præmunire, which made it penal to endeavor to enforce the authority of papal bulls and provisions in England. By later statutes a number of offenses of a miscellaneous description have been rendered liable to the penalties of a præmunire.

PRÆNESTE, prē-nēs'tē. The modern Palestrina. A very ancient city of Latium, situated on the slope of the hills about 20 miles southeast of Rome. Tradition ascribed its foundation to Telegonus, the son of Ulysses, or to a certain Cæculus, son of Vulcan. It was one of the important cities in the early Latin League, and is first mentioned by Livy (ii, 19, 2) as taking the side of Rome against the other cities of the league in 499 B.C. In 383 B.C. the town began to lord it over the allies of Rome, and two years later declared war on Rome. It was vanquished and forced to surrender to Cincinnatus (380 B.C.). In the Hannibalic war the Prænestines were faithful to Rome, and were rewarded with an offer of Roman citizenship, which, with lofty local pride, they refused to accept. They spoke a dialect of Latin which seemed amusing to the Romans, and to the people of the metropolis their habits seemed provincial. During the civil wars between Marius and Sulla (q.v.) Marius (q.v.) made Præneste his headquarters, but the city was taken and destroyed by Sulla (82 B.C.), who rebuilt it with great splendor and settled a Roman colony there. Under the Empire Præneste was a favorite summer resort, on account of its lofty position. Præneste was renowned for its large and magnificent temple of Fortune, with an oracle much frequented by worshipers. (Cf. *Sortes Prænestinæ*, Cicero, *De Div.*, ii, 41.) During the Middle Ages Palestrina was long a bone of contention between the popes and the powerful Colonna family, and was destroyed in 1436, but afterward rebuilt. In 1630 Pope Urban VIII ceded it to the Barberini. Palestrina is now a squalid town occupying approximately the site of the ancient temple of Fortune; its population in 1909, according to Baedeker, was 7000. Besides the Barberini Palace it contains fine remains of the ancient polygonal walls. The great composer Giovanni Pierluigi da Palestrina was born here. Con-

Magoffin, "A Study of the Topography and Municipal History of Prænestе," in *Johns Hopkins University Studies*, vol. xxvi (Baltimore, 1908). See FIBULA PRÆNESTINA; ITALIC LANGUAGES.

PRÆNES'TINE BROOCH. See FIBULA PRÆNESTINA.

PRÆNO'MEN (Lat., forename, from *præ*, before + *nomen*, name). That one of the three names of the freeborn Roman which corresponds to the modern given or Christian name. See AGNOMEN; COGNOMEN; NOMEN.

PRAET, prät, JULES VAN (1806–87). A Belgian statesman and historian, born at Bruges. He studied law at Ghent, was appointed archivist of Bruges, later became secretary to Prince Leopold of Saxe-Coburg, and after the latter assumed the title of Leopold I, confidential adviser in the royal suite. In the various difficulties attending the beginnings of the monarchy he was of great assistance. He wrote a *Histoire de la Flandre* (1828), defective owing to the uncritical use of sources, and *L'Origine des communes flamandes* (1829), of much value. But his most important work is his *Etudes sur l'histoire politique des derniers siècles* (3 vols., 1867, 1874, 1884), an admirable series of essays on European politics, in which the analysis of noteworthy historical personages occupies an important place. Consult Wauters, *Notice sur Jules van Praet* (Brussels, 1889).

PRÆ'TOR (Lat., leader, governor, commander; originally *prætor*, from *præ*, before + *ire*, to go). The title of an important magistrate among the ancient Romans. The name meant originally simply leader, and as such was first applied to the two consuls, after the expulsion of the kings. As a separate office the prætorship was created in 366 B.C., open only to patricians as a compensation for the consulship, to which plebeians were now made eligible. (See LICINIAN ROGATIONS.) Thus the patrician prætor was a sort of third consul, and in fact was called colleague of the consuls, and was accompanied by 6 lictors, as the consuls were accompanied by 12. (See LICTOR.) In 377 B.C. the prætorship too was thrown open to the plebeians, and became the highest judicial office within the city and the immediate stepping-stone to the consulship. With the growth of Rome's foreign relations and the increase in the city's foreign population, the judicial business became too vast for one magistrate, and in 246 B.C. a second prætorship was founded. Thenceforth the original prætor, known as *prætor urbanus* (city prætor), presided over litigation between Roman citizens, while the foreign prætor (*prætor peregrinus*) presided over cases where one or both of the litigants were foreigners. In 227 B.C. two more prætors were appointed, for the special administration of affairs in Sicily and Sardinia, while Spain received two more in 197 B.C., and in course of time the number was further increased, until it reached the maximum of 18. The next titles of which there is mention are those of *prætores ærarii*, or *ad ærarium*, connected with the national treasury, and *prætores tutelarii*, a sort of judges of probate. The prætorship was ordinarily of annual tenure, and the age required was 30 years. After his year of service in Rome the prætor went as governor to some province.

Botsford, *The Roman Assemblies* (New York, 1909); F. F. Abbott, *A History and Description of Roman Political Institutions* (3d ed., Boston, 1911).

PRÆTO'RIAN GUARD (Lat. *prætoriæ cohortes, prætoriani*). The bodyguard of the Roman emperors. A *prætoria cohors*, or select guard of the most valiant soldiers, was attached to the person of Scipio Africanus (see COHORT); but it was to Augustus that its institution as a separate force was due. He formed nine cohorts, each consisting of 1000 men (horse and foot) under the command of a prefect; but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased the number of the cohorts to 16. The prætorians served at first for 12 and afterward for 16 years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the Imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favor with liberal donations. The prætorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications and unmindful as to how they obtained them. After the death of Pertinax (193 A.D.) they actually sold the purple for a sum of money to Didius Julianus; but in the same year their peculiar organization was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes they were entirely abolished by Constantine (312 A.D.). Consult the article "Prætoriani Milites," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

PRÆTO'RIUM (Lat. *prætorium*, neut. of adj. *prætorius*, belonging to the *prætor* (q.v.), transliterated into Gk. *πραιτώριον, praitōrion*). It signified originally the tent of the prætor or general; then the military council gathering there. It also designated the official residence of a provincial governor; after the time of Augustus, a palace or any magnificent dwelling; finally, the Imperial bodyguard. In the New Testament the Greek word is variously rendered, owing to the effort of the translators to convey in each case the local or specific significance of the term. Hence in the Authorized Version it is called "the common hall," margin, "governor's house" (Matt. xxvii. 27); "judgment hall," margin, "Pilate's house" (John xviii. 28, 33, xix. 9); "Herod's judgment hall" (Acts xxiii. 35); and "the palace," margin, "Cæsar's court" (Phil. i. 13). Only in Mark xv. 16, a passage parallel to Matt. xxvii. 27, is it called "prætorium." The Revised Version

renders the term in the Gospels by its transliterated form "prætorium," margin, "palace"; in the Acts passage by "palace," margin, "prætorium"; and in Philippians by "prætorian guard." Whatever building the governor occupied at any time was, by virtue of the fact, the prætorium. In Jerusalem this was probably the well-known palace of Herod, described by Josephus (*Ant.*, xv, iv, 3), a fortified structure near the Jaffa gate. It is possible that the reference in Matthew (xxvii. 27) and Mark (xv. 16) is not to any portion of Herod's palace, but to a court elsewhere located and designated prætorium because used for the military council of the garrison. Consult for further details the various commentaries on the passages enumerated above and Sir W. M. Ramsay, *Saint Paul the Traveler and the Roman Citizen* (New York, 1896).

PRÆTORIUS. See PRÄTORIUS.

PRAGA, prä'gà. A suburb of Warsaw (q.v.).

PRAGMATIC SANCTION (Fr. *pragmatique*, from Lat. *pragmaticus*, from Gk. πραγματικός, *pragmatikos*, relating to civil affairs, from πρᾶγμα, *pragma*, deed, from πράσσειν, *prassein*, to do). A solemn ordinance or decree of a sovereign dealing with matters of primal importance and regarded as constituting a part of the fundamental law of the land. The term originated in the Byzantine Empire and signified a public and solemn decree by a prince, as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. The name is given in later European history to several important decrees, of which the principal are: (1) those issued by the Emperor Frederick II in 1220 and 1232 confirming certain customary rights of local authority wielded by bishops and nobles in the German Empire; (2) an ordinance of Charles VII of France for the reformation of the Gallican church, issued in 1438 after the Council of Basel; (3) the decree of the Emperor Charles V, issued in 1547, declaring his Burgundian inheritance indivisible and the perpetual appanage of the house of Hapsburg; (4) and especially to the ordinance of the Holy Roman Emperor Charles VI, who, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa. The decree was issued in April, 1713, as a family law of the Hapsburgs, and between 1720 and 1724 was ratified by various national diets under the Austrian crown, becoming thereupon a part of the organic law. The act provided that in default of male issue to Charles VI the Austrian territories, which were declared inseparable, should descend in the female line according to the law of primogeniture. To lend greater security to the act, Charles VI sought to gain first the ratification of the Great Powers, and to this end Austrian policy was directed during the greater part of his reign. Among the guarantors of the sanction were Great Britain, France, Prussia, Russia, and Holland. Nevertheless the death of the Emperor was followed by a speedy repudiation of their pledge on the part of a number of the Powers and an attack on the Austrian dominions by Prussia, Bavaria, Saxony, and France, Spain entering into alliance with the last-named Power. England supported Austria. The conflict is known as the War of the Austrian Succession. Consult Varenbergh, "La pragmatique sanction de Charles VI, sa garantie et son infraction," in *Académie d'archéologie de Belgique*, vol. xxviii (Antwerp, 1872), and *Cambridge Modern History*, vol. vi (New York, 1909). (See AUSTRIA-HUNGARY; CHARLES VI; MARIA THERESA; SUCCESSION WARS.) (5) The settlement of the succession of the Kingdom of Naples, which was ceded by Charles II of Spain in 1759 to his third son and his descendants.

PRAGMATISM. A term which, first used in print in 1898 by William James (q.v.), has since become widely current to designate first a philosophical attitude and secondly a theory of logic. As a philosophical attitude pragmatism is expressed by James's summary: "Theories thus become instruments, not answers to enigmas, in which we can rest." The attitude is anti-intellectualistic. (See INTELLECTUALISM.) It is opposed to the assumption that the intellect can discover truth in the sense in which truth consists in correspondence between an idea in our mind and some external reality outside of the mind. All views of the world become thus ways that man has of handling his practical problems. For the person of pragmatic temper there is no significance in disputes about questions that have no practical bearing on experience and on life. Whether God or mechanical laws are responsible for the past history of the world is, for James, a meaningless question, for the past is an accomplished fact—it is bagged—and cannot be changed by any theory we may have as to its cause. On the other hand, the question at issue between materialism and theism becomes vital when we look to the future; materialism means that everything before us is cut and dried and that our efforts do not count, whereas theism means a future capable of being made to conform more or less to our ideals.

Pragmatism as a logic has concerned itself so far mainly, if not exclusively, with the question, What is truth? It denies that truth is a correspondence of our ideas with independent and objective fact or with an absolute truth experienced in some transcendental consciousness. Such correspondence, it maintains, never could be discovered, if it existed; and therefore, in accordance with the pragmatic attitude the assertion of such a truth has no significance; it can make nothing in our lives different from what it would be if there were no such truth. In the position taken by pragmatic logic towards competing views of truth, therefore, we see that the general pragmatic attitude becomes particularized in being applied to a special problem. Without the pragmatic attitude the pragmatic logic on its negative side would lose its whole significance. But the pragmatic logic has a positive side also; not content with brushing aside what it considers the irrelevancies of contrasting logics, it develops a positive theory of truth on an empirical basis. It takes the ideas that have been accounted true and tries to determine what it is in them that gives them this rating. James answers: "True ideas are those that we can assimilate, validate, corroborate, and verify. False ideas are those that we can not. But what do the words verification and validation themselves pragmatically mean? They, again, signify certain practical consequences of the verified and validated ideas. They lead us, namely, through the acts and other ideas which they instigate, into or up to, or towards, other parts of experience, with which we feel all the while—such feeling being among our potentialities—that the original ideas re-

main in agreement. The connections and transitions come to us from point to point as being progressive, harmonious, satisfactory. This function of agreeable leading is what we mean by an idea's verification." An idea thus agrees with reality, in the pragmatist sense of agreement, when it agreeably leads to reality. "To 'agree' in the widest sense with a reality *can only mean to be guided either straight up to it or into its surroundings, or to be put into such working touch with it as to handle either it or something connected with it better than if we disagreed.* Better either intellectually or practically!" It follows that the "truth of an idea is not a stagnant property inherent in it. Truth *happens* to an idea. It *becomes* true, is *made* true by events. Its verity *is* in fact an event, a process: the process namely of its verifying itself, its veri-*fication.* Its validity is the process of its valid-*ation.*"

But, while such "simply and fully verified leadings are certainly the originals and prototypes of the truth process," experience "offers indeed other forms of truth process, but they are all conceivable as being primary verifications arrested, multiplied, or substituted one for another." But there are true ideas that are not verified; no attempt is made to verify them; and "they form the overwhelmingly large number of the truths we live by. Indirect as well as direct verifications pass muster. Where circumstantial evidence is sufficient, we can go without eye-witnessing. . . . Verifi*ability* . . . is as good as verification. For one truth process completed there are a million in our lives that function in this state of nascency. They turn us *towards* verification; lead us into the *surroundings* of the objects they envisage; and then, if everything runs on harmoniously, we are so sure that verification is possible that we omit it, and are usually justified by all that happens. Truth lives, in fact, for the most part on a credit system. Our thoughts and beliefs 'pass,' so long as nothing challenges them, just as bank notes pass so long as nobody refuses them. But this all points to direct face-to-face verifications somewhere, without which the fabric of truth collapses like a financial system with no cash basis whatever. You accept my verification of one thing, I yours of another. We trade on each other's truth. But beliefs verified by *somebody* are the posts of the whole superstructure."

The brief exposition of pragmatism given above rests on James's writings; but it is altogether too simple and schematic to suffice for a thorough presentation of the pragmatic logic, which would be out of the question in this article. The most detailed and painstaking development of the pragmatic logic stands to the credit of John Dewey (q.v.) and his former colleagues of the University of Chicago. (See INSTRUMENTALISM.) F. C. S. Schiller (q.v.), of Oxford, has contributed most largely to the controversial development of pragmatism, but his positive work has been in the metaphysical application of pragmatism. (See HUMANISM.) His humanism, however, is admittedly more or less idiosyncratic; for "pragmatism may ultimately lead to a number of metaphysics, each of which will represent a personal guess at a final synthesis of experience, while remaining essentially undogmatic and improvable."

Although pragmatism is still very young, it has had rather an extensive history. C. S. S. Peirce (q.v.) seems to have been the first to make explicit the pragmatic principle, in 1878; James took it up in 1898 and elaborated and popularized it; Dewey deepened it by careful experiential analysis; Schiller aggressively martialized it and called it humanism. A large number of the former pupils of James and Dewey in the United States are somewhat pronounced pragmatists. In Germany pragmatism appears in varying degrees of mildness in the writings of Jerusalem, Jacoby, and others; in France it finds advocates, although Bergson's influence appears to have diverted the interest somewhat—for, while Bergson has some views that are pragmatic, he can hardly be called a pragmatist *sang pur.* In Italy Papini (q.v.) is even more militant than is Schiller in England. But even where pragmatism has not been accepted as a satisfactory attitude or logic, its influence has made itself powerfully felt, and very few alert thinkers of the last decade have been untouched by it. Incidentally it has contributed to a great revival of popular interest in philosophy.

PRAGUE, präg (Boh. *Praha*, Ger. *Prag*). The capital of the Austrian Crownland of Bohemia, situated on both banks of the Moldau, 150 miles northwest of Vienna (Map: Austria, D 1). Excluding the suburbs, Prague consists of seven parts: the Altstadt, on the right bank of the river; the old Ghetto, known as the Josephstadt and surrounded by the Altstadt; the Neustadt, which incloses the Altstadt; the Kleinseite, on the slopes of the Laurenzberg along the left bank of the river; the Hradschin, the kremlin of old Prague, lying on an elevation northwest of the Kleinseite; the new quarter of Wischehrad, on the right bank of the river south of the Neustadt; and the industrial quarter of Holeschowitz-Bubna in the northeast.

The Moldau is spanned in Prague by nine bridges, of which the best known is the Karlsbrücke (1357–1507), 546 yards long, with two mediæval towers and many buttresses embellished with statues of saints. They include that of St. John of Nepomuk, supposed to have been thrown into the river here by order of King Wenceslas IV and regarded by the Bohemians as a patron saint of bridges. The most inter-

esting portion of Prague is the Altstadt, which preserves its mediæval appearance. Its centre is the Grosser Ring, a fine square, with a monument (Mariensäule) erected in 1650 in commemoration of the liberation of the city from the Swedes. On the eastern side of the square stands the old Hussite Teyn Church (begun in the fourteenth century), adorned with two striking towers and containing the tomb of Tycho Brahe, marble statues of the apostles to the Slavs, Cyril and Methodius, and a fine winged altar.

Opposite the Teyn Church is the town hall, the oldest parts dating from 1381. It is a handsome building with a tower, and contains the council chamber of the old structure which has been so closely associated with the eventful history of the city. Its balcony is embellished with statues, and the council chamber contains a large painting by Brožik, "Huss before the Council of Constance." Besides the buildings of the famous university (see PRAGUE, UNIVERSITY OF) the Altstadt contains the Rudolphinum, a fine Renaissance edifice on the Rudolfs Quai, with a conservatory of music, an art industrial museum, and an extensive picture gallery, with many works by Bohemian, Dutch, Italian, French, and German masters; the Kreuzherren-Kirche, modeled after St. Peter's; the palace of Count Clam Gallas (1701–12), in the baroque style; the Kinsky Palace, with a valuable library; the Pulverthurm, a relic of the old wall which once separated the Altstadt from the Neustadt; and the Königshof, formerly the palace of the Bohemian kings, now used as barracks.

The Josephstadt formed the Ghetto of Prague until 1848, but is now inhabited mostly by Gentiles. It is the most densely populated portion of the city, and contains the old Jewish synagogue dating from the twelfth century and the curious Jewish burial ground crowded with ancient tombstones having Hebrew inscriptions and symbols denoting the tribe of the deceased.

The Hradschin contains a vast Burg begun, it is fabled, by Princess Libussa and completed by Maria Theresa. In the council chamber of the Burg is shown the window from which the two Imperial councilors were hurled in 1618—the initial act in the Thirty Years' War. The unfinished Gothic cathedral in the Hradschin was begun in 1344 and its choir completed in 1385. Among its interesting objects are the marble mausoleum of the Bohemian kings, the chapel of St. Wenceslas, embellished with precious stones and faded frescoes, and the silver monument to St. John of Nepomuk. In the western part of the Hradschin is the Premonstratensian abbey of Strahow (founded in the twelfth century), with its church of the Assumption, containing the tomb of St. Norbert, the founder of the order, and a picture gallery, library, and natural-history collection. Among other prominent features of the Hradschin are the barracks, formerly the palace of Count Czernin; the Capuchin monastery; the Renaissance palace called the Belvedere, erected by King Ferdinand I in 1538; the archiepiscopal palace; and the Schwarzenberg Palace.

The Kleinseite, though less attractive than the Altstadt and the Hradschin, possesses some buildings of historical and architectural interest. Chief among them are the churches of St. Nicholas and St. Thomas; the palace built by Wallenstein in 1623–30, with a fine garden and many valued relics of the general and a chapel containing paintings by Dürer and others; the palace of Nositz, with a notable picture gallery; the Lobkowitz Palace, with an extensive library; the hall of the Provincial Diet; and the Supreme Court.

The Neustadt, the largest part of Prague, with its fine streets, its modern public buildings, and the general air and stir of a modern city, presents an impressive contrast to old Prague. It contains the imposing Czech National Theatre completed in the Renaissance style in 1883; the Bohemian National Museum, opened in 1891, with its various collections and library; the new German theatre; the courts of justice, formerly a Rathaus; several fine banks and hospitals; an exchange, etc. Among its churches are the Maria Schnee-Kirche, St. Peter's, and the Karlshof. In the quarter of Wischehrad, adjoining the Neustadt, is the modern citadel built on the site of the old fortress destroyed by the Hussites.

During the latter part of the nineteenth century Prague greatly improved in appearance. It also extended its municipal activity, so that at present it owns the water works, the gas and electric plants, the markets, etc. The sanitary conditions have improved, and the park area has been enlarged. The administration is in the hands of a burgomaster and two deputies, an assembly, and a council. The fame of Prague as an educational centre dates from the Middle Ages, when its university was one of the leading institutions of higher learning in Europe. During the latter half of the nineteenth century the struggle for supremacy between the Germans and the Czechs and the revival of a national consciousness among the latter have given a strong stimulus to the intellectual life of the people. This found its expression in the establishment of many national educational institutions at Prague, the centre of Czech culture. In 1882–83 was established the Czech university, whose attendance is about two and one-half times that of the German university here. Some of the secondary schools have also since been duplicated, and show a steady increase in attendance. Besides the 2 universities and the 12 German and 6 Czech secondary schools, Prague has a German and a Czech polytechnic, seminaries for teachers, a school of art, a noted conservatory of music, and many special schools. The most prominent scientific organizations are the Bohemian Academy of Science, Literature, and Art, founded 1890; the Royal Bohemian Scientific Association, about 1770; and the Society for Literature in Bohemia, founded in 1891.

Situated on one of the chief waterways of Bohemia and at the junction of seven railway lines, Prague is naturally the economic centre of the crownland. Its industries are of a wide range, including the manufacture of various metal products, railway cars, leather, cotton goods, gloves, chemicals, beer, and flour. Prague is a great sugar market, and trades extensively in local manufactures and raw products. In population Prague is the third city (after Vienna and Budapest) of Austria-Hungary. The population of the city proper was 170,521 in 1880 and 182,530 in 1890. With an area of 8.1 square miles, Prague had 223,741 inhabitants at the census of Dec. 31, 1910, as compared with 222,831 in 1900. In 1910 Roman Catholics numbered 199,634 (89.2 per cent); Evangelicals, 4593 (2); Jews, 18,041 (8.1). Of the inhabit-

ants in 1910 (excluding 2570 foreigners) persons whose mother tongue was Bohemian (including Moravian and Slovak) numbered 202,067; German, 18,753. The Bohemian, or Czech, element increased from 74.1 per cent in 1900 to 77.1 per cent in 1910, while the German element declined from 7.7 to 6.3 per cent. Suburban to Prague are the three cities of Smichow, Karolinenthal (Karlín), and Köngliche Weinberge (Vinohrady Královské); the combined communal area of the three is 402 square miles, and their communal population in 1910 aggregated 419,395 and 541,504 in 1914, as compared with 326,789 in 1900.

History. Nothing definite is known about the foundation of Prague, but there is evidence that it existed as a town as early as the latter part of the tenth century. As the residence of the kings the town played a prominent part in the early history of Bohemia. The Altstadt obtained municipal rights and was surrounded with walls in the first half of the thirteenth century. The Neustadt was established about a century later. Under the rule of Charles IV Prague became, with the establishment of the university (1348), one of the principal cities of the German Empire. In the following century, however, it became the theatre of the Hussite wars (see HUSSITES), and many of its churches and a part of its fortifications were destroyed. It soon recovered and entered upon a new period of prosperity, which culminated under Rudolph II. In the seventeenth century came the Thirty Years' War, which began with the defenestration of the Imperial counselors at Prague (1618). In the battle of the White Hill, fought close to the city, the forces of Frederick of the Palatinate were completely defeated by the Imperialists in November, 1620. Prague was taken by the Saxons in 1631 and retaken by Wallenstein in 1632. In 1635 a peace was concluded here between Ferdinand II and the Elector of Saxony. In 1648 the Swedes captured the Kleinseite, on the right bank of the Vltava (Moldau)—the last episode of the Thirty Years' War. The city was taken by the French, Bavarians, and Saxons in 1741, and capitulated to Frederick the Great in 1744 after a devastating bombardment. Frederick won a victory over the Austrians here in 1757, and then unsuccessfully besieged the city. For the history of Prague during the nineteenth century, see the history of Bohemia. The peace of Prague, Aug. 23, 1866, terminated the Seven Weeks' War between Prussia and Austria.

PRAGUE, COSMAS OF. See COSMAS OF PRAGUE.

PRAGUE, LUKE OF. See LUKE OF PRAGUE.

PRAGUE, UNIVERSITY OF. Prague has two universities, one German, the other Bohemian. Of these the older and more famous is the former, which is the oldest of German universities. It was founded by Charles IV in 1348 on the basis of an older school dating from the middle of the thirteenth century, and was organized on the model of the University of Paris, with the four faculties of theology, law, medicine, and arts, and all rights and privileges of a *studium generale*. It has also one college, founded by Charles and endowed by Wenceslas IV. The Hussite movement interrupted the remarkable prosperity of the foundation, as Huss was one of the leading spirits of the institution, and rector in 1403. Owing to an order of Wenceslas IV, growing out of the Hussite disturbances, that the Bohemian nation should have three votes to the German one in the university convocation, the Germans seceded and founded the University of Leipzig (q.v.). Others joined Heidelberg and Cologne. The Hussite movement had been joined to a national Bohemian movement and had developed into a political as much as a religious agitation; the university from the time of the secession lost its cosmopolitan character and became more identified with Bohemian interests and development. In 1419 Catholics were expelled from the university, and in the troublous times that followed it lost most of its students and nearly all its property. In the latter part of the fifteenth century, however, the foundation of many colleges in great part repaired this loss In the seventeenth century its religious complexion was changed, and in 1654 it was united with the Jesuit college, coming under the influence of that order. The Czech movement of the nineteenth century found expression at the University of Prague, first in the increase of lectures in the Czech language, and eventually in the foundation of the Czech University of Prague in 1882–83, with the three faculties of law, medicine, and arts, to which theology was added in 1891–92. The Czech university has much outgrown its German rival. The number of students in the German university in 1912–13 was 2053; in the Czech university, 4406.

PRAIRIAL, prâ'rê'âl'. The ninth month in the French Republican calendar, extending from May 20 to June 18 in the years I–VII and from May 21 to June 19 in the years VIII–XIII.

PRAIRIE (Fr. *prairie*, It. *prateria*, from ML. *prataria*, meadowland, from Lat. *pratum*, meadow). In general, an undulating, grass-covered plain, as distinguished from a forested plain on the one hand and a semiarid region or steppe on the other. The name is applied more specifically to the extensive plain that stretches from southern Michigan and western Ohio across Indiana, Illinois, Missouri, Iowa, Wisconsin, and Minnesota, thus including almost the entire area between the Ohio and the Missouri-Mississippi rivers. West of the Missouri River this level expanse is continued by the Great Plains to the base of the Rocky Mountains, while on the east it merges imperceptibly into the Alleghany plateau. Its surface is unbroken by marked elevations, but the monotony is relieved by the broad undulations and by the channels of the streams tributary to the Ohio, Mississippi, and Missouri, which have been worn down in places so as to expose vertical walls or bluffs 100 feet or more in height. The elevation above sea level ranges from 300 to 1500 feet. The prairies are underlaid by Paleozoic sandstones and limestones in nearly horizontal position; but the surface formation is largely of glacial origin and consists of bowlder clay and sand more or less rearranged and decomposed by weathering and erosion. A fine sandy deposit resembling the loess of China occurs over wide areas in the Mississippi valley. The prairies are characterized by a heavy, rich soil admirably adapted for the growth of cereals, and while formerly covered only with grass and

supporting herds of buffalo and deer, they have been brought under a high state of cultivation. As to the characteristics of their vegetation prairies may be divided into two general groups: climatic, which include typical portions of the western part of the Mississippi valley; and edaphic, which are smaller and are developed almost without exception from swamps. Among the theories commonly held to account for the treelessness of the great Western prairies are: (1) the lack of sufficient rainfall; (2) the grazing of animals and the action of fire; and (3) the excessive transpiration, due to wind—all of which prevent the growth of trees. See HEMPSTEAD PLAINS; ILLINOIS; INDIANA; UNITED STATES; ETC.

PRAIRIE, THE. A novel by J. Fenimore Cooper (1827). It is the last of the Leatherstocking series.

PRAIRIE CHICKEN. See GROUSE.

PRAIRIE DOG. A Western American ground squirrel, two species of which (*Cynomys columbianus*, west of the Rockies, and *Cynomys ludovicianus*, east of these mountains) are locally common from the Canadian to beyond the Mexican boundary of the United States. The prairie dog is about a foot long and of robust form, with strong limbs and claws well calculated for digging. Its home is the dry upland plains, where it dwells in colonies, whose permanent towns, or burrows, each marked by a hillock of earth about the entrance, spread densely over many acres under the natural prehistoric conditions, but now sometimes cover hundreds of square miles. The burrows are deep and extensive and at first go down at a very steep slope to a depth of 12 to 15 feet, when they suddenly turn and run in a horizontal direction, and here and there branch into chambers, some of which are elevated and form family rooms. In other rooms fodder is stored, or refuse and dung are deposited. The mound about the hole is packed hard, not only by the tramping of the animals, but by their crowding it down with their noses; this hillock prevents water from running into the burrows when the plain is flooded by heavy rains, and serves also as a tower of observation. The prairie dogs feed on grass and herbage, which is soon exhausted near the burrows, compelling the animals to go farther and farther away for food. This they dislike to do, as it exposes them to attack from enemies; and after a time they prefer to dig a new burrow nearer a supply of food. Thus a town is always spreading and contains many empty burrows. Like other animals habituated to desert regions, they do not drink at all, and the early belief that subterranean pits were dug by them down to a water supply has been proved erroneous. Artesian wells within dog towns have failed to strike water as often as elsewhere. The animals are diurnal and most active morning and evening. They come out daily during the winter, except when it is very stormy; but this practice varies with the latitude and climate.

They are prolific, especially in the southern half of their territory, and would multiply with excessive rapidity were it not for numerous enemies, especially rattlesnakes and other serpents. These are courageously resisted by the prairie dogs, which sound the alarm the moment a snake enters a hole, gather, and proceed to fill the entrance with earth, packing it down, thereby sometimes entombing the snake forever. Probably few snakes go down the passages, which are so steep that they could with difficulty climb out, but depend on lying hidden in the grass and striking down the young squirrels when out at play or in search of food. This is the method of the coyote, kit fox, wild cat, hawks, and owls, who find the dog towns a profitable hunting ground. Badgers, however, can, if they will, easily dig up a burrow and devour the helpless family. The worst enemy is the black-footed ferret, a weasel of the plains, which easily penetrates the burrows, and against whose ferocity and skill the squirrels can make little defense. Every prairie-dog town is also tenanted by many little burrowing owls. See BURROWING OWL.

All these conditions together served in the natural state of things to hold the prairie dogs in check, but the changes brought about by civilization have been so favorable to these little animals, by the reduction of their enemies on the one hand and the augmentation on the other hand of their food supplies by the farmers' plantations of meadow grass, alfalfa, and grain, that they have increased into a very serious pest. The squirrels may be killed by poison in various ways, but best by the use of bisulphide of carbon. A teaspoonful of this cheap liquid is placed upon some absorbent substance (a nodule of dry horse dung or half a corn cob will serve the purpose well) and dropped down the hole, which should then be stopped with earth. The fumes are heavy, sink into the depths of the burrow, and kill the inhabitants. See Plate of GOPHERS, LEMMINGS, AND MARMOTS.

PRAIRIE DU CHIEN, prā'rĭ dụ shēn'. A city and the county seat of Crawford Co., Wis., 60 miles south of La Crosse, on the Mississippi River and on the Chicago, Burlington, and Quincy and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, B 5). It has Campion College, St. Mary's College, and Keewatin Academy, for boys. The ruins of old Fort Crawford, built in 1828, are of historic interest, as are also the Black Hawk grounds, State Park, and the many Indian mounds to be found near by; and the mineral springs in the vicinity make Prairie du Chien of considerable importance as a health resort. It is the commercial centre of a fertile agricultural region, and manufactures woolens, pearl buttons, pickles, barrels, egg cases, veneer, etc. Pop., 1900, 3232; 1910, 3149.

Near Prairie du Chien a fort seems to have been built by the French as early as 1689, but this was soon abandoned and another was built in 1775. The present settlement dates from 1783. The village and fort were surrendered by the English to the United States in 1786, though they were again captured during the War of 1812 and held until 1816. Prairie du Chien was first incorporated in 1872. Consult: "Early Days of Prairie du Chien," in the *Wisconsin Historical Society Collections*, vol. v (Madison, 1868), and Durrie, *Annals of Prairie du Chien* (ib., 1872).

PRAIRIE FOX. The kit fox (q.v.).

PRAIRIE HARE. See HARE.

PRAIRIE PIGEON, or PRAIRIE PLOVER. A local name in the western United States for both the golden plover and the upland plover (a sandpiper).

PRAIRIE RATTLESNAKE. The small rattlesnake, or massasauga (*Sistrurus catenatus*), of the prairie regions of the central United States. See RATTLESNAKE.

PRAIRIE WARBLER. A wood warbler (*Dendroica discolor*) of the eastern United States, olive green above, spotted with dull red, and lower parts rich yellow, with conspicuous black streaks upon the cheeks and along the sides of the body. It frequents brushy districts, and its habits, song, nest, and eggs resemble those of the common yellow warbler. Consult Elliott Coues, *Birds of the Northwest* (Washington, 1874), and F. M. Chapman, *Warblers of North America* (New York, 1907).

PRAIRIE WOLF, or RED WOLF. The coyote.

PRAJAPATI, prá-jä'pá-tē (Skt., lord of beings). The name of a Hindu divinity, the lord of all creatures and the first to practice human sacrifice. In the Rig-Veda the word is used also as an epithet of Savitar (q.v), the revivifying aspect of the sun, and of the invigorating Soma (q.v.). Prajapati's character was essentially that of a creator, and he thus became not only a synonym of Brahma (q.v.), but also of those divine personages who, produced by Brahma, created all existing beings, including gods and demons. Manu names 10 such Prajapatis engendered, through pure meditation, by Brahma, viz., Marichi, Atri, Angiras, Pulastya, Pulaha, Kratu, Prachetas or Daksha, Vasishtha, Bhrigu, and Narada. The Puranas (q.v.) contain many legends about them, together with varying accounts both of their number and origin. In modern India the cult of Prajapati has almost disappeared, although the kumhars, or potter caste, of the Punjab still worship him. Consult: E. W. Hopkins, *Religions of India* (Boston, 1895); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); id., *History of Sanskrit Literature* (London, 1913); L. D. Barnett, *Antiquities of India* (ib., 1913).

PRAJNA PARAMITA, prŭj'nä pä'rä-mē'tä (Skt., wisdom which has gone to the other shore; absolute or transcendental wisdom). The title of the principal Sutra of the Mahayana school of the Buddhists. Its main object is metaphysical, and its doctrine is the entire negation of the subject as well as the object, teaching that the supreme good, defined by it as the wisdom that releases from transmigration, has no more reality than he who strives to gain it. The beginning of the work is merely a eulogy of Buddha and of the bodhisattvas, who form his retinue. Other parts contain narratives of wonderful phenomena connected with the apparition of Buddhist saints, descriptions of the benefits arising from an observance of Buddhistic doctrine, or verses in which the Buddha is praised by his disciples. Both on account of the extent to which such episodical topics could easily be expanded, as well as by reason of the amplifications of the real substance of the work, several recensions of the Prajna Paramita are in existence. Some of these contain no more than 7000 slokas, or distichs, but others amount to 18,000, 25,000, or even 100,000 slokas. Consult Ghoṣa, "Catasāhasrikā-prajñā-pāramitā: A Theological and Philosophical Discourse of Buddha with his Disciples in 100,000 Stanzas," in *Bibliotheca Indica*, vols. i–xvii (Calcutta, 1902–12).

PRAKRIT, prä'krit (Skt. *prākrta*, natural, unrefined, vernacular; contrast with Sanskrit from *saṁskṛta*, purified). The term Prakrit is applied to all vernaculars of ancient India and indicates a certain state of phonetic decay as compared with the literary standard. The historical development of these vernaculars is usually divided into three stages—primary, secondary, and tertiary. The Prakrits of the primary stage, of which traces are found even in some old Vedic hymns, are furthermore divided into two classes—those of Madhya-dēśa, or Midland, where they have existed from the earliest known times, and those of what is known as the Outer Languages. Their development may be compared to that of the Romance languages, for, although declensional and conjugational processes underwent little change, there is yet a tendency towards simplification of combinations of consonants and broader diphthongs. To a period extending from the sixth to the eleventh centuries belong the secondary Prakrits, varying all the way from Pali (q.v.), the language of Buddhism, which differs little from the Sanskrit standard, to Maharashtri, in which the old consonantal system has, as in modern French, suffered excessive decay; e.g., Skt. *bratam;* Pali, *vatam;* Maharashtri, *vaam*. The most important of the secondary Prakrits were Magadhi, the dialect of Behar; Ardhamagadhi, spoken in Oudh and Baghelkhand; Sauraseni, of the district around Muttra; and Maharashtri, the language of Berar. Markandeya Kavindra, writing about the middle of the seventeenth century, states in his *Prākṛtasarvasva* that there were four main divisions of secondary Prakrits—*bhāṣā*, *vibhāṣā*, *apabhraṁśa*, and *pāiśāca*. (See PISACA LANGUAGES.) Under *bhāsās*, or language proper, he includes 5 dialects, besides 2 others that are closely related. The *vibhāsās*, or dialects, comprise also 5 dialects, while the *apabhraṁśas*, or patois, include 27 and the *pāiśācas* 11. Of all the Prakrits by far the most important was Maharashtri, which is the one implied by the native grammarians when they speak simply of Prakrit. This is the dialect that is employed sometimes in two slightly modified forms called Ardhamagadhi, and Jaina Maharashtri, in the sacred texts of Jainism (q.v.). An important source for the great majority of Prakrits, however, is the Indian drama. According to the conventions of Hindu dramaturgy only the principal male characters speak Sanskrit. The lower male and all the female rôles are in various Prakrits, often corrupted in course of time by careless or ignorant scribes and editors. On the other hand, women of high birth, their friends, courtesans, and celestial nymphs may speak Sanskrit as well as Prakrit. Prakrit is not derived from classical Sanskrit (see SANSKRIT LANGUAGE), but from a dialect group closely akin to Vedic Sanskrit. As analogues between Prakrit and Vedic Sanskrit may be cited the change of intervocalic *ḍ* to *ḷ*, as Skt. *garuḍa*, name of a mythical bird, Prak. *garula;* instrumental plural in *-ēhim*, as Prak. *vacchēhim*, with trees, Vedic *vṛkṣébhiḥ*, but classical Skt. *vṛkṣāiḥ;* Prak. *rukkha*, tree, Vedic *rukṣa*, not found in classical Sanskrit.

The chief phonological characteristics of Prakrit are the loss of Sanskrit *r*, the shortening of the Sanskrit diphthongs, *ē*, *ō* before consonant groups, the frequent elision of intervocalic *k, g, j, t, d, p, b, v*, the common change of medial *kh, gh, th, dh, bh* to *h*, the change of *n* to *ṇ* throughout, and of *ś* and *s* to *s* or rarely to *h*, and the simplification of consonant groups.

In morphology the inflection is characterized especially by the growth of *a* stems at the expense of the *r*- and consonant stems, as Skt. *pitar*, father, but Prak. *piara;* Skt. *karman*,

deed, Prak. *kamma*. The old dual is lost excepting in *dō, duvē, bē*, two; and the genitive assumes the functions of the dative. The pronominal declension is to a very large extent influenced by the nominal, while in all periods of Sanskrit the two systems are kept distinct. In conjugation there is but one system, apart from some scattered forms, as contrasted with the nine present formations in Sanskrit. Verbs are, therefore, conjugated according to the Sanskrit *a* class, as Skt. *vartati*, turns, Prak. *vaṭṭaï*. Excepting the past participle the middle voice has almost disappeared. The tense system is extremely meagre, consisting of only present and future. Of the imperfect, aorist, and perfect some sporadic examples have survived. These tenses are regularly formed in Prakrit by *bhū* and *as*, to be, with participles, as *gaō atthi*, is gone, Skt. *jagāma* (classical Skt. also *gatō 'sit*). The moods are the indicative, optative, and imperative, but the subjunctive, as in classical Sanskrit, is lost. As is natural, the dialects differ much from one another in regard to inflection and frequency of forms. Thus, the ending of the second person plural present indicative (*-tha* in Sanskrit) is *-ha* in Maharashtri, Jaina Maharashtri, and Ardhamagadhi, *-dha* in Sauraseni and Magadhi, *-hu* in Apabhramsa; the optative is very common in Ardhamagadhi and Jaina Maharashtri, comparatively rare in Maharashtri, and almost never found in the other dialects.

Since the Prakrit forms in the literature have been corrupted usually by scribes, the most trustworthy sources are the native grammarians, especially Hemacandra (ed. and trans. by Pischel, Halle, 1877–80), the most complete, although rather late, dating about the twelfth century, Vararuci (ed. and trans. by Cowell, London, 1868, and ed. by Tailanga, Benares, 1899), the earliest, and Canda (ed. by Hoernle, Calcutta, 1880). The Apabhramsa is treated in the *Prakṛtapiṅgālasūtra*, edited by Sivadatta and Parab (Bombay, 1894). There are also several grammarians whose works exist only in manuscript, and a lexicon by Dhamapāla (ed. by Bühler in Bezzenberger's *Beitrage zur Kunde der indogermanischen Sprachen*, vol. iv, Göttingen, 1878). The literature proper is quite extensive. It includes not only parts of the Sanskrit drama as well as the Jaina texts already mentioned, but also epic and lyric poetry. The former class is represented by two Maharashtri poems. Of these the first is the *Sētubandha* (Building of the Bridge), also called *Rāvaṇavaha* (Death of Ravana) by an unknown author, but frequently erroneously attributed to Kalidasa (q.v.). It was known as early as the seventh century, and deals, as its name implies, with the Rama cycle. (See RAMAYANA.) It has been edited and translated by Goldschmidt (Strassburg, 1880–83) and by Sivadatta and Parab (Bombay, 1895). The second epic is the *Gaüḍavaha*, an historical poem by Bappaīrāa (Skt. *Vākpatirāja*) about the beginning of the eighth century (ed. by Pandit, Bombay, 1887). The lyric is represented by the *Sattasaī* (Seven Centuries) by Hāla, who lived probably between the third and seventh centuries, at any rate before 1000. This collection of beautiful lyrics has been edited and translated by Weber (Leipzig, 1881) and again edited by Durgaprasad and Parab (Bombay, 1889). In the drama we have the *Karpūramañjarī* of Rājasekhara (q.v.). Other works were composed in Prakrit, such as the *Bṛhatkathā* (Great Story) of Gunadhya, now lost, which formed the basis of Somadra's *Kathāsaritsāgara*, while the *Gītagōvinda* of Jayadeva (q.v.) was apparently adapted from an Apabhramsa original.

About the eleventh century arose the tertiary Prakrits. Thus, Sauraseni, having originally developed from the Madhya-dēśa group, gave rise to Western Hindi (spoken in 1901 by 40,714,925 persons) and Panjabi (spoken by 17,070,961 persons). From the cognate dialect, Avanti, sprang Rajasthani (10,917,712 speakers) and Gujarati (9,439,925 speakers); from Ardhamagadhi, Eastern Hindi (22,136,358 speakers); and from a Vrachada Apabhramsa, Sindhi (3,494,971 speakers). Maharashtri, which developed from one of the Outer Languages, has given the modern Marathi (18,237,899 speakers) and the cognate Magadhi, divided into the modern Bihari (34,579,844 speakers), Oriya (9,687,429 speakers) (see URIYA), Bengali (44,624,048 speakers), and Assamese (1,350,846 speakers). It is generally believed that the languages of the Madhya-dēśa, or Midland, are the outgrowth of the language of the Aryans of the second invasion, while the speakers of the Outer Languages, passing through the Panjab on their way to the Madhya-dēśa, drove before them a number of Aryan settlers towards the south, east, and west, with the result that the languages of these districts became more closely related to the Vedic than to those of the Madhya-dēśa.

Henry, *Les littératures de l'Inde: Sanscrit, Pâli, Prâcrit* (Paris, 1904).

PRAKRITI, prä'krē-tē (Skt. *prakṛti*, element, foundation). In Hindu philosophy, potential matter, which must be carefully distinguished from nature, for it exists only conditionally, and develops consciousness only when beheld by Purusha, or Man, who may thus be called the efficient cause of the world as contrasted with its material cause, Prakriti. The union of these two principles gives rise to Buddhi, or perception (also called Mahat, or the great), as well as to Ahaṁkara, or belief in the existence of the ego, and the Tanmatras, or elements of the senses, both in their subjective and objective aspects, to which *manas*, or perception, is added. Prakriti is uncreated and is coeternal with Brahma (q.v.). Manas, the five Tanmatras, Buddhi, and Prakriti are often called the eight Prakritis, the first seven being productive as well as produced, while the primal Prakriti has the distinctive epithet *avyakta*, or unmanifested. Consult Max Müller,

Six Systems of Indian Philosophy (New York, 1903).

PRAM, präm, or **PRAAM** (Fr. *prame*, Dutch *praam*, Ger. *Prahm*, *Prahme*, from OChurch Slav. *pramŭ*, Pol. *prom*, ferry; ultimately connected with Skt. *par*, to cross, Eng. *fare*). A large flat-bottomed boat or lighter used in the continental ports of the North Sea and Baltic for loading and unloading merchant ships.

PRAM, präm, KRISTEN HENRIKSEN (1756–1821). A Danish poet and editor, born in Norway of Danish parents. He was a man of wide learning and great mental activity. The number of his works, however, is much greater than their value. Of his poems only *Emilies Kilde* need be mentioned. His principal work was done for the *Minerva*, a monthly critical journal published in Copenhagen, of which he was one of the founders. He was sole editor from 1790 until Rahbek took charge in 1794. His works were edited by Rahbek (6 vols., 1824–29).

PRANG, LOUIS (1824–1909). A German-American engraver, lithographer, and publisher. He was born in Breslau, Germany, participated in the revolutionary movement of 1848, emigrated to the United States in 1850, and settled in Boston, where he became successively a wood engraver (1851), a lithographer (1856), and a publisher (1861). He made a specialty of color printing, reproducing oil paintings and water-color facsimiles of holiday cards, etc., and later originated the Prang method of art instruction in public schools, publishing the books and material needed for the carrying out of that method. He was president of the Prang Educational Company, of Boston. He wrote *The Prang Standard of Color* (1898). His wife, MARY DANA HICKS, also became well known as an art educator.

PRASE, prāz (Fr. *prase*, leek-green, from Gk. *πράσον*, *prason*, leek). A transparent to translucent cryptocrystalline variety of quartz, varying in color from a dull leek to deep green. It is sometimes cut as a gem. Specimens of prase are found on Staten Island, N. Y., and at various other places in the United States, none of which, however, are of a quality suitable for gems.

PRA'SEODYM'IUM (Neo-Lat., from Gk. *πράσιος*, *prasios*, leek-green + *didymium*, q.v.). A metallic chemical element found associated with the similar element neodymium (q.v.). Its chemical symbol is Pr; its atomic weight is 140.6. The element forms two distinct oxides, corresponding respectively to the formulæ Pr_2O_3 and PrO_2, and a hydroxide of the formula $Pr(OH)_3$. The chloride of praseodymium, $PrCl_3$, is colored green in both the anhydrous and the hydrated states. The nitrate, $Pr(NO_3)_3 \cdot 6H_2O$, combines with the nitrates of rubidium and ammonium to form double salts. Pure praseodymium metal was obtained by Muthmann and Weiss in 1904 by the electrolysis of the fused anhydrous chloride; it has a specific gravity of 6.48, and melts at 940° C. (1724° F.).

PRASLIN, EUGÈNE ANTOINE HORACE, COMTE DE CHOISEUL-. See CHOISEUL-PRASLIN.

PRATER, prä'tẽr, THE. The principal park of Vienna (q.v.).

PRATI, prä'tê, GIOVANNI (1814–84). An Italian poet, born at Campo Maggiore in the Giudicarie. He studied law at Padua, but gave more attention to poetry than to jurisprudence. His first notable poem was the *Edmenegarda* (1841), a work which shows the influence of Byron and Lamartine. Going to Milan, he there published the *Canti lirici*, the *Canti del popolo*, and the *Ballate*, all of which reflect his civic feelings as well as his adherence to the romantic doctrines. At Turin in 1844 he put forth the *Memorie e lacrime* and the *Nuovi canti*. On account of his *Albertismo*, glorifying Charles Albert, he was expelled from Tuscany by order of Guerrazzi, who was then in power, and took refuge in Piedmont. With the change of capital he passed from Turin to Florence and thence to Rome, becoming Counselor of Public Instruction and Senator in 1876. He died at Rome. To the later period of his life belong two collections of verse, the *Psiche* (1875) and the *Iside* (1878), which contains his best lyrics of this time. Of sensitive spirit and quick fancy, he lacks robustness of thought. Some of his verse ranks with the best modern lyric poetry, but some of it is very poor. He attracted many followers, but created no school. Consult his *Opere varie* (5 vols., 1875), and De Gubernatis, *Ricordi biografici* (Florence, 1873).

PRAT'INAS (Lat., from *Πρατίνας*). A Greek poet, born in Phlius in the Peloponnesus, who lived in Athens about 500 B.C. According to Suidas he was a contemporary and rival of Æschylus, and was the first to introduce the satyric drama into Athens. He also wrote tragedies, lyrics, and *hyporchemata*, a kind of choral ode, of which a considerable and interesting fragment has been preserved by Athenæus (xiv, 617). For the fragments of his lyrics, consult Bergk's *Poetæ Lyrici Græci* (Leipzig, 1843; new ed., 1914); also Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

PRATO, prä'tô, or PRATO IN TOSCANA. A city in the Province of Florence, Italy, situated on the Bisenzio, 11 miles northwest of Florence (Map: Italy, C 3). The city is well built, surrounded by walls, and protected by a citadel. The cathedral, partly Tuscan-Romanesque and partly Gothic, was completed in 1320. The Madonna delle Carceri is a church in the Renaissance style, built in 1485. There are several other churches, a town hall with a picture gallery, a music academy, and a library of 25,000 volumes. The city has a Gymnasium, a lyceum, and a technical school. The industries are straw plaiting and manufactures of woolen and cotten goods, silk thread, biscuits, hats, and machinery. There are also iron and copper works and productive serpentine quarries. Pop. (commune), 1901, 51,453; 1911, 53,750, (town), 17,200. Prato was an independent city before it became subject to Florence in the fourteenth century.

PRÄTORIUS, prâ-tō'rê-ụs, MICHAEL (1571–1621). A German composer and writer, born at Kreuzburg. He occupied the position of kapellmeister at Lüneburg, and later was kapellmeister, organist, and secretary to the Duke of Brunswick. With the exception of these facts nothing is known of his life. Among his compositions are: *Musœ Sioniæ*, a collection of 1244 vocal numbers in nine parts; *Eulogodia Sionia* (1611); 60 motets; *Missodia Sionia* (1611); *Terpsichore* (1612), which included dance pieces by Prätorius and some French composers; *Puericinium* (1621); 14 church songs; and many anthems, songs, and contrapuntal pieces. His great work, *Syntagma Musicum* (1615–20), is beyond question the most valuable extant treatise on contemporary musical instruments, espe-

cially the organ. Prätorius was a skillful composer, but is of more value to the musical historian for his erudite treatises.

PRATT. A city and the county seat of Pratt Co., Kans., 80 miles west of Wichita, on the Ninnesch River and on the Chicago, Rock Island, and Pacific, the Atchison, Topeka, and Santa Fe, and the Anthony and Northern railroads (Map: Kansas, D 7). It is in a productive farming and stock-raising district, and has a large State fish hatchery and fine courthouse and school buildings. The commission form of government has been adopted. Pop., 1900, 1213; 1910, 3302.

PRATT, BELA LYON (1867–). An American sculptor. He was born at Norwich, Conn., and studied at the Yale School of Art, at the Art Students' League, New York, under Saint-Gaudens, and in Paris under Falguière and Chapu. After 1893 he was instructor in modeling at the Boston Museum of Fine Arts. His best work is plastic in conception and refined in modeling. Charming ideal works include "Fountain of Youth," "Study of a Young Girl," the decorative panels "Music," "Drama," and "Dance," in the Boston Opera House, and the figures "Philosophy," Congressional Library, and "Science" and "Art," Boston Public Library. His best-known monuments are the Soldiers and Sailors Monument (Malden, Mass.), "Andersonville Prison Boy" (Andersonville, Ga.), "Spanish War Soldier" (St. Paul's School, Concord, N. H.), "Butler Memorial" (Lowell, Mass.), "Army Nurses' Memorial" (State House, Boston). Among his intensely personal portraits are the busts of Phillips Brooks (Harvard University) and Bishop Huntington and the statues of General Stevenson (State House, Boston) and Dr. Coit (St. Paul's Church, Concord, N. H.). To the Chicago and Buffalo expositions he contributed colossal groups. Pratt became an associate of the National Academy (1900), was awarded a gold medal at the Panama-Pacific Exposition, San Francisco (1915), and, also in 1915, received an honorary degree of A.M. from Harvard.

PRATT, CHARLES. See CAMDEN, first EARL OF.

PRATT, CHARLES (1830–91). An American merchant and philanthropist, born at Watertown, Mass. He removed to New York City in 1851 and began his business career in the oil and petroleum trades. In 1879 he became president of the board of trustees of Adelphi Academy, in Brooklyn, and in 1887 he founded Pratt Institute (q.v.), in Brooklyn.

PRATT, ENOCH (1808–96). An American philanthropist, born at North Middleboro, Mass. In 1831 he settled in Baltimore, where he soon became prominent in the iron trade, as well as in financial circles. He founded the House of Reformation and Instruction for Colored Children at Cheltenham, Md., the Maryland School for the Deaf and Dumb, at Frederick, and the Pratt Free Library, which he presented to the city of Baltimore and which was opened in 1886.

PRATT, ORSON (1811–81). A Mormon apostle, born at Hartford, N. Y. He received only a common-school education, but in later life managed, despite great difficulties, to acquire considerable knowledge, particularly of Hebrew and mathematics. He became a member of the Mormon church in 1830, and soon rose high in the organization, becoming one of the Council of Twelve in 1834 and one of the Twelve Apostles in 1835. He was accounted one of the most eloquent preachers in the church, and made numerous missionary journeys to England and elsewhere. Because of his championship of his faith as a writer and speaker, he became known as the Paul of Mormonism. Pratt was many times a member of the Utah Assembly and was several times its Speaker. From 1874 until his death he was church historian and church recorder. He was also professor of mathematics in the University of Deseret. In 1854 he discovered the law of planetary rotation, and wrote a number of books on mathematical subjects. His published works include: *Divine Authenticity of the Book of Mormon* (1849); *The Great First Cause* (1851); *Cubic and Biquadratic Equations* (1866); *Key to the Universe* (1866); *The Bible and Polygamy* (1870).

PRATT, PARLEY PARKER (1807–57). A Mormon apostle, called the Isaiah of his people, brother of Orson Pratt. He was born in Burlington, N. Y., joined the Mormons in 1830, and five years afterward had risen to the dignity of one of the Twelve Apostles. He worked as a missionary in the East and the Middle West; in 1840 was sent to England and at Manchester established and for a short time edited the *Millennial Star;* and on his return to America accompanied the party which first visited the valley of the Great Salt Lake, in which Parley's Peak and Parley's Cañon were named for him. After missionary work on the Pacific coast he set out for the East, but was murdered near Van Buren, Ark. His works include: *Voice of Warning* (1837); *History of the Persecutions in Missouri* (1839); *Key to the Science of Theology* (1854).

PRATT, SAMUEL JACKSON (1749–1814). An English writer, better known in his day as COURTNEY MELMOTH. His father was a brewer of St. Ives in Huntingdonshire. The son was ordained in the English church, but he soon abandoned the pulpit for the stage. For several years he performed with little success in London, the provinces, and Ireland. Pratt published an immense number of books, some of which went through several editions and were translated into French. They comprise verse, travel, criticism, biography, and plays.

PRATT, SILAS GAMALIEL (1846–1916). An American composer, born in Addison, Vt. His musical education was obtained under native teachers until he was 22 years old, when he went to Berlin to study piano under Bendel and Kullak and composition under Kiel. On a subsequent visit he also studied score reading with Dorn. He organized the Apollo Club of Chicago in 1871. In 1890 he was appointed professor of piano in the New York Metropolitan Conservatory and in 1906 removed to Pittsburgh, where he established the Pratt Institute of Music and Art. He arranged and conducted many festivals and frequently, both in the United States and in Europe, gave concerts of his own works. As a composer he decidedly favors the larger forms. His works include three operas, *Zenobia* (1882), *Lucille* (1887), *The Triumph of Columbus* (1893); three symphonies; two symphonic poems, *Sandalphon* and *A Tragedy of the Deep* (after the *Titanic* disaster); a *Centennial Overture;* a festival overture, *The Voyage of Columbus;* a suite for orchestra, *The Tempest;* songs and piano pieces.

PRATT CITY. Formerly a city in Jefferson Co., Ala., but annexed to the city of Birmingham in 1910.

PRATT INSTITUTE. A coeducational school for art and industrial training, established in Brooklyn, N. Y., in 1887 by Charles Pratt (q.v.). The institute comprises normal, technical, and trade departments, with a total attendance in 1914–15, allowing for duplications, of 3620, distributed as follows: school of fine and applied arts, 996; school of household science and arts, 1557; school of science and technology, 1337; kindergarten, 101; library, 23; gymnasium, 201. The institute conducts both day and evening classes, and has a liberal endowment, amounting in 1914 to $5,476,715.05. The buildings, which number 13, are well equipped with excellent laboratories and museums, and were valued in 1914 at $1,787,197.77. The income of the institute was $272,152.43. The library contains 109,098 volumes. A banking institution, known as the Thrift, is maintained for saving and investment by the students and others. The management is in the hands of a board of seven trustees, under the presidency of Charles M. Pratt.

PRATZ, prâts, LE PAGE DU (?–1775). A French explorer in America. He was born in the Low Countries, served in the French army, and, about 1718, having acquired an interest in the French Compagnie d'Occident, went to New Orleans. His attempts to found a colony were unsuccessful, but he explored the basins of the Missouri and the Arkansas, spending eight years inland. Du Pratz returned to France in 1734. He published *Histoire de la Louisiane* (1758), a work of considerable historic value.

PRAWN (formerly also *praun, prane,* probably from Lat. *perna,* sea mussel, ham). A shrimplike crustacean of the family Palæmonidæ, remarkable for a long serrated beak projecting from the carapace. Many of them are semitransparent and exhibit very fine colors; they are also very active creatures and most interesting inmates of an aquarium, but are excessively voracious, and are likely to make great havoc among its other inhabitants. The common European prawn (*Palæmon serratus*) attains a length of 3 or 4 inches. It is even more esteemed for the table than the shrimp. Several species of edible prawns occur on the coasts of the United States, the best known and most abundant of these being *Palæmonetes vulgaris.*

PRAXITELES (Lat., from Gk. Πραξιτέλης). A celebrated sculptor of ancient Greece, of whose life little is known with certainty, except that he was a citizen of Athens and lived in the fourth century B.C. Pliny gives Olympiad 104 (364–361 B.C.) as his date, and Vitruvius says he worked on the Mausoleum at Halicarnassus, about 353 B.C. The former date seems connected with the battle of Mantineia and the activity of Praxiteles, Cephisodotus (q.v.), perhaps an elder brother, and other Athenian artists at this period in the Peloponnesus. There is nothing in the statements about Praxiteles that indicates artistic activity on his part after 330 B.C. His most famous works have perished, and are known to us, if at all, only through Roman copies. The most famous was the Aphrodite of Cnidus, which Pliny calls the finest statue in the world. In it the goddess was represented as having just laid aside her clothing to enter the bath; she was naked, but, while conscious of her beauty, showed plainly her reluctance at displaying it even to herself. The only good complete copy is a statue in the Vatican. The best head is in private possession in Berlin. The statue shows how the ideals of the fifth-century art had been modified. The gods and goddesses of this period have lost the superhuman element and are little more than idealized men and women. Another famous statue was the Eros of Thespiæ, by some thought to be the original of the Eros of Centocelli in the Vatican, though this is doubtful. Praxiteles was celebrated for his satyrs, and two very frequent types may with probability be referred to his originals. One is the youthful satyr who pours wine from a pitcher in his raised right hand into a bowl in his left, well represented by the Palermo copy; the other is the resting satyr, best known from the Capitoline statue immortalized by Hawthorne in his *Marble Faun.* Another work is one reproduced in the statues which represent the youthful Apollo playfully threatening with an arrow a lizard crawling towards him on a tree trunk, which must be Praxiteles' "Apollo Sauroctonos" (q.v.). More fortunate than other artists of antiquity, Praxiteles is known to us by one undoubted original, the Hermes of Olympia, which was found May 8, 1877, during the excavation of the Heræum, at Olympia, where it was seen by the traveler Pausanias. The youthful god is here represented as the protector of his baby brother Dionysus. He rests his left elbow on a tree trunk, over which his cloak is hung, while on the lower arm sits the baby stretching one hand towards some object (perhaps a bunch of grapes held in the extended right hand of the god). The attitude of the god is easy and the pose graceful, giving opportunity for a variety of contrasting curves, while the technical execution is beyond praise. But the chief beauty of the work is in the wonderful head, which is strong and thoughtful yet full of sensitiveness and delicacy. The lines are finely curved, and in the modeling every part receives equal attention, so that the effect is produced by an infinite number of details, without giving undue prominence to any part, thus contrasting somewhat strongly with the methods of Scopas (q.v.). In sharp contrast to the perfection of the god is the crudeness of the figure of the child; in children, evidently, Praxiteles had no interest. Another work which makes strong claim to being an original of this artist and which, if not done by Praxiteles himself, was almost certainly executed by his assistants from his drawings, is the Basis from Mantineia, where on three slabs is reproduced the strife of Apollo and Marsyas in presence of the Muses. The figures are in low relief and are full of grace, though without the perfection which characterizes the Hermes. A fine marble bust found at Eleusis is also regarded by many competent judges as the original of a Eubuleus by Praxiteles. It certainly shows strong resemblance to the Satyr and other works of this artist, but the identification cannot be regarded as certain.

sage of Greek Art (New York, 1913), also general histories of Greek art. See FAUN OF PRAXITELES; GREEK ART, II (*c*), *Age of Praxiteles and Scopas;* and Plate of POLYCLITUS AND PRAXITELES.

PRAY, prī'ĕ, GEORG (1723–1801). A Hungarian scholar and historian, born at Neuhäusel. In 1745 he entered the Jesuit Order and subsequently taught in various academies. Upon the suppression of the Jesuits by Clement XIV he was appointed royal historiographer of Hungary and in 1777 custodian of the library of the University of Buda (removed in 1784 to Pest). In 1790 he became canon in Grosswardein and later abbot of Tormowa. He is to be ranked with Stephen Katona (1732–1811), also a Jesuit, as a founder of scientific Hungarian history. His publications, strongly patriotic in tone, include *Annales Veteres Hunnorum, Avarorum et Hungarorum 200 ad 997* (1761); *Annales Regum Hungariæ* (1763–70); *Specimen Hierarchiæ Hungaricæ* (1776–79).

PRAY, ISAAC CLARK (1813–69). An American journalist, playwright, actor, and theatrical manager, born in Boston. He graduated at Amherst College in 1833 and entered newspaper work in his native city, but soon began writing plays. In England, in 1846, he appeared as an actor in *Hamlet* and *Othello*. In 1850 he became dramatic critic for the New York *Herald* and later for a time he edited the Philadelphia *Inquirer*. He engaged successfully in theatrical management also, besides being the author of *Virginius* and about 30 other plays. Among his works are *Prose and Verse* (1836); *Poems* (1837); *Book of the Drama* (1851); *Memoirs of James Gordon Bennett* (1855).

PRAY, JAMES STURGIS (1871–). An American landscape architect. He was born in Boston, was educated at Harvard College and at the Bussey Institution and Arnold Arboretum in connection with Harvard, and was employed by Olmsted Brothers of Brookline, Mass., from 1898 to 1903. He was afterward engaged in independent practice until 1906, when he became a member of the firm of Pray, Hubbard, and White. At Harvard he was appointed assistant professor in 1905, chairman of the school of landscape architecture in 1909, and Charles Eliot professor in 1915, succeeding F. L. Olmsted (q.v.). Pray contributed to architectural journals, to *Landscape Architecture*, and to other publications, and is author of *City Planning* (1913).

PRAYER (OF. *priere*, Fr. *prière*, from ML. *precaria*, prayer, from Lat. *precari*, to entreat; conected with OChurch Slav. *prositi*, Skt. *prach*, to ask, Goth. *frah*, I asked, OHG. *frāgēn*, Ger. *fragen*, AS. *frignan*, prov. Eng. *frain*, to ask). In a broad sense, a verbal address made to a spiritual being. Such a communication usually embodies a petition, but may also contain confession, apology, thanksgiving, tidings, explanation, or meditation. In general, prayer, which in the higher religions has become the greatest religious act of the believer, is in the lower religions a mere accompaniment of sacrifice, explaining for what god the gift is intended and what the giver desires. "Here is butter; give us cows" is the typical prayer of the primitive religions. From the point of view of comparative religion the main characteristics of prayer may be arranged under several heads. 1. *Universality*. It would seem that the act of prayer must be as general as belief in spirits, i.e., common to humanity. Occasionally, as in some African tribes, certain of the gods are considered too exalted to listen to ordinary persons, but should be addressed through the medium of an intercessor. Minor gods, on the other hand, are open to appeal from any quarter. Prayer is offered also to the departed souls of the family, who are supposed to exercise a sort of guardianship over their kindred. In all lands, probably, hunters and fishermen entreat the particular patron of their craft, or the spirit which resides in the fetish they carry. Thus, African boatmen, while crossing a river, offer prayer to a crocodile as a divine being. In Australia also it is said that any person whosoever may approach the abode of a spirit, to whom is addressed information and advice, on which the latter is expected to act. From such testimonies it may be inferred that prayer, in a wide sense, is universal and that supposition of its absence has arisen from misunderstanding or limitation of the term to one familiar type. 2. In early religion, *simplicity*. Primitive prayers are usually plain, direct, and for immediate wants. The Papuans sacrifice to the ancestral spirits and say, "Good father, here is food for you. Eat it. Be kind to us on account of it." Ceremonies connected with special occasions or the beginning of special enterprises were accompanied by simple statements of wants. "Let food grow for us"; "Bring rain for our crops"; "Make our hunting successful"; "Give children." "May we conquer our enemy and bring back many heads." Prayers like these are common among the primitive races. 3. *Growing formalism*. Prayer early began to be formalized. Three influences tended to this: (*a*) Any permanent or frequently recurring needs tended to formalize the terms in which aid was asked from the gods. The recurring seasons of the year brought seedtime and harvest, the need of rain, and thanks for the crops; the constant pressure of enemies, the need of food, the operations of hunting and fishing, frequent sickness, all aided the repetition of prayers, especially if any form had been found particularly effective. (*b*) Prayer, like other parts of worship, takes its form from social intercourse. The god must not be approached with less formality than the chief; and when, in the growth of civilization, the ruler is surrounded with pomp and circumstance and petitions to him are prefaced with adulation and formality, the forms of prayer follow suit. Prayers must be expressed in set terms and uttered in attitudes of humility—kneeling, or prostrate on the ground, or with many genuflections. (*c*) The influence of the priesthood (see PRIEST) is in the same direction. Their natural tendency is to make everything connected with worship more elaborate, not merely to enhance their own power, but to add dignity to the worship. As the nation gains in the sense of order and beauty, prayer naturally follows and is expressed in the finest poetry and with the deepest reverence of which the race is capable. The Vedic hymns in India and prayers in the Babylonian, Egyptian, and Hebrew religions illustrate this. 4. *The decay of prayer*. In many religions the growing formalism issues in the passing of prayer into magic. The form is regarded as itself efficient, compelling the gods to fulfill the desires of the suppliant. Repetition may enhance its value, as when the Hindu repeats "Ram, Ram" or "Siva, Siva" hundreds of times. Sometimes

the god disappears entirely from consciousness and the prayer becomes a form with magic power in itself. The test is this: when the utterance is conceived as addressed to a spirit or god who can hear, it is prayer; when it is believed to accomplish a result without the intervention of any personal power, it is magic. 5. *Imprecation.* As prayer is employed in order to obtain benefits for the pleader, so by a natural antithesis it is used to injure enemies, on whom it invokes the divine anger. This function of cursing is as ancient and universal as that of blessing. It is the regular business of shamans and medicine men to bring disaster on foes, cause their injury and death, blight their crops, and destroy their armies. In the same manner prayer is employed to undo the evil spirits, as in old Babylonian exorcistic formulas and in the exorcisms of the early Christian Church.

In the Christian sense, prayer is any voluntary expression of communion with God, whether formal or informal, brief or prolonged, individual or collective. Adoration, thanksgiving, confession, intercession, are all joined with petition in Christian prayer. It rests upon the appreciation of the loving care of the all-wise and all-powerful Father. It is fundamental that the praying Christian must be perfectly submitted to the will of God and desirous of finding more completely what is its application to his own conduct and affairs. His petitions may then embrace the supply of all his wants, physical and spiritual; and he may be sure that he will be heard and answered as God's infinite wisdom shall see best for him and all concerned in his welfare. Christian prayer is in the spirit of confidence and humility which Christ taught. It is prayer as Christ prayed.

Bibliography. The best discussions of prayer from the Christian standpoint will be found in the treatises on systematic theology and apologetics; also: Edward Bickersteth, *A Treatise on Prayer* (18th ed., London, 1853); H. P. Liddon, *Some Elements of Religion* (ib., 1872–80); J. F. Clarke, *The Christian Doctrine of Prayer* (Boston, 1874); D. G. Monrad, *The World of Prayer* (Eng. trans., Edinburgh, 1879); D. W. Farnell, *The Evolution of Religion* (New York, 1905); F. B. Jevons, *Introduction to the Study of Comparative Religion* (ib., 1908).

PRAYER, WEEK OF. A season marked by special devotional meetings among Christians of many denominations throughout the world at the beginning of each new year. It originated in the Presbyterian mission of Lodiana, India, in 1858. Reports of the remarkable religious awakening in the United States the year before having reached India (see REVIVALS, RELIGIOUS), the members of this mission, at their annual meeting in November, issued an invitation for a universal concert of prayer, to be held yearly, beginning with the first week in January, 1860. The request was taken up by the Evangelical Alliance, which was already using that week as a time of prayer, and met with a hearty response, and the week of prayer has been regularly observed ever since.

PRAYER BOOK, COMMON. The name commonly given to the service books used in public worship by the churches of the Anglican communion, designated on the title-page as *The Book of Common Prayer, and Administration of the Sacraments, and other Rites and Ceremonies of the Church.* As the only official liturgical book of these churches, it thus contains in small compass all that was left by the reformers of what in the Roman Catholic church is spread out into the missal, breviary, pontifical, and ritual. The purpose of the compilers was explicitly, in addition to substituting English for Latin and removing all that they considered "superstitious or ungodly" in the pre-Reformation books, to simplify and abridge the service so that the laity might take an intelligent part in it. The process began in the reign of Henry VIII, but the earliest complete book was that published in 1549 and known as the first prayer book of Edward VI. It was drawn up with great prudence, altering as little as possible what had been familiar to the people. This book was compiled by Cranmer and Ridley, assisted by 11 other divines, and revised by Convocation. The matins, lauds, and prime of the breviary were combined into the "order for morning prayer," while the evening prayer was made up from vespers and compline. The communion service was largely based on the old English missals, especially that of Salisbury, which had been the one most used. The ordination services were added in 1550.

The influence of the more radical and especially the continental reformers (such as Bucer and Peter Martyr) was exerted in favor of a more thoroughgoing change, and a revised book, the second prayer book of Edward VI, appeared in 1552, marking the furthest point of departure from the older ways. Many of the ancient ceremonies which had been retained in the first book were now omitted; the surplice for priests and deacons and the rochet for bishops were prescribed as the authorized vestments, whereas it is to the standard of the first book that the ritualistic party in modern times appeals for sanction (see ORNAMENTS RUBRIC, THE); prayers for the dead were omitted, and the formula used in the communion of the people was made to satisfy a Virtualist or even a Zwinglian view of the sacrament. (See LORD'S SUPPER.) In 1559, however, under Elizabeth, who had little sympathy with the extreme and aggressive reformers, such changes as were made were in the nature of a return to the first book; and some further changes made by James I in 1604, after the Hampton Court Conference, had a not dissimilar bearing. After the use of the prayer book had been absolutely prohibited by law under the Commonwealth, and restored with the monarchy, the question of revision came up once more and was discussed in the lengthy sittings of the Savoy Conference; but the numerous changes that were made in 1662, when the English book practically assumed its final form, were not of a nature to conciliate the defeated Puritans, as was shown by the fact that 2000 left their churches rather than use it. An attempt to reopen the matter with this end in

view was made in 1689, after the Revolution, but nothing came of it except the report of a commission. In Scotland the Episcopal church uses the English book, with the exception of a permissive use, under certain circumstances, of a different communion office, based upon Laud's proposed book for Scotland. The disestablished Church of Ireland made a thorough revision in 1878, in a more strongly Protestant sense than any other of the current books.

The history of the American Book of Common Prayer has distinct and interesting features of its own. When the separate Episcopal church in the United States was organized, a book was compiled in 1783, now known as the Proposed Book, which had only a qualified and informal acceptance. The book actually adopted by the General Convention of 1789 disclaims in its preface the intention of departing from the Church of England in any essential point of doctrine, discipline, or worship. Its variations, accordingly, are chiefly those required by local circumstances or made for the purpose of removing archaisms in the language, though more important changes are the omission of the Athanasian Creed, the option of omitting the use of the cross in baptism and of the words "he descended into hell," in the Creed, and the addition of certain prayers. The influence of the Scottish bishops from whom Seabury obtained his consecration was felt in the restoration, following their own use, of the invocation of the Holy Ghost in the central prayer of the eucharistic office, after primitive models. Minute, careful, and deliberate processes of revision, lasting over nine years, resulted in the publication in 1892 of a prayer book which probably will remain materially unchanged for many a year.

See LITURGY.

PRAYER FOR THE DEAD. The practice which prevails in the Roman Catholic, Greek, and other Oriental churches of praying for the souls of the deceased with the intention and expectation of obtaining for them an alleviation of their sufferings after death, because of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. A belief in the efficacy of sacrifice and prayer for the dead existed in many of the ancient religions, especially those of Egypt, India, and China. The existence of this belief, implicit, if not explicit, affords the only rational explanation of many of the practices of the Greeks and Latins with regard to their dead. In primitive religions it is often difficult to distinguish between sacrifice to the dead and sacrifice for the dead. Among the Jews the custom of prayer for the dead is attested by the well-known text in 2 Maccabees xii. 44, 45, that it is "a holy and wholesome thought to pray for the dead that they may be loosed from their sins." The practice of prayer for the dead is equally recognizable in the early Christian Church. The parable of Lazarus and the rich man evidently portrays a definite belief in the intercommunion of this earth with the world beyond the grave. The fathers of the first centuries frequently allude to prayers for the dead as a common and unquestioned practice. The liturgies of all the rites without exception contain such prayers. Prayer for the dead has been a constant tradition of the Roman Catholic and Eastern churches. The development of the doctrine of purgatory fixed more firmly the custom of prayers and masses for the dead. The Protestant churches, repudiating the doctrine of purgatory, repudiated also prayers for the dead. The English church does not expressly forbid the practice, though prayers for the dead are eliminated from the prayer book, and there is an almost unbroken tradition of ecclesiastical authorities, including such names as Andrewes, Barrow, Ken, Wesley, and Keble, who approved of it.

PREACHING FRIARS. See DOMINICANS.

PREADAMITES. Supposed inhabitants of the earth anterior to Adam. The term is applied particularly to a theory advanced by Isaac de la Peyrère (better known by his Latinized name Pererius), which he attempted to prove from the Bible. Peyrère was born of a Calvinist family of Bordeaux in 1594, and was attached to the service of the Prince of Condé. His theory was first made public in Paris in 1655 in the form of a commentary on Rom. v. 12–14 entitled *præadamitæ*. The same year he published the first part of a formal treatise on the preadamite hypothesis and the theological consequences to be derived therefrom, entitled *Systema Theologicum ex Præadamitarum Hypothesi*. According to his hypothesis Adam was the progenitor of the Jewish race only, and it is only of him and his race that the Bible is designed

to supply the history. Other races existed on earth before that of Adam; but of them the Bible contains no record, nor did the Mosaic law regard them or impose any obligation upon them. It was only under the gospel that they began to be comprehended in the law, which through Christ was given to all the human races of the earth.

As his book was published in the Low Countries, he fell under the animadversion of the Inquisition, and eventually was arrested in the diocese of Mechlin, but was released at the instance of the Prince of Condé. He afterward went to Rome, where he conformed to the Roman Catholic church and made a full retraction of his erroneous opinions (*Epistola ad Philotimum*, Rome, 1657). He was offered preferment by the Pope, Alexander VII, but returned in preference to Paris, where he entered the Seminary of Notre Dame des Vertus, in which he resided till his death in 1676. For a modern discussion of this theme, consult Winchell, *Preadamites* (Boston, 1880).

PRÉ AUX CLERCS, prā ō klârk, LE. A large plain once extending to the gates of Paris, northeast of the abbey of St. Germain des Prés, on the left bank of the Seine, so called because in the Middle Ages it was a resort of the students of the university. The part owned by the abbey attracted students by being nearer, and riots with the monks resulted in legislation by which it was ceded to the university in 1368. Later it was a resort of fashion and of duelists. It is now covered by the Faubourg Saint-Germain.

PREB'END (ML. *præbenda*, prebend, allowance of food and drink, fem. sing. or neut. pl. of Lat. *præbendus*, gerundive of *præbere, prahibere*, to offer, from *præ*, before + *habere*, to have). Originally, a portion of food, clothing, or money allowed to a monk or other cleric out of the revenues of a cathedral or collegiate church. After the organization of chapters of canons, endowments came to be made for their support, the canons usually living in common. When, about the eleventh century, canons ceased to live in common, each received a share of the revenues of the cathedral, called a prebend. At the present time in the Church of England all prebendaries in residence are by law styled canons, but the holders of disendowed prebendal stalls are still known as prebendaries.

PREBLE, prĕb'l, EDWARD (1761–1807). An American naval officer. He was born in Portland, Me., ran away from home in 1777, joined a privateer, and soon afterward entered the Massachusetts marine as a midshipman on the *Protector*. In 1779 he was captured and imprisoned on the prison ship *Jersey* in New York harbor, but was soon released, and until the close of the war served on the *Winthrop*. While attached to this vessel, with only 14 men he boarded a British brig in Penobscot Bay, Maine, and took her out in the face of a battery. When the United States navy was organized, in 1798, he was one of the first to be commissioned as lieutenant, and in 1799 was promoted captain. In the same year, while in command of the *Essex*, he convoyed from Batavia a fleet of merchant vessels. In May, 1803, he was put in command of the squadron fitted out against the Barbary Powers. Arriving off Tangiers in October, he forced the Sultan of Morocco to renew the Treaty of 1786 (see BARBARY POWERS, WARS WITH THE), and then cruised for some time in the vicinity of Tripoli, which port he kept closely blockaded for several months. On July 25, 1804, his fleet then consisting of a frigate, three brigs, three schooners, two bomb vessels, and six gunboats, he attacked the defenses of Tripoli and the Tripolitan fleet with great vigor, captured three gunboats, and sank three more. Five subsequent attacks did considerable damage. However, in September of the same year he was superseded in his command by Commodore Samuel Barron. Preble received a medal and a vote of thanks from Congress, and in 1806 was urged by President Jefferson to enter the cabinet as Secretary of the Navy, but declined on account of failing health. In 1807 he died of tuberculosis at Portland.

PREBLE, GEORGE HENRY (1816–85). An American naval officer, born at Portland, Me., a nephew of Edward Preble. He entered the United States navy as a midshipman in 1835, and during the war with Mexico participated in the operations along the Gulf coast of that country. In 1853 he was assigned to the *Macedonian*, accompanying Commodore Perry to Japan. While in the Far East he was sent on an expedition to punish Chinese pirates. During the early part of 1862 he commanded the gunboat *Katahdin* and participated in Farragut's operations against New Orleans. He was promoted commander in July, 1862, and while he was commanding the *Oneida* off Mobile his blockade was broken by the Confederate cruiser *Oreto* or *Florida*. For this he was dismissed from the service, until it was learned that the *Florida* owed her escape solely to superior speed. Preble was then reinstated. In 1864 he was in command of the fleet brigade which coöperated with General Sherman's army. Later he was chief of staff of the North Pacific squadron (1868–70), commandant of the Philadelphia Navy Yard (1873–75), and commanding officer of the South Pacific station (1877–78). In 1876 he was promoted rear admiral, and in 1878 retired. He published *A History of the Flag of the United States, etc.* (1880) and *A Chronological History of the Origin and Development of Steam Navigation* (1883).

PRE-CAMBRIAN FORMATIONS. A term usually applied to all formations which are older than those containing the *Olenellus* fauna of the Cambrian period. The reason for applying so general a name to this series of rocks is that the Pre-Cambrian strata are often so highly metamorphosed and devoid of organic remains that their stratigraphic relations are indistinct, and it is therefore impossible to assign them an exact position in the geologic scale.

The Pre-Cambrian rocks consist in general of: (1) a great series of more or less highly metamorphosed igneous and sedimentary strata, such as gneisses, schists, slates, quartzites, crystalline limestones, etc.; (2) igneous rocks but slightly altered; (3) recognizable sedimentary rocks, which in rare cases contain fossils. In addition to the intense metamorphism which some of these rocks have undergone, they are often interfolded and much broken by faults. The mere fact that rocks are highly metamorphosed, however, does not determine them to be of Pre-Cambrian age, for such changes have sometimes taken place in rocks of much later date, as in the Devonian and Carboniferous.

The length of time occupied by the Pre-Cambrian periods must always be largely a matter of speculation, but geologically it extended from

the time of formation of a solid crust up to the beginning of the Cambrian. Judging from the variety of forms that are found developed in as early a period as the Cambrian, and the length of time that has been required to develop the present fauna and flora found on the earth, the length of Pre-Cambrian time must have undoubtedly been very great. The highly altered character of the Pre-Cambrian rocks has unfortunately obliterated many fossil remains that were buried in the sedimentary strata, and as a rule it is only in the younger members of the series that distinct fossils have been found.

The classification of the Pre-Cambrian rocks is attended with great difficulty, and no single system has as yet been adopted by the geologists of different countries. In the United States and in Canada the formations are usually divided into a lower system called the Archean and an upper system termed the Algonkian. The former is sometimes also termed the basement or fundamental complex, and consists of igneous and highly metamorphosed rocks, so altered that their original condition is a matter of great uncertainty. Under the Algonkian are included the younger Pre-Cambrian rocks, which can usually be identified as sedimentary, although igneous intrusions of large extent also took place in this period. An earlier classification grouped all the Pre-Cambrian rocks as Archean, subdividing them into a lower series called the Laurentian and an upper series, the Huronian, which corresponds in general to the present Algonkian.

The Pre-Cambrian rocks are widely distributed over the earth, but by no means in a uniform manner. They usually occur in disconnected areas, which are especially developed along the axes of mountain ranges, and also in larger unbroken masses that may cover many thousands of square miles. They constitute the base upon which the Cambrian and later strata have been deposited. Their exposure at the surface may be due to their having remained uncovered since early geologic times or because the overlying sediments and other rocks of later date have been worn away. The more important Pre-Cambrian areas found in North America are the following: 1. Laurentian area of Canada, consisting of a basement complex or Archean system known as the Ottawa gneiss, which grades up into the Grenville series of Algonkian age. 2. The Hastings district southwest of Ottawa. 3. The original Huronian area bordering the north channel of Lake Huron and extending west to Lake Superior. Both the Archean and Algonkian are recognizable here, the latter being subdivided into an upper and a lower Huronian. 4. Adirondack area of eastern New York. 5. The Lake Superior region. Probably a greater amount of work has been done in this area than in any other of Pre-Cambrian age, and the stratigraphic details have been most carefully worked out. 6. Eastern United States, a belt extending from Maine through New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Maryland; Georgia, North Carolina to Alabama, and consisting of a complex series of semicrystalline and holocrystalline rocks. 7. Black Hills area. 8. Southeast Missouri area. 9. Central Texas. 10. Scattered areas in the Cordilleran region. Pre-Cambrian rocks are known also in Great Britain, Scandinavia, central Europe, China, India, and Australasia.

The Pre-Cambrian rocks are rich in ores and mineral materials. Almost inexhaustible supplies of iron ore are found in the Lake Superior region, constituting the largest iron-mining district in the United States, and important deposits of the same metal are known in the Pre-Cambrian gneisses and schists of New York and New Jersey. Many valuable quarries of building stone, especially granite and marble, are located within the Pre-Cambrian areas, while the other economic minerals include graphite, garnet, apatite, talc, emery, feldspar, gold, copper, and nickel.

PRECE'DENCE (ML. *præcedentia*, from Lat. *præcedere*, to go before, from *præ*, before + *cedere*, to go, yield: connected with *cadere*, Skt. *śad*, to fall). The order in which individuals are entitled to follow one another in a state procession or on other public occasions. In former days questions of this sort were considered of great importance; thus, the memoirs of Saint-Simon are largely occupied with minute histories of acrid controversies on these points. In modern times, with the gradual diminution of court ceremonial, less interest attaches to them; but they are still minutely regulated in some countries, either by statute law, by royal letters patent, or by ancient usage. The order of precedence among different countries is in modern practice reduced, as in the signing of treaties by several powers, to the alphabetical order of their names. Precedence among the diplomatic representatives accredited to any government depends upon the date of the presentation of their credentials, ambassadors, however, ranking envoys and ministers plenipotentiary. Precedence involves the right to be presented, or to pass into a room, first or before another; but in processions, especially those of ecclesiastical dignitaries, the persons of highest rank regularly come last.

In the United States the only positive precedence is that given by official position, and in the settling of uncertain questions arising under this system there is no final authority, different administrations having acted in different ways. The most generally accepted order of official precedence at the national capital is as follows:

The President; the Vice President and President of the Senate; ambassadors in their order; the Chief Justice of the United States; Senators; the Speaker of the House; Representatives

in Congress; associate justices of the Supreme Court; the Secretary of State, members of the Diplomatic Corps other than ambassadors, and foreign members of international commissions; the Secretary of the Treasury; the Secretary of War; the Attorney-General; the Postmaster-General; the Secretary of the Navy; the Secretary of the Interior; the Secretary of Agriculture; the Secretary of Commerce and Labor; the general of the army and the admiral of the navy; the governors of States; the Chief Justice and associates of the Court of Claims; circuit and district judges of the United States; the justices and associates of Territories and District of Columbia; the lieutenant general and the vice admiral; diplomatic representatives of the United States; major generals, rear admirals, and staff officers of equal rank; brigadier generals and commodores; chiefs of quasi-independent civil bureaus; chiefs of departmental bureaus in the order of their chief officers; colonels, captains of the navy, staff officers of equal rank, the colonel of the marine corps; consuls general and consuls of foreign governments, according to date of exequatur, and the same of the United States, according to seniority of service; lieutenant colonels and majors of the army, commanders and lieutenant commanders of the navy, and staff officers of equal rank; the commissioners of the District of Columbia, governors of Territories, lieutenant governors, and other elective State officers in their accepted order at home; captains, first lieutenants and second lieutenants of the army, lieutenants, masters, and ensigns of the navy, and staff officers of equal rank; assistant secretaries of executive departments, secretaries of legations, secretaries of the Senate and House of Representatives; and the clerk of the Supreme Court.

For the full table of precedence in England, consult any peerage; for that of Germany, Stillfried, *Ceremonialbuch des preussischen Hofs* (Berlin, 1878); for the older continental usage, Hellbach, *Handbuch des Rangrechts* (Ansbach, 1804). Articles on precedence will be found in encyclopædias of various countries, often with royal or official orders regarding it.

PRECEDENT (from Lat. *præcedens*, pres. p. of *prædere*, to go before). In a general sense, any act or determination which is taken as a guide to action under similar circumstances thereafter.

In its technical legal sense the term "precedent" has come to be employed to designate (*a*) the settled practice of the bar and (*b*) the judicial determination of questions of law by the courts. The popular expression "forms and precedents" points to the former use of the word, as in the forms of pleading and the forms employed in conveyancing, which have acquired commanding authority in the legal profession and are implicitly followed by successive generations of lawyers, until changed by statutory authority, only because of a long-continued exact observance.

Of a different character is the judicial precedent. This has intrinsic authority and exerts a more or less binding force from the hour of its promulgation. It is not peculiar to the common-law system of England and the United States, but is in some degree essential to the administration of every legal system. Indeed, it is involved in the very conception of law as a rule of conduct that the same acts shall produce the same legal consequences, that the same combination of circumstances, however often it may arise, shall invariably be dealt with in the same way.

In this respect, however, there is considerable difference between the system of the United States and the civil-law system on the continent of Europe. While it is undoubtedly the practice for a court in France or Germany, e.g., to follow a rule which has been frequently and consistently followed as law by the superior courts of the jurisdiction, it is now generally conceded that judicial usage, as such, has formally no binding force and materially only so much value as belongs to it as a sound exposition of legal principle, while in England and the United States such usage is of controlling authority.

C. Carter, *Law: Its Origin, Growth, and Function* (New York, 1907); J. C. Gray, *Nature and Sources of the Law* (ib., 1909). See DICTUM; LAW; STARE DECISIS.

PRECEN'TOR (Lat. *præcentor*, leader in music, from *præcinere*, to sing before, from *præ*, before + *canere*, to sing). The official in a chapter, whether cathedral or collegiate, whose duty it was to lead the singing. He began the psalm or hymn, which was taken up and repeated either by the celebrant or another of the body or by the rest of the choir. In modern chapters the precentor ranks next in dignity to the provost or dean. He usually has charge of training the choir and of the selection of the music. Among the nonepiscopal bodies the precentor is the person who begins and conducts the singing, and who usually stands in front of the pulpit, sometimes at one side of it.

PRECEPT (Lat. *præceptum*, rule, doctrine, maxim, precept, neut. sing. of *præceptus*, p.p. of *præcipere*, to instruct, admonish, take beforehand, from *præ*, before + *capere*, to take). In law, a command or mandate in writing, directed to a sheriff or other ministerial officer and constituting his authority to do the act named therein. It is generally considered as synonymous with the word "process."

PRECEPTORS, COLLEGE OF, LONDON. An educational institution established in 1846 and incorporated by Royal Charter in 1849 for the purpose of promoting the interests of education, especially among the middle classes, mainly through the training of teachers. From its initiation the advancement of the education of girls and the training of schoolmistresses and governesses were accepted as among the important duties of the college. The influence of the college has always been exercised through the conduct of examinations of secondary-school pupils and of teachers. In 1867 the first examination in the theory and practice of education was held; in 1871 a successful series of lectures in education was carried out and was followed in 1872 by the establishment of the first chair in education in England, held by Joseph Payne. The college also conducts winter meetings, and offers short courses in education for teachers. The system of examination of secondary schools, begun in 1853, has exercised an important influence, in the absence of centralized control, both

in coördinating the work of these schools and in setting up standards for teachers. At a time when the English secondary schools paid little attention to any subject outside the classics, the college performed the valuable service of promoting the study of mathematics and science.

The college has about 1000 active members, divided into the ranks of fellows, licentiates, and associates, according to the examination passed. There are, in addition, about 4500 persons holding these ranks who are not members of the college. A valuable educational library, a common room, and offices are maintained in London, and the *Educational Times* is published monthly as the organ of the institution. Consult the annual *Calendar*.

PRECEP'TORY (ML. *præceptorius*, relating to instruction, from Lat. *præceptor*, instructor, from *præcipere*, to instruct, admonish, take beforehand). The name given to provincial communities of the Knights Templars, the superiors of which were called knights preceptors. All the preceptories of a province were subject to a provincial superior, called grand preceptor; and there were three of these who held rank above all the rest, the grand preceptors of Jerusalem, Tripolis, and Antioch. Such communities among the Hospitallers were known as commanderies. See TEMPLARS.

PRECES'SION (ML. *præcessio*, advance, precedence, from Lat. *præcedere*, to go before). The points in which the equator intersects the ecliptic, called the equinoctial points, do not remain stationary, but retrograde slowly, i.e., move from east to west. This motion is called the precession of the equinoxes (q.v.). The word "precession" is used because if on one day one of the equinoctial points arrive at the meridian of a place simultaneously with a fixed star, it will next day arrive at the meridian sooner than the star, or will precede it in transit. The amount of this movement is about 50″ each year, and the equinoctial points will therefore require 25,800 years to make a complete circuit in the heavens. This movement of the equinoxes explains also the want of coincidence between the signs of the zodiac and those of the ecliptic. See ARIES.

If the earth were truly spherical and homogeneous, or, more generally, if it were such that the resultant of the gravitational attractions exerted on all its parts by any other body always passed through a single definite point in its mass, its diurnal rotation would not be affected by the attractions of any other bodies. If originally rotating about a principal axis of inertia, it would forever revolve about it, and the direction of the axis would remain fixed in space. To put this in more popular language, the polestar (q.v.) would always be the same star. But, although the earth rotates about an axis almost exactly coinciding with its axis of figure, the attraction of various bodies, especially the sun and the moon, on the oblate protuberant portion at the equator tends to give it a rotation about an axis in the plane of the equator, and the combination of these two rotations gives rise to a shifting of the instantaneous axis of rotation in the earth and also in space. If this attracting force were constant, the pole of the equator would revolve about the pole of the ecliptic in a circle and the equinoxes would move along the ecliptic at a constant rate. But, owing to the disturbance called nutation (q.v.), produced by the varying attraction of the sun, and particularly of the moon, the motion of the pole is waved and not exactly circular, and consequently a slight periodic variation is produced in the mean rate of precession. This gives rise to a small displacement of the mean position of the equinox, amounting to a few seconds only, and known as the equation of the equinox. See LUNAR THEORY.

PRECHTL, prĕk't'l, JOHANN JOSEPH VON (1778–1854). An Austrian physicist, born in Bischofsheim and educated at Würzburg. He settled in Vienna in 1802 and in 1815 became director of the Institute of Technology there. He founded in 1809 the Naval Academy at Triest. Prechtl wrote many articles for the *Technologische Encyklopädie* (1830–55), of which he was editor, and for the *Jahrbücher des Polytechnischen Instituts* (1819–39), which also was under his editorial charge, and published: *Grundlehren der Chemie in technischer Beziehung* (1814–15; 2d ed., 1817–18); *Praktische Dioptrik* (1828); *Untersuchungen über den Flug der Vögel* (1846).

PRÉCIEUSES RIDICULES, prā'syĕs' rē'dē'kŭl', LES (Fr., the ridiculous bluestockings). A brilliant comedy by Molière, first produced on Nov. 18, 1659, in the Hôtel du Petit-Bourbon in Paris, and acted in 1660 before the King, who presented 3000 livres to the actors. The success of the play was due to Molière's scathing and brilliant satire of the *esprit précieux* developed in the Hôtel de Rambouillet and exhibited in its most exaggerated form by Mademoiselle de Scudéry and her school.

PRÉCIEUX, prā'syĕ' (Fr., finical, affected). An epithet applied to the affected style which developed in France during the seventeenth century. It was the outcome of a movement for purity and refinement in language, fostered in various Parisian salons, notably in that of the Hôtel de Rambouillet. Under its influence fantastic turns of speech replaced simple expressions to such a degree that the whole movement acquired a ridiculous character and led Molière to write his brilliant satire *Les précieuses ridicules*, which gave the deathblow to the school. See RAMBOUILLET, HÔTEL DE.

PRECIOUS METALS. As the predominant use of the precious metals is for monetary purposes and radical changes in the quantity of the metals affect all prices, much interest attaches to their production. From the collapse of the

AVERAGE ANNUAL PRODUCTION IN FINE OUNCES

	Gold	Silver
1493–1520	186,470	1,511,050
1521–1600	238,071	8,660,207
1601–1700	293,304	11,970,731
1701–1800	610,882	18,336,720
1801–1840	512,214	20,028,887
1841–1850	1,760,502	25,090,342
1851–1860	6,508,293	28,792,113
1861–1870	6,082,534	39,226,778
1871–1880	5,567,062	71,046,308

1912	22,549,335	224,310,654
Total production 1493–1912	714,747,822	11,083,136,909

Roman Empire to the discovery of America it is probable that no important additions were made to the world's monetary stock. With the discovery of America a new era came in, but it was not before the conquest of Mexico (1521) and of Peru (1533) that appreciable additions were made to the world's stock of silver and gold. The course of gold and silver production since 1493 is given in the table on page 167. Consult E. A. Smith, *Sampling and Assay of the Precious Metals* (Philadelphia, 1914). See GOLD; SILVER.

PRECOCITY, prē-kŏs'ĭ-tĭ (from Lat. *præcox*, ripened too soon, from *præcoquere*, ripen beforehand, from *præ*, before + *coquere*, to cook; connected with Gk. *πέπτειν*, *peptein*, Skt. *pac*, to cook). Supernormal early development, especially of the mental functions. The chief problems of precocity are (1) the relation between mental precocity and bodily abnormalities, (2) the relation between precocity and genius, (3) the course of training that the precocious child should receive. It is popularly supposed that precocious children are particularly subject to nervous and certain other diseases and to arrest of physical growth, so that they are in danger of mental stagnation or degeneration. Statistical studies tend to show, however, that early manifestation of genius is not incompatible with prolonged development. Donaldson, e.g., calculates that of 287 geniuses in various fields 80 per cent gave distinct signs of promise before 20, 80 per cent produced work before 30, 84 per cent attained fame before 40. Musical talent is especially likely to be precocious; only 6 per cent of the great composers failed to show marked ability as children.

Two forms of mental precocity should be distinguished, viz., superiority of general intelligence and superiority of special capacity, or talent. As regards training it is generally agreed that precocious children, especially those of the latter type, should receive physical attention and that their bent should be allowed neither to incite to overstrain nor to result in mere virtuosity. With recent advances in the treatment of subnormality there has come a growing recognition of the need for similar study and training of supernormality in both its forms.

Consult: Francis Galton, *Hereditary Genius* (London, 1892); H. H. Donaldson, *Growth of the Brain* (ib., 1895); A. Lang, "Genius in Children," in *North American Review*, clxiv (New York, 1897); A. F. Chamberlain, *The Child: A Study in the Evolution of Man* (ib., 1900); H. H. Ellis, *Man and Woman*, in "Contemporary Science Series" (4th ed., ib., 1911); W. Stern, "The Supernormal Child," in *Journal of Educational Psychology*, ii (Baltimore, 1911).

PRECOGNITION, prē'kŏg-nĭsh'ŭn (Lat. *præcognitio*, foreknowledge, from *præcognoscere*, to know beforehand, from *præ*, before + *cognoscere*, to know). In Scots law, an examination before a judge ordinary or justice of the peace, corresponding in the United States (1) to a preliminary examination before a magistrate of a person accused of a criminal offense and (2) to the taking of depositions. In Scottish practice the term is also applied to an examination of witnesses by a solicitor before the trial of a civil cause, at which time it is customary for him to write down the substance of their testimony, the writing itself being sometimes called a precognition.

PREDEL'LA. The step or ledge on the rear edge of an altar table, upon which stands the altarpiece (see ALTAR) or the cross and candlesticks; hence by extension the painting or other decoration upon the front of the step. Some of these paintings are works of exquisite art, e.g., that by Fra Angelico in the Louvre. By a further extension the term is sometimes incorrectly applied to the entire altarpiece with the altar step on which it stands.

PREDENTATA. See DINOSAURIA.

PREDES'TINA'TION (Lat. *prædestinatio*, from *prædestinare*, to determine beforehand, from *præ*, before + *destinare*, to determine). A theological term signifying (1) generally, God's predetermination of the events of the world, (2) specifically, the eternal decree of God whereby certain men are appointed unto salvation. The opposite decree is called that of reprobation. The two ideas of an eternal God who works by plan in governing the world and of such a sinful condition among men that no one could be saved without the operation of God, logically lead to the idea of predestination. This connection of thought is found in St. Paul, was elaborated by Augustine, and was established in the Reformed theology by Calvin, forming a central conception in the Augustinian and Calvinistic systems. The term, by its connection with the word "destiny," conveys an unfortunate implication, as if predestination had to do with fate. Theologians have usually, however, maintained that predestination did not destroy the freedom of the will. With Augustine predestination is an affair of grace, and concerns chiefly what God will Himself do, the persuasives He will employ to elicit the good choice of the will. He made no attempt to exhibit the reasons why some are brought to faith and salvation and others not. It was a matter of the inscrutable wisdom and mercy of God. In this reticence he has been imitated by most of his followers. Negatively, Calvin and the Reformed theology emphasized with great force the position that the predestination of God did not depend upon the divine foreknowledge of faith which would be exercised by the elected individual, for that faith, as the entrance into the kingdom of God and the condition of salvation, is the result of the election. They did not, however, exclude all foreknowledge of the individual. The Arminians were sometimes thought to condition predestination upon foreknowledge of faith, but no creed states this (except certain creeds of the Greek church). The main contention of Augustine, that salvation begins in the initiative of God, is generally accepted by evangelical Christians; but the adjustment of this position to human freedom is a point in reference to which much diversity prevails. In recent times the drift of opinion has been against efforts to make such an adjustment, and the current of discussion has carried theological interests into other departments of thought. Present tendencies are to emphasize the known, the facts of human religious experience, and avoid inferences of a precarious nature as to the unknown. Consult the treatises on systematic theology, particularly Charles Hodge (3 vols., New York, 1871–72); J. B. Mozley, *A Treatise on the Augustinian Doctrine of Predestination* (2d ed., London, 1878); J. Forbes, *Predestination and Free Will* (Edinburgh, 1879); Dodge, *The Purpose of God* (Boston, 1894); M. Scheibe, *Calvin's Prädestinationslehre* (Halle, 1897); H.

von Schubert, *Die sogenannte Prädestinatus* (Leipzig, 1903). See ARMINIANISM; AUGUSTINE, SAINT; CALVINISM; ELECTION; FREE WILL; PELAGIANISM.

PRED'ICABLE (Lat. *prædicabilis*, what may be spoken of, from *prædicare*, to declare, from *præ*, before + *dicare*, frequentative of *dicere*, to say). A term in the scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan—genus, species, difference (*differentia*), property (*proprium*), and accident (*accidens*). Genus is the name of any class—marked off by some attribute or attributes, called generic—subdivided into further classes, which are called the species of the genus. The other three designations—difference, property, accident—are names given to attributes, other than the generic, possessed by objects classified. The difference, or more frequently the specific difference, is what distinguishes species of the same genus. Property designates any mark peculiar to a class but not used as a basis of classification. The accident is any feature which is neither a generic attribute, a specific difference, nor a property. There is much confusion of thought and conflict of usage in connection with the terms "property" and "accident." Consult the logical works mentioned under LOGIC.

PREDICAMENT, IN LOGIC. The Latin translation of the Greek term for "category" (q.v.).

PRED'ICATE. See JUDGMENT.

PREDIS, prā'dēs, AMBROGIO DE (c.1455–c.1515). A Milanese painter of the Renaissance. He was educated in the school of Foppa, and afterwards became a follower of Leonardo to the extent that their works were confounded for many years. "The Virgin of the Rocks," in the National Gallery, London, is now generally conceded to be a copy by De Predis of Leonardo's original in the Louvre. He was the favorite painter of Ludovico Sforza, "the Moor," and probably went to Innsbruck in 1499 with the duke and his family. The portrait by him of the Emperor Maximilian (1502), who married Bianca Sforza, is in the Vienna Gallery; that of a young woman thought to be Bianca herself, and formerly attributed to Leonardo, is in the Ambrosiana, Milan. It is a masterpiece, but the real portrait of Bianca is in the Widener collection, Philadelphia. De Predis was rescued from oblivion by Giovanni Morelli, the art critic. Among the portraits now generally attributed to him are "The Musician," in the Ambrosiana, and Francesco Brivio, in the Poldi-Pezzoli collection, Milan—both fine examples. Portraits of unknown personages by him, usually bust or profile, are in the Bergamo Gallery (two), Weber collection, Hamburg, Hanover Museum (two), National Gallery, London, Frizzoni collection, Milan, Winthrop collection, New York, and elsewhere. Interesting miniatures by him are in the British Museum and the Trivulzio collection, Milan. Despite certain defects of drawing De Predis is one of the most interesting painters of the Milanese school. Consult Morelli, *Italian Painters* (London, 1892).

PREECE, SIR WILLIAM HENRY (1834–1913). A British electrical engineer, born in Carnarvon, Wales, and educated at King's College School, London. He held important positions at various times with the Electric and International Telegraph Company, the London and Southwestern Railway, the Channel Islands Telegraph Company, and the Post Office Department, of which he was engineer in chief from 1892 to 1899. In the latter year he was knighted. Preece did valuable pioneer work in railway signaling and, more especially, in wireless telegraphy and telephony, and he was an excellent popular lecturer. He revised Goodeve's *Telegraphy* (1876, with Sir James Sivewright; 18th ed., 1905; revised by his son, W. L. Preece, 1914); and Noad's *Student's Text-Book of Electricity* (1879); and wrote, with the Count du Moncel, *Incandescent Electric Lights* (1882), with Julius Maier, *The Telephone* (1889; Ger. version, 1889; Fr., 1890), and, with A. J. Stubbs, *A Manual of Telephony* (1893).

PREËMPTION (ML. *præemptio*, a buying before, from Lat. *præ*, before + *emptio*, purchase, from *emere*, to buy). In international law, the right of a belligerent power to seize provisions and other articles belonging to the citizens of a neutral state while such goods are in transit to an enemy port, as being probable contraband of war, and for which proper compensation or indemnity is made to the owners. The English rule is to pay the market value of the goods seized, together with a reasonable probable profit, usually estimated at 10 per cent on that amount. By the treaty of Nov. 19, 1794, between the United States and Great Britain, certain articles, as munitions of war and naval stores, were classed as absolute contraband of war and subject to confiscation, and it was further stipulated that all other articles seized as contraband of war should be bought at a reasonable price and the owner indemnified for all damages sustained thereby. Compensation is often made as a matter of grace or of policy where the capture, though sustained by the captor's prize courts, is of doubtful legality or where its legality is strongly disputed by the government of the neutral shipper. Great Britain applied this principle on a large scale in connection with its blockade of German and neutral European ports in 1915. See CONTRABAND OF WAR; INTERNATIONAL LAW; and consult the authorities mentioned under the latter title.

In English law the term preëmption is employed to denote a contract right to buy real property, in event of a sale, at a price equal to or greater than the highest price offered by any other person to the owner within the stipulated time. In the United States this sort of right is commonly included under the phrase "option to purchase."

Preëmption Right. A right formerly given to citizens of the United States under the public land laws to buy a quarter section of public lands at a limited price in preference to all other persons, provided they complied with certain regulations. The preëmption laws were repealed by Act of Congress, March 3, 1891 (26 U. S. Stat. at Large, p. 1097), but the rights of those who had previously filed their claims were saved. This means of acquiring public land differed from that provided by the homestead laws, which require occupation and cultivation. See HOMESTEAD LAWS; LANDS, PUBLIC.

PREËSTABLISHED HARMONY, THE DOCTRINE OF. The theory propounded by Leibnitz to account for the agreement between the changes which take place in the various monads constituting the universe. Each monad (q.v.) develops its own life in causal independence of

its environment, by virtue of its own intrinsic nature; but there is a logical interrelation between all constituents in a systematic whole. From all possible systems God chose the one which is our universe and gave it reality. In doing this He once for all gave reality to the harmony between the different elements in the system in their progressive development. This view differs from occasionalism (q.v.), propounded by Geulincx, in that the latter holds that correspondence is produced by God at the particular time, while according to the doctrine of preëstablished harmony the correspondence has been previously ordained, and leaves no necessity for the perpetual intervention of God. The term "doctrine of preëstablished harmony" is used also for any view which holds that the order of the universe is not one of continuous dynamic interrelation, but was imposed once for all at the very beginning. This generalized use of the term thus does not presuppose Leibnitz's monadism. See CONTINUITY, LAW OF; LEIBNITZ; OPTIMISM.

PREËXISTENCE, DOCTRINE OF. The belief that human souls were in existence before the generation of the bodies with which they are united in this world. The idea has always been widely spread throughout the East. The Greek philosophers too, especially those who held the doctrine of transmigration, as the Pythagoreans, Empedocles, and Plato, were familiar with the conception. With some of the early Christians, as Origen, the assumption of such preëxistence was connected with the belief that God had created the souls of men before the world and that these were united with human bodies at generations or at birth. Subsequently the followers of this opinion were termed preexistencists, to distinguish them from the traducianists, who held that children received soul as well as body from their parents. Consult Julius Müller, *Die christliche Lehre von der Sunde* (Breslau, 1839; 2d ed., 1888; Eng. trans., Edinburgh, 1852-53, 1868), and G. H. Howison, *The Limits of Evolution* (2d ed., New York, 1905). See METEMPSYCHOSIS.

PRE'FECT (Lat. *præfectus*, overseer, governor, from *præficere*, to set over, from *præ*, before + *facere*, to make, place). The title of many officers and magistrates in ancient Rome. The most important was the *præfectus urbi*, or city warden, an appointive office of high rank established in very early times. In the kingly period the city prefect represented the King during his absence from the city in time of war, and under the Republic he performed the same office for the consuls, being himself always an ex-consul. Later, with the establishment of the office of city prætor (see PRÆTOR), that of city prefect lost its importance, until renewed in the reorganization of the government by Augustus. It now became an Imperial magistracy of very high importance, and, as before, only ex-consuls were eligible. The duty of the *præfectus urbi* was to maintain order in Rome; he was thus a sort of chief of police, as in France and in Italy to-day. Other prefects of high (senatorial) rank under the Empire were the *præfectus alimentorum*, in charge of the public grain supply; the *præfectus ærarii Saturni*, or head of the civil treasury; and the *præfectus ærarii militaris*, or head of the military treasury. Members of the second, or equestrian, rank (see EQUESTRIAN ORDER) were eligible, under the Empire, to another class of prefectures, of which the most important was the command of the Emperor's bodyguard (the prætorian guard, q.v.), with the title *præfectus prætorio*. The power of the prætorian prefect was often great enough to cause the overthrow of an emperor and dictate the choice of his successor. The *præfectus annonæ*, in charge of the free distribution of grain to the poor, and the *præfectus Ægypti*, vice regent of the Emperor in Egypt, were both men of equestrian rank, as were also the admirals stationed at the navy yards of Ravenna and Misenum (*præfecti classis*) and the captain of the city police (*præfectus vigilum*). In the army also there were prefects in charge of the camp and of the separate legions, cohorts, and *alæ*. Finally, in some towns of Italy the highest local magistrate had the title of *præfectus iure dicundo*.

PREFERENCE SHOP. See CLOSED SHOP.

PRE'FORMA'TION (from Lat. *præformare*, to shape beforehand, from *præ*, before + *formare*, to shape, from *forma*, shape). A view originating in the seventeenth century with Malpighi and Bonnet. They assumed that the germs of all coming generations were contained in one primordial egg. According to this view all the parts and organs of the chick are present in the germ or egg, there being no differentiation, but only an unfolding of parts (*evolution*) existing, infinitesimal in size, in the egg. Haller emphatically stated that there was no such thing as the differentiation of parts, that no part of the body was made before another, but that all the organs were simultaneously created. It logically followed that the germ destined to give origin to the animal—the ovum according to ovulists, the sperm as asserted by the spermatists (q.v.)—contained within itself the germ of the next generation, that of the next after, and so on indefinitely, so that the first created male or female of each species contained within its sperms or ova the germs of all future generations, inclosed within one another, like a nest of Chinese boxes. The theory of incasement (*emboîtement*) propounded by Swammerdam in 1733 was that the form of the larva, pupa, and imago of the butterfly preëxisted in the egg and even in the ovary, and that the insects in these stages were distinct animals, contained one inside of the other. This explanation Swammerdam extended to the entire animal kingdom.

Consult, for recent statements: Delage, *La structure des protoplasma et les théories sur l'hérédité* (Paris, 1895); A. S. Packard, *Text-Book of Entomology* (New York, 1898); Parker and Haswell, *Text-Book of Zoölogy* (ib., 1910).

PREGEL, prā'gel. The principal river of East Prussia, formed by the confluence of the Ister and the Angerapp, below Insterburg (Map: Prussia, J 1). It flows in a westerly direction and enters the east end of the Frisches Haff about 5 miles below Königsberg. Its total length is about 80 miles, navigable throughout.

PREGNANCY. See ABORTION; MENSTRUATION; OBSTETRICS.

PREHISTORIC MAN. See MAN, SCIENCE OF; PALEOLITHIC PERIOD.

PREHNITE, prān'īt (named in honor of Colonel *Prehn*, who discovered it at the Cape of Good Hope in the latter part of the eighteenth century). An aluminium-calcium orthosilicate that crystallizes in the orthorhombic system. It has a vitreous lustre and is light green to white in color. It is widely distributed and occurs in

eruptive rocks, usually associated with zeolites. When cut and polished it yields a gem resembling chrysoprase in color and lustre, and polished slabs have been cut from masses in China. See CHLORASTROLITE.

PREL, prĕl, KARL, BARON DU (1839–99). A German philosophic author. He was born at Landshut, studied at Munich, and, after 13 years (1859–72) in the Bavarian army, devoted himself to philosophy. His chief works are: *Oneirokritikon: Der Traum vom Standpunkte des transcendentalen Idealismus* (1868), which won him an honorary doctorate from Tübingen; *Der Kampf ums Dasein am Himmel* (1874; 3d ed., *Entwickelungsgeschichte*, 1882); *Die Mystik der alten Griechen* (1888); *Die Philosophie der Mystik* (1885; Eng. version, 1889); *Die Magie als Naturwissenschaft* (1899); *Der Tod, das Jenseits, das Leben im Jenseits* (1899; 2d ed., 1900). His selected works in 19 volumes were published at Leipzig in 1900–01.

PREL'ATE (ML. *prælatus*, prelate, Lat. *prælatus*, set before, p.p. assigned to *præferre*, to set before). A title given to certain ecclesiastics of a higher order, usually to patriarchs, metropolitans, archbishops, bishops, and in the Roman Catholic church to the heads of religious houses and certain other officials. The essential of the office is that it shall have ecclesiastical jurisdiction over other ecclesiastical offices. In the Roman Curia certain officials, although not bishops, wear the episcopal purple and are addressed as Monsignore. By the derived term "prelacy" is understood such an ecclesiastical polity as provides for a gradation of the clergy in rank, as distinguished from a system in which all the clergy are on an equality. Consult P. A. Baart, *The Roman Court* (Milwaukee, 1895), and E. L. Taunton, *The Law of the Church* (St. Louis, 1906).

PRELL, HERMANN (1854–). A German historical painter and sculptor. He was born at Leipzig and studied under Grosse in Dresden and Gussow in Berlin, then went to Italy to study fresco painting, in which branch he produced his most important works. Chief of these are: 11 mural paintings symbolizing the "Principal Epochs in the History of Architecture" (1881–82, Banquet Hall, Architects' Union, Berlin); "Justice" and "Valor" and "Henry IV Granting Privileges to Worms in 1074" (City Hall, Worms); cycles of historic episodes and allegorical scenes, respectively, in the city halls at Hildesheim (1888–91) and Danzig (1896) and over the staircase of the Breslau Museum (1894); mythological scenes and sculptures in the Albertinum (1901–05) and the Rathaus, Dresden (1908–12), and the frieze with subjects from northern mythology in the throne room of the German Embassy in Rome. Of his easel pictures the Dresden Gallery contains the "Betrayal of Christ" (1886), and the Breslau Museum a "Repose in Egypt" (1890). Prell was a member of the Academy of Berlin, where he taught in 1886–91, and of Dresden, in which he became professor; and he received the great gold medal at Berlin in 1893. He ranks as one of the foremost historical painters of modern Germany. He is especially known for his successful use of casein colors in fresco. In later life he essayed sculpture. For his biography, consult F. H. Meissner (Vienna, 1898) and A. Rosenberg (Bielefeld, 1901); for illustrations of his works, G. Galland (Charlottenburg, 1904).

PREL/LER, FRIEDRICH (the Elder) (1804–78). A German landscape painter, the principal representative of the so-called historic landscape in the nineteenth century. Born at Eisenach, April 24, 1804, he early removed to Weimar, where, through Heinrich Meyer (q.v.), who subsequently was his instructor, Goethe became interested in him. In 1821 Preller went to Dresden, where he copied Dutch and French masters in the Gallery. Returning to Weimar, he was introduced by Goethe to the Grand Duke Charles Augustus, who in 1824 took him to Antwerp. Here Preller studied at the Academy under Van Brée. With a stipend from the Grand Duke, he went to Milan and to Rome, where he came under the influence of Koch. At Naples in 1830 he first conceived the idea of his life work, the "Odyssey Landscapes," and there he also met Dr. Härtel, who commissioned him to paint seven of these subjects for his Roman house at Leipzig. Preller also received the commission to execute six "Thuringian Landscapes" with historical figures for the ducal palace at Weimar and to paint in tempera "Five Scenes from Oberon" (1835–39) in the Wieland room. Among the results of journeys to the isle of Rügen (1837 and 1839) and to Norway (1840) are pictures in the Weimar Museum, one in the Dresden Gallery, and one in the National Gallery, Berlin.

After 20 years Preller resumed his favorite theme of the "Odyssey Landscapes" in 16 charcoal drawings (1854–56, National Gallery, Berlin), exhibited in Munich, 1858. The Grand Duke of Weimar commissioned him to paint the cycle in his New Museum, and Preller set out for Italy in 1859 to make new studies, which resulted in another modified series of 16 compositions, the cartoons of which are in the Leipzig Museum, and the encaustic paintings, executed 1863–68, constituting one of the chief ornaments of the Weimar Museum. The cycle traverses Homer's entire narrative. Although deficient in color, Preller is simple and impressive in line. He alone of his school was able to impart life to the figures of his austere and impressive landscape. He also etched 28 plates of good quality. Consult: Schöne, *Friedrich Prellers Odysseelandschaften* (Leipzig, 1863); Jordan, *Die Odyssee in Prellers Darstellung* (ib., 1873); Roquette, *Friedrich Preller* (Frankfort, 1883); Gensel, *Fricdrich Preller* (Bielefeld, 1904).

PRELUDE, prĕl'ūd *or* prē'lūd (OF. *prelude*, Fr. *prélude*, from Lat. *præludere*, to play before, from *præ*, before + *ludere*, to play). In music, a short preface or an introduction to a more extended movement or composition, or to a dramatic performance or church service. It is in the same key with the selection which it is to introduce and to which it is intended as a preparation. For a long time the prelude constituted an essential portion of the older sonata and suites. In the seventeenth century Corelli in his *Sonate da Camera* introduced the custom of beginning all such works with *preludio* in slow time; hence the introduction (q.v.) in our modern sonatas and symphonies. The German composers developed this idea. In some of the suites of J. S. Bach the prelude is as important as any of the regular movements. When this master wrote the *Well-Tempered Clavichord* he prefaced each fugue with a prelude. Bach's organ preludes are masterpieces, notably the magnificent one in E flat introducing the St. Ann's fugue. Mendelssohn followed Bach in

his six *Preludes and Fugues* for piano (op. 35). Chopin wrote a book of preludes which rank among the most beautiful of his shorter compositions, but they are entirely independent compositions, complete in themselves. Richard Wagner, from the time of his writing *Lohengrin*, uses the word "prelude" (*Vorspiel*) instead of overture. He aimed to give in the orchestral introduction to his dramatic works either a complete synopsis of the drama or its fundamental idea. He has, indeed, done this also in his overtures to *The Flying Dutchman* and *Tannhäuser*. Only in *Lohengrin* does the prelude end with a complete cadence; in all the other works the prelude leads without a cadence directly into the first act. See INTRODUCTION; OVERTURE.

PREMIER. See MINISTRY.

PREMIL'LENA'RIANS. See ADVENTISTS; MILLENNIUM; MILLER, WILLIAM.

PREM'ISE, IN LOGIC. See SYLLOGISM.

PREM'ISES (OF. *premisse*, Fr. *prémisse*, from ML. *præmissa*, premise, fem. sing. of Lat. *præmissus*, p.p. of *præmittere*, to send before, put before, from *præ*, before + *mittere*, to send, Skt. *mīv*, to push). In law, the introductory part of any legal writing, which usually contains preliminary statements or descriptions, necessary to a complete understanding of the main body of an instrument, as the "stating" part of a bill in equity, or the part of a deed which precedes the habendum clause and which contains a description of the property conveyed. As a result of this custom of speaking of the description of the property in a deed as the premises, popular usage has extended the meaning of the term to the land itself.

PREMIUM PLAN. A method of rewarding a worker for increased output by adding to his regular day pay a considerable fraction (usually one-half) of the wage value of any time he may save in completing the job assigned to him. The amount of time to be considered as saved is determined by comparing the time actually taken with a standard fixed in advance. This standard is usually based upon, though not necessarily identical with, the time formerly taken to perform the same or similar work, but in the case of a new job it may be fixed by the estimate of a foreman or other official. The arrangement is wholly voluntary. The worker is not under compulsion to better or even to equal the standard time. He is rewarded by the premium if he betters the standard performance, but no change is made in the regular day-wage agreement, and the premium plan thus may be and is used in establishments where the day-wage scale is fixed by collective bargaining and trade-union conditions. It is in use in a larger number of industrial establishments than any other system except day pay and straight piece rates. An identical system is said to have been long used in the British textile trades. In the United States the underlying idea was first advanced by Henry R. Towne, under the title of "gain sharing," in 1889; but the practical method of working it out for industrial use was proposed by F. A. Halsey in 1891, the name "premium plan" being given it by him. Certain difficulties arising in its use (especially when a serious overestimate has been made in setting the standard time and the workers' premiums thereby become inordinately large) have led to various modifications, of which the most important is attributable to James Rowan, of Glasgow, and is named after its author. In the Rowan premium the workers' share is determined, not by dividing with him the value of the time he saves, but by reducing the time saved to a percentage of the standard time allowed and then applying that percentage to the time actually taken. The formula is: *Time saved* ÷ *Time set* × *Time taken* = *Premium*, i.e., = the time the wage value of which is allowed as a premium. The important practical result of the Rowan plan is that, no matter what error has been made in setting the standard time, the worker's total earnings never can exceed double the standard day rate paid him.

PREMON'STRATEN'SIANS, called also NORBERTINES. A religious order which during the four centuries from the twelfth to the sixteenth was one of the most numerous and powerful monastic bodies in Europe. Its houses were especially numerous in Germany, but there were many monasteries also in England, where, because of the color of their habit, the Norbertines were called White Canons. The order was founded by St. Norbert, a native of Xanten in the diocese of Cleves, who was born about 1080. Norbert's youth had been irregular, but, converted at the age of 35, he afterward lived very strictly, devoting himself to the conversion of others. While engaged in this work he realized the need for missionaries to help the local clergy. He was soon joined by 13 companions to whom he gave the rule of St. Augustine and founded his first monastery (1120) in the forest of Coucy, near Laon, at a place called Pré Monstré (the field shown), or Prémonstré (foreshown), because Norbert felt that this was the place that had been pointed out to him by a vision. This became the mother house, and the order came to be named from it.

The order spread rapidly, first in France and the Low Countries and, after Norbert's election (1127) as Archbishop of Magdeburg, also in Germany. The abbot of the mother house at Coucy held the rank of general and was superior of the entire order. This continued to be the case until the French Revolution. St. Norbert also founded an order of nuns which spread almost as rapidly and as widely as that for men. Towards the close of the sixteenth century (1573), as the result of the Catholic reaction that followed the Council of Trent, a reform movement similar to that in the Franciscan Order made considerable modification of the existing Premonstratensian Institute. The reformed communities remained united with the older body, however, and in 1630 the modified rule was accepted by all the communities. In the seventeenth century numerous colleges were formed at the universities of western Europe. Since the end of the seventeenth century the order has declined in numbers. The female branch became almost extinct in the eighteenth century. There was a reawakening in the nineteenth century in the male branch, but the order has suffered much from suppression in Italy, Spain, the German Empire, and Switzerland. It flourishes in Austria and Holland, however, and there are some houses in England. There are also 11 houses of nuns in Europe. In the United States there is a house at Depere, Wis., which was founded from the abbey of Heeswijk (Holland). Consult: M. Geudens, *A Sketch of the Præmonstratensian Order in Great Britain and Ireland* (London, 1878); Currier, *History*

of Religious Orders (New York, 1894); F. A. Gasquet, "The English Præmonstratensians," in *Transactions of the Royal Historical Society*, vol. xvii (London, 1903); Max Heimbucher, *Orden und Kongregationen* (Paderborn, 1907).

PRENCE, or PRINCE, THOMAS (1600–73). An American Colonial governor, born at Lechdale in Gloucestershire, England. He was one of the company of Puritans that settled in Leyden, Holland, and in 1621 he followed the Pilgrims to New Plymouth. He was a man of considerable wealth and soon became a person of influence in the Colony and was chosen to fill its most responsible offices. He was elected Governor in 1634 and 1638 and annually from 1657 until his death in 1673, the law requiring the Governor to live in Plymouth being waived in his favor. From 1635 until 1637 and from 1639 until 1656 he was one of the assistants, and in 1654 he was authorized to establish in the Kennebec settlement a government subordinate to that at Plymouth. In religious affairs he represented the intolerance of his age, but, on the other hand, he may be considered the founder of the New England public schools, for he zealously advocated the establishment of a system of free education and secured the passage of a law giving profits of Cape Cod fisheries to the support of a school in Plymouth. Consult Francis Baylies, *Historical Memoir of the Colony of New Plymouth* (2 vols., Boston, 1866).

PREN'DERGAST, EDMOND FRANCIS (1843–). An American Roman Catholic archbishop. He was born at Clonmel, Ireland, but came to the United States in 1859. After studying at St. Charles Seminary, Overbrook, Philadelphia, he was ordained a priest in 1865. He was an assistant at St. Paul's, Philadelphia, and at Susquehanna Depot, Pa.; served as rector at Bristol, Pa., for four years, at Allentown, Pa., until 1874, and thereafter at St. Malachy's, Philadelphia, until 1897; and was vicar-general of the archdiocese in 1895–97. Father Prendergast was consecrated auxiliary bishop of Philadelphia in 1897 and was appointed archbishop in 1911.

PRENDERGAST, SIR HARRY NORTH DALRYMPLE (1834–1913). A British soldier, born in India. He was educated at Brighton College and at the East India Company's College at Addiscombe, entered the military service in 1854, was with the sappers and miners during the Persian War of 1856–57, and as a member of the Central India field force distinguished himself in 1858. In the Abyssinian War (1867–68) he commanded the detachment of Madras sappers and miners and in 1885–86 commanded the expedition that obtained the annexation of Upper Burma to the British Empire. He then (1886) commanded all the British forces in Burma and subsequently occupied various posts, including that of officiating Resident at Mysore and Chief Commissioner of Coorg in 1891–92. In 1887 he attained the rank of general of Royal Engineers. He was created K.C.B. in 1885 and promoted G.C.B. in 1902.

PRENDERGAST, JOHN PATRICK (1808–93). An Irish politician and historian, born at Dublin. He was educated at Trinity College, Dublin, was admitted to the bar in 1830, and was active as a writer of pamphlets and newspaper articles from the Liberal Nationalist point of view. His chief work, however, was done in connection with Irish history, in which he published the following studies: *The History of the Cromwellian Settlement of Ireland* (1863; 2d ed., 1875); *The Tory War in Ulster* (1868); *Ireland from the Restoration to the Revolution* (1887).

PRENDERGAST, MORRIS BRAZIL (1861–). An American landscape and figure painter. He was born in Boston and studied in Paris at the Julian and Colarossi academies (1892–96) and later independently in Italy. Upon his return to the United States he settled in Boston, but in 1914 removed to New York. His subjects are usually landscapes with figures, and he is especially known for his Massachusetts seashore views, conceived in a highly individual manner. He excels equally in oil and in water color, in paintings decoratively conceived but true to nature in a large way. The color is rich and powerful, the sentiment always joyful. A large exhibition of his paintings was held in New York in 1915. Among his best works are: "Chrysanthemum Market"; "The Fête"; "Taking the Air"; "On the Cliffs"; "The Merry Maidens"; and a "Group of Figures, No. 2" (1915). Prendergast became one of the leaders of radical tendencies in American art, and was elected president of the American Association of Painters and Sculptors and a member of the Boston and New York Water Color societies.

PREN'TICE, GEORGE DENISON (1802–70). An American journalist, born at Preston, Conn. He graduated at Brown University in 1823, studied law and was admitted to the bar, but never practiced, and in 1828 became the first editor of the *New England Review*. In 1830 he removed to Kentucky, and there published his popular campaign life of Henry Clay (1831). He established in the Whig interest at Louisville in 1830 the *Journal*, which soon came to be the best-edited and most widely read newspaper in that region. He did much to increase the *Journal's* circulation and his own fame through originating the brief, pointed paragraph, theretofore almost unknown. A collection of these paragraphs, edited by himself, appeared in 1860 as *Prenticeana* (rev. ed., 1870). Prentice was a vigorous opponent, and was so frequently involved in duels as to become a subject of jest. He was antagonistic to secession, and it is said that his editorials had an important influence in keeping Kentucky from withdrawing from the Union. He published in the *Journal* considerable verse, later edited by J. J. Piatt (Cincinnati, 1876). He also contributed for some time a column of Wit and Humor to Robert Bonner's New York *Ledger*. He retired from the editorship of the *Journal* in 1867. Consult the sketch by J. J. Piatt, in the edition of the *Poems* above referred to, and Henry Watterson, *Memorial Address* (Cincinnati, 1870).

PREN'TISS, BENJAMIN MAYBURY (1819–1901). An American soldier, born at Belleville, Va. (now W. Va.). In 1841 he settled in Quincy, Ill., and three years later he became first lieutenant of a militia company organized to aid in quelling Mormon disturbances. He served during the Mexican War as a captain of volunteers, and at the outbreak of the Civil War organized a company which he offered to the Federal government. Soon afterward he was appointed colonel of the Seventh Illinois, and on May 17, 1861, was promoted brigadier general of volunteers and was given command of Cairo, then one of the five principal military centres

of the Union. In September, however, he was succeeded by General Grant. On Dec. 28, 1861, he defeated the Confederates at Mount Zion. On April 3, 1862, he joined Grant at Shiloh, and was given command of the new Sixth Division, composed of raw troops. This division with that of Sherman occupied the most exposed position, and upon them fell the unexpected onslaught of the Confederates on April 6. After making a creditable resistance General Prentiss and the greater part of his division surrendered. He was exchanged in October, and the next month was commissioned a major general of volunteers while attending the court-martial called to try Fitz John Porter (q.v.). On July 3, 1863, while commanding at Helena, Ark., he repulsed an attack by a superior force of Confederates under Generals T. H. Holmes and Sterling Price. On Oct. 28, 1863, he resigned his commission. He afterward went to reside at Quincy, Ill., where he engaged in business.

PRENTISS, GEORGE LEWIS (1816–1903). An American clergyman and theologian, a brother of Sergeant Smith Prentiss. He was born at Gorham, Me., graduated at Bowdoin College in 1835, and taught for a year in Gorham Academy. Subsequently he spent two years at Halle and Berlin and some time in England. In 1845 he became pastor of the South Trinitarian Church at New Bedford, Mass., and from 1851 to 1858 was pastor of the Mercer Street Presbyterian Church, New York, resigning to seek health by foreign travel. Of the Murray Hill Church of the Covenant, New York, which he had organized, he served as pastor in 1862–73, and thereafter until his retirement in 1896 he was professor of pastoral theology, Church polity, and mission work in Union Theological Seminary. He published a volume on *The Union Theological Seminary* (1889), and as a supplement to this *The Agreement between Union Seminary and the General Assembly* (1891). His autobiography is contained in *The Bright Side of Life* (2 vols., New York, 1901).

His wife, ELIZABETH PAYSON PRENTISS (1818–78), was born in Portland, Me., a daughter of the Rev. Edward Payson (q.v.). She was educated in Portland and Ipswich, taught school for a few years, and was married to Dr. Prentiss in 1845. She was the author of books for children and of several popular religious works, the most important of which was *Stepping Heavenward* (first published serially in the Chicago *Advance*, 1869). Her life and letters were published by her husband (New York, 1882).

PRENTISS, SERGEANT SMITH (1808–50). An American lawyer and orator, born in Portland, Me. He graduated at Bowdoin College when 19 years old, settled in Natchez, Miss., and was admitted to the bar at 21. His keen intellect and oratorical ability made him at once successful. In 1832 he removed to Vicksburg. In 1835 he was elected as a Whig to the State Legislature, and two years later was returned to Congress, but was unseated. He was reëlected, however, in the following year, and this time was allowed to serve. In 1840 he made speeches in many parts of the country urging the reelection as President of William Henry Harrison, but withdrew from politics in 1842. In 1845, having by an unfavorable legal decision lost much of his property, he removed to New Orleans, where he practiced with success. A *Memoir* of Prentiss was edited by his brother, George Lewis Prentiss (q.v.) (2 vols., New York, 1855, 1870).

PRENZLAU, prĕnts'lou, or **PRENZLOW.** A town in the Province of Brandenburg, Prussia, on the Ucker and the Lower Ucker Lake, 58 miles north-northeast of Berlin (Map: Germany, E 2). Among its churches is the handsome Gothic St. Mary's, built of brick. The town has a Gymnasium and a teachers' seminary. Sugar, cigars, beer, machinery, woolen yarn, leather, oleomargarine, and finished wood products are manufactured. Prenzlau is first mentioned in the twelfth century and was the capital of the Ucker Mark. It is noted as the scene of the surrender of the Prussians under Hohenlohe to the French under Murat in 1806. Pop., 1900, 20,228; 1910, 21,431.

PREPARATION (Lat. *præparatio,* from *præparare,* to make ready beforehand, from *præ,* before + *parare,* to make ready). A term in music, applied to the introduction of dissonances. According to the older theorists no dissonance could be introduced without being *prepared,* i.e., the note forming a dissonance had to occur in the preceding chord and in the same part as a note of harmony. See CONSONANCE; DISSONANCE.

PREPOSITION (OF. *preposition,* Fr. *préposition,* Lat. *præpositio,* from *præponere,* to place before, from *præ,* before + *ponere,* to place). In grammar (q.v.), an indeclinable word preceding a noun or a pronoun in an oblique case and showing the relation of such a noun or pronoun to another noun, pronoun, adjective, or verb. Originally the preposition was only a specialized form of the adverb and is consequently in the last analysis a stereotyped case form of a noun. Thus, the Indo-Germanic **peri,* around, which is represented by Skt. *pari,* Gk. περί, Lat. *per,* Goth. *fair,* and Ger. *ver-* in such verbs as *vergehen,* to go to destruction, was primarily the locative case of an inferred noun **per-,* connected with the verbal root **per,* to cross. The adverbial nature of prepositions is shown by their use in verbal compounds, as Lat. *per astra,* through the stars, besides *perire,* to go through, to perish. In an earlier period the preposition did not "govern its case." The preposition was purely adverbial, and the case of the noun depended altogether on other syntactic considerations. In such a sentence as Latin *it ad flumen,* he goes to the river, *ad* primarily pointed out the direction, while *flumen* was an accusative denoting in itself the end of the motion implied in the verb. The decay of feeling for the force of inflectional endings led to an increased value of prepositions, which developed from local adverbs to words that actually governed case relations. The term "preposition" is faulty, since these words may in many languages stand after the noun which they govern, and they are then sometimes called postpositives or postpositions. In English the preposition has lost in great part its adverbial character, although traces of this value survive in such uses as *to see a thing through,* as compared with *to see through a thing.* As connectives, they govern the objective case only, as *in the house, to the house, from the house,* where more conservative languages would employ a locative, an accusative, and an ablative respectively. The possessive case has been supplanted in great measure by the objective case with *of.* The principle is frequently maintained that a

phrase or sentence should not end with a preposition on account of the weak termination thus given. Many of the best literary authorities, however, disregard this, and there is no good reason for a rigid observance of such a rule either on stylistic or on historical grounds. Consult Berthold Delbrück, *Vergleichende Syntax der indogermanischen Sprachen*, vol. i (Strassburg, 1897), and Michel Bréal, *Essai de sémantique* (6th ed., Paris, 1913).

PREPO'TENCY (Lat. *præpotentia*, superior power, from *præposse*, to be superior in power, from *præ*, before + *posse*, to be able). The power of exerting a preponderating influence in the act of reproduction. Thus, some one male ancestor excelling in some physical or mental character, such as form, color, and disposition, is known to have transmitted his qualities through many generations. Not only may the individuals of a normal species thus transmit their marked or superior qualities, but also aberrations or sports may thus be transmitted, unless bred out by crossing. In certain historic families some one ancestor and after him others in the same family have shown great power in transmitting their likeness through the male line, as in the case of the Austrian emperors of the house of Hapsburg, and so with the mental qualities of certain Roman families. It is especially noticeable among domesticated animals, where qualities and ancestry have long been recorded. The famous bull "Favorite" is said to have exerted a prepotent influence on the short-horned race of cattle. The Jews are more prepotent than the English race, are of better, i.e., purer, breed, but the prepotency declares itself only when intermarriages take place. In nature prepotency may (1) arise spontaneously and abruptly along with sports in one or more directions, or gradually with the help of natural selections; (2) it may be gradually acquired when a few individuals of any given species or variety are so isolated that inbreeding is inevitable. In cases of crosses between different breeds, says Redfield, prepotency appears to lie with that breed which has had its characters most firmly fixed by in-and-in breeding. Hence animals of pure blood are prepotent over mongrel stock. In the life of an individual a character is more firmly fixed in middle life than in youth, and observation of horses has shown that the older individual is or tends to be more prepotent than young males.

Consult J. C. Ewart, *The Penycuik Experiments* (London, 1899), and Charles Darwin, *The Variations of Animals and Plants under Domestication* (authorized ed., 2 vols., New York, 1900).

PRERADOVIĆ, prā-rä'dô-vĭch, PETER (1818–72). A Croatian poet, born at Grabonitza. He entered the Austrian army, took part in the war with Italy, and rose to the grade of general (1866). When he was stationed in Dalmatia (1842), he took up the study of his native tongue, which he had almost forgotten, and began to write in that language. His works, which rank him as the greatest Croatian poet of the century, include *Prvenci* (1846), *Nove pjesme* (1851), and the epics *Prvi ljudi* and *Slavenski Dioskuri*. The collected edition, *Pjesnička Djela*, published at national expense (1873), contains a biography by Trnski and a critical study by Marković. A few of his poems were turned into German by Spicer (1895).

PRE'-RAPH'AELITES. A term which, properly signifying the Italian painters before Raphael, is now commonly applied to a group of English painters in the nineteenth century. It was first used in this sense of a group of young German artists who, after their expulsion from the Vienna Academy in 1810, established themselves in the deserted Franciscan convent of San Isidoro at Rome. They formed an art brotherhood which was to live in seclusion and sanctity, and were nicknamed the German Lay Brothers, and afterward the Nazarenes. Their object was the restoration of Christian art to its mediæval purity, and they took as their guides the Pre-Raphaelite masters. They regarded the mental conception as the chief feature of a work of art, and form as the chief vehicle of its expression, color being subsidiary. The leader and moving spirit of the school was Overbeck (q.v.); other members were Cornelius, the brothers Schadow, Philip Veit, Schnorr von Carolsfeld, Führich, and Steinle. They afterward scattered throughout Germany—some, like Cornelius, relinquishing their tenets; but Overbeck remained at Rome, faithful to the end. Their art is characterized by a certain naïveté and a very imperfect technic.

The name is most commonly applied to the school that arose in England about the middle of the nineteenth century and accomplished great results both in art and literature. The movement originated with a band of seven young men—Dante Gabriel Rossetti and his brother William Michael, John Everett Millais, William Holman Hunt, Frederick George Stephens, Charles Collinson, and Thomas Woolner the sculptor. The brotherhood was formed in the autumn of 1848, and its ruling spirit was D. G. Rossetti. The latter had been a pupil of Ford Madox Brown (q.v.), who both influenced and was influenced by the brotherhood, although he never joined it. Its painting really began with "The Eve of St. Agnes," a picture by Holman Hunt, who was the first to realize the purity of work in the early Italian painters and to seek to rival their sincerity. For a time in 1850 they published a periodical called *The Germ*, in which some of Rossetti's earliest poetical work and his fine prose study "Hand and Soul" first appeared.

Their art represents a reaction against the pseudoclassic, imitative tendencies of their day, as manifested particularly in historic and genre painting. They sought inspiration in the age preceding Raphael, a time when art was simple, sincere, and religious. The most prominent features of their art were its mystic and religious sentiment, which appeared especially in the choice of subject, the spiritual quality of their pictures, and a very careful and conscientious execution, with great emphasis on truth of detail. These principles were violently attacked and with some justice, since mysticism sometimes led to affectation and the exaggerated rendition of detail caused the neglect of the ensemble. Millais afterward deserted the brotherhood, but they found an eloquent defender in John Ruskin and strongest of followers in Sir Edward Burne-Jones, a disciple of Rossetti. William Morris and Walter Crane also were associated with them and influenced by their principles. The movement had many other followers, and even to-day its tendencies are reflected in the work of some British artists. Their chief influence was to restore spirituality and poetic feeling, which had well-nigh perished

in British art, and their maxims also led to a more thorough study of form than had been usual. In literature the movement may really be considered as a recurrent phase of the wider Romantic movement, the teaching of which had been somewhat obscured in the half-century since its proclamation in England. In its looking back to the Middle Ages it harmonized with the Oxford movement of its own day and with the Gothic revival of Pugin. Its mental attitude is magnificently represented in the highly colored, imaginative "painter's poetry" of Rossetti, in much of the work of William Morris, and in some of Swinburne's.

G.

PRERAU, prā'rou. A town of Moravia, Austria, situated 40 miles northeast of Brünn (Map: Austria, E 2). It contains an ancient castle, a Gothic town hall, a Bohemian college, an agricultural and a trade school. There are considerable manufactures of textiles, also of sugar, hardware, and agricultural machinery. Prerau was formerly the chief seat of the Moravian Brethren. Pop., 1900, 16,727; 1910, 20,245.

PREROG'ATIVE (Fr., from Lat. *prærogativa*, from *præ*, before + *rogare*, to ask). In English law, certain rights and privileges pertaining exclusively to the sovereign, free from the control of any other power in the state. Once the right of taxation, the right to administer justice, the right to control and direct the military and naval forces of the state, and the power to grant franchises and other privileges were royal prerogatives. A persistent and effective struggle was carried on, first by the barons and later by the commons, to narrow the scope of the royal prerogative, which survives to-day only as a legal fiction. Consult: William Stubbs, *Constitutional History of England* (6th ed., Oxford, 1897); Sir William Blackstone, *Commentaries* (4th ed., 2 vols., Chicago, 1899); Pollock and Maitland, *History of English Law* (2d ed., 2 vols., Cambridge, 1903).

PRES'BYO'PIA. See SIGHT, DEFECTS OF.

PRES'BYTER (Lat. *presbyter*, from Gk. *πρεσβύτερος*, *presbyteros*, elder, comparative of *πρέσβυς*, *presbys*, old man). The term was used by the Jews to designate the chief official of the synagogue or a member of the Sanhedrin. Its use in Acts xiv. 23, however, in all probability, has no reference to officials modeled after the synagogal officers, but to elder (mature) men of the newly formed Christian communities, into whose hands was committed the general religious and administrative care of the converts. The varied functions exercised by these elder men are evidenced in the case of the officials referred to in 1 Thess. v. 12, and were distributed among distinctive officers only as the growth of the Church's work compelled complexity of administration. This primitive grouping of functions in single officials is seen also in the reference to elders in 1 Tim. v. 17, and possibly in Titus i. 5. See BISHOP; ELDER; ORDERS, HOLY; PRESBYTERIANISM.

PRES'BYTE'RIAN ALLIANCE. See ALLIANCE OF THE REFORMED CHURCHES HOLDING THE PRESBYTERIAN SYSTEM.

PRES'BYTE'RIANISM AND THE PRESBYTERIAN CHURCHES. Presbyterianism is a system of Church government by presbyters, or elders. This fact distinguishes it from other forms of Church government—the papal, the episcopal, and the congregational. "In the presbyterian system all ecclesiastical authority is in the body of presbyters called by Christ, and ordained by presbyters to rule over the Church. . . . The Presbyterian churches exalt the Scriptures above the Church, and urge that Christian men and Christian assemblies should wait upon God and listen for the voice of His Spirit speaking infallibly in his Word." Calvin has been regarded as the founder of Presbyterianism, and it is true that he was the first to organize the Reformed church on a presbyterian model; but it should be remembered that government by a body of elders was maintained by the Waldensians and others from a much earlier age.

The name being derived from the form of Church government, the term "Presbyterian" properly includes all those who accept the presbyterian government, even though there may be differences in their theological beliefs. So, in the general Presbyterian Council held at Edinburgh in 1877, the German state establishments and the French and Dutch Reformed churches were represented. Presbyterians are generally Calvinistic in doctrine and for the most part accept the Westminster Assembly's Confession of Faith and the Larger and Shorter catechisms as the symbols of belief. They do not, however, all agree in the interpretation of those standards.

Presbyterian Polity rests on representative government and an ascending series of appellate courts. There are three classes of officers in every well-organized church—the minister or pastor, who is also called a teaching elder; the body of ruling elders, who, with the pastor, have the spiritual oversight of the church; and the deacons, who have care of the relief of the poor and in some churches manage also the financial affairs. The primary governing body is the church session, which consists of a pastor and the ruling elders, chosen by the congregation. Elders were formerly chosen only for life, but now in some branches of the church hold office for a term of years. The church session is under the control of the presbytery to which it belongs. The presbytery consists of the pastors and churches of a given district. The presbyteries are united in a larger governing body called the synod. The larger synods of the United States are representative bodies consisting of ministers and elders chosen from the presbyteries according to some definite ratio. The smaller synods are undelegated bodies, all the ministers and one elder from each church constituting the body. In some of the smaller branches of the church the synod is the ultimate court. The completed system, however, includes

a General Assembly, which is the supreme court. It meets annually and consists of ministers and elders chosen by the respective presbyteries in some definite ratio. Appeals and complaints are carried from the lower to the higher judicatory, beginning with the session and terminating with the General Assembly. In the Presbyterian church in the United States appeals from the synods to the General Assembly are limited to cases involving doctrine or government. In the other Presbyterian churches appeals from the synods to the Assembly are allowed in all cases. The Assembly also has general jurisdiction over the various agencies of the church, such as the theological seminaries and the boards doing the benevolent and missionary work.

Presbyterian Churches in Scotland. Christianity was probably introduced into Scotland about the beginning of the third century, and the claim has been made that the early Celtic churches were nonprelatical. However that may be, they were later brought into the Roman obedience and remained thus until the Reformation. Since that time the history of the Presbyterian church in Scotland has been practically a history of the country. The life of John Knox (q.v.) is the epitome of the Scottish Reformation. The first public movement towards the organization of the Presbyterian church was the drawing of a bond known as "The First Covenant." It was signed at Edinburgh, Dec. 3, 1557, by some of the most powerful Scottish barons and by many of the lesser nobility. This act brought forth a proclamation from the Queen Regent forbidding any one to preach or administer the sacrament without the authority of a bishop, but the Reformed party triumphed, and in 1560 Parliament abolished the Roman Catholic form of worship, adopted a confession of faith agreeing with those of the Reformed churches of the Continent, and appointed ministers of the Protestant faith to various parts of the Kingdom. On Dec. 20, 1560, the first General Assembly of the Church of Scotland was held in Edinburgh. It consisted of six ministers and 34 laymen. In this same year a committee of five persons, including Knox, had been appointed "to commit to writing their judgments touching the reformation of religion." Their *First Book of Discipline* was rejected by the nobles, though accepted by the church. In 1581 the *Second Book of Discipline* was adopted by the Assembly and is still in force together with the Westminster standards. The undaunted perseverance of John Knox and Andrew Melville at last procured complete recognition of the Calvinistic faith and the Presbyterian form of government as the established religion of Scotland. This was ratified by Parliament, with the consent of King James (I of England and VI of Scotland) in 1592. His duplicity, however, soon made itself manifest when he tried to force the episcopal polity on his Scottish subjects. In this he was followed by his successors, Charles I, Charles II, and James II. The ecclesiastical affairs of the country were in great confusion. In 1610 the Glasgow Assembly restored the episcopal government. In 1638 the Assembly rescinded the acts of six previous assemblies, condemned and deposed the bishops, and abolished episcopacy. In 1661 Parliament passed the Rescissory Act, which repealed the legislation of the previous 21 years, and episcopacy was restored to its former position. After the accession of William and Mary, in 1689, civil and religious liberty was restored and Presbyterianism was revived. In 1690 an Act of Settlement was passed, prelacy done away with, and the Westminster Confession adopted. Though both England and Scotland had been under one crown for nearly a century, they still continued separate kingdoms, each with its own Parliament and executive, independent of the other, but upon their union in 1707 the position of Presbyterianism was guaranteed, and it has since continued to be the established religion of Scotland. The Church of Scotland is the Established church, from which the other bodies have from time to time withdrawn. It differs from them chiefly in maintaining a connection with the state.

The question of patronage caused great dissension at an early period, for the Scotch claimed the right to elect their own clergy, or at least the privilege of vetoing an unsatisfactory appointment. A worldly spirit manifested itself, men who were lax in principle obtained important positions, and strange doctrines were taught; the result was the secession of several important bodies. The first party to withdraw were the Covenanters or Cameronians, who objected to the interference of state with church, and who therefore, on July 27, 1712, renewed the covenants (q.v.). They were lineal descendants of the covenanted presbytery and logically true to their principles. The former Covenanters protested against the errors of prelacy, and their successors were now equally emphatic against the backsliding of presbytery. Another body, led by Ebenezer Erskine (q.v.), came out in 1733, forming a party known as the Associated Presbytery or the Seceders. Again, in 1760, another body left the mother church. These men were known as the Relief Synod. On May 13, 1847, these churches united, forming the United Presbyterian church of Scotland.

The Free church of Scotland originated in a protest against civil patronage of the church, the civil courts claiming not only the right to control the temporalities of the church, but also the power to rule in spiritual affairs. In 1834 the General Assembly passed the Veto Act, under which the church courts might reject a "presentee" of the state, if by them deemed unfit for his office. This Act was annulled by the civil courts and the House of Lords in 1839. The Assembly could not agree thus to surrender what it believed to be a right bestowed by the head of the church. The collision between the civil and ecclesiastical courts was so direct that those who held to the independence of the church saw only one way of relief, which was to leave the Established church. Therefore, in 1843, 470 members, under the lead of Chalmers, Candlish (qq.v.), and others, signed an Act of Separation and Deed of Demission, and the Free church of Scotland was the result. It renounced all benefits of establishment, but expressed its firm adherence to the doctrine and maintained the forms of worship and discipline of the Church of Scotland.

The United Free church of Scotland was the result of a movement towards union between the two great bodies which had left the established church. On Oct. 31, 1900, a Uniting Act was formally adopted by the Free Church Assembly and the United Presbyterian Synod sitting in Edinburgh. On the following day the ministers of the two churches, some 3000 in number, marched in procession from their respective

halls to Waverley Market, where they convened as the first General Assembly of the United Free Church. Principal Rainy was the first moderator. The new church received from the United Presbyterian church 637 ministers and 199,089 communicants; from the Free church, 1149 ministers and 296,089 communicants. A minority of 27 ministers and 500 elders voted against the union, and resolved to continue the Free church.

The Reformed church of Scotland, descended from the Covenanted church, glories in its adherence to the principles for which Cameron, Renwick, and Cargill shed their blood. In 1660 the Act of Supremacy was passed, which constituted the King supreme judge in all matters, civil or ecclesiastic; and the oath of allegiance, which declared it to be treason to deny the supremacy of the King in church and state, was imposed. The Covenanters asserted their belief in the covenants and renounced their allegiance to the King on the ground that he had broken his vow, made at his coronation, and had forfeited his right to rule. As a matter of course persecution followed, the leaders perished on the scaffold, and the people were left without a head. They resolved themselves into societies for worship and mutual edification. This caused them to be called the Society People, though they spoke of themselves as the Persecuted Remnant. Later the spirit of compromise entered the church, and, in the desire to comply with the King's wish to include as many as possible of the prelatic clergy, the church received a large number of the very men who had been most earnest in its persecution under the old régime. The Society People could not approve of the conduct of either King or church, and it was therefore impossible for them to identify themselves with the Established church. For lack of sufficient number of ministers, the first presbytery of this people was not formed till Aug. 1, 1743; but from this time the Reformed Presbyterian church went steadily forward, adhering to its peculiar principles with great firmness of purpose, increasing, indeed, with such rapidity that it was for a time beyond its power to supply ministers sufficient for the needs of the people. Later, however, it gradually declined, and nearly all its members joined either the Free or the United Presbyterian church of Scotland.

Presbyterian Church of England. In England the principles of the Puritans were practically Presbyterian, although they were for the most part more concerned with resistance to power, exercised as they believed against the Word of God, than with the development of church government. Still the ministers of London and its vicinity organized a presbytery at Wandsworth in Surrey in 1572, and other presbyteries followed in spite of the hostility of Queen Elizabeth. In July, 1643, in obedience to a summons from Parliament, the Westminster Assembly met in Westminster Abbey and continued in session until 1647. The documents known as the Confession of Faith, the Form of Church Government, the Directory for Worship, and the Larger and Shorter catechisms, drawn up by this Assembly, were approved by Parliament in 1648. (See CREEDS AND CONFESSIONS.) Parliament in 1647 passed an ordinance making Presbyterianism the established religion of England, but this law never went into practical effect. When Cromwell and the Independents came into power, their influence was thrown against Presbyterianism, partly perhaps because of the resistance of the latter to the trial and execution of Charles I. After the Restoration, by command of Charles II, the Savoy Conference (q.v.) was held at the residence of the Bishop of London in 1661. The purpose was, nominally, to alter and reform the liturgy in such a way as to meet the feelings of those who had serious scruples against its use. The negotiations were a failure, as the bishops refused to make any changes. This conference was followed by the Act of Uniformity, which took effect Aug. 24, 1662. Two thousand ministers who would not consent to abjure the Solemn League and Covenant or to be episcopally reordained, resigned their charges or were ejected from them. Sixty thousand church members were imprisoned or fined, 5000 of whom died in prison. After the Revolution and the Act of Toleration in 1689, Presbyterianism flourished again. In 1691 the Presbyterians entered into articles of agreement with the Independents, giving up presbyteries and synods. Arian and Socinian doctrines prevailed to such an extent that the name Presbyterian became synonymous in England with Unitarian. In the meantime there existed in England a few congregations connected with the Scottish church formerly known as the Secession church, later as the United Presbyterian church. At the formation of the Free church of Scotland, the greater number of the English churches connected with the church of Scotland espoused the cause of the Free church and took the name of the Presbyterian church of England. On June 18, 1876, the first synod of the Presbyterian church of England was constituted by the union of the Presbyterian church and the United Presbyterian.

Irish Church. The history of Presbyterianism in Scotland is also essentially its history in Ireland. The first presbytery in Ireland was organized in 1642 by Scottish chaplains accompanying the army sent there to subdue the Great Rebellion of that period. The Presbyterian population increased by immigration from Scotland. Early in the eighteenth century doctrinal differences began to appear, and in 1726 a schism took place. Those who would not subscribe to the Westminster Confession formed themselves into the Presbytery of Antrim. The orthodox body was called the Synod of Ulster. Scottish Seceders, coming over in the middle of the eighteenth century, did much to maintain purity of doctrine in the northern provinces. Owing to laxity of doctrine in the Irish church, the Covenanters made steady progress, and in 1792 their first Irish presbytery was formed. In 1835 the Synod of Ulster endeavored to stem the tide of lax doctrine by requiring subscription to the Confession of Faith. The grounds of separation between them and the Seceders being thus removed, a union was happily consummated in 1840.

The Presbyterian Synod of Seceders in Ireland was formed in 1818 by a union between the two sections of the Scottish Secession church in Ireland, the Burghers and the Antiburghers. The division arose in Scotland in 1747 in regard to the propriety of an oath administered to the burgesses which pledged the taker to support "the true religion presently professed within the realm and authorized by the laws thereof." Those who defended the taking of the oath were called the Burghers; those who condemned it

the Antiburghers. This controversy spread to Ireland. At the time of the union of these two bodies there were 97 ministers. In 1840 the Synod of Seceders united with the Synod of Ulster, taking the title of the Presbyterian church in Ireland.

Calvinistic Methodist or Presbyterian Church of Wales. This body has been Calvinistic in its doctrine from its beginning. In 1735–36 Howell Harris, Howell Davis, and Daniel Rowlands began to preach in different parts of Wales. Whitefield heard of them and worked with them, and for a short time the Calvinistic Methodists of Wales were associated with the Methodists of England, but after 1748 Whitefield ceased to act as their head and their connection with England was gradually broken off. In 1811 they held a General Synod at Bala, when 21 persons were ordained to the ministry. In 1864 the churches of North and South Wales came under the control of one General Assembly. In this church every elder is a member of presbytery. There is a branch of this church in the United States.

Presbyterian Church of the British Colonies. In Canada the Presbyterian church dates from the Conquest in 1759. Its first preacher is supposed to have been the Rev. George Henry, chaplain of a British regiment stationed in Quebec. In Montreal the first Presbyterian church was organized in 1790. In Upper Canada the pioneers of Presbyterianism were from the Reformed Dutch church. One of the earliest missionaries was the Rev. Robert McDowell, who was sent by the Classis of Albany in 1798. Other ministers were sent from Scotland, and later, with immigrants from Scotland and the north of Ireland, Presbyterianism took firm root in Canada. In 1831 the Synod of the Presbyterian Church of Canada was formed in connection with the church of Scotland. It consisted of 25 ministers. The Secession church of Scotland was also represented and was known as the Synod of the United Presbyterian Church in Canada. In 1844, after the disruption in Scotland, a division took place in the Presbyterian church in Canada, and 25 ministers withdrew, calling themselves the Presbyterian church of Scotland. In 1861 this body and the United Presbyterian church in Canada united under the name of the Canada Presbyterian church, with a roll call of 226 ministers. The same churches in the lower provinces also united as the Presbyterian church of the Lower Provinces. After the confederation of the provinces which now form the Dominion of Canada, there arose a natural desire for an ecclesiastical union which had long been contemplated. Negotiations were begun in 1870, and the union was happily brought about, June 15, 1875, in the city of Montreal, the church thus united numbering 634 ministers and 90,658 communicants.

There are also Presbyterian churches in all of the other colonies. The Australian Presbyterian church was founded while that country was still a penal colony. In 1836 the first Presbyterian minister was there in the person of Rev. Mr. Clow, a retired chaplain of a Highland regiment. The representatives of the different forms of Presbyterianism united in 1867 on the abolition of state aid. In August, 1901, the Presbyterian churches of Australia united and signed the deed in Sydney, the Rev. Dr. Meiklejohn being the first moderator of the new body.

The New Zealand Presbyterian church was founded about the year 1840. In 1900 it comprised two assemblies—the Otago and the Southland—with 201 ministers and about 26,000 communicants, and its contributions were about $310,000. On Oct. 31, 1901, these two bodies united and now form the Presbyterian church of New Zealand. The first united Assembly was held in Dunedin, and the Rev. James Gibbs was made moderator.

The Presbyterian church of South Africa comprises three branches: the General Assembly of the Presbyterian Church of South Africa, the Synod of the Free Church Mission of Kaffraria, the Synod of the Presbyterian Church of Basuto Land.

The Presbyterian church of Jamaica numbers 30 ministers and about 12,000 communicants.

Presbyterian Church in the United States of America. This body was founded by the Scottish, Irish, French, German, and Dutch Reformed immigrants. Fugitives from persecution, they took refuge in the more liberal colonies of Pennsylvania, Maryland, New Jersey, Virginia, and the Carolinas, and some in New England. The founding of a Presbyterian colony on Massachusetts Bay took place in 1625. With the arrival of more colonists in 1629 a church was fully constituted under the Rev. Samuel Skelton. Christ's Presbyterian Church was established at Hempstead, Long Island, in 1644. The Rev. Francis Doughty, an English Presbyterian minister, was the first Presbyterian to preach in New York. He ministered there from 1643 to 1648. A Presbyterian church, however, was not organized until 1717. Francis Makemie, an Irish minister of the Presbytery of Laggan, is considered the father of organized Presbyterianism in America. He founded several churches in Maryland and Virginia. Later he crossed the ocean to appeal to the mother church for help. In 1707 he was imprisoned in New York for preaching without permission, for at that time the Episcopal church was practically the Established church, and no dissenter was allowed to preach without a license. In the meantime other Presbyterian churches had been founded—one in Freehold, N. J., in 1692; one in Philadelphia, in 1698, under the care of Jedediah Andrews. The first American presbytery was organized in Philadelphia, probably in 1706—the precise date having been lost—and consisted of seven ministers: Francis Makemie, Samuel Davis, John Hampton, and George McNish, from Ireland; Nathaniel Taylor and John Wilson, from Scotland; and Jedediah Andrews, from New England. The growth of the church was rapid, and in 1716 the Synod of Philadelphia was formed, consisting of four presbyteries: Philadelphia, with six ministers and churches; New Castle, six ministers and churches; Snow Hill, three ministers and churches; Long Island, two ministers and several churches. There is no record at this time that any standards of doctrine had been adopted by the synod, although as most of the ministers were of Scottish descent, it is probable that the Westminster standards were those to which the young church adhered. In 1729, by an "adopting act," the synod made the Westminster Confession of Faith their doctrinal standard, "as being in all the essential and necessary articles good forms of sound words and system of Christian doctrine." They also agreed that no one should be ordained to the ministry or received

into membership who had scruples as to the Confession, "save only about articles not essential and necessary to doctrine, worship, and government." The ministers from abroad, however, were more strict in their doctrinal ideas and laid more stress on scholarship than the native ministers, who insisted more on a living Christian experience, and who, in view of the great needs of the new country, were disposed to receive into the ministry students who were sound in doctrine, but whose opportunities for education had been limited. In 1739 party feelings were stirred by the visit of George Whitefield, and the synod was divided into a party warmly befriending revivals and a party standing aloof from that form of work. By 1741 this dissension resulted in a schism, and two synods were formed—the Old Side, called the Synod of Philadelphia, insisting on a thoroughly educated ministry; the New Side, or Synod of New York, which laid more stress on piety and zeal. There was but slight difference between the two bodies as to doctrine or discipline. After a separation of 13 years this breach was healed and the two synods united under the title of the Synod of New York and Philadelphia, with more than 100 churches under its care.

At this time the tide of population was flowing rapidly westward. The frontier communities contained many men of lawless habits. Hostile Indians were numerous. The opposition of the state church added to the difficulties of the Presbyterian pioneer. Men of education and strength of character were needed. The church found them in the Tennents of New Jersey, Brainerd (the missionary to the Indians), Davies of Virginia, and many others whose work still lives in the Christian communities they established. In 1766, fearful of the legal establishment of the Church of England, the synod agreed to meet in annual convention with the General Assembly of Connecticut "to unite their endeavors and counsels for spreading the gospel and preserving the religious liberties of the church." This arrangement was continued till the War of 1776.

During all the struggle of the United States for independence the Presbyterians stood as one man for the defense of the civil and religious liberty of the country. John Witherspoon, one of its most prominent ministers, was a signer of the Declaration of Independence and before Congress made one of the most effective pleas for the liberty of our country. Although during the Revolutionary War many buildings were destroyed and congregations disbanded, still the vitality of the church continued, and when peace was restored it grew so rapidly that the need of a General Assembly became evident. In 1785 a large committee was appointed to consider a form of complete organization for the Presbyterian church in the United States. In May, 1788, the synod met and resolved itself into a General Assembly, which held its first meeting in Philadelphia the following year. The first Congress of the country was in session in New York at the same time. The first General Assembly embraced four synods (New York and New Jersey, Philadelphia, Virginia, and the Carolinas), 17 presbyteries, 419 congregations, and 180 ministers. This Assembly adopted the Westminster Confession of Faith after making changes in chapters 20, 23, and 31, and the Larger and Shorter catechisms. The form of government of the Scottish church was also adopted, but modified so as to deny to the civil magistrate any right of interference in church affairs, except for protection only.

In 1801 a plan of union was agreed upon between the Presbyterian church and the Connecticut General Association which provided terms for mutual help in the weaker communities. Presbyterian ministers might serve Congregational churches and vice versa.

The Presbyterian church, at the time of the union, numbered 26 presbyteries, 300 ministers, and nearly 500 congregations. Early in the century there were many revivals, especially in the southwestern part of the country, which brought into service many as catechists and exhorters who were neither highly educated nor firm believers in the peculiar doctrines of the Presbyterian church. The controversy over these questions brought about the secession of the Presbytery of Cumberland and resulted in 1810 in the formation of the Cumberland Presbyterian church (see below). The beginning of the nineteenth century showed increased zeal on the part of the Presbyterian church for missionary enterprise. Within a few years, in New York, Pennsylvania, and New England, missionary societies were formed to send the gospel to the Indians and among the pioneers. In 1802 the General Assembly organized a Standing Committee of Missions, consisting of 7 members, later increased to 19 members, whose duty it should be "to collect during the recess of the Assembly all the information in their power relative to the concerns of missions and missionaries," and to "superintend generally under the direction of the Assembly the missionary business." In 1816 the title of the committee was changed to Board of Missions, and it was authorized to act with a larger measure of independence. The growth of the church was rapid. In 1834 it contained 32 synods, 111 presbyteries, and about 1900 ministers. At this time signs of the future schism which divided the church for so many years into the Old and New schools became apparent. For some time there had existed a diversity of doctrinal beliefs among the ministers and churches. New doctrines, coming largely from New England, were adopted by the members of the New School party. In the Old School branch there was a leaning to the strict doctrine and discipline of the Scottish church; Albert Barnes (q.v.), of Philadelphia, and Lyman Beecher (q.v.), of Lane Seminary in Cincinnati, were both subjected to trial and censure by their presbyteries. The church was shaken by the controversy. The agitation over slavery divided it still further. The New School party felt called upon to denounce it, while the Old School thought that duty did not require that the church should pronounce on the subject. In 1837 the Assembly, having (for the first time in five years) a majority of Old School members, disowned or exscinded three of the synods of western New York and one in Ohio, with all the churches and ministers belonging to them. Great excitement prevailed throughout the church. A meeting of the excluded synods was held at Auburn, N. Y., in August, 1837, as the true constitutional Assembly, at which trustees were appointed for the care of the property of the corporation. These trustees later brought legal action to determine their rights, and a verdict was given in their favor, but on appeal to a higher court the de-

cision was overruled on points of law and a new trial granted. The matter was not pressed further. In 1838 the New School members demanded enrollment for the excluded commissioners of the preceding year. This was refused, and the bodies separated, each claiming to have the constitutional succession and using the title the General Assembly of the Presbyterian Church in the United States of America. The Old School church had seminaries at Princeton, N. J., Allegheny, Pa., Columbia, S. C., Danville, Ky., and Chicago. The New School seminaries were Union, N. Y., Auburn, N. Y., Lane at Cincinnati, and Blackburn, Ill. Each church carried on its work with great zeal, both at home and abroad; each branch was active in encouraging educational institutions, and, as they flourished side by side, each grew more confident of the orthodoxy and usefulness of the other. The Old School Assembly of 1837 had organized its Board of Foreign Missions, and it continued to support the boards of Home Missions and of Education which had been organized before the division. The New School carried on its home mission work through the American Home Missionary Society. Later, however, it organized permanent committees on home missions, education, and publication, through which its work was carried on, while its foreign work was conducted through the American Board of Commissioners for Foreign Missions.

But now signs of the approaching national storm began to appear. In 1858 the southern part of the New School church dropped off and organized under the title of the United Synod of the Presbyterian Church, South. A hundred ministers and 200 churches constituted this synod, which remained a separate organization until 1864, when it joined the General Assembly of the Southern Presbyterian Church. In 1861 the Old School branch suffered a similar defection, as the Assembly of that year took action which grieved the Southern commissioners, who withdrew and organized the Southern Presbyterian church, under the title of the Presbyterian Church in the United States (see below). With the abolition of slavery and the close of the Civil War a new spirit arose in the two branches of the church in the North. The New School had proved its soundness in the faith. In 1866 the two Assemblies met in St. Louis and for the first time in a generation partook of the Lord's Supper together. A committee was appointed to consider plans for union, these plans were submitted to the various presbyteries, and in 1869 the two assemblies met and paved the way for the union which was consummated in November, 1869, in Pittsburgh. The next year both assemblies met in the First Church of Philadelphia as one body. At this time the ministers numbered 4238, the churches 4526, and the members 446,561. In 1888 the General Assembly celebrated in the city of Philadelphia the first century of its organization. In 1788, at the time of the first Assembly, there were but 419 churches and not more than 20,000 communicants. At the centennial there were 6436 churches reported and about 700,000 communicants.

In 1889 the General Assembly received overtures from a number of presbyteries asking for some revision of the doctrinal standards. In reply that Assembly sent overtures to all the presbyteries asking whether revision were desired and to what extent. About two-thirds of the presbyteries expressed a desire for revision, and the Assembly of 1890 appointed a committee on revision, consisting of 15 ministers and 10 ruling elders. This committee presented a report in 1892 recommending sundry changes in the Confession of Faith, but the overtures from the Assembly failed of the constitutional majority, and revision was for the time abandoned. The demand for some modification of the Confession continued and by 1900 had become so general that the Assembly of that year appointed another committee of 15 to consider the whole question of a restatement of doctrine. It reported progress in 1901, was enlarged and continued with instructions to report the next year. At the Assembly of 1902 in the city of New York a unanimous report was made. The committee recommended that additional statements concerning the love of God for all men, missions, and the Holy Spirit be added in the form of new chapters to the Confession of Faith. The committee also presented a brief statement of the Reformed Faith in 16 articles, which was designed not to take the place of the Confession of Faith as a doctrinal standard of the Presbyterian church, but to be an interpretation of it. This "Brief Statement of the Reformed Faith" was adopted with only two dissenting voices.

The great national expansion following the War with Spain in 1898 gave a marked advance to the missionary operations of the church. The field of home missions, which already extended to Alaska, was widened to include Porto Rico and, later, Cuba, while in the Pacific the Philippine Islands were added to the vast foreign missionary territory.

This enlarged work for the church was naturally followed by a tendency towards the strengthening and unification of church forces. In 1903 the assemblies of the Presbyterian church in the United States of America and of the Cumberland church appointed committees to consider the question of union between these two bodies. Plans presented by these committees were considered by their respective assemblies in 1904 and 1905 and submitted to the various presbyteries, by whose vote the union was approved. This union was declared at the assemblies of 1906 and consummated in 1907, when the two churches, for the first time in 97 years, held their annual Assembly together. Since this union there has been marked progress both in membership, which now numbers more than a million and a half, and in the gifts for church support and missions, which in 1915 reached the grand total of $27,784,000.

Presbyterian academies and colleges are found in all the States, while twelve theological seminaries which are under the care of the Assembly provide for the church an educated ministry. They are as follows: Princeton Theological Seminary, at Princeton, N. J. (founded 1812); Auburn Theological Seminary, at Auburn, N. Y. (1820); Western Theological Seminary, at Allegheny, Pa. (1827); Lane Theological Seminary, at Cincinnati (1832); McCormick Theological Seminary, at Chicago (under General Assembly, 1859); Danville Theological Seminary, at Danville, Ky. (1859), which has been consolidated with the Louisville Theological Seminary of the Southern church and is now styled the Theological Seminary of Kentucky; San Francisco Theological Seminary,

at San Anselmo, Cal. (1871); the Theological Seminary at Omaha, Neb. (1891); and two German theological seminaries—at Bloomfield, N. J. (1869), and at Dubuque, Iowa (1852). There is also a theological department in connection with Biddle University for Freedmen, established in 1868, and with Lincoln University at Oxford, Pa., established in 1871; both of these are supplying ministers for the colored population. For further details, see the separate articles on the more important of the institutions named above.

Presbyterian Church in the United States. In May, 1861, the General Assembly, meeting in Philadelphia, adopted a paper in reference to the Civil War, which asserted the loyalty of the church to the Union and promised the support of all its churches and ministers to the Federal government. The Southern Presbyterians, feeling that the church had exceeded her rights in pronouncing on a political question, "concluded that a separation from the General Assembly aforesaid was imperatively demanded. Not in the spirit of schism, but for the sake of peace and for the protection of the liberty with which Christ had made them free." Accordingly the representatives of 47 presbyteries commissioned for that purpose met in Augusta, Ga., on Dec. 4, 1861, and organized a new Assembly, designated as the Presbyterian Church in the Confederate States of America. After the war, however, the word "United" was substituted for "Confederate," and "of America" was dropped. The Southern Presbyterian church disavows all connection with political matters and emphasizes its purely ecclesiastical mission. At the time of its organization the Southern church included 10 synods, 47 presbyteries, about 700 ministers, and 75,000 communicants, of whom 10,000 were of the African race. The missionary work of the church is conducted by permanent committees and is carried on in many foreign lands as well as in the United States. The interests of publication and colored evangelization are also conducted by efficient committees. This church in 1915 had a membership of 332,339. During the church year 1914–15 it made a net gain of 7 per cent. Its contributions the same year for all purposes were $4,792,860. The standards of the church are: the Westminster Confession of Faith, the Larger and Shorter catechisms, the Form of Government and Directory for Worship, somewhat altered to suit the circumstances of the church. Every church officer is required to adopt them.

This church has theological seminaries at Richmond, Va. (Union Theological Seminary), and Columbia, S. C. (Columbia Theological Seminary). The seminary at Louisville and Danville Seminary have been united, and the seminary is now at Louisville, Ky. There are also theological departments in connection with the University of Texas and the Southwestern Presbyterian University at Clarksville, Tenn., and, for negroes, Stillman Institute, Tuscaloosa, Ala.

Cumberland Presbyterian Church. This body was organized in Tennessee on Feb. 14, 1810, by three Presbyterian ministers, Finis Ewing, Samuel King, and Samuel McAdow. They called the organization the Cumberland Presbytery. This act was the crisis of a movement begun a dozen years earlier, the great spiritual revival which had stirred that part of the Southwest, under the leadership of James McGready and others. This revival was widespread, and its converts were so many that the demand for ministers was far in excess of the number the church could furnish. Under the advice of some of the most honored ministers of the time, men of approved intelligence and religious character were chosen as exhorters, even though they had not had the education usual to candidates for the ministry. The urgency of the need seemed to the revival party a sufficient reason for the custom. The men so ordained were permitted to adopt the Westminster Confession of Faith with the exception of "the idea of fatality." The controversy along these two lines increased till it resulted in the formation of the new church. In 1813 the Cumberland Presbytery had so increased as to make necessary its division into three presbyteries and the formation of a synod. One of its first acts was to appoint a committee to prepare a Confession of Faith. In 1869 the colored people asked and received consent of the General Assembly to the organization of the African Cumberland Presbyterian church. For the reunion of the Cumberland church with the Presbyterian church in the United States of America, see the *Presbyterian Church in the United States of America*, above. The growth and statistics of the Cumberland church at the time of the consummation of this union are shown in the table on page 183.

United Presbyterian Church of North America. This body was organized in Pittsburgh, Pa., on May 26, 1858, by a union of the Associate and the Associate Reformed churches. By one line the United Presbyterian church is descended from the Covenanters of Scotland, by the other line it is descended from a body of men who were imbued with the ideas which later brought forth the Free church of Scotland. The basis of the union was the Westminster Standards together with a Testimony. The Testimony consists of 18 articles designed to set forth the views of the church on "certain points not distinctly introduced into the Confession of Faith." The church holds to a restricted communion; it has been and still is distinguished by its attitude on the subject of church psalmody, using only the Psalms for its worship of song. In 1881 the General Assembly by a very small majority repealed the rule forbidding the use of instrumental music in the worship of God. The United Presbyterian church has always maintained a high standard for the ministry. As early as 1794 the Associate church established a theological seminary in Pennsylvania, the first on the continent. Other seminaries and colleges have been founded. Home and foreign mission work has prospered as well as freedmen's work, publication, and ministerial relief. At the union, in 1858, there were 408 ministers, and the contributions were $253,150 for all purposes. The United Presbyterian church has two theological seminaries—one at Allegheny, Pa., founded in 1825; and one at Xenia, Ohio, founded by the Associate Synod in 1794 at Service, Pa., removed to Canonsburg in 1821, and to Xenia, Ohio, in 1825.

Reformed Presbyterian Synod. This body was founded in 1743 by members of the Covenanting or Reformed Presbyterian church of Scotland. In 1798 a presbytery was organized in Philadelphia. In 1800 it enacted a law that no slaveholder should be a communicant, a position always maintained. Members of this

church neither vote at political elections, enlist in the army, nor serve on juries. In 1833 the questions relating to the extent of severance between church and state led to the disruption of the church, the General Synod of the Reformed Presbyterian Church being formed of those who, while adhering to the Standards, permitted their members to discharge the duties of citizens. This body has a theological seminary at Philadelphia, founded in 1807. The Reformed Presbyterian church (Covenanter) has a theological seminary at Allegheny City, Pa.

Associate Reformed Presbyterian Synod of the South. This body was organized in 1803 at Brick Church, Fairfield Co., S. C. Until 1822 it was connected with the General Synod, composed of the synods of New York and the West. But the General Synod always met in New York, and, as the Southern men could so seldom attend, it was decided in 1822 to become an independent synod. The separation was not on account of slavery or sectionalism. It has churches in every Southern State and flourishing mission work in Mexico. Its educational institutions are Erskine College, Erskine Theological Seminary, and Due West Female College, all located at Due West, S. C.

Associate Synod of North America. This is a small body which declined to enter the union which in 1858 constituted the United Presbyterian church. It has 12 ministers and about 1000 members and coöperates with the original Seceders of Scotland in mission work in India.

In 1875 the first step was taken towards a closer affiliation of Presbyterian churches in the organization in London of the Alliance of Reformed churches holding the Presbyterian system. The object is to promote fellowship among all branches of Presbyterianism. The American section of the alliance represents over 2,000,000 communicants. Seven denominations unite in it, viz., the Reformed church in America, the Presbyterian church in the United States of America, the Presbyterian church in the United States, the Reformed church in the United States, the United Presbyterian church, the Associated Reformed Presbyterian Synod, and the Cumberland Presbyterian church (colored). The alliance meets biennially.

Statistics. The accompanying tables give the latest available figures for the different Presbyterian churches.

	Presbyteries	Ministers	Churches	Church members	Sunday-school members	Home work	Foreign work
Presbyterian church in U. S. A.	292	9,685	9,996	1,513,240	1,375,875	2,884,818	2,256,334
Presbyterian church in U. S. (South)	85	1,850	3,438	332,339	310,278	800,981	544,162
United Presbyterian church of N. America	75	1,151	1,136	192,028	196,500		
Cumberland Presbyterian church	22	950	1,445	55,000	40,000		
Reformed Presbyterian Church General Synod	5	24	20	2,500	1,500	No definite returns	
Welsh Presbyterian, or Calvinistic Methodist	12	112	91	15,000	12,000		
Associate Reformed Synod of the South	9	115	158	14,036	9,437		
Reformed Presbyterian Church Synod	11	134	114	9,315	9,779		
Presbyterian church in Canada	73	1,787	2,325	314,832	252,300		

	Presbyteries	Church members	Sunday-school members
Church of Scotland	84	713,782	225,465
United Free church of Scotland	65	507,675	229,292
Free church of Scotland	13	8,000	6,674
Presbyterian church of England	12	86,848	93,361
Presbyterian church in Ireland	36	104,569	91,477
Reformed Presbyterian Synod, Ireland	4	4,000	741
Calvinistic Methodist or Presbyterian church of Wales	25	183,647	213,857

Macphail, *The Presbyterian Church: A Brief Account of its Doctrine, Worship, and Polity* (London, 1908).

PRES'BYTERY (ML. *presbyterium*, from Gk. *πρεσβυτέριον*, assembly of elders, from *πρεσβύτερος*, *presbyteros*, elder). Generally, the body or class of presbyters or elders in the Christian churches taken collectively. More specifically, in the churches having a Presbyterian form of government, it is one of a series of judicatories,

ranking next above the session, which is the court of a local church, and below the synod (q.v.). The presbytery as an ecclesiastical judicatory is most completely developed in the Presbyterian church in the United States of America, where its composition and powers are defined in the Form of Government as follows: "A presbytery consists of all ministers, and one ruling elder for each congregation, within a certain district. The presbytery has power to receive and issue appeals from church sessions, and references brought before them in an orderly manner; to examine and license candidates for the holy ministry; to ordain, install, remove and judge ministers; to examine and approve or censure the records of church sessions; to resolve questions of doctrine or discipline seriously or reasonably proposed; to condemn erroneous opinions which injure the purity or peace of the Church; to visit particular churches for the purpose of inquiring into their state and redressing the evils that may have arisen in them: to unite or divide congregations, at the request of the people, or to form and receive new congregations; and in general to order whatever pertains to the spiritual welfare of the churches under their care." Such a presbytery corresponds to a classis in the Reformed churches. The name "presbytery" is also commonly applied in the Roman Catholic church to the pastoral residence of the priest or priests of a parish.

PRESBYTERY. The space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir, but is usually applied to the part inclosed by the choir stalls in mediæval churches.

PRES'COTT. A town and the county seat of Grenville County, Ontario, Canada, on the St. Lawrence River and the Canadian Pacific and Grand Trunk railways, 50 miles south of Ottawa (Map: Ontario, K 4). The town possesses county buildings, a public library, and government marine works. Industrial establishments include a distillery, creamery, grain elevator, planing mill, brewery, and manufactories of emery wheels, caskets, veneer paper, etc. Pop., 1901, 3019; 1911, 2801.

PRESCOTT. A city, the former capital of the Territory of Arizona and the county seat of Yavapai County, 134 miles by rail north of Phœnix, on the Santa Fe, Prescott, and Phœnix and the Atchison, Topeka, and Santa Fe railroads (Map: Arizona, C 3). It contains the Pioneers' Home, a unique institution, which cares for all pioneers of 25 years' residence, both men and women; St. Joseph's Academy, Mercy Hospital, a Carnegie library, and a handsome courthouse. The city is 5347 feet above the sea, in a rich gold, copper, and silver country. Stockraising and farming are carried on extensively. Pop., 1900, 3559; 1910, 5092.

PRESCOTT. A city and the county seat of Nevada Co., Ark., 31 miles southwest of Arkadelphia, on the Prescott and Northwestern, and the St. Louis, Iron Mountain, and Southern railroads (Map: Arkansas, B 4). It has an important cotton and peach trade, and ships also lumber, live stock, wool, furs, chickens, turkeys, eggs, butter, peanuts, cotton seed, etc. Pop., 1910, 2705.

PRESCOTT, ALBERT BENJAMIN (1832–1905). An American chemist, born at Hastings, N. Y. He graduated in medicine at the University of Michigan in 1864, and was made assistant professor of chemistry there in 1865, professor of organic and applied chemistry in 1870, dean of the school of pharmacy in 1876, and director of the chemical laboratory in 1884. Prescott served as president of the American Chemical Society in 1886, of the American Association for the Advancement of Science in 1891, and of the American Pharmaceutical Association in 1900. He wrote: *Qualitative Chemical Analysis* (1874; 5th ed., 1901); *Chemistry of Alcoholic Liquors* (1875); *Outlines of Proximate Organic Analysis* (1875; 2d ed., 1877); *First Book in Qualitative Chemistry* (1879; 11th ed., 1902); *Organic Analysis* (1887; 2d ed., 1889).

PRESCOTT, GEORGE BARTLETT (1830–94). An American electrical engineer, born at Kingston, N. H. He learned telegraphy soon after the system had been put into practical use, by 1858 had become superintendent of the lines of the American Telegraph Company and by 1866 superintendent for the Western Union Company; from 1873 until 1880 was electrician of the International Ocean Telegraph Company; was one of the early promoters of the telephone; and was connected with numerous telegraph and telephone companies. In 1852 he discovered that the aurora borealis is an electric phenomenon. He invented an improvement in telegraph insulators in 1872; with Thomas A. Edison invented and introduced the duplex telegraph and the quadruplex telegraph; and also introduced from Europe, which he visited in 1873, the system of sending messages in pneumatic tubes. He published: *History, Theory, and Practice of the Electric Telegraph* (1860); *Electricity and the Electric Telegraph* (1877); *The Speaking Telephone* (1878); *Dynamo-Electricity* (1884); *Bell's Electric Speaking Telephone* (1884); and *The Electric Telephone* (1890).

PRESCOTT, OLIVER (1731–1804). An American soldier, born at Groton, Mass. He graduated at Harvard in 1750, practiced medicine, and became brigadier general of militia for the County of Middlesex and a member of the Board of War in 1776. From 1777 to 1780 he was a member of the Massachusetts Supreme Executive Council, in 1779 was made judge of probate for the County of Middlesex, and in 1781 was promoted to the rank of second major general of State militia. In 1786-87 he took a prominent part in the suppression of Shays's Rebellion (q.v.).

PRESCOTT, WILLIAM (1726–95). An American soldier, born at Groton, Mass. In 1755 he served with distinction as lieutenant and captain under Gen. John Winslow (q.v.). After the battle of Lexington he organized a regiment of minutemen and marched as its colonel to Cambridge. On June 16, ordered to Charlestown, he threw up intrenchments at Breed's Hill, near Bunker Hill. In the next day's battle, during which he is generally considered to have been the Patriot commander, he displayed great bravery, and was the last to leave the field. After serving about two years longer he returned to his farm, but again served as a volunteer for a short time at Saratoga in 1777. He was subsequently a member of the Massachusetts Legislature for several years. Consult S. A. Green, *Colonel William Prescott and Groton Soldiers in the Battle of Bunker Hill* (Boston, 1909).

PRESCOTT, WILLIAM HICKLING (1796–1859). An American historian. He was the son of a distinguished lawyer and statesman and grandson of Col. William Prescott, and was born at

Boston, May 4, 1796. He entered Harvard College in 1811 as a sophomore, and graduated in 1814. While there he lost the sight of one eye by an accident, and the other was so affected that he had to pass several months in a darkened room. He partly recovered the sight of it, but he could use it only a little each day and never in any difficult work. He entered his father's law office, but in January, 1815, the injured eye became inflamed and refused to yield to remedies; so it was determined in the autumn that he should seek health by wintering at St. Michael's and get medical advice in the spring. At the Azores, where he often had to live in a darkened room, he acquired the accomplishment of learning almost by heart long passages which he had thought out and which he meant to have written. Physicians told him that the sight was hopelessly gone from one eye and that the preservation of the other depended on his health. Prescott now returned to Boston, after a sojourn in Europe, and on May 4, 1820, married Miss Susan Amory. A legal career was, of course, out of the question, but Prescott's family were well off; so his half blindness was not made still more cruel by the trammels of poverty. He determined, despite the special difficulties in his case, to devote himself to a literary career. His reading of Gibbon's autobiography increased his passion for historical writing. After studying extensively for years in English, French, German, Italian, and Spanish literature and history and after considering many plans for historical works, he finally, in 1826, chose the Spanish field for his labors.

Owing to his bad eyesight he was obliged to have the aid of readers and secretaries, and for his own writing had recourse to a writing frame designed especially for the blind. After eight years of hard labor he produced the first results of his research, the *History of the Reign of Ferdinand and Isabella the Catholic* (3 vols., dated 1837, though published 1838). The work at once gained favor, and was soon translated into French, Spanish, and German. He then spent six years on what is probably his most brilliant work, a *History of the Conquest of Mexico, with a Preliminary View of the Ancient Mexican Civilization, and the Life of the Conqueror, Hernando Cortés* (3 vols., 1843). His third work in the series was the *History of the Conquest of Peru, with a Preliminary View of the Civilization of the Incas* (3 vols., 1847). These greatly added to his reputation. He was made corresponding member of the French Institute, and on his visit to Europe in 1850 was received with honor. In 1855 appeared two volumes of the *History of the Reign of Philip the Second, King of Spain*, and in 1858 the third volume, but the work was cut short by a stroke of apoplexy. He had, however, added to his series by editing Robertson's *History of the Reign of Charles the Fifth* (3 vols., 1857), adding thereto a supplement, the third volume, embracing the life of the Emperor after his abdication. On Jan. 27, 1859, he succumbed to a second stroke of apoplexy. Aside from his histories his literary work consists of a preface to Madame Calderon de la Barca's *Life in Mexico* (2 vols., 1843); *Biographical and Critical Miscellanies* (1845); "A Memoir of the Honorable John Pickering," in vol. x of *Collections of the Massachusetts Historical Society*, 3d series; and a *Memoir of the Honorable Abbott Lawrence* (1856). An edition of his works (16 vols., ed. by J. F. Kirk, 1870) is very satisfactory. There is also a more recent 20-volume edition (Philadelphia, 1906).

Prescott is eminent in American letters as one of the first and most accomplished of the historians. Slightly younger than Irving and later in acquiring literary reputation, he excelled him in the extent and system with which he treated his work. To him, with Irving in history and romance, Ticknor in Spanish literary research, and Motley, a few years later, in history, belongs the honor of having introduced and made popular to the English-speaking and a good part of the foreign world the story of the Spanish nation. Technically, as an historian, Prescott has been justly criticized for a tendency to color his pictures too highly and to allow his admiration for his heroes to get the better of his judgment; nor is he altogether successful in dealing with political complications. His most serious defect is one for which he cannot fairly be held responsible. American archæology has been revolutionized since his day by the labors of Morgan, Bandelier, and others, and the more or less romantic and distorted pictures of Mexican and Peruvian development given by the Spanish chroniclers on whom Prescott relied have been corrected. Thus his work needs to be read in the light of modern research and to be corrected at various points, but with the proper allowance and viewed as literature its high rank seems assured. His style is dignified, refined, and always eminently readable, and his histories have truly become household classics. Consult: George Ticknor, *Life of William Hickling Prescott* (Boston, 1864); Theodore Parker, "Prescott as an Historian," in *The American Scholar* (new ed., ib., 1907); also lives by Rollo Ogden (ib., 1904), and H. T. Peck (New York, 1905).

PRESCRIP'TION (Lat. *præscriptio*, from *præscribere*, to prescribe, from *præ*, before + *scribere*, to write). A formula by which the physician directs the compounding and dispensing of medicines. Prescriptions were formerly written entirely in Latin, the common scientific language; but at the present time and in the United States the tendency is to restrict the employment of Latin to the names of the ingredients of the formula, English being used for the directions. Since the botanical or chemical names are the only ones by which vegetable or mineral drugs can be definitely known, Latin is retained for this part of the medical formula. The formal prescription consists of four parts: 1. The superscription comprises the name of the patient, date, and the sign ℞. The latter is now used as an abbreviation of the Latin word *recipe* (take); although the derivation of the sign is obscure, the symbol was formerly thought to stand for Jupiter. 2. The inscription or body of the formula consists of the names and quantities of the drugs to be compounded. The names of the ingredients, as before stated, are written in abbreviated Latin, and the quantities set down in apothecaries' measure or according to the metric system. 3. The subscription is made up of directions to the apothecary. 4. The signature (Lat. *signetur*, let it be labeled) consists of directions to the patient—dose, time, and method of taking. This is followed by the physician's signature or initials. Consult: M. D. Mann, *Manual of Prescription Writing* (6th ed., New York, 1907); A. H. Prichard, *Practical Prescribing, with Clinical Notes* (Ox-

ford, 1914); J. M. Swan, *Prescription Writing and Formulary* (Philadelphia, 1915); Osborne, *Handbook of Therapy* (Chicago, 1915).

PRESCRIPTION. In Roman legal procedure, a prescription was a plea which the prætor placed at the beginning of the instruction (*formula*) which he sent to the referee (*judex*) in order that it might be examined before all other disputed issues. The prescription of long time was one of the most important of the Roman prescriptions; and in mediæval procedure the word "prescription" was used only to designate such a plea. In the broadest sense, prescription means the legalizing of an existing state of things in consequence of lapse of time—the establishment of legal rights by the prolonged exercise of corresponding powers and the extinction of rights by prolonged failure to use the powers which they are supposed to confer. In early law the field of prescription is practically unlimited. In highly developed law no substantive rights are acquired or lost by prescription except rights in things. Remedial rights, or rights of action, however, are regularly lost by nonuser.

Civilians divide prescription into acquisitive, by which rights are created, and extinctive, by which they are destroyed. For the prescription of actions the English law employs the term "limitation." See LIMITATION OF ACTIONS.

Roman Law. *Prescription of Rights in Things.*—According to the Twelve Tables, movables (except stolen things) were acquired "by use" (*usucapio*) in one year, immovables in two. In the later Republic the prætors and provincial governors developed for provincial real estate a "prescription of long time." Justinian fused the two institutions, limiting the term "usucapion" to movables and "prescription" to immovables. Under the rules which he laid down the person who acquired possession in good faith and who maintained uninterrupted possession for a certain period became owner. The period, in the case of movables, was 3 years; in the case of immovables, if the owner lived in the same province, it was 10 years; if he lived in another province, it was 20 years. Public and ecclesiastical property was excluded from this ordinary prescription; also all property of which the owner had been dispossessed by theft or violence, although it had subsequently come into the hands of an honest possessor.

Justinian further enacted that when the owner's action of recovery was extinguished by prescription, the possessor, if he had acquired possession in good faith, should become owner. Property excluded from the ordinary prescription was in most instances capable of being acquired by this *præscriptio longissimi temporis* (30 or 40 years).

Prescription of Actions.—At early Roman law rights of action, as such, were perpetual; they ceased to exist only when the substantive right was lost (as by usucapion). The equitable actions given by the prætors, however, were limited, and Imperial legislation finally limited all actions. The periods varied from 6 months to 40 years; the ordinary period was 30 years.

Acquisitive prescription and the prescription of actions were regularly suspended in the case of persons unable to exercise their rights, e.g., persons under household authority and infants.

Immemorial Prescription.—A survival from early law, when prescription had a wider range, is found in the rule that any state of things which has existed so long that no memory remains of its origin is presumed to have been legally established. The Roman jurists, however, invoked this rule only to protect public use of private property—e.g., rights of way and artificial watercourses—and to prevent interference with ancient dikes and channels regulating the flow of surface water.

Modern Civil Codes. Prescription has lost much of its importance by reason of changes in the law of property. The general retention or adoption of the old German rule that honest acquisition of movables gives title has left no room for prescription of movables except as regards lost or stolen things. In these cases the honest possessor apparently becomes owner when the former owner's action of recovery is extinguished, which occurs in periods varying from 2 to 10 years. As regards real property, the importance of prescription has been greatly lessened by official registration of titles and the indisposition of the law to recognize other than registered rights. Consult authorities cited under CIVIL LAW; also Unterholzner, *Verjährungslehre* (2d ed., Liepzig, 1858), and Grawein, *Verjährung und gesetzliche Befristung* (1880).

English and American Law. In the common-law system prescription is employed in a narrower sense than in the legal systems derived from the Roman law, being restricted to the acquisition of the interests in land described as incorporeal, such as easements and profits *à prendre*, the acquirement of title to personal property and to corporeal interests in land by lapse of time being comprehended under the heads of ADVERSE POSSESSION and LIMITATION OF ACTIONS (qq.v.). The common-law theory of the effect of prescription is also radically different from that of the civil law, as its operation is not to sanction a wrongful possession, but to furnish evidence, more or less conclusive, of the lawful origin of the right claimed. This theory in English law took on the grotesque form of the doctrine of a lost grant, the open and notorious enjoyment of the right claimed without interruption for the prescriptive period raising a presumption that it was originally conferred by deed from the owner of the land affected, the tender of the deed in court being excused by the further fiction of its loss. This presumption may still be rebutted by showing that the alleged grantor could not possibly have made the grant in question, but in England (where prescriptions are now mainly governed by statute), as well as in the United States (where they are still regulated by the common law), the fiction of a lost grant has now generally been abandoned and the whole doctrine placed on a more rational basis by being assimilated to the principles governing adverse possession of lands. The latter, however, still retain many of the peculiarities derived from the feudal doctrines of seisin and disseisin (qq.v.), the legal title of the adverse holder of land being in theory based, not on the length of his possession, but upon his seisin, however wrongful this may have been—the lapse of time operating only to quiet the title thus obtained.

The period of prescription has varied from the immemorial enjoyment of the earlier common law (interpreted to signify an uninterrupted user from the accession of Richard I, 1189) to the modern period, which, by analogy to the limitation of real actions by statute, is usually fixed at 20 years. As in the case of limitation,

also, the prescriptive term will not begin to run during the existence of a legal disability, as infancy, insanity, or coverture, in the owner of the land over which the right in question is asserted, nor if the land is at the time of the adverse user in the possession of a tenant or disseisor. An easement or profit once acquired, however, against the tenant in fee simple binds the land into whosesoever hands it may thereafter come.

The operation of the principle of prescription is further restricted by limiting it to rights of enjoyment of a common and well-known sort and, in the United States, to such as answer the description of positive or affirmative as distinguished from negative rights. Thus, while rights of way, of drainage, and the like may be gained by prescription everywhere, the negative easements of light and of lateral support cannot generally be acquired in this way in the United States, although in England no such distinction is recognized. But new and unusual incidents of ownership resting on prescription—such, e.g., as the right to the access of air to a windmill or the right to a fine view—will not be admitted even in Great Britain. Such rights, as well as the negative easements, in the United States arise only by grant.

Strictly speaking, prescriptive rights, as the expression is used in English law, are to be further distinguished from public or quasi-public rights in the nature of easements or profits, such as commons appendant, customary rights of way, and the like, even when these rest, as they commonly do, on immemorial enjoyment. The distinction rests on the fact that prescription in legal theory always presumes a grant; and if the right in question is claimed by an indefinite number of people, as in the case of a custom, it cannot rest on a grant, and is therefore not strictly prescriptive in character. Consult Emory Washburn, *Treatise on the American Law of Easements and Servitudes* (4th ed., Boston, 1885); T. A. Herbert, *History of the Law of Prescription in England* (New York, 1891); C. J. Gale, *Treatise on the Law of Easements* (8th ed., Toronto, 1908).

PRESENTATION AT COURT. See COURT, PRESENTATION AT.

PRESENTMENT (OF. *presentment, presentement*, from *presenter*, to present, from Lat. *præsentare*, to set before, from *præsens*, pres. p. of *præesse*, to be at hand, from *præ*, before + *esse*, to be). An informal accusation by a grand jury as to a crime coming to its notice, and afterward reduced to the form of an indictment. It is usually the result of an investigation conducted before it or based upon information as to a crime communicated to it by some one while it is in session. A presentment differs from an indictment in that the latter is found by indorsing the words "a true bill" on a formal bill of indictment prepared and laid before the grand jury by a prosecuting officer. The words "presentment" and "indictment" are frequently used as being interchangeable, but this is not sanctioned by the best authorities. See GRAND JURY; INDICTMENT.

Presentment also has a special meaning in the law of negotiable paper, as describing the offering of a bill of exchange for acceptance or a formal demand of payment. See BILL OF EXCHANGE; NEGOTIABLE INSTRUMENTS.

PRESERVATION OF FOOD. See FOOD, PRESERVATION OF.

PRESERVES. See GAME PRESERVES.

PRESIDENT (OF. *president*, Fr. *président*, from Lat. *præsidens*, president, pres. p. of *præsidere*, to preside, direct, sit before, from *præ*, before + *sedere*, to sit). The chief executive officer of the United States government, chosen for a term of four years by an electoral college. In case of removal, resignation, death, or inability to discharge the duties imposed by the Constitution and laws he is succeeded by an officer called Vice President. The electors by whom the President is chosen are appointed in each State in such manner as the Legislature thereof may direct, each State being entitled to as many electors as it has Senators and Representatives in Congress. At present the practice is to choose the electors by popular vote on a general ticket. This election takes place on the Tuesday following the first Monday in November of the year preceding that of the new presidential term. These electors assemble in their respective State capitals on the second Monday of January following for the purpose of casting their votes, which are in turn transmitted to Congress and officially counted by that body on the second Wednesday of February. In case no candidate receives a majority of the electoral votes the election is taken to the House of Representatives, where the members voting by States choose a President from the three highest candidates on the list. This happened in 1800 and again in 1824. The President is inaugurated on the 4th of March following the election. He is eligible for reëlection without limit as to the number of terms, but the precedent set by Washington of refusing a third term has never been broken. Nine Presidents have been elected for a second term. The convention which framed the Constitution of the United States was well-nigh unanimous in opinion as to what should be the character of the presidential office, although there were differences of opinion as to what should be the tenure and mode of election. The State governors and presidents afforded a tolerably clear model for the creation of the national executive, and it may be said that these were followed rather than the British executive. The qualifications for the presidency are fixed by the Constitution; they are citizenship acquired by birth in the United States, 14 years' residence in the United States, and the completion of the thirty-fifth year of age. Before entering upon the discharge of his duties the President is required to swear or affirm that he will faithfully execute the duties of the office to which he has been elected and to the best of his ability preserve, protect, and defend the Constitution of the United States. On the occasion of the inauguration the President delivers a public address in which he announces his political policy, and annually upon the meeting of Congress he sends a message to that body containing information of the state of the Union and making such recommendations as may seem to him wise and expedient. The President may also send special messages to Congress for the purpose of urging important matters upon their attention.

The President receives compensation for his services in a salary which since 1909 has been fixed by statute at $75,000 per year, and which cannot be increased or diminished during his term. He is also allowed the use of the executive mansion, with the furniture and effects kept therein, and $25,000 for expenses of travel. He is prohibited by the Constitution from accepting

any other emolument from any one of the commonwealths or from any foreign prince, king, or state. He is privileged from the jurisdiction of any court or magistrate, but may be impeached by the House of Representatives for treason, bribery, or other high crimes and misdemeanors, and upon conviction by the Senate must be removed from office. Being then divested of his official character, he is subject to indictment and trial in the regular courts as any other private individual. The privilege of resigning from office is recognized by the Constitution, and the formalities of relinquishment are prescribed by a statute of Congress.

The powers and duties of the President include the management of the foreign relations of the United States; the calling together of Congress in extraordinary session and the furnishing it with information concerning the government; the power to veto legislative measures; the command of the army and navy; the granting of reprieves and pardons; the execution of the laws; and the appointment of the officers of the United States. See UNITED STATES; and for the electoral votes cast for the various candidates for the presidency and the vice presidency, see ELECTORAL VOTES. See also ELECTORAL COLLEGE. Consult: Edward Stanwood, *History of the Presidency* (2 vols., Boston, 1903–12); Gardiner, *Constitutional Powers of the President* (New York, 1905); Bryce, *The American Commonwealth*, vol. i (ib., 1910); Grover Cleveland, *Independence of the Executive* (Princeton, N. J., 1913).

PRESIDIO, prā-sē'dyō; *often Anglicized*, prē-sid'ī-ō (Sp., garrison, guard). There are two military reservations in the United States designated presidio—the Presidio of San Francisco and the Presidio of Monterey, both in California. The Presidio of San Francisco is a military reservation of 1479.94 acres, situated in the northwest suburbs of San Francisco, on the southern margin of the harbor of San Francisco. It was established early as a military post by the Spanish, and was continued by Mexico, when it succeeded Spain and by the United States after the cession of the territory by treaty. It was reserved for military purposes by executive order dated Nov. 6, 1850, afterward modified by executive order dated Dec. 31, 1851. The post office, Presidio Station, San Francisco, Cal., is 5 miles from the city. A street railway connects them. The usual garrison is one regiment of infantry. The Letterman General Hospital is an adjunct of the post.

The Presidio of Monterey is a military reservation of 398.13 acres, partly situated within the city limits of Monterey, Cal., overlooking the bay. It was occupied as a military post by the Spanish government as early as 1772, and eventually the United States obtained title. By executive order dated Nov. 23, 1866, the reservation included only 158.14 acres, but it was enlarged in 1903 and in 1906. The usual garrison is a regiment of cavalry, besides which there are a field hospital and an ambulance company. Consult *Military Reservations* (rev. ed., Washington, 1910).

PRESQUE ISLE, prĕsk' īl'. A town in Aroostook Co., Me., 42 miles north by west of Houlton, on the Bangor and Aroostook and the Canadian Pacific railroads (Map: Maine, E 2). It contains a hospital, a public library, and an opera house, and enjoys some popularity as a summer resort. There are farming and lumbering interests and some manufactories. Pop., 1900, 3804; 1910, 5179.

PRESS. See DIES AND DIE SINKING; HYDRAULIC PRESS; MACHINERY; METAL-WORKING MACHINERY; PRINTING.

PRESS, FREEDOM OF THE. The immunity of the printing press from responsibility to the government for the character of the matter which it publishes except in the case of matter deemed libelous. (See LIBEL.) In the early history of the printing press no such immunity was recognized, and it became an established rule that a free press was wholly incompatible with an absolute government. The censorship of the press originated in the attitude of the Roman Catholic church, which in 1515 formally decreed through the Council of the Lateran that no publication should be issued from any place over which the church had jurisdiction without the written sanction of the Bishop or of the Inquisitor of the diocese. The institution of the censorship gradually became a feature of the policy of the civil authorities in the various states of continental Europe, from some of which it has not yet disappeared. At present no censorship exists in France, Switzerland, Sweden, Spain, Italy, Norway, the Netherlands, Belgium, Denmark, and Germany, but the press laws are very rigid in some of these, such as Spain, France, and Germany, and their governments claim and exercise the right to suppress in a summary manner journals deemed obnoxious to the public peace and security. In time of war this right is carried to such an extreme that scarcely any liberty remains to the press of publishing matter either of fact or of opinion. The constitution of France contains no guarantee in behalf of freedom of the press. That of Switzerland does, but authorizes the cantonal governments to enact laws to prevent the abuse of the same, and empowers the Federal government to punish similar abuses when directed against its authority or that of its officers. The constitution of Prussia secures to every person the right to express his opinion freely by word, writing, print, or pictorial representation, and prohibits the establishment of a censorship, but in the same article empowers the Legislature to place restrictions upon the press and to enact laws for the punishment of abuses of the liberty of printing. The laws enacted in pursuance of this provision are very severe and place substantial limitations upon the freedom of the press. In Russia the censorship in an arbitrary form still exists. There newspaper publishers are required to obtain permission to print and then lodge with the government a considerable sum as caution money. Those who are unable to comply with the latter requirement are required to send their articles to a censor three days previous to publication.

In England, after a long struggle, almost complete liberty of press now prevails in time of peace. In war time a rigid and thorough censorship is imposed. From the time of the Reformation until the Commonwealth the English press was subject to a censorship under the direction of the crown. During the period of the Civil War and the Commonwealth it was practically free from molestation, but upon the restoration of the Stuarts the old restrictions were revived. In 1694 the censorship of the press was discontinued. During the reign of Anne severe acts were passed against printers, and some of the most distinguished men of letters of England,

including Steele and Defoe, were punished for violating these laws. At the same time numerous tracts, books, and newspapers were burned by the common hangman. The censorship, however, was not revived. With a view to the repression of the obnoxious Whig press, the Tory government imposed on printers a stamp duty, which in the reign of George III was increased to fourpence on every paper. Likewise taxes on advertisements were imposed. But these measures proved ineffective, and were finally repealed towards the middle of the nineteenth century. One of the most prolonged struggles in behalf of the freedom of the press in England was in relation to the publication of parliamentary debates. Until 1729 newspaper reports of parliamentary proceedings were unknown. About that time fragmentary reports began to appear in the newspapers, whereupon the Commons resolved that it was a breach of privilege, as it tended to make members answerable to their constituencies, and this is the theory to-day. For breach of this privilege many printers were prosecuted and fined, in the year 1764 no less than 200 informations being filed in behalf of the crown. (See WILKES, JOHN.) The real liberty of the English press dates from the passage of the Fox Libel Act of 1792, which enacted that the decision in libel suits belonged to the jury and not to the judge. This reversed the view which the courts had acted on for many years. It is the general rule, disregarded naturally in time of war, that the press is unrestricted except in case of libelous matter. But the common-law rule that it is an indictable offense to publish anything against the constitution or the established form of government is still formally in force, though scarcely ever applied.

In the American Colonies the attempt was made to introduce the British system of a rigid censorship, and among the instructions to the Colonial governors was that they were to provide by all necessary orders that no person keep any press for printing and that no book, pamphlet, or other matter be printed without their special leave and license first obtained. There were numerous instances of the public burning of books and the punishment of printers. (See BRADFORD, WILLIAM; ZENGER, PETER.) After the overthrow of British authority in the Colonies the principle of the freedom of the press was incorporated in the first State constitutions, and has been continued in all succeeding ones and without exception. It is usually provided that in prosecutions for libel the truth may be given in evidence, that the motive shall be taken into consideration, and that the jury shall determine both the law and the facts. The great freedom with which the newspapers criticize and often ridicule public officials, especially by means of cartoons and pictures, has sometimes led to something of a reaction in favor of more stringent libel laws. As an example of this may be mentioned the stringent law passed in Pennsylvania in 1903. The Constitution of the United States prohibits Congress from passing any law abridging the freedom of the press. Notwithstanding this provision Congress in 1798 passed an Act for the punishment of persons convicted of printing matter calculated to bring the government into disrepute. It was in force two years, and there were a number of notable prosecutions under the law. In recent years there has been much agitation in favor of restraining the press from the publication of evidence and opinion in the course of criminal trials, on the ground that such publication tends to defeat the ends of justice. The inherent difficulties in the way of discriminating between legitimate views and matter prejudicial to the administration of justice have deterred the Legislatures from adopting a policy of restriction. See ALIEN AND SEDITION ACTS; NEWSPAPER.

PRESS ASSOCIATIONS AND AGENCIES. Associations and agencies for the collection, transmission, and distribution of news began with the telegraph. In continental Europe agencies gather news, pay tolls on its transmission, and sell it to any paper which subscribes for the service. Such agencies are believed, with good reason, to be under government control. A press association, on the other hand, is a coöperative organization of which the members are newspapers, and only those papers which are members can secure the service maintained by the association. In the British Isles agencies and associations exist side by side. Where, as in the United States, there are associations and no agencies, the associated papers possess exclusive rights, and papers outside the pale are at a great disadvantage; but under this system the public receives the greatest benefit.

Baron Paul Julius von Reuter (q.v.) established the pioneer agency service. Eventually he extended his service over the world, and passed the business on to his sons. In Europe are also numerous agencies covering countries (Havas, France; Wolff, Germany, etc.); these follow the lines of Reuter's. In England the Central News Agency, organized in connection with Eastern Telegraph lines, has been conspicuous in its special field. Reuter's and the Central News, together with other agencies—Dalziell's, organized at London and having affiliations with a leading London paper; the National Press Agency; the Exchange Company—supply foreign and London local and provincial news at tariff rates. The Press Association, organized when the English telegraphs were taken over by the government in 1868, is a coöperative organization of newspaper proprietors. The association takes Reuter's foreign service, and furnishes London and provincial news to its subscribers.

The history of American newspaper associations may be divided into three periods. From 1849 to 1882 the Associated Press comprised associations in the larger cities, led by New York, plus State associations serving the dailies in the smaller cities. These associations, through the exchange of news and the exclusion of new papers except by unanimous consent, constituted a virtual monopoly. The central control rested with the New York Associated Press, which, besides possessing a monopoly of New York news, gained substantial control of foreign and Washington news. This news was distributed to city and state associations throughout the country, the service paying most of its own expenses by the rates charged. The ruthless vigor with which the New York association enforced its rules and maintained its monopoly aroused hostility to all press associations, an attitude which has not yet disappeared. The New York Associated Press, whose wide ramifications led the entire organization to be termed the Associated Press, in 1882 found itself confronted with a powerful rival, the Chicago

Associated Press, first organized in 1865. These two associations thereupon made a 10-year agreement to coöperate in an expanded service. When this contract expired in 1892 the old New York Associated Press ceased to exist. Of its seven members the *World* went over to the Chicago, or Western, association, while the other six papers joined (1893) the United Press (not the same United Press that was organized in 1907). Originating in 1867 among a few Eastern papers, by 1871 the United Press had become an evening-paper association and by 1883 had drawn to itself a number of papers, like the Boston *Globe*, which had won success without an Associated Press franchise. In 1894 they were joined by the Southern association. The Western Associated Press and the United Press divided the field until 1900, when a decision of the Illinois Supreme Court held the Chicago association illegal. In October, 1900, while the United Press continued to hold a group of papers led by the New York *Sun*, the leading papers of the United States organized at Chicago a new Associated Press, which was incorporated under a New York statute regulating voluntary organizations not for profit. Within 15 years more than 900 dailies were receiving Associated Press service. In membership, total circulation, and expenditure, this association is without a rival anywhere. In 1915, as the result of an attack made on it under the Sherman Anti-Trust Act (q.v.), after a complaint by the New York *Sun*, admission to its membership was made more liberal and its members were allowed to take any other news service. It is still subject to criticism, but represents an advance on previous associations. The president in 1915 was Melville E. Stone. The original United Press Association became the Laffan News Syndicate after 1889. In 1907 the Publishers' Press (Atlantic coast), the Scripps-McRea League Newspapers (Pittsburgh to Denver), and the Scripps News (Pacific coast) organized the United Press Associations, whose service was thereafter taken by many evening papers and by some morning papers. The president in 1915 was Roy W. Howard. In addition the Hearst News Service and the International News Service are to be mentioned. The newspaper publishers of the United States are organized in the American Newspaper Publishers' Association, which meets annually to legislate on business issues at the same time that the Associated Press meets. For friendly intercourse and discussion there are State press associations and a national association. Canadian papers have been organized since 1859 in the Canadian Press Association, which distributes news and holds a meeting each year; and there is a similar Australian association.

PRESSBURG, prĕs'bŭrĸ (Hung. *Pozsony*). A royal free city geographically in, and capital of, the County of Pressburg, Hungary, situated in a beautiful region on the north bank of the Danube, 35 miles east of Vienna (Map: Hungary, E 2). It is one of the finest cities of Hungary. The fortifications of the old town have given place to spacious boulevards. The Danube is here spanned by the new King Francis Joseph iron bridge. The most attractive of the churches is the eleventh-century Gothic cathedral, restored in 1861–80, in which many of the kings of Hungary were crowned. On the tower is a pyramid surmounted by a gilded royal crown. The old castle, burned in 1811 and existing now only as a ruin, was once the residence of the kings of Hungary. The beautiful thirteenth-century town hall contains a museum of Roman antiquities. The city has several handsome palaces, including the winter palace of the Primate of Hungary. Other features are the Landhaus, the seat of the Hungarian Diet till 1848; the new theatre; the park, with an open-air theatre; and the race course. The equestrian statue of Maria Theresa, erected in 1897, is also noteworthy. Among the educational institutions are a royal law school, a Roman Catholic Gymnasium, a Protestant lyceum, a priests' seminary, several industrial schools, and a rich library. The philanthropic institutions are among the best in Hungary. Pressburg has a large dynamite factory, a famous brush factory, and a petroleum refinery. It also manufactures pastry, turnery, cabinetwork, tobacco, ribbons, cloth, machinery, leather, chemicals, etc. There is a lively trade, chiefly in grain, cattle, and wine. Pop., 1890, 56,048; 1900, 65,867; 1910, 78,223. In 1910 persons to whom Hungarian was the mother tongue numbered 31,705; German, 32,790; Slovak, 11,673. Roman Catholics numbered 59,198; Evangelicals, 10,509; Jews, 8207. The area of the city is 29 square miles.

Pressburg is first mentioned in the ninth century. In the twelfth century it was strongly fortified, and became a place of great strategic importance. From 1541 to 1784 it was the capital of Hungary. Here in 1687 the Hungarian Diet formally accepted the hereditary succession of the Hapsburgs. After the battle of Austerlitz in 1805 Napoleon and the Emperor Francis concluded the Peace of Pressburg (December 26), by which Austria ceded the former Venetian dominions to the Kingdom of Italy and Tirol to Bavaria. Consult Ortvay, *Geschichte der Stadt Pressburg* (Pressburg, 1892–98), and id., *Pressburgs Strassen und Plätze* (ib., 1905).

PRESSED GLASS. See GLASS.

PRESSENSÉ, prā-sän'sā', EDMOND DEHAULT DE (1824–91). A French Protestant clergyman. He was born in Paris, studied theology at Lausanne, Halle, and Berlin, and was pastor of the Free Evangelical Congregation of the Taitbout, Paris (1847–70). He was deputy to the National Assembly (1871–76) and advocated amnesty to the National Guards who had joined the Commune, moderation in legislation concerning the International organization, and free education. From 1883 he was a life Senator. He believed that the Evangelical church should be independent of the state. He died in Paris. He founded the *Revue Chrétienne* and the *Bulletin Théologique*. Among many of his works translated into English are *Early Years of Christianity*, four volumes, and *Jesus Christ: His Life and Work*. Consult the biography by H. Loyson (Paris, 1891).

PRESSENSÉ, FRANCIS DEHAULT DE (1853–1914). A French publicist, born in Paris. He served in the Franco-Prussian War (1870–71), was in the diplomatic service at Constantinople and at Washington, and later became one of the principal contributors to the *Temps* and then to the *Aurore*. He was prominent as a defender of Dreyfus. From 1902 to 1913 he was a Socialist deputy from Lyons. In 1903 he advanced his idea of a United States of Europe. Pressensé voted, in 1905, for the

separation of church and state. Among his writings are: the important *L'Irlande et l'Angleterre depuis l'acte d'union jusqu'à nos jours* (1889); *Le cardinal Manning* (1896; Eng. trans.); *Manifestations franco-anglo-italiennes pour l'Arménie et la Macédoine* (1904).

PRESS GANG. See IMPRESSMENT.

PRESS'LER, MAX ROBERT (1815–86). A German forester, born in Dresden. He studied at the School of Technology there and taught in Zittau and in the Academy of Forestry at Tharandt until 1883. Pressler contributed largely to the advance of forestry by his inventions, among which the most important is the *messknecht* for measuring the height of trees, and by his writings, which are full of novel theories for the most part based on exact calculation. *Der rationelle Waldwirt und sein Nachhaltswaldbau höchsten Reinertrags* (1858–85), his chief work, is a protest against the methods of the old school.

PRESSURE, CENTRE OF. See CENTRE OF PRESSURE; HYDROSTATICS.

PRESSURE, CRITICAL. See CRITICAL POINT.

PRESSURE, GRADIENT OF. See ISOBAROMETRIC LINES.

PRESSURE, SENSATIONS OF. See CUTANEOUS SENSATIONS

PRESSURE GAUGE. See MANOMETER.

PRESTATION. See CORVÉE.

PRES'TER JOHN, i.e., Presbyter, or Priest John. A supposed Christian king and priest, whose territory was believed during the Middle Ages to lie either in Asia or in Africa. The first record of this personage appears in the chronicle of Otho of Freisingen, who lived in the twelfth century. From that time the legend grew and developed. It was believed, and various travelers so reported, that the Nestorian Christians had built up a large monarchy ruled over by a priest king named John. Letters from this mysterious personage addressed to the Byzantine Emperor or the Pope were circulated, giving marvelous accounts of the inhabitants and the wealth of the territory. In the fourteenth and fifteenth centuries the home of Prester John was generally believed to be in Africa, where it was identified with the Christian Kingdom of Abyssinia. Consult: Sir Henry Yule, *Cathay and the Way Thither*, published for the Hakluyt Society (2 vols., London, 1866); id., *Book of Sir Marco Polo* (2 vols., ib., 1874); Oppert, *Der Presbyter Johannes im Sage und Geschichte* (2d ed., Berlin, 1870); G. Brunet, *La légende du Prêtre-Jean* (Bordeaux, 1877); S. Baring-Gould, *Curious Myths of the Middle Ages* (London, 1884); J. Buchan, *Prester John* (London, 1910).

PRESTO (It., quick). In music, a direction that a piece should be performed in a very rapid manner. In this tempo conductors mark only the first beat. The term *prestissimo* is also sometimes used to denote the utmost possible rapidity of execution.

PRES'TON. A manufacturing and market town in Lancashire, England, on the Ribble, at the head of its estuary, 21 miles north-northeast of Liverpool (Map: England, D 3). The chief public buildings are the town hall (which contains the guild hall and exchange), the Preston and County of Lancashire royal infirmary, the corn exchange and market house, the house of correction and courthouse, the Harris Institute, the public library, and the institute and school for the blind. St. Walburge's Roman Catholic church is noted for its lofty spire, 306 feet high. Preston's great municipal enterprise was the acquisition of the dock and harbor rights of the Ribble in 1883 for $364,000 and an outlay on improvements of over $6,000,000. The channel was deepened to admit vessels of 17-foot draft, and a dock of 40 acres with warehouses and 8500 feet of quayage was built. Its principal export is coal; its imports are grain, iron, and timber. Besides the Ribble harbor rights the town owns its water supply, tramways, markets, refuse destructor, sewage farm, and maintains baths, free libraries, and three large public parks. Cotton and linen are extensively manufactured. There are iron and brass foundries, iron shipbuilding yards, carriage works, machine shops, and malting, brewing, and ropemaking establishments. Several great fairs are held here during the year, besides the usual weekly markets.

Originally called Priest's Town, from its ecclesiastical institutions, it received its first charter from Henry II. The celebrated Preston guild of merchants has held bidecennial festivals since 1329, the earliest on record. During the Civil War the town declared for the King, but was taken by the Parliamentary forces, and near the town Oliver Cromwell overwhelmed the Scots in 1648. It figured in the Jacobite rebellions of 1715 and 1745. In 1832 Joseph Livesey here originated the total-abstinence movement. Pop., 1901, 112,982; 1911, 117,113. Consult: Hewitson, *History of Preston* (Preston, 1883); Fishwick, *History of the Parish of Preston* (Rochdale, 1900); *Victoria History of the County of Lancaster* (8 vols., London, 1906–14).

PRESTON. A town in Waterloo County, Ontario, Canada, on the Grand Trunk and Canadian Pacific railways, about 55 miles by rail southwest of Toronto (Map: Ontario, E 7). The town has a public library and three parks. Its industrial establishments include planing, rolling, and woolen mills and manufactories of woodworking machinery, furniture, cigars, stoves and furnaces, electric and steam cars, hay machinery, metal shingles, beer, brushes, farm implements, wagons, sleighs, shoes, and piano players. Pop., 1901, 2308; 1911, 3882; 1915 (local est.), 5200.

PRESTON, ANN (1813–72). An American physician and educator, born in West Grove, Chester Co., Tenn, the daughter of Amos Preston, a Quaker. She entered the Woman's Medical College of Philadelphia in 1850, when the institution was opened, graduating in 1852. Here she was professor of physiology and hygiene from 1854 and dean from 1866. Her address to the Philadelphia County Medical Society, which had decided to ignore women physicians, finally gained a victory for her sex. In the field of juvenile literature she wrote *Cousin Ann's Stories for Children* (1848).

PRESTON, HARRIET WATERS (1836–1911). An American novelist and translator, born in Danvers, Mass. Her chief original works are: *Aspendale* (1871); *Love in the Nineteenth Century* (1874); *Is That All?* (1876); *A Year in Eden* (1887); *Private Life of the Romans* (1893), with Miss L. Dodge. Noteworthy among her translations are: *The Life of Madame Swetchine; The Writings of Madame Swetchine* (1869); *Celebrated Women* (selected from Sainte-Beuve's *Portraits de femmes*); Sainte-Beuve's *Madame Desbordes-Valmore* (1872); Paul de Musset's *Alfred de Musset* (1877); Mistral's *Mirèio* (1873); the *Georgics* of Vergil (1881).

PRESTON, JOHN SMITH (1809–81). An

American political leader and Confederate soldier, born at Abingdon, Va. He graduated at Hampden Sidney College in 1824, studied at the University of Virginia and at Harvard, and traveled in Europe. He settled at Columbia, S. C., but had large agricultural interests in Louisiana. For several terms he was a member of the South Carolina State Senate. Preston became an ardent Secessionist and led his State's delegation at the Charleston Convention of 1860. The next year, as one of the commissioners to Virginia, he made a notable speech at Richmond urging the Virginians to leave the Union. He participated in the first battle of Bull Run, but soon afterward was appointed chief of the conscription bureau, with the rank of brigadier general. After the war he lived in Europe for several years. Until his death he remained bitterly hostile to the Federal government.

PRESTON, MARGARET (JUNKIN) (c.1825–97). An American author, born in Philadelphia, Pa. She married T. L. Preston of the Virginia Military Institute and lived afterward in Virginia and Maryland. Her first writing appeared in 1849 in *Sartain's Magazine.* Her first book, *Silverwood* (1856), was a novel. Her later writings are almost entirely poetical and express deep religious feeling and ardent sympathy with the cause of the South in the Civil War, especially in *Beechenbrook* (1866), in which are some widely known lines on Stonewall Jackson's grave and a lyric "Slain in Battle." Other books of hers are: *Old Songs and New* (1870); *Cartoons* (1875); *Colonial Ballads* (1887); *For Love's Sake* (1887); *Aunt Dorothy* (1890). Consult E. P. Allan, *Life and Letters of Margaret J. Preston* (Boston, 1903).

PRESTON, RICHARD GRAHAM, VISCOUNT (1648–95). An English Jacobite politician and conspirator. He was born at Netherby, Cumberland, was educated at Christ Church, Oxford, and became a member of Parliament at 27. For his support of the Stuarts he was rewarded with a Scottish peerage (1681) and in 1682 was sent on a diplomatic errand to France. He returned (1685) to enter the Parliament of James II, and became a member of the Privy Council. After the downfall of the Stuarts Preston continued to be their agent in France. Upon one of his visits to London he was imprisoned in the Tower for six months but was still regarded by the Jacobites as the true Secretary of State. In 1691 he was condemned to death, but saved himself by betraying his fellow plotters. He translated *Boëthius' De Consolatione Philosophiæ.*

PRESTON, THOMAS SCOTT (1824–91). An American Roman Catholic clergyman. He was born at New Hartford, Conn., of Protestant parents. When he graduated from Trinity College, Hartford, in 1843, he took the vow of celibacy. After completing his course at the General Theological Seminary in New York, he was identified with several Episcopal churches. Coming under the influences of the Tractarian (q.v.) movement, he studied at St. John's College, Fordham, and was ordained a Roman Catholic priest in 1850. He became secretary to Archbishop Hughes and from 1855 till his death administered the chancery. In 1861 he was appointed rector of St. Ann's to succeed Dr. John M. Forbes (q.v.). In 1874 he became vicar-general of the archdiocese; two years later the Pope conferred the title of Monsignor, and in 1888 he was named a Prothonotary Apostolic. He was a strict disciplinarian and warm supporter of parochial schools. He published a number of books on devotional and controversial subjects, among them *Protestantism and the Bible* (1880) and *Protestantism and the Church* (1882).

PRESTON, WILLIAM CAMPBELL (1794–1860). An American lawyer, orator, and educator, born in Philadelphia, and educated at Washington College (Va.) and South Carolina College. About 1817 he went abroad, met Washington Irving and his brother, and with them made walking trips through Wales and Scotland. He returned to the United States in 1819, was admitted to the bar in 1820, and removed to Columbia, S. C., in 1822. He soon won a great reputation, particularly as a jury lawyer. From 1828 to 1832 he was a member of the Legislature and was a prominent advocate of Nullification (q.v.), of which John C. Calhoun was the leading defender. In 1833 Preston was elected to the United States Senate as a Calhoun Democrat. In 1842, on account of differences of opinion with his constituents, he resigned and resumed the practice of law. From 1845 to 1851 he was president of South Carolina College and lectured on belles-lettres.

PRESTONPANS, prĕs'ton-păns'. A village in Haddingtonshire, Scotland, on the Firth of Forth, 8 miles east of Edinburgh (Map: Scotland, F 4). It gives its name to the battle fought in the vicinity in which the Jacobites under Prince Charles Edward routed the royal army under Sir John Cope, capturing their cannon, baggage, and military chest, Sept. 21, 1745. Pop., 1901, 3382; 1911, 4722.

PRESTRE DE VAUBAN, SÉBASTIEN LE. See VAUBAN, S. LE PRESTRE DE.

PRESTWICH, prĕst'wĭch. A cotton-manufacturing town in Lancashire, England, 4½ miles north-northwest of Manchester, of which it is a residential suburb. It is a favorite place of residence for Manchester merchants. Pop., 1901, 12,766; 1911, 17,195.

PRESTWICH, SIR JOSEPH (1812–96). An English geologist. He was born at Clapham, London, and was educated at University College, London. Though engaged as a wine merchant until his sixtieth year, he frequently contributed to the *Transactions of the Geological Society* and in 1874 was appointed professor of geology at Oxford (1874–88). His reputation rests chiefly on his classification of the Tertiary deposits of England, which he was the first to correlate with the strata of the Paris basin, and on his promulgation of the theory of man's contemporaneity with other Pleistocene mammals. Of his publications, the most important is his treatise on *Geology* (2 vols., 1886–88), which is considered one of the best existing presentments of the principles of the science from the point of view of the antiuniformitarian. Professor Prestwich was president of the Geological Society of London (1870–72), vice president of the Royal Society (1870–71), and president of the International Geological Congress (1888). He was knighted in 1896. Consult the *Life and Letters of Sir Joseph Prestwich,* by his widow (London, 1899); also H. B. Woodward, *Joseph Prestwich* (Washington, 1898).

PRESTWICHIA, prĕst-wĭch'ĭ-à (Neo-Lat., named in honor of Sir Joseph Prestwich, the geologist). A fossil merostome found in the Carboniferous coal measures of North America and Europe. The chief interest of this fossil lies in its close resemblance to one of the larval stages of *Limulus,* in which respect it forms

a link in the history or phylogeny of the latter peculiar organism. See MEROSTOMATA.

PRESUMP'TION (Lat. *præsumptio*, anticipation, from *præsumere*, to presume, anticipate, take for granted, from *præ*, before + *sumere*, to take). In law, in its broadest sense, an inference as to the existence of a fact not known or proved to exist, which inference arises from its logical connection or association with certain other facts which are known or proved. As thus defined, a presumption may be nothing more than a mere inference of fact such as a jury is required to make in rendering a verdict. Thus, proof of the loss of a vessel in a storm with the other attendant circumstances may create a presumption or inference of the fact of death of a passenger sufficient to justify a jury in finding the death of the passenger as a matter of fact, unless the "presumptive" proof of the fact of death is rebutted or explained away by proof of other circumstances.

In a narrower and more important sense the term signifies an inference of fact which is required by some positive rule of law to be made from the proof or known existence of certain other facts. Thus, the proof that one has not been seen or heard from by his friends or acquaintances for a considerable period, together with other circumstances, may or may not give rise to the presumption of his death; but if the absence is prolonged for a period of seven years, it is a positive rule of the common law that such absence, when unexplained, shall be deemed presumptive evidence of death.

It is evident that the effect of a presumption of this class is to give a weight or significance to facts actually proved in a given case not warranted by logic and not justifying in the absence of an express rule of law a finding by the court or jury of the existence of the fact presumed. Such presumptions are based upon considerations of convenience and serve a useful purpose in aiding in the proof of facts which it might be impossible to establish by any inference logically flowing from facts actually proved. It is for this reason that presumptions of this class are called "presumptions of law," i.e., presumptions required by the law, as distinguished from mere logical inferences of fact. The effect of the presumption is prima facie to establish a fact, which, however, may be rebutted by the proof of other facts inconsistent with the fact presumed.

There is still a third class of presumptions so called, which are not true presumptions at all, but legal fictions. They are in reality rules of substantive law, although stated as presumptions of fact, and consequently they cannot be explained or rebutted. Thus, the conclusive "presumption" that a child under the age of seven has not capacity to commit a crime, or that one is presumed to know the law or the contents of certain public records, is not a presumption, but a positive rule of law which cannot be controverted. Oftentimes such rules of law originated as presumptions of fact, as, e.g., the rule that 20 years' use of a right or interest in real estate gives rise to the conclusive presumption that such use is by virtue of a lost grant and is therefore lawful. Originally the presumption was a presumption of fact, which might be rebutted like any other true presumption, but with the sanction of a long line of judicial decisions the presumption became adopted as a rule of substantive law, if there had been 20 years' user of the property which established the lawfulness of the use as a matter of law, and the question as to whether the use of property was by virtue of a lost grant ceased to be a jury question.

The function of the true presumption of law is primarily to aid a litigant in sustaining the burden of proof cast upon him by the pleadings in a case or by the rules of procedure. Consult J. D. Lawson, *The Law of Presumptive Evidence* (2d ed., St. Louis, 1899). See *Burden of Proof*, under EVIDENCE.

PRETENDER (from *pretend*, OF. *pretender*, Fr. *prétender*, from Lat. *prætendere*, to pretend, allege, hold out, from *præ*, before + *tendere*, to stretch). The name borne in English history by the son and the grandson of the dethroned James II, the two being specifically known as the Old Pretender and the Young Pretender respectively. See STUART, JAMES FRANCIS EDWARD; STUART, CHARLES EDWARD LOUIS PHILIP CASIMIR.

PRETENSE, ESCUTCHEON OF. See ESCUTCHEON.

PRETO'RIA. The capital of the Transvaal Province, formerly the South African Republic, British South Africa, and the administrative capital of the Union of South Africa. It is situated 4500 feet above sea level on the south slope of a spur of the Magalies Berge, in the south-central part of the province, 46 miles by rail, north-northeast of Johannesburg (Map: Cape of Good Hope, J 5). It was regularly laid out on an extensive scale, with wide and straight streets crossing at right angles, but it never acquired much economic importance, owing to the competition of Johannesburg. The Raadzaal, or former Parliament House, 126 feet high, surmounted by a statue of liberty, and the large government offices are the most important buildings. Pop., 1911, 49,743, of whom 29,618 were whites. Pretoria, named after the Boer General Pretorius, was founded in 1855 to succeed Potchefstroom as capital of the Transvaal Republic. In May, 1900, it surrendered to the British, after which its four imposing fortresses were dismantled. Consult Boyd, "Pretoria," in *Anglo-Saxon Review*, vol. iv (London, 1900).

PRETO'RIUS, *Dutch pron.* prâ-tō'rĭ-ŭs, MARTHINAS WESSELS (1827–1901). A South African soldier and statesman, the first president of the South African Republic. He was born in Natal, the son of Andries Pretorius, one of the leaders of the "Great Trek" and subsequently commandant general of the Boer forces. He succeeded to his father's rank and position upon his death, in 1852, and strove to carry out his policy, which had for its object the consolidation of the various independent Boer states. He won distinction as a military commander in the wars with the Kafirs and in 1860 was chosen president of the Orange Free State. When, in 1864, the small Boer states north of the Vaal River combined to form the South African Republic, Pretorius left the Free State and threw in his fortunes with the new republic, of which he was at once elected president. He was reelected in 1869, but in the following year, because of dissatisfaction over the arbitration agreement to which he had assented, in reference to territory claimed by the Baralong tribe, he resigned office. The acts of his successor, President Burgers, led in 1877 to friction with the British authorities, and to a proclamation annexing the Transvaal to the British Empire

Pretorius took a prominent part in the revolt which followed, and after the independence of the republic was recognized in 1880 he, with Kruger and Joubert, organized a provisional government. Pretorius expected to be chosen president, but the commanding position won by Paul Kruger in the struggle led to his election in 1883 and the final retirement of Pretorius to private life. One of the most conservative of Boer leaders, during his last years he bitterly opposed the war policy of Kruger, declaring prophetically that it meant the final extinction of both the Boer republics. He died at Potchefstroom, May 19, 1901. Pretoria, the administrative capital of the Union of South Africa and of the Province of the Transvaal, was named for him.

PREUSSISCH-EYLAU. See EYLAU.

PREVENTION OF CRUELTY TO CHILDREN. See CRUELTY TO CHILDREN, PREVENTION OF.

PREVENTIVE MEDICINE. See HYGIENE, *Military Hygiene.*

PREVESA, prĕ'vâ-zà *or* prâ-vā'zà. A fortified seaport of Greece, in the Department of Janina, situated at the entrance to the Gulf of Arta (Map: Balkan Peninsula, C 5). Formerly a town of the Ottoman Empire, it was annexed to Greece as a result of the Balkan War (q.v.) of 1912–13. It has considerable trade. Pop., about 7000.

PREVIOUS QUESTION. A question put to a parliamentary assembly upon motion of a member to ascertain whether it is the will of the assembly to vote at once and thus put a stop to further debate on the subject under consideration. The form of the previous question is: "Shall the main question now be put?" If the vote is in the affirmative, the subject under discussion must then be voted on without further debate on the main question or amendment. This puts it in the power of a bare majority to shut off debate at any time. Under the name of closure this method of parliamentary tactics was first extensively resorted to by Mr. Gladstone in the House of Commons in 1882 in order to prevent dilatory or obstructive motions of the minority. It has been frequently resorted to in the United States House of Representatives from the earliest time, but up to the present time has not been tried in the Senate, where the practice of unlimited debate is allowed. In the House of Representatives the defeat of the previous question operates to keep the business before the House as though no motion had been made, but in the English Parliament it has the effect of postponing consideration for the day. The object of the practice in the United States is to hasten action, and a motion is made by a friend of the measure; in the English Parliament the purpose is to get rid of the subject for the time, and the motion is made with the purpose of voting against the measure.

PREVORST, prâ'fôrst, SEERESS OF (1801–29). A German clairvoyante, whose real name was Friederike Hauffe. She was the daughter of a forester of Prevorst. In 1826 she met the German poet Justinus Kerner (q.v.), whose book on her was translated into English by Mrs. Catherine Crowe as *The Seeress of Prevorst* (1845).

PREVOST, prĕ-vō' *or* prĕv'ō, AUGUSTINE (1725–86). A British soldier. He was born in Geneva, Switzerland, entered the British army, and in the French and Indian War distinguished himself in Wolfe's attack on Quebec. He became lieutenant colonel in command of the Sixtieth Regiment in 1761, and after the death of Gen. Henry Bouquet in 1765 commanded the British troops in the Southern Department, with headquarters at Pensacola. In 1778 he subdued temporarily an uprising in Georgia. In 1779 he abandoned Augusta on the approach of General Ashe, but later, at Brier Creek, turned and administered a severe defeat to his pursuers. He then drove Moultrie back on Charleston, laying waste the country and encouraging his Cherokee allies to acts of the greatest barbarity. Before he could take Charleston, however, Moultrie, its commander, was joined by Pulaski and Prevost withdrew into Georgia. Later in 1779 he repulsed an attack on Savannah by the combined French and American forces under D'Estaing and Lincoln. For this success he was promoted major general. He was the father of Sir George Prevost.

PREVOST, SIR GEORGE (1767–1816). A British soldier and administrator, son of Augustine Prevost. He was born in New York City, entered the British army in 1783, when he became captain, and between 1790 and 1801 saw service in the West Indies, commanding the British troops in St. Vincent in 1794–95 and acting as Military Governor of St. Lucia from 1798 to 1801, after which for a year he was Civil Governor. In 1802 he was appointed Captain General and Governor in Chief in Dominica. Created Baronet in 1805, he was the same year made major general and three years later lieutenant general. In 1808 he was appointed Lieutenant Governor and commander in chief of Nova Scotia, in 1809 was second in command at the capture of Martinique, and in September, 1811, succeeded Sir James Craig as Governor of Lower Canada and Governor-General of British North America, which position he retained throughout the War of 1812, nominally, but not always actually, directing, as commander in chief, the British operations in Canada. On May 29, 1813, in concert with Sir James Yeo, he made an unsuccessful attack upon Sacketts Harbor, N. Y., and on Sept. 11, 1814, in conjunction with Downie, who commanded the naval forces, was again unsuccessful in an attack upon Plattsburg, N. Y., where he was repulsed by the Americans under Macomb. For his faintheartedness or lack of enterprise on the latter occasion he was called before a court-martial, but died before a verdict could be rendered.

PRÉVOST, prâ'vō', (EUGÈNE) MARCEL (1862–). A French novelist, born in Paris, May 1, 1862. He was educated by the Jesuits and at the Polytechnic School, engaged in tobacco manufacturing, and entered the literary field in 1891. In 1887, however, he published *Le scorpion,* an attack on Jesuit education; and this story was followed by *Chonchette* (1888) and *Mademoiselle Jaufre* (1889), both of which were less crude and more sentimental and idyllic, though with some affectation of moralizing. *Cousine Laura* satirized the distortions of love, and the author pursued the theme in *La confession d'un amant* (1891). His next work, *Lettres de femmes* (1892), was the first to win distinct notice. It was succeeded by *Nouvelles lettres de femmes* (1894) and *Dernières lettres de femmes* (1897). The series are gracefully writ-

ten, witty, ironical, ingenious, and thoroughly seasoned to the moral taste of the French. The dominant note is sensual perversity. *L'Automne d'une femme* (1893) is nobler, but *Les demi-vierges* is distasteful and *Le moulin de Nazareth* (1894) may be classed as revolting. *Notre compagne* (1895), a collection of stories, is, on the other hand, never vulgar, always clever, and often pure; and *Le jardin secret* (1897) is a strong and worthy narrative of conventional marriage, with the moral of Goethe's *Die Mitschuldigen*. In 1900 appeared *Les vierges fortes*, which was composed of two volumes, *Frédérique* and *Léa*. In 1901 *L'Heureux ménage* was published. These last volumes deal with the woman question, both as concerns the education and the free life of young girls and the marriage relation. M. Prévost does not appear to find that the new or higher education for young women, as he understands its development in England and America, points to anything very satisfactory for the French. Later works are the novels *Le pas relevé* (1902); *Lettres à Françoise* (1902); *La princesse d'Erminge* (1904); *L'Accordeur aveugle* (1905); *Monsieur et Madame Moloch* (1906); *Femmes* (1907); *Lettres à Françoise mariée* (1908); *Pierre et Thérèse* (1909); *Missette* (1911); *Lettres à Françoise maman* (1912), and the drama *La plus faible* (1904). As a whole his stories suggest Bourget and Maupassant. At his best he is less powerful, less searching, but in narration he is admirably deft, lucid, compact, swift, and unerring. His feminine psychology is masterly. Prévost was elected to the French Academy in 1909. Consult Winifred Stephens, *French Novelists of To-day* (New York, 1914).

PRÉVOST, Pierre (1751–1839). A Swiss physicist and philosopher, born at Geneva. He studied theology and law, became professor of philosophy in 1780 at the Akademie der Wissenschaften in Berlin, and after 1784 held a similar chair at Geneva until 1810, when he was made professor of physics. He formulated the law of exchange in radiation. Prévost revised G. L. Le Sage's *Traité de physique* and published various works on physics and philosophy.

PRÉVOST D'EXILES, prā'vō' dāg'zēl', Antoine François (1697–1763). A French novelist, best known as the author of *Manon Lescaut* (q.v.). Prévost was born at Hesdin, April 1, 1697. His father was a petty official. Antoine had been by turns a student of the Jesuits, a novice among them, a soldier (1713–14), a Jesuit, a soldier again, and, as "the unhappy end of a too tender attachment," a Benedictine (1721–28). Then we hear of him as wanted by the police for a libel on the Duke of Tuscany and for alleged breaches of conventual discipline. It was a fateful period in the history of the French novel when Prévost sought refuge in England (1728), where he remained for two or three years and, after a hasty and not wholly voluntary departure, returned thither in 1733 famous as author of the *Mémoires d'un homme de qualité*, the seventh volume of which is his greatest and shortest novel, *Manon Lescaut* (1731). Prévost remained once more two years in England, viewed askance by the Huguenot colony, and so thrown more with the English, the result of which appears in *Cléveland, ou le philosophe anglais* (8 vols., 1731–38); *Les mémoires de M. de Montcal;* and an Irish novel, *Le doyen de Killerine* (6 vols., 1735–40), which he followed after his return with a story based on the life of the fascinating Greek girl, Mademoiselle Aïsse, then a reigning Parisian celebrity. He died at Chantilly, Nov. 23, 1763.

Prévost wrote two other novels besides those already mentioned, *Mémoires pour servir à l'histoire de Malte* and *Mémoires d'un honnête homme;* but the later years of his life were devoted almost wholly to translations of the novels of Richardson, begun in 1742, by which he influenced literature even more than by *Manon Lescaut*, propagating an undiscriminating interest in England and the English, whose democratic spirit inspired him to warm enthusiasm. Thus he helped to shake French confidence and pride of social and intellectual superiority and to pave the way both for a cosmopolitan literary spirit and for Rousseau.

His average work closely resembles the lesser novels of Defoe, but *Manon* affected radically the novels of Rousseau and Diderot, and can be traced through Hugo and Dumas and George Sand to the present day. Prévost himself tells us that the story is "a terrible example of the force of passion." In Richardson Prévost found a fuller expression of himself than he had yet been able to attain. *Pamela* in English began to appear in 1740. Prévost recognized its value instantly, and in 1742 his French version appeared in London. The English *Clarissa* is of 1748–49, the French of 1751. Richardson begins *Grandison* in 1753; Prévost, while awaiting its completion, busies himself in an attempt to spread English and German literature in France through founding with Rousseau a *Journal Etranger*. Prévost's work was that of editor as much as translator, and Richardson greatly profited by the process. Prévost's *Œuvres choisies* appeared in 39 volumes (Amsterdam, 1783–85, 1806). Of *Manon Lescaut* the editions are many. Consult: C. A. Sainte-Beuve, in *Causeries de lundi*, vol. ix (Paris, 1862); id., in *Portraits littéraires* (vols. i–iii, 2d ed., ib., 1864); Henry Harrisse, *L'Abbé Prévost* (ib., 1896); V. Schroeder, *Un romancier français au XVIIIe siècle, l'abbé Prévost: la vie, ses romanes* (ib., 1898); Texte, *Jean Jacques Rousseau and the Cosmopolitan Spirit in Literature*, English translation (New York, 1899).

PRÉVOST-PARADOL, pā'rà'dôl', Lucien Anatole (1829–70). A French journalist and author, born in Paris. He studied at the Collège Bourbon and at the Ecole Normale and in 1851 obtained the French Academy's prize for eloquence. After obtaining his degree of doctor of letters in 1855, he was appointed to the chair of French literature at Aix, but in the following year resigned his professorship and became one of the editors of the *Journal des Débats*, writing most of the leading articles. He also wrote for the *Courrier du Dimanche*, and his opposition to the Empire and his advocacy of a responsible ministry brought him into difficulties with the censorship. In 1865 he was elected a member of the Academy, and in 1868 visited England, where he received a warm welcome. Believing that the Empire had at last adopted the principle of parliamentary government, he consented in 1870 to fill the post of Envoy at Washington. The Franco-Prussian War affected him so greatly that he committed suicide in Washington. He died July 20, 1870, nine days after shooting himself. His chief works are: *Revue de l'histoire universelle* (1854); *Essais de politique et de littérature* (1859–63); *Quelques*

pages d'histoire contemporaine (1862–66); *La France nouvelle* (1868). Consult Gréard, *Prévost-Paradol* (Paris, 1894).

PREWITT, prōō'it, THEODORE F. (1832–1904). An American surgeon. He was born at Fayette, Howard Co., Mo., studied at the St. Louis Medical College (M.D., 1856), and settled in St. Louis, where he practiced until his death. He held several important hospital offices, for 25 years serving as surgeon to St. John's Hospital. In 1875 he became professor of surgery in the Missouri Medical College and later was elected dean. On the consolidation of the Missouri Medical College with the St. Louis Medical College to form the medical department of Washington University, Prewitt was continued in the chair of surgery, which he occupied until his death. He served as president of the Missouri State Medical Society and of the American Surgical Association.

PREYER, prī'ĕr, WILHELM THIERRY (1841–97). A German physiologist and psychologist, born at Moss Side, near Manchester, England. He was educated at the universities of Bonn, Berlin, Heidelberg, Vienna, and Paris, became a lecturer in the philosophical faculty at Bonn in 1865, in 1867 in the faculty of medicine also, and in 1869 was appointed professor of physiology and director of the physiological institute at Jena. He was a lecturer at Berlin from 1888 to 1893, when he returned to Jena. Preyer made laboratory investigations in regard to spectrum analysis, propounded a theory of sleep, investigated the limits of perception of pitch, and applied the principles of H. G. Grassmann's (q.v.) theory of extension to psychology. He also conducted researches in connection with the blood, respiration, the color sense, and other subjects. Among his writings are: *Die Blausäure* (2 parts, 1868–70); *Die Blutkrystalle* (1871); *Das myophysische Gesetz* (1874); *Ueber die Ursache des Schlafes* (1877); *Die Entdeckung des Hypnotismus* (1881); *Der Hypnotismus* (1890); *Darwin: sein Leben und Wirken* (1896).

PRI'AM (Lat. *Priamus*, from Gk. Πρίαμος). In Greek legend, a son of Laomedon and Strymo, or Placia (others give his mother other names), and last King of Troy. His name was originally Podarces (swift foot), but was changed to Priam on account of his having been ransomed by his sister Hesione from Heracles, who had made him prisoner when he captured Troy from Laomedon. His first wife was Arisbe, daughter of Merops, whom he gave away to a friend in order to marry Hecuba, by whom, according to Homer, he had 19 sons, though from other wives the number was increased to 50 and as many daughters, whose names, with some variations, may be found in Apollodorus and Hyginus. The best known of the sons are Hector, Paris, Deïphobos, Helenus, Troïlus, and of the daughters, Cassandra and Polyxena. Priam is represented as too old to take any active part in the Trojan War; in Homer (*Iliad*, iii) he appears only once on the field of battle, to ratify the truce before the duel of Paris and Menelaus. He, however, takes part in Trojan councils, and after the death of Hector visits the Grecian camp, guided by Hermes, to ransom the body of his son from Achilles. The later epics recounted his death at the capture of the city in somewhat different ways. The usual account represents him as slain, after a feeble attempt at resistance, by Pyrrhus, son of Achilles, in his own palace court at the altar of Zeus Herkeios, where he had taken refuge. Cf. Vergil, *Æneid*, ii, 486–558. See TROY.

PRIA'PUS (Lat., from Gk. Πρίαπος, *Priapos*, Πρίηπος, *Priēpos*). One of the lesser figures in the ordinary Greek and Roman mythology, though at Lampsacus, Cyzicus, and other places in the fertile districts on the Hellespont and the Propontis he was held in high honor. The Lampsacene tradition called him son of Dionysus and Aphrodite, but his parentage was variously related. He was a god of fruitfulness and reproduction, particularly of gardens and vineyards, though his protection was extended also to the flocks and herds. In art he was sometimes represented as old and effeminate, clothed in Asiatic garb, a kerchief on his head, and with the folds of his garment held up and filled with fruit. More commonly his image was set up in gardens and vineyards to scare away birds and thieves. The character of these images led to many coarse jests in the poets and elsewhere. (Consult Horace, *Sermones*, i, 8.) The *Priapea* is a collection of 80 short Latin poems, partly collected from the walls of the temple of Priapus, and for the most part apparently not later than the Augustan age. Consult Bücheler, *Petronius, etc.* (5th ed., Berlin, 1912). For Priapus, consult the article "Priapos" in W. H. Roscher, *Lexikon der griechischen und romischen Mythologie*, vol. iii (Leipzig, 1897–1909).

PŘIBRAM, pr̆zhē'brâm, or **PRZIBRAM**. A town of the Crownland of Bohemia, Austria, 33 miles southwest of Prague (Map: Austria, C 2). It derives its importance from extensive lead and silver mines in the neighborhood, the largest in the Empire. They were worked as early as 1330, and since 1819 have been mainly the property of the government. One of the shafts, the Albertschacht, is 3637 feet deep. Close to the town is the Heilige Berg (1903 feet), a shrine visited by more than 100,000 pilgrims yearly. Pop., 1900, 13,576; 1910, 13,330, mostly Bohemians.

PRIBER, prē'bâr', CHRISTIAN. A French Jesuit who went among the Cherokee in 1736 and settled at Great Tellico town, in what is now east Tennessee. He at once set to work studying the Cherokee language, compiling a dictionary and grammar and adapting himself to the native dress and mode of life for the time in order better to accomplish their civilization and conversion. He drew up for their adoption a regular form of government modeled upon the European plan, with a prominent chief as principal ruler and himself as secretary. Fearing that the result would be to win over the Cherokee to the French interest, the English government of South Carolina undertook to arrest him, but the Indians refused to give him up, and the commissioner was obliged to return under safe-conduct of an escort furnished by Priber. In 1741, however, he was seized by some English traders while journeying in Alabama and sent as a prisoner to Frederica in Georgia, where he soon afterward died in prison.

PRIBILOV, prē'bē-lôf', **PRIBILOF** (or SEAL) **ISLANDS**. A group of small volcanic islands in Bering Sea, belonging to the United States, named for their discoverer, Pribilov, in 1786. They are 200 miles southwest of the Alaskan mainland (Map: Alaska, D 7). St. Paul, the largest, has an area of 35 square miles and had a population of 201 in 1910, and St. George, the next in size, an area of 27 square

miles and a population of 90. They are isolated and surrounded by fog, which probably causes the otary, or fur seal, to select these grounds for the purpose of breeding, so that these islands are the centre of the Bering Sea seal fisheries. The Pribilovs were made a fur-seal reservation in 1868. Churches, schools, and sanitation have materially improved the condition of the natives. Reindeer have lately been introduced with success. On St. Paul the United States navy has a wireless station. Consult: H. W. Elliott, *Our Arctic Province* (New York, 1887); A. W. Greely, *Handbook of Alaska* (ib., 1914); E. L. Jones, *Report of Alaska Investigations in 1914* (Washington, 1915).

PRICE, BARTHOLOMEW (1818–98). An English mathematician, born at Coln St. Denis, Gloucestershire. He graduated B.A. in 1840 and M.A. in 1843 at Pembroke College, Oxford, where he became a fellow in 1844 and tutor and mathematical lecturer in 1845, and was public examiner in 1847–48 and 1853–55 and proctor in 1858. From 1853 until shortly before his death he held the Sedleian chair of natural philosophy at Oxford, and in 1891 was elected master of Pembroke College. Price was author of *A Treatise on the Differential Calculus* (1848) and of an important *Treatise on Infinitesimal Calculus* (4 vols., 1852–60; 2d ed., 1857–89).

PRICE, BONAMY (1807–88). An English economist. He graduated at Worcester College, Oxford, in 1829, taught from 1830 to 1850 at Rugby, and from 1868 until his death held the Drummond professorship of political economy at Oxford. He was an earnest advocate of the principles of free trade and, in a series of lectures delivered in the United States (1874), he gave vigorous expression to his opinion on the subject. His publications include: *The Principles of Currency* (1869); *Currency and Banking* (1876); *Practical Political Economy* (1878).

PRICE, IRA MAURICE (1856–). An American Semitic scholar, born near Newark, Ohio. He graduated at Denison University in 1879 and for a year was professor of Greek and modern languages at the University of Des Moines, Iowa. He was instructor (1886–88) and professor (1888–92) of Hebrew and cognate languages in the Baptist Union Theological Seminary, then, at the University of Chicago, associate professor and after 1900 professor of Semitic languages and literature. Dr. Price became associate editor of the *American Journal of Semitic Languages and Literature* in 1892 and of the *American Journal of Theology* in 1897. His works include: *An Introduction into the Inscriptions Discovered by Mons. E. de Sarzec* (1887); *A Syllabus of Old Testament History* (1890; 8th ed., 1912); *Introduction to Old Testament* (1891); *The Monuments and the Old Testament* (1899; 5th ed., 1907); *The Ancestry of our English Bible* (1907; 5th ed., 1911).

PRICE, LANGFORD LOVELL (1862–). An English economist, born in London. He was educated at Trinity College, Oxford, in 1888 became fellow and treasurer of Oriel, and was Newmarch lecturer in statistics at University College, London, in 1895–96. In 1897 he was governor of Dulwich College and in 1898 was appointed an examiner in the moral sciences tripos at Cambridge. Price's writings include: *Industrial Peace* (1887); *A Short History of Political Economy in England* (1891; 2d ed., 1896); *Money and its Relation to Prices* (1896; 3d ed., 1909); *Economic Science and Practice* (1896); *A Short History of English Commerce and Industry* (1900); *The Position and Prospects of the Study of Economic History* (1908); *Co-operation and Co-partnership* (1914).

PRICE, RICHARD (1723–91). A British nonconformist divine and political and moral philosopher. He was born at Tynton, Wales, the son of a dissenting minister of stern Calvinistic tendencies. For most of his life after 1743 he was at Stoke Newington as private chaplain or preacher. In 1769 he published his *Treatise on Reversionary Payments;* this was followed in 1771 by his *Appeal on the Subject of the National Debt* and by the compilation and publication of the celebrated *Northampton Mortality Tables* and various important works relating to life assurance and other annuities. In 1776 appeared his *Observations on Civil Liberty and the Justice and the Policy of the War with America.* Of this work 60,000 copies are said to have been sold in a few months. So greatly was it admired in the United States that the American Congress in 1778, through Franklin, communicated to him their desire to consider him a fellow citizen and to receive his assistance in regulating their finances, an offer which he declined, principally on the ground of age. The work procured him the freedom of the city of London, and in 1783, at the same time as Washington, he received the honorary degree of LL.D. from Yale University. His importance as a philosopher is measured by his *Review of the Principal Questions in Morals* (1757; 3d ed., rev. 1787). He died April 19, 1791. Consult William Morgan, *Memoirs of the Life of Richard Price, D.D.* (London, 1815).

PRICE, STERLING (1809–67). An American Confederate soldier, born in Prince Edward Co., Va. He was educated at Hampden Sidney College, but removed to Chariton Co., Mo., in 1831. In 1844 he was elected to Congress, but in 1846 he resigned and raised the Second Missouri Cavalry for the Mexican War. Under Gen. Stephen W. Kearny he marched from Fort Leavenworth to Santa Fe, suppressed an insurrection, and completed the conquest of California. He was promoted brigadier general of volunteers in 1847, and the next year defeated a Mexican force at Santa Cruz de Rasales. From 1853 to 1857 he was Governor of Missouri. In the beginning of 1861 he was a Conditional Union man and was president of the convention called to consider the secession of the State. Eventually he joined the Secessionists, was appointed major general of State troops, and began to organize the forces. He participated, under McCulloch, in the battle of Wilson's Creek (1861) and under Van Dorn in the battle of Pea Ridge (1862) and was made a major general of the Confederate army. Price was assigned to command the Army of the West, but operated first in Tennessee. On Sept. 19, 1862, he was defeated by Rosecrans at Iuka, Miss., and on October 3–4 took part in General Van Dorn's unsuccessful attack on Corinth. Until February, 1863, he served in northern Mississippi. The next July he took part in the unsuccessful attack on Helena, Ark. While in command of the district of Arkansas, under Gen. E. Kirby Smith, he opposed Gen. Frederic Steele. In September, 1864, he made a raid into Missouri, fought a number of battles and skirmishes, and gained

5000 recruits, but was forced to retreat into southwest Arkansas. After the close of the war he went to Mexico and became interested in a colonization scheme, but soon returned. Consult T. L. Snead, *The Fight for Missouri* (New York, 1888).

PRICE, THOMAS RANDOLPH (1839–1903). An American English scholar, born at Richmond, Va. He studied at the University of Virginia and at Berlin and Kiel until 1861, when he went home and served in the Confederate army during the Civil War. In 1867 he was appointed to the professorship of Latin and Greek at Randolph College, and afterward had the chair of Greek and English there and the chair of Greek in the University of Virginia until 1882, when he was made professor of English language and literature in Columbia University. He edited *Othello* in the Bankside Shakespeare (1890), and previously published *The Teaching of the Mother-Tongue* (1877) and *The Construction and Type of Shakespeare's Verse as Seen in Othello* (1888).

PRICHARD, prĭch'ard, JAMES COWLES (1786–1848). An English physician, ethnologist, and scholar, born at Ross, Herefordshire, and educated in medicine at Bristol, London, and Edinburgh. He upheld the ethnological theory of the primitive unity of the human race. In addition to his classical studies and the mastery of French, Italian, Spanish, and modern Greek, he devoted himself to Celtic, and was the first to show the Indo-Germanic character of the Celtic group of languages. In another field his *Treatise on Insanity and Other Disorders Affecting the Mind* (1835) was long a standard work. In 1845 he was appointed a commissioner in lunacy in London. Prichard was virtually the founder of anthropological science in England. Among his numerous works the most important are: *A Review of the Doctrine of a Vital Principle* (1829); *Eastern Origin of the Celtic Nations* (1831); *Researches into the Physical History of Mankind* (5 vols., 1836–47); *Different Forms of Insanity in Relation to Jurisprudence* (1842); *Natural History of Man* (1843); *On the Relation of Ethnology to Other Branches of Knowledge* (1847).

PRICKLY HEAT. The popular name for *miliaria papulosa*, an eruptive skin disease, caused by obstruction of the sweat ducts and characterized by a large area of small, red, acuminate papules crowded closely together, with excessive sweating, heat, and itching. In tropical countries it is a formidable disease. In temperate climates it is frequently seen in a mild form during hot weather. Cathartics internally and cooling lotions (such as weak carbolic acid, solution of boric acid or of bicarbonate of soda) locally give relief. In babies the disease is a source of acute suffering. Prophylactic measures consist of clothing the child in loose, cool, absorbent materials, bathing it frequently, and keeping it out of the heat. See MILIARIA.

PRICKLY PEAR, or INDIAN FIG (*Opuntia*). A genus of 200 or more species of cacti, fully half of which occur in the southwestern United States. Their fleshy, spiny or hairy stems, generally formed of compressed or cylindrical articulations, are leafless, except upon younger shoots, which produce small, cylindrical, early, deciduous leaves. The flowers, which spring from among the clusters of prickles or from the margin or summit of the articulations, are solitary, or corymbose-paniculate, generally yellow, rarely white or red. The fruit, which resembles a fig or a pear, with clusters of prickles on the skin, is mucilaginous and generally eatable. Some species are used for hedge plants in warm countries. The common prickly pear, or Indian fig (*Opuntia vulgaris*), a low-growing native of the eastern United States from Massachusetts southward, is naturalized in many Mediterranean and other warm countries. It grows well on rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. Its yellow or purple tinged oval fruit, somewhat larger than a hen's egg, has a pleasant acid flavor, but is inferior to that of *Opuntia ficus indica*, of which there are many distinct varieties. It is extensively used in many countries as an article of food. The dwarf prickly pear, a variety of *Opuntia vulgaris*, very similar, but smaller, and having prostrate stems, is naturalized in Europe as far north as the sunny slopes of the Tirol. The tuna (*Opuntia tuna*), much used in some parts of the West Indies as a hedge plant, and also valuable as a food of the cochineal insect, has red flowers with long irritable stamens and an edible fruit. *Opuntia engelmanni* (see Plate of CACTI) is one of the larger flat-jointed species common from Texas westward. From Texas to California and in Mexico are many species with cylindrical stems and upright habit of growth, some attaining a height of 10 feet or more. Some of the thick, fleshy, flat-jointed species are eaten by stock in spite of their spines. Sometimes the spines are singed off to make the plants less difficult to eat. Spineless varieties are grown for the special use of stock. In the Cape of Good Hope, Australia, and elsewhere the species introduced for stock food have become a serious pest.

PRIDE, THOMAS (?–1658). A soldier during the great Civil War in England. He was early a brewer. In 1644 he entered the Parliamentary army as captain, and for a time served under Essex. His promotion was rapid, and he distinguished himself in several of the great battles, notably at Naseby in 1645, where he commanded Harley's regiment. In the quarrel between the army and Parliament he energetically supported the former, and was given command of Harley's regiment. On Dec. 6, 1648, under orders from Fairfax, he prevented about 140 members from sitting in the House of Commons, arresting over 40 of them, in order to prevent an agreement with Charles I. This incident has gone down in history as Pride's Purge. Pride was a commissioner at the trial of the King and was one of those to sign the death warrant. He died Oct. 23, 1658. At the Restoration he was attainted as one of four regicides, but his body does not seem to have been exhumed.

PRIDE AND PREJUDICE. A novel by Jane Austen (1813), written in 1796.

PRIDEAUX, prē'dō, HUMPHREY (1648–1724). An early English Oriental scholar. He was born at Padstow, Cornwall, and was educated at Westminster and at Christ Church, Oxford (B.A., 1672). In 1676 he published in Oxford an account of the Arundelian marbles, under the title of *Marmora Oxoniensia*. In 1679 the Lord Chancellor Finch appointed him rector of St. Clement's at Oxford and in 1681 a canon at Norwich. In 1688 he became Archdeacon of Suffolk and in 1702 dean of Norwich. His principal works are his *Life of Mahomet* (1697),

long popular, but inaccurate and now superseded, and *The Connection of the History of the Old and New Testament* (1715–16), for many years a standard work. His *Life* was published in London in 1748, and his letters to John Ellis were edited for the Camden Society by Thompson (London, 1875).

PRIDEAUX, JOHN (1718–59). An English soldier, born in Devonshire, England. He became ensign in the British army in 1739, took part in the battle of Dettingen, Germany, in 1743, fought in America against the French, became colonel and brigadier general, was intrusted by General Amherst with the command of the expedition to reduce Fort Niagara in 1759, and while preparing for the siege was killed in the trenches by the accidental bursting of a shell. For an account of his expedition, consult Francis Parkman, *Montcalm and Wolfe* (Boston, 1884).

PRIDE OF INDIA. See CHINA TREE.

PRIDE'S PURGE. See PRIDE, THOMAS.

PRIEGO DE CÓRDOBA, prē-ā'gō dā kōr'dō-bä. A town of south Spain in the Province of Córdoba, situated about 50 miles southeast of the city of that name (Map: Spain, C 4). It has a very old church and the ruins of an old castle. The chief manufactures are cotton textiles and olive oil. Pop., 1910, 17,691. Priego was an important fortress under the Moors and was several times captured and recaptured.

PRIENE, prī-ē'nē (Lat., from Gk. Πριήνη). A Greek city of Asia Minor, situated on the north shore of the Latmic Gulf on a projecting spur of Mount Mycale. The Acropolis and the earliest settlement were on a plateau inaccessible except by rock-cut steps, while the later city covered a series of lower terraces. Priene was one of the 12 cities of the Ionian League and claimed as its founder Æpytus or Ægyptus, son of Neleus, though tradition told of a second body of settlers from Bœotia, who gave to the place in early times the name Cadme. At that time the city was close to the shore and possessed a small but good harbor, which has now been completely destroyed by the alluvial deposits of the Mæander, which have filled the greater part of the ancient gulf. Even in Strabo's time the city was over 4 miles from the coast, and the distance is now much greater. The city was from an early period involved in a quarrel with Samos about the ownership of lands on Mount Mycale, and inscriptions show that the dispute was not settled until Roman times. It was conquered in the second half of the seventh century B.C. by the Lydian King Ardys, and later, for its support of a Lydian revolt, it was severely treated by the Persians. Its prosperity was renewed by the wise councils of Bias (q.v.), but it again suffered for its participation in the Ionic revolt (500–494 B.C.) from Persia. Later it came under the rule of the Athenians and was about 442 B.C. placed by them under the protection of Miletus. During the fifth and fourth centuries it seems to have been of small importance, and its real development took place after Alexander's conquest of Asia. Under his patronage was erected the beautiful temple of Athena Polias, the work of the architect Pythias, who seems also to have laid out the new city on the lower terraces. This temple was excavated by Pullan and Newton for the Society of Dilettanti in 1868 and found to be a masterpiece of Ionic architecture, rivaling in its proportions and finish the Erechtheum at Athens, though with interesting variations in details. The gradual silting up of the bay must have made the place unhealthy, and under the Byzantine emperors the city was deserted. Fortunately no later settlers were attracted to the site, and thus the ancient houses and buildings fell into ruin or were destroyed by earthquake and buried in débris.

From 1895 to 1898 excavations were undertaken for the Berlin Museum by Th. Wiegand, and as a result the ancient city has been uncovered, and for the Greek town life of the Hellenistic age Priene must take a place similar to that occupied by Pompeii (q.v.) for the life of Italy under the early Empire. The city was planned with great care. East and west, parallel to the mountain side, ran a series of straight streets, connected at regular intervals by narrow lanes, which ascend the hill. The rectangles thus formed were normally 35 × 47 meters and contained four houses, whose entrances were on the side streets, so that on the thoroughfares were only blank walls, unbroken save perhaps by windows in the upper stories. The theatre, council house, market place, temple of Æsculapius, and other public buildings were also laid bare, and a wealth of inscriptions and smaller objects recovered. Preliminary reports of the excavations may be found in the *Archäologischer Anzieger,* published in the *Jahrbuch des archaologischen Instituts* (Berlin, 1900). In 1904 Th. Wiegand and H. Schroder published a work entitled *Priene, Ergebnisse der Ausgrabungen und Untersuchungen in den Jahren 1895–98* (Berlin). A popular account by A. L. Frothingham was published in the *Century Magazine,* vol. lxii (New York, 1901); another, by W. G. Leutner, appeared in the *Classical Weekly,* vol. v (ib., 1911). In 1910 a colored lithograph, giving a bird's-eye view of the excavation, by A. Zippelius, was published (Leipzig, 1910); as explanatory of this Th. Wiegand published "Priene, ein Begleitwort zur Rekonstruktion von A. Zippelius," in *Neue Jahrbücher für das klassische Altertum,* vol. xxv (Leipzig, 1911). Consult also H. von Gärtringen, *Inschriften von Priene* (Berlin, 1907), with collection of references by ancient writers to the city; K. Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern,* 401–408, with plan (2d ed., Leipzig, 1914). For the temple of Athena Polias, see Pullan and Newton, *Antiquities of Ionia,* published by the Society of Dilettanti (London, 1881). For the ancient history, see Lenschau, "De Rebus Prienensibus," in *Leipziger Studien,* vol. xii (Leipzig, 1890).

PRIESSNITZ, prēs'nĭts, VINCENZ (1799–1851). The founder of hydrotherapy. He was born at Gräfenberg in Austrian Silesia and at first devoted himself to farming. It appears that a neighbor who had been in the way of healing trifling wounds on himself and others by means of cold water, treated Priessnitz in this way for a serious injury from the kick of a horse; and having had his attention directed to the virtues of cold water, Priessnitz, indisputably possessed of sharpness of intellect and some aptitude for the practice of the healing art, began to cure ailments with cold water and soon attained considerable reputation. As the number of applicants for advice went on increasing, he gradually evolved a system of treatment for the various cases presented. Opposition to him on the ground of unlicensed practicing gave way before special authority

from the Austrian government, and in 1826 the Gräfenberg water cure was established. In 1833 Priessnitz abandoned farming in order to devote himself to the care of the establishments which he had to provide for the reception and treatment of his patients. A monument was erected in his memory in Gräfenberg in 1888. See HYDROTHERAPY.

PRIEST (AS. *prēost*, OF. *prestre*, Fr. *prêtre*, priest, from Lat. *presbyter*, elder, presbyter). The title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In the early history of mankind there was no priest. The god was often a local object, like a stone or a river; the worship was simple, every one knew how to do it, and no priest was needed. The chief or the head of the family made the sacrifices, like Abraham in the stories of Genesis. Among the Aztecs, whose chief god was the sun, the king was high priest of the nation, all his family were regarded as sacred to the sun, and the women of the priest king were vestal virgins sacred to the god and the king. A survival of this stage of religion is the sacrifices to heaven in China, which can only be made by the Emperor. The priest, like the carpenter and the smith, arose from the division of labor. As the ritual grew more elaborate, it was necessary for some one to specialize in its knowledge; and as the priesthood grew, it tended to the elaboration of the ritual. At this stage the priesthood often became hereditary. At last it became necessary for a priest to be present at the ritual, while the offerer still performed the sacrifices. This is the stage found in the Vedic period in India. In most developed religions the priesthood has advanced a stage farther, and the priest himself performs the sacrifice, the offerer being only a spectator or sometimes not present at all. This opens the way for the priest to be regarded as the necessary mediator with the gods, without whom any approach to them would be impossible. The religion then becomes thoroughly sacerdotal. The origin of the priest is different from that of the shaman of Central Asia, the prophet or seer of Semitic religions, the wizard or medicine man of many other peoples. The seer is in communion with the gods or spirits primarily because of his experiences of ecstasy or of his possession of some occult power; the priest because of his knowledge of worship. The seer is an "inspired man," whose power is individual. The priest is an official, whose power is representative. Sometimes the two classes are in more or less open conflict, as were sometimes the priests and prophets of Israel. More often the priests absorbed the functions of the "inspired men" and took to themselves the positions of exorcist and oracle, as did the priests of Babylonia.

The chief formal priesthoods of antiquity, certainly those most elaborately developed, were those of the Hebrews, the Egyptians, and the Hindus. Compared with these, the priests of Greece and Rome formed a less compact social organization. (See GREEK RELIGION; ROMAN RELIGION.) The development of the priest and different ideas associated with his office are illustrated by the following account of the priesthood among the Hebrews, ancient Egyptians, and Hindus.

Hebrew and Jewish Priesthood. According to the later Jewish theory the priesthood belonged exclusively to the family of Aaron, while the remainder of the tribe of Levi held but the subordinate position of attendants at the sanctuary. But the examination of the historical records proves that this limitation of priestly prerogative was of late origin. The earlier strata of the historical books exhibit sacrifice as the right of all, especially of the heads of families. (Cf. the histories of the Patriarchs and of Manoah and Micah, Judg. xiii, xvii, xviii.) When the kingdom was organized the rights of the family chief passed to the king, and David (2 Sam. vi, where he is clothed with the priestly ephod) and Solomon (1 Kings viii; cf. ix. 25) take the part of priests. Also David's sons are said to have been priests (2 Sam. viii. 18). It was also the prerogative of national and religious leaders, of prophets like Samuel (1 Sam. xvi) and Elijah (1 Kings xviii). But from the beginning of the national history there existed a family or caste to which the priesthood was a profession—the so-called tribe of Levi, which may have taken to the priesthood because it had been able to obtain no land for its own possession and so must obtain a living among other tribes as best it could. Tradition made Moses a member of this tribe and gave the priestly functions to his brother Aaron.

The *locus classicus* for the position of the Levites in the early history is the story of Micah (see above), where, while a Levite is not necessary, he is much preferred; the Levite in question appears to be a grandson of Moses (Judg. xviii. 30, R. V.; see GERSHOM). Again, the priest at the ark in Shiloh is Eli, of the line of Ithamar, son of Aaron; doubtless this connection gave the Levites a prerogative in priestly functions, of which they were enabled to take advantage upon the settlement of the ark in Jerusalem and especially upon the building of the temple by Solomon. From this time on, it would seem, the sacerdotal functions of the religion of Yahwe in the Southern Kingdom came gradually to be monopolized by the Levites. The prestige of the temple naturally tended in Judah to the exaltation of a special priestly caste throughout that land, whose leading family were the priests of the royal temple at Jerusalem. As for the Kingdom of Israel, it is not stated (except in the doubtful passage 1 Kings xii. 31) whether the priests belonged to the Levites or not. During the monarchy hierarchical grades arose; thus, Abiathar of the line of Ithamar is the leading priest under David, to be dispossessed under Solomon by Zadok of the line of Eleazar. With the expansion of the caste and the growth of the sacred ritual, differentiations in office ensued, which resulted in the sacrificial functions being reserved for "the sons of Aaron," the remaining Levites, including Moses' descendants, being degraded to lower ministries. The Restoration immensely exalted the position of the priesthood, especially of its chief, the head of the family of Jerusalem priests. (Cf. Zech. iii, vi.) But it possessed no political force and little spiritual stimulus, so that it became a close corporation, intent upon enjoying and increasing its temporal privileges, leaving the development of religion in the hand of more popular leaders. The priesthood was raised to its highest honor through the assumption of the monarchy by the priestly Maccabæan family, so that for 70 years a priest king ruled Israel. (See MACCABEES.) With the fall of the Mac-

cabæan kingdom and the destruction of that family by Herod, the priesthood fell back to its conventional position, becoming the tool of the Romans, who made and unmade the high priest. (Cf. Annas and Caiaphas in the Gospels; also Acts xxiii. 2 et seq.) It had a small but strong party behind its back in the Sadducees (q.v.), so named after the above-mentioned Zadok. With the destruction of the temple in 70 A.D. the priesthood ceased, as sacrifice was no longer legitimate. The tradition of the ancient caste is still faintly preserved in certain Jewish families.

As for the functions of the priesthood, in addition to the sacrificial acts, which were accompanied with blessing and prayer, there was the important office of the divine oracle, for which the instrument of Urim and Thummim (q.v.) was used, in all kinds of questions. (Cf. the histories of Saul and David.) Also in early times the priests at the various sanctuaries possessed the right of giving the *torah* or instruction of God in all matters. (Cf. Deut. xvii. 8 et seq.) With the codification of the law the teaching function passed from the priests to the more zealous lay expounders, the Scribes (q.v.). The support of the priests came in earlier times directly from the worshipers; they had the right to certain portions of the sacrifices, to the tithes, and other offerings. (Cf. 1 Sam. ii. 12 et seq.; Neh. x. 32 et seq.) Later there was established a more definite provision for the support of the temple and its priests in a poll tax levied upon all Jews. (Exod. xxx. 13; Neh. x. 32; cf. Matt. xvii. 24, R. V.) The number of the priests grew to vast proportions, according to Josephus over 20,000, and they were divided into 24 classes (1 Chron. xxiv), the individuals coming up to Jerusalem at their appointed seasons. (Cf. Luke i.) The priests alone had access into the Holy Place, the high priest alone into the Holy of Holies. For the dress of the priests, see Ex. xxviii; for general regulations, Lev. xxi, and passim in the Priestly Code. This history well illustrates the growth of priesthood, its tendency to a monopoly of worship, and its loss of leadership through formalism and the security of hereditary position. See AARON; HIGH PRIEST; LEVITE.

Egyptian Priesthood. From the earliest times each Egyptian nome had its own local cult administered by a priesthood who formed a sort of collegiate body and were divided into several classes. Every person of rank had a place in the worship. The highest class were the priests called by Egyptians *ḥen nuter* (servants of the god). Their functions are not very clearly defined, but it would seem that they conducted the temple services with the aid of the inferior clergy and delivered the oracles of the god. The duty of the *kheri-ḥeb* (he with the book) or "reciter priest" was to recite from the ancient sacred books, and he usually officiated at funerals, where he read over the deceased the appropriate chapters of the Book of the Dead (q.v.). As these old religious texts were believed to possess magical powers, the *kheri-ḥeb* came to be regarded by the people as a magician. Lowest in order of rank stood the *we'b*, a name which signifies "pure." The we'b was required to examine into the purity of sacrificial animals before they were laid upon the table of offerings; he also poured out drink offerings and performed the rites of ceremonial purification by sprinkling with holy water. At the head of the priestly college of each nome stood the chief prophet or high priest, who was usually, though not necessarily, the ruler. During this period the number of professional priests was relatively small, and besides the high priest, who was usually a layman, there were brotherhoods of pious laymen, termed *Unnut* (hour priests), attached to the various temples. Each member devoted a certain portion of his time to the temple services, and the association took part in a body on stated occasions. Nobles and high officials usually held one or more priestly offices, but it is probable that in the majority of cases their duties were more or less perfunctory. The funerary chapels attached to the tombs of important personages were served by priests entitled "servants of the Ka" (*ḥen ka*), and in the temples connected with the pyramids of Egyptian kings the worship of the deceased monarchs was conducted by priests styled "prophets of the pyramid."

Under the New Empire the position of the priesthood changed considerably, though to a less extent in the smaller country temples and in the ancient sanctuaries than in the great temples of the new capital, Thebes. The priesthood of Ammon, which may be considered as fairly representative of the later period, contained five gradations of rank: the first, second, and third prophets, the divine father, and the we'b. The high priest or first prophet of Ammon held a very exalted position; he not only directed the affairs of the great national sanctuary, at the head of which he stood, but also exercised a sort of pontificate over all the temples of Egypt. The second prophet of Ammon had, among other duties, the superintendence of the artists belonging to the temple, and the we'b officiated as "reciter priest." The priestly office was no longer hereditary, as in the older period, and, though the sons of priests often followed their fathers' profession, this was largely due to personal or family influence. A young man might be appointed to the priesthood in his fifteenth or sixteenth year, and his subsequent progress depended upon his abilities and upon the influence he could exert. The priests arrogated to themselves power and gathered wealth and often played an important part in Imperial politics.

Priests of all classes were bound to observe rigid personal cleanliness. They shaved their heads, wore pure linen garments, and, in case of contact with anything ceremonially unclean, must perform the necessary rites of purification before they could exercise their sacred functions.

In the older period noble ladies frequently bore priestly titles; they were usually prophetesses of Neith or Hathor, though to what extent they actually took part in the temple services it is difficult to say. It is probable that such titles were chiefly honorary. Under the New Empire women of all ranks were connected with the various temples, especially that of Ammon of Thebes, as singers or musicians. They were regarded as forming the harem of the god and held different degrees of rank. Certain women of high rank, e.g., bore the title of "chief concubine" of the god, and at the head of the mystical harem of Thebes stood the "legitimate wife of the god," usually the Queen herself, who represented the goddess Mut, the heavenly consort of Ammon.

Connected with the Serapeum (q.v.) of Memphis and with other temples of Serapis in Egypt

was a regularly organized monastic system. The monks lived in cells, which they were not permitted to leave, and received their food through air holes in the wall, their sole channel of communication with the outer world. They called each other brethren and sought by pious meditation to overcome their passions and attain a condition of insensibility to external impressions. See EGYPT.

Hindu Priesthood. The growth of a priest caste can be traced in the history of Hindu literature. Originally a king, or paterfamilias, whether of priestly caste or not, could offer sacrifice. Then priests who knew the ritual and the Vedic hymns must be present. In the Brahmanic period the magical value and the elaboration of sacrifices were multiplied. Any defective performance of the sacrificial rites was supposed to entail the most serious consequences both in this life and in the future. As the duration of a Hindu sacrifice varied from one day to a year, or even more, the number of priests required at such a ceremony likewise varied. Again, as there are sacrificial acts at which verses from the Rig-Veda only were recited, others requiring the inaudible muttering of verses from the Yajur-Veda only, others, again, at which verses only of the Sama-Veda were chanted, and others, too, at which all these three Vedas were indispensable, there were priests who merely knew and practiced the ritual of the Rig-Veda or the Yajur-Veda or the Sama-Veda, while there were others who had a knowledge of all these Vedas and their rituals. The full contingent of priests required at a great sacrifice amounts to 16. Other inferior assistants, such as the ladle holders, slayers, choristers, and the like, are not looked upon as priests. From one to four priests sufficed at the minor sacrifices, or those of daily occurrence. The power of the priests became absolute. They monopolized all approach to the gods. For the common people they took the place of gods. "There are two kinds of gods; the gods are gods, and the priests who perform the sacrifices, they also are gods." No one needed to worship the gods; to fee the priests was sufficient. The gods themselves lived upon sacrifices. The sun would not rise if the priests did not sacrifice. It is not surprising that under this extravagant sacerdotalism the old Vedic gods were obscured, and a new ritual god, Brahman, the god of prayer, took the chief place. The priesthood became hereditary and belonged only to the Brahman caste, who claimed for themselves the first rank in society and almost divine honors. No country in the world so well illustrates the outcome of the unrestricted growth of priestly power as does India. In other lands the state has at least struggled to keep the priesthood within bounds; here the priesthood remained supreme. The only restriction was in the growth of monastic sects like Buddhism and Jainism, in which priesthood found no place. In these, however, the monks were later transformed into priests, since they knew the rites which developed in the originally simple religion or were borrowed from priestly faiths. For the priesthood of the Buddhists, Jainas, and Tibetans, see BUDDHISM; JAINISM; LAMAISM.

In the history of the Christian Church the question of the existence of a priesthood properly so called has given rise to fundamental divisions. The real problem in the Christian Church is whether the religion has any room for a special, authoritative class of mediators, to stand between God and man, or whether all Christians are alike priests, each able to come into the presence of God and present for himself his own prayers. It is essentially the old strife between prophet and priest; between religion as a personal relation to God and religion as an official ceremonial, in which God should be approached through the proper representative appointed by him. On the one hand, Roman Catholic theologians contend that the Apostles were definitely made by Christ partakers of his mediatorial priesthood, with power to hand it down to their successors (cf. John xx. 21), and assert that from the date of this commission there has been an unbroken tradition of sacerdotal power, whose most important function is the offering of sacrifice for the living and the departed (see MASS); that the Christian ministry is as truly a priesthood as that of the Jewish law, though with higher functions. There is a sense in which they admit this priesthood to be shared by the whole body of the faithful; but its specific exercise they claim is strictly limited to those who have been set apart by episcopal ordination. The Protestant bodies generally deny the existence of any such class or powers and have therefore usually abandoned the use of the word "priest," substituting for it "presbyter" or "minister"—though Milton, dissatisfied with the thoroughness of the English Reformation, complained that "New presbyter is but old priest writ large." See APOSTOLIC SUCCESSION; BISHOP; ORDERS, HOLY.

PRIESTLEY, JOSEPH (1733–1804). An English chemist and clergyman. He was born March 13, 1733, at Fieldhead, Yorkshire, the son of Jonas Priestley, a woolen-cloth dresser. At six years of age, because of his mother's death, he was adopted by his father's sister. In languages he mastered Latin, Greek, Hebrew, Italian, French, German, Chaldee, and Syriac. He also had a mathematical mind and was given to scientific research. From 1752 to 1755 he

attended the Nonconformist Academy at Daventry, where he joined freely in theological discussions and found himself always on the heterodox side of the questions at issue. He announced himself a necessitarian and finally became a Socinian and denied the deity of Jesus Christ. Despite his unorthodox views, however, and a serious impediment in his speech, he sought the ministry, beginning at 22 years of age with a small congregation at Needham Market in Suffolk. While there, he wrote *The Scripture Doctrine of Remission*, published in 1761. From Needham he went to Nantwich, and thence to Warrington, where he was appointed a teacher of languages and belles-lettres in a Nonconformist academy. Here he married and spent six of the happiest years of his life. The University of Edinburgh gave him an honorary degree in recognition of his literary work, and he became acquainted with Franklin and Price.

While living next door to a brewery in Leeds, whither he had removed to take charge of Mill Hill Chapel, Priestley became interested in the production of carbonic acid and succeeded in forcing it into water. He also wrote a *History of Electricity* and afterward published political tracts and papers, some of which were opposed to the government's attitude towards the American Colonies. In 1772 he became librarian and "literary companion" to Lord Shelburne at a salary of £250 a year and in 1774 accompanied him on a tour in France and Germany. About this time he wrote the *Letters to a Philosophical Unbeliever* and other works criticizing the doctrines of Hume and others. It was in 1774, also, that Priestley first produced oxygen. This discovery, one of the greatest in the history of science, made it possible for Lavoisier correctly to interpret the process of combustion, to cast out of scientific thought the concept of phlogiston, and to place chemistry on a true foundation. Priestley himself, unfortunately, failed to realize the consequences of his discovery, and even after they had been pointed out clearly by his illustrious contemporary (who, however, was his inferior as an experimenter) he refused to abandon the phlogistic doctrine. In 1777 he published his *Disquisition Relating to Matter and Spirit*. This led to the severance of his relations with Lord Shelburne, and in 1780 he became the minister of a dissenting chapel at Birmingham. Here he made the acquaintance of James Watt and of Dr. Darwin, the grandfather of Charles Darwin, and here he carried on his celebrated controversy with Bishop Samuel Horsley, in which he was the recognized champion of Socinianism. His reply to Edmund Burke's *Reflections on the French Revolution* led to his being made a citizen of the French Republic and unhappily resulted in his house and chapel being burned by a mob and all his books, manuscripts, and scientific instruments being destroyed. This occurred in 1791, and because of the attack he left Birmingham and took up ministerial work at Hackney, London. He preached there for three years, and then, in 1794, removed to America, whither his sons had emigrated the year before. He settled at Northumberland, Pa., and spent the rest of his life there. He preached and lectured occasionally, but his services were not in great demand and his oratorical powers were failing. He declined the offer of a professorship of chemistry at Philadelphia and later the principalship of the University of Pennsylvania. Most of his time was spent with his books and in scientific experiment, and he continued to write till the time of his death, although his later years were clouded by the physical infirmities of age. He died Feb. 6, 1804.

Priestley was in many ways a remarkable man. He presented the unusual combination of theologian, scientist, and politician. His manifold and varied publications gave evidence of the scope of his genius. His pen was untiring. In religion and in politics he was a radical, but he was a sincere seeker after truth and a man of unblemished reputation and irreproachable moral character. His *Theological and Miscellaneous Works* and *Memoirs and Correspondence* were collected and edited by John T. Rutt—the former in 26 vols. (London, 1817–32), the latter in 2 vols. (ib., 1831–32). The edition contains more than 130 separate works, varying in size from short pamphlets to four-volume treatises, and the subjects treated cover a vast range. Consult: Leslie Stephen, in *History of English Thought in the Eighteenth Century* (3d ed., New York, 1902); Thorpe, *Joseph Priestley*, in "English Men of Science Series" (ib., 1906); J. H. Muirhead, in *Nine Famous Birmingham Men* (2d ed., Birmingham, 1909). His *Memoirs* were edited by Cooper and Christie (2 vols., London, 1906).

PRIETO, prē-ā'tō, JOAQUÍN (1786–1854). A Chilean politician and soldier, born at Concepción. Although at first a Royalist, he took the patriot side in 1811 and was foremost in the fight for independence. After the war he served as member of the Congress and Senate. In the Civil War of 1829–30 he defeated Friere at the battle of Lircay (1830) and was made provisional President of Chile. This appointment was ratified six months afterward, and he was reëlected President in 1836, but retired in 1841. During his administration a new constitution (1833) was adopted and many reforms were introduced, especially in public instruction. He later held several offices.

PRIGG vs. PENNSYLVANIA. An important case decided in 1842 by the Supreme Court of the United States, which defined the rights and duties of the various States with reference to the rendition of fugitive slaves. In 1826 Pennsylvania passed a law against kidnapping which imposed severe penalties upon any one who should remove any negro from the State with the intention of reducing or returning such slave to a condition of slavery. In 1837 a slave woman, Margarette Morgan, who five years before had escaped from her owner in Maryland into Pennsylvania, was seized by one Edward Prigg, the attorney of her owner, without the simple process provided by law, and, together with her children, was delivered to her mistress. Prigg was thereupon tried and convicted of kidnapping in the court of York Co., Pa., and the decision of this court was confirmed by the Supreme Court of Pennsylvania, to which Prigg appealed. The case was then carried before the Supreme Court of the United States, which, by a vote of five to four, reversed the earlier decisions and, among other things, decided (1) that by the Constitution the national Congress had the exclusive right to legislate concerning the rendition of fugitive slaves; (2) that the legislatures of the various States had no power to pass legislation upon this subject; (3) that Pennsylvania's Law of 1826 was therefore void; (4) that "the owner of a slave is clothed with

entire authority in every State in the Union to seize and recapture his slave, whenever he can do it without any breach of the peace or any illegal violence"; and (5) that no State could be compelled to aid the enforcement of a United States law on this subject. Though the right of slave owners to their fugitive slaves was unequivocally confirmed, this decision has been regarded by many as in one respect a "triumph of freedom," since it relieved the various free States of any necessary participation in the catching and returning of fugitive slaves and encouraged them to pass laws, known as "Personal Liberty Laws," prohibiting all State officials, under heavy penalties, from aiding slave catchers in any way and forbidding the use of State jails for the detention of captured fugitives. Consult J. B. Thayer, *Cases on Constitutional Law*, vol. i (Boston, 1895).

PRILLIEUX, prē'yē', EDOUARD ERNEST (1836–1915). A French botanist, born in Paris. In 1877 he was appointed professor of botany at the Institut National Agronomique; in 1883 he was made inspector general of agriculture and in the same year became an Officer of the Legion of Honor. In 1897 he was elected Senator from the Department of Loir-et-Cher and in 1899 a member of the Académie des Sciences. His publications include articles on vegetable parasites, contributed to various French periodicals, and *Maladies des plantes agricoles et des arbres fruitiers et forestiers, etc.* (1895–97).

PRILUKI, prē-lo͞o'kē. A district town in the Government of Poltava, Russia, situated 145 miles northwest of Poltava (Map: Russia, D 4). It has a considerable milling industry and trades in the agricultural and animal products of the neighborhood. Pop., 1911, 30,485.

PRIM, prēm, JUAN, MARQUIS DE LOS CASTILLEJOS, COUNT DE REUS (1814–70). A Spanish general and statesman. He was born in Reus, Catalonia, entered the army at an early age, rendered Narváez (q.v.) efficient assistance in securing the downfall of Espartero in 1843, and was made Count. He was active in bringing about the return of Queen Christina, but in 1844, on account of his defection from Narváez, was sentenced to imprisonment on a charge of conspiracy against the latter's life. In 1845 he was pardoned by the Queen, who made him Governor of Porto Rico. He led the progressive party in the Cortes (1848–53), was in exile (1853–58), and served in the campaign in Morocco (1859–60). For his victory at Los Castillejos, Jan. 1, 1860, he was made Marquis and Grandee. In 1862 he was commander of the Spanish troops in Mexico, dispatched to act in conjunction with the French and English forces, but, disapproving of the plans of the Emperor Napoleon, he returned to Spain, where the Cortes sanctioned his course. In 1864 he was driven from Madrid, accused of participating in a military conspiracy, and in 1866 he began an unsuccessful insurrection against the government of O'Donnell (q.v.) and was forced to flee to England. In 1868 he joined Serrano in the revolution which dethroned Isabella. In the provisional government (October) Prim became commander in chief, Minister of War, and President of the Council. He was responsible for the choice of Prince Leopold of Hohenzollern to fill the vacant throne, a choice which brought on the Franco-German War (q.v.). Afterward, through his agency, Amadeus I (q.v.) was called to the throne. Prim was shot by an assassin Dec. 28, 1870, and died from his wounds on the 30th, before Amadeus arrived in Madrid. Consult: Louis Blairet, *Le général Prim et la situation actuelle de l'Espagne* (Paris, 1867); Guillaumot, *Juan Prim et l'Espagne* (ib., 1870); H. Leonardon, *Prim* (ib., 1901), with a bibliography.

PRI'MARY ELECTION (Lat. *primarius*, relating to the first or earliest, from *primus*, first, from *pro*, before; connected with Gk. πρό, *pro*, Skt. *pra*, Goth. *faúr*, OHG. *fora*, Ger. *vor*, AS., Eng. *for*). The term used to designate the means through which candidates for elective offices are nominated. In a more restricted sense it is applied to formal elections, either of delegates to nominating conventions or of party nominees. In either case only party members are entitled to a vote in the primaries. In certain municipalities the nonpartisan primary is in use. Here the whole electorate may take part in selecting the candidates later to be voted upon in the regular elections. Until recently the primary election was a wholly extralegal institution, i.e., it was unregulated by statute. Each party framed its own rules and devised its own machinery for the selection of its candidates without legal restriction. The theory was that whatever political action antedated the election was beyond the domain of law, and hence the manner in which each party brought forward its candidates was to be determined by its own action. Every proposal to place the primary under the supervision of the State was attacked as a species of despotism repugnant both to the liberty of parties and to the private rights of politicians. For a long time the non-officially conducted primary was the source of little or no abuse, but with the enormous growth of the city population and the complexity of political life in general the opportunities for fraud and corruption multiplied so that in many communities, especially in the larger cities, the primary degenerated into a confederation of selfish partisan associations from which a large majority of the voters were excluded. In the decade 1890–99 the progress of reform was rapid. By the end of the decade primary elections were regulated by law in two-thirds of the States. In general these laws provided that sufficient public notice should be given; that the elections should be by ballot; that the election officers should be sworn; that the expense of conducting the primaries should be borne by the State or in some cases, as in Mississippi, by the candidates; that frauds should be punished according to prescribed penalties; and that these requirements should be compulsory in the large cities and optional elsewhere. After 1900 the primary reform movement takes a new direction. Instead of serving chiefly to select delegates to convention with power to make nominations, the direct nomination of candidates by the general voters came to be the ideal of the movement. In 1915 the direct primary had come to be practically the universal mode of selecting either State or local nominees, or both, throughout the United States. In addition, the nomination of candidates for Congress and for the United States Senate was generally subject to direct primary laws. In 1910 Oregon provided for a preferential vote for presidential candidates, and in 1911 New Jersey, North Dakota, Nebraska, Wisconsin, and California adopted this plan. The following two years saw the adoption of the plan by 11 more States. In the presidential elections of 1912

presidential primaries were held in many States under the auspices of the parties without having been provided for by law.

The movement for primary reform has been essentially a reaction against the convention system. The choice of candidates by convention had degenerated often to selection by party bosses. It was believed that through primary reform the power of the boss could be broken. This has not in fact resulted, but there can be little doubt that the new system has forced the boss to be somewhat more regardful of the general party opinion. The system has increased the cost of elections and according to its opponents deterred the most desirable civic types from entering political life, since they do not possess the power of appeal to the masses needed to secure nomination under the primary system. Consult: C. E. Merriam, *Primary Elections* (Chicago, 1908); C. E. Fanning, *Select Articles on Direct Primaries* (3d ed., Minneapolis, 1911); McLaughlin and Hart (eds.), *Cyclopedia of American Government*, vol. iii (New York, 1914). See CAUCUS; CONVENTION; ELECTION.

PRIMARY QUALITIES. Those qualities which are in some systems of philosophy supposed to belong to the object as it is in itself apart from its appearance in some one's perception of it. Secondary qualities are supposed to belong to the object only as it appears in consciousness Various lists of primary qualities have been given. Locke's list includes "solidity, extension, figure, motion or rest, and number." The distinction between primary and secondary qualities appears in most realistic systems of philosophy. See KNOWLEDGE, THEORY OF; REALISM.

PRI'MATE (Lat. *primas*, chief, from *primus*, first). A title in some of the Christian churches applied to a bishop as first in a province or group of provinces. A metropolitan is a primate as presiding in his province, or one of several metropolitans as presiding over others. The title does not seem to have come into ordinary use until the ninth century, after which it was given to the metropolitans of certain sees as the special representatives of the Pope. It strictly belongs to the Latin church, but in its general use it corresponds with that of exarch in Eastern churches. In early usage the primate, as such, was the head of a particular church or country and held rank, and in some churches a certain degree of jurisdiction, over all the archbishops and bishops within the national church. This jurisdiction, however, was confined to the right of visitation and of receiving appeals. In England, as a settlement of the quarrels between Canterbury and York, the Pope designated the Archbishop of Canterbury as primate of *all* England, while the Archbishop of York was to be known as primate of England. At present in the Catholic church the title, when used, is by special favor and confers no right over other prelates.

The title of primate is also given to several bishops of the Church of England in the British colonies. In the Episcopal church of Scotland the title *primus* is given to the presiding bishop. He is chosen by vote of all the bishops without their being bound to give effect to seniority of consecration or precedency of diocese. See METROPOLITAN; PATRIARCH.

PRIMA'TES (Lat., chiefs). The highest order of mammals, including man, monkeys, and lemurs (qq.v.). They are characterized by the presence of well-developed clavicles, two pectoral mammæ, and orbits directed forward, encircled by bone and shut off from the temporal fossæ. The innermost digit of the hands and feet are usually opposable to the others; this is always so in at least one pair of limbs. The terminal joints of the digits bear flat nails, rarely claws. The incisor teeth are typically two in each jaw, directly in front, and canine, premolar, and molar teeth are also present. The brain (except in lemurs) exhibits a high type of structure, the cerebrum being very large and covering the cerebellum, and the surface of the former is much convoluted. Excepting man, the Primates are arboreal forms and are peculiarly well fitted for such a life. The tail is often long and sometimes prehensile. They are mostly small or medium-sized animals, though some of the anthropoid apes are large. They are omnivorous eaters, but fruit, berries, and other vegetable matter form a large part of their diet. The order is easily divided into two distinct suborders, the Lemuroidea and Anthropoidea—the former containing only lemurs and their near allies, spectres, pottos, aye-ayes, etc. (qq.v.), while the latter includes all the marmosets, monkeys, baboons, apes, and man (qq.v.). Consult D. G. Elliot, *A Review of the Primates* (3 vols., New York, 1913).

PRIMATICCIO, prē'mȧ-tēt'chō (called by the French "Le Primatice"), FRANCESCO (1504–70). An Italian painter, sculptor, and architect. He was born in Bologna and was the pupil of Innocenzo da Imola and Bagnacavallo, but was mainly influenced by Giulio Romano, his next master, whom he assisted in the decorations of the Palazzo del Tè in Mantua. Later he was influenced also by Michelangelo and Correggio. In 1532 he was called by Francis I to France and with Rosso was employed at Fontainebleau. He succeeded Rosso as director of works there and before Francis's death had executed his most important frescoes in the Gallery of Ulysses, destroyed when the palace was remodeled in 1738. As his other work at Fontainebleau has been freely restored, his style, distinguished by beauty of modeling, grace, and invention, but spoiled by affectation and mannerisms, can best be judged of from his drawings, many of which are in the Louvre and the Stockholm Gallery. In 1544 he was made abbé of St. Martin of Troyes, and Catharine de' Medici appointed him court architect, in which capacity he made designs for the Valois tombs at Saint-Denis. His activity at Fontainebleau resulted in the formation of the so-called school of Fontainebleau, which greatly promoted the Italian influence on French art. Consult Dimier, *Le Primatice* (Paris, 1900).

PRIME. See BREVIARY.

PRIME, EDWARD DORR GRIFFIN (1814–91). An American clergyman and journalist. He was born at Cambridge, N. Y., and graduated from Union College in 1832. He graduated from Princeton Theological Seminary in 1838 and had pastorates at Scotchtown, N. Y., and New York City. In 1853 he became substitute editor of the New York *Observer*, while his brother, Samuel Irenæus Prime (q.v.), was in Europe. Afterward the two were associated until 1885. Edward Prime continued to edit the paper for a year after his brother's death. He traveled much abroad, spent the winter of 1854–55 in Rome, and made a journey round

the world in 1869–70 to study religious conditions in Eastern countries. He published: *Around the World* (1872); *Forty Years in the Turkish Empire; or Memoirs of Rev. William Goodell* (1876); *Civil and Religious Liberty in Turkey* (1875); *Notes . . . of the Prime Family* (1888).

PRIME, SAMUEL IRENÆUS (1812–85). An American clergyman, traveler, and writer. He was born at Ballston, N. Y., and graduated from Williams College in 1829. Three years later he entered Princeton Theological Seminary, was licensed to preach in 1833, and in 1835 was installed pastor of the Presbyterian Church at Ballston Spa, N. Y. For a time he was principal of the academy at Newburgh, N. Y. In 1840 he entered upon the chief work of his life as editor of the New York *Observer*, a paper of which he afterward came to be the principal owner. His brother and then his son, Wendell Prime, carried on the editorship after his death. He was the founder of the New York Association for the Advancement of Science and Art, president and trustee of Wells College, and a trustee of Williams College. Besides a large number of books of religious character he published: *Life in New York* (1846); *Travels in Europe and the East* (1855); *Letters from Switzerland* (1860); *American Wit and Humor* (1859); *The Alhambra and the Kremlin* (1873); *Life of Samuel F. B. Morse* (1875); *Irenæus Letters* (1880, 1885). Consult the autobiography in *Irenæus Letters* (2d series, New York, 1885), and E. D. G. Prime, *Notes . . . of the Prime Family* (ib., 1888).

PRIME, WILLIAM COWPER (1825–1905). An American journalist, brother of S. I. Prime and of E. D. G. Prime, born at Cambridge, N. Y. He graduated at Princeton in 1843, was admitted to the bar and practiced law in New York City until 1861, when he became part owner and editor in chief of the New York *Journal of Commerce*. In 1869 he gave up his editorial work and revisited Egypt and Palestine, where he had spent some time in 1855–56. It was at his instance that Princeton in 1884 established a chair of the history of art. Of this he became the first incumbent. His interest in art matters brought him into close connection with the Metropolitan Museum in New York, of which he was first vice president after 1874. He wrote: *The Owl-Creek Letters* (1848); *The Old House by the River* (1853); *Boat Life in Egypt and Nubia* (1857); *Tent Life in the Holy Land* (1857); *Coins, Medals, and Seals, Ancient and Modern* (1861); *Pottery and Porcelain of All Times and Nations* (1878); and the hymn "O Mother dear, Jerusalem" (1865). He also edited *McClellan's Own Story* (1886).

PRIME MERIDIAN CONFERENCE. See TIME, STANDARD.

PRIME MINISTER. See MINISTRY.

PRIM'ER. See HOURS, BOOK OF.

PRI'MER. A device for igniting the propelling charge in firearms or artillery. Cannon were first ignited by red-hot irons or port fires applied to loose powder on the vent (touch-hole). These were replaced by slow match, and later the powder was put into tubes or quills for insertion into the vent. In 1782 flintlocks were used upon naval cannon. Friction composition was invented in 1807, and a few years afterward percussion caps were introduced for cannon. Later, and to a certain extent at present, friction primers were used. A copper tube extending into the vent holds an explosive charge which is ignited by pulling a roughened wire through the friction composition in a housing in the outer end of the tube. This has been largely displaced by fulminate caps set in the bases of metallic fixed-ammunition cases and exploded by percussion or electricity. In percussion primers a firing pin strikes the fulminate of mercury which rests on an anvil. In electric primers the current heats a fine platinum wire set in guncotton. See CARTRIDGE; GUNS, NAVAL; ORDNANCE; SMALL ARMS.

PRIMES (from Lat. *primus*, first). One of the two classes into which integers are divided according to divisibility. Integers that are not exactly divisible by any integer except themselves and one are called *primes*, all others being called *composite* numbers. Thus, 1, 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, ... are primes. Two integers are said to be prime to each other, or relatively prime, when they have no common factor except unity. Thus, 11 and 21, 15 and 32, 23 and 48 are relatively prime. One of the earliest and best-known methods of selecting primes is the sieve of Eratosthenes (200 B.C.). This consists in writing down all the odd numbers from 3 on and then striking out all the multiples of 3, 5, 7, ... Tchebichev (1850) was the first to reach any valuable conclusions in the way of ascertaining the number of primes between two given limits. Riemann (1859) also gave a well-known formula for the limit of the number of primes not exceeding a given number. Consult Lehmer, *Factor Table for the First Ten Millions* (Washington, 1912), and *Tables Giving a Complete List of Prime Numbers between the Limits 1 and 10,006,721* (ib., 1913). See NUMBER.

PRIMITIÆ. See FIRST FRUITS.

PRIM'ITIVE BAPTISTS. See BAPTISTS, *Baptists, Old School, or Primitive.*

PRIMITIVE METHODIST CONNECTION. See METHODISM.

PRIMITIVE SOCIETY. See GENS; MARRIAGE; SOCIETY; SOCIOLOGY; TRIBE.

PRIMO, prē'mō (It., first). A term used in music with the following significations: in four-hand arrangements for piano the music played by the performer of the treble part is marked *primo*, that played by the performer of the bass, *secondo; prima donna*, the leading female singer (soprano); *prima vista*, at first sight; *prima volta* (abbreviated I) is always followed by a bracket extending over one or more measures before a *repeat* begins; *tempo primo* denotes a return to the original rate of speed; *primo uomo*, the leading male singer (first tenor or soprano). This last term is no longer used, but was in general use during the seventeenth and eighteenth centuries, when in Italy the principal rôles in operas were written for and sung by male sopranos.

PRI'MOGEN'ITURE (ML. *primogenitura*, from Lat. *primogenita*, rights of the first-born, neut. pl. of *primogenitus*, first-born, from *primus*, first + *genitus*, p.p. of *gignere*, to produce). In the law of inheritance, the right of the first-born to take by descent the real property of a deceased ancestor, to the exclusion of all others of equal degree of consanguinity. The term has sometimes been employed in a wider sense to describe any priority which, in various legal systems, the law has accorded to the first-born, thus comprehending the birthright of the

Hebrew and of Hindu law (where that belonged, as was not always the case, to the eldest son), which was at the most a right to a double portion of the inheritance, as well as the right of the eldest of the heirs in certain forms of Anglo-Saxon tenure to the chief house (*mansio*) of the ancestor. But the term is in modern law usually restricted to the persistent rule of inheritance which has for centuries maintained itself in our common-law system, whereby the eldest son or his issue, or, failing lineal descendants, the eldest male in the next degree of consanguinity, takes all the real estate of which his ancestor died seised and intestate, to the exclusion of all female and of junior male descendants of equal degree. Although not confined to lineal descendants, but comprehending the remotest degrees of consanguinity, the principle of primogeniture has never in the common law of land been applied to female heirs, who have, whether lineally or collaterally descended from their common ancestor, always been permitted, in default of male heirs, to share the inheritance equally.

This rule of descent, due, in its origin, to the exigencies of the feudal system, was formerly common to feudal Europe, but it has long since disappeared everywhere but in England. It has not generally been adopted in the English-speaking colonies of Britain, and though introduced with the rest of the common-law system into the American Colonies, it was abrogated and abandoned by them at an early period in their history. Consult: Sir H. J. Maine, *Lectures on the Early History of Institutions* (7th ed., London, 1897); Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899); Pollock and Maitland, *History of English Law before the Time of Edward I* (2d ed., 2 vols., Cambridge, 1903); Sir H. J. Maine, *Ancient Law* (4th Amer. ed., New York, 1906); and the authorities referred to under REAL PROPERTY. See DESCENT; INHERITANCE; BOROUGH ENGLISH.

PRIMORSKAYA, prē-môr'skà-yà. The Russian name of the Maritime Province (q.v.) in Siberia.

PRIMROSE, ARCHIBALD PHILIP. See ROSEBERY, EARL OF.

PRIM'ROSE, CHARLES. The vicar in Goldsmith's *Vicar of Wakefield.*

PRIMROSE FAMILY. A popular name for a family of plants. See PRIMULACEÆ.

PRIMROSE LEAGUE, THE. A political league founded in London in 1883 in support of the principles advocated by the Earl of Beaconsfield (see DISRAELI), the name being adopted, it is said, on account of a preference shown by him for that flower. The membership includes both sexes, and the titles applied to members are Knight and Dame.

PRIM'ULA (ML., fem. of Lat. *primulus,* dim. of *primus,* first; so called in allusion to the early bloom), PRIMROSE. A genus of plants of the family Primulaceæ, comprising about 200 species, mostly perennials, generally having only radical leaves and bearing the flowers in an umbel, more rarely solitary, on a scape. This genus is indigenous to North America, Asia, and Europe, and more than half the number of species are native to the Himalaya, China, and Japan. Two small unimportant species are found in eastern North America, with quite a number in the Rocky Mountain and Pacific coast States. Their fine colors and soft, delicate beauty have led to the cultivation of some of the species, and numerous varieties and hybrid forms with single and double flowers of various tints have been developed. They are extensively grown in ornamental gardening and also as house and conservatory plants. The common primrose (*Primula vulgaris*) is abundant in woods, hedges, and meadows in most parts of Europe. It has spoon-shaped and deeply veined leaves and bears its yellowish-white blossoms on single-flowered scapes. It is the parent species of

EUROPEAN WILD PRIMROSE (CULTIVATED FORM).

many cultivated varieties. The name "primrose" belongs especially to this species. The English cowslip (*Primula officinalis*) is allied to the common primrose, and the oxlip (*Primula elatior*) is an intermediate between the two species. These are among the earliest spring-blooming flowers. The Chinese primrose (*Primula sinensis*) is a popular ornamental plant in residences and conservatories and is commonly sold in flower markets. It is highly prized for its numerous large flowers of a variety of colors borne in umbels above the foliage. *Primula obconica* is another beautiful Chinese species, largely grown in conservatories for its numerous pale lilac or purple and sometimes nearly white blossoms. There are many hybrids and garden varieties of the different species. The garden primroses prefer a rich, moist, loamy soil, and shady positions. The greenhouse varieties are potted in light soil chiefly composed of leaf mold with some sand and loam. The varieties grown in the open are propagated by seed or by dividing the clumps. The seed is sown out of doors in summer, preferably in pans; the young plants are potted and kept in a cold frame or the greenhouse over winter. In the spring the plants are set out in the pots where desired. Sometimes strong seedlings are planted in the open directly from the seed pans. The tender varieties grown under glass are also increased by seeds and offsets started in the greenhouse. See AURICULA; POLYANTHUS; Plate of CRANBERRY; and Colored Plate of GREENHOUSE PLANTS. In America certain species of *Œnothera* (q.v.) are called evening primrose.

PRIM'ULA'CEÆ (Neo-Lat. nom. pl., from ML. *primula,* primrose), PRIMROSE FAMILY. A family of dicotyledonous herbs, containing about

30 genera and 400 species of wide distribution in the Northern Hemisphere, a few occurring in southern South America and South Africa. The flowers, often terminal on scapes, are regular, usually five-parted, and followed by capsular fruits. The most familiar genera are as follows. *Primula*, which gives name to the family, includes about 150 species, commonly known as primroses. *Samolus*, with about 10 species, includes the water pimpernels or brookweeds, the name indicating the nature of the habitat. *Lysimachia*, with about 70 species, includes the loosestrifes, among which is the commonly cultivated moneywort (*L. nummularia*). A very beautiful genus is the *Dodecatheon*, with about 30 species, commonly called shooting stars or American cowslips.

PRIMULIN. See COAL-TAR COLORS.

PRI'MUM MO'BILE (Lat., the first part movable). In the Ptolemaic system of astronomy, the tenth or outermost of the crystalline spheres, supposed to revolve from east to west every 24 hours, carrying the other spheres with it.

PRINCE (OF., Fr. *prince*, from Lat. *princeps*, from *primus*, first + *capere*, to take). An epithet which was originally applied to the *princeps senatus* of the Roman state and afterward became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterward applied to persons enjoying kingly power. In various parts of continental Europe the title "prince" is borne by families of eminent rank, but not possessed of sovereignty; and in England a duke is, in strict heraldic language, entitled to be styled "high puissant and most noble prince," and a marquis or earl as "most noble and puissant prince." Practically, however, in England, the term "prince" is restricted to members of the royal family. In Germany and Austria the ambiguity of applying the same title to the members of the royal houses and princely families, not sovereign, is avoided, the former being styled "Prinz," the latter "Fürst." The German Fürst takes rank below the duke (Herzog). In France the title has frequently been borne by, e.g., the son of a duke, thus denoting no special rank or precedence.

PRINCE, JOHN DYNELEY (1868–). An American philologist, born in New York City. He graduated at Columbia in 1888, studied at Berlin in 1889–90, and obtained his Ph.D. at Johns Hopkins in 1892. He was professor of Semitic languages from 1892 to 1902 and dean of the Graduate School (1895–1902) at New York University, and thereafter held the chair of Semitic languages at Columbia until 1915, when he was transferred to the newly created chair of Slavonic languages. In 1906 and 1908 he was a Republican member of the New Jersey Assembly, of which he was Speaker in 1909, and in 1911–13 was a member of the New Jersey Senate, being its president in 1912. Prince was also acting Governor of New Jersey in 1912, and was an unsuccessful candidate for Congress in 1914. His publications include: *Mene, Mene, Tekel, Upharsin* (1893); *A Critical Commentary on the Book of Daniel* (1899); *Kulóskap the Master* (1902), with C. G. Leland; *Materials for a Sumerian Lexicon* (1908); *Assyrian Primer* (1909).

PRINCE, MORTON (1854–). An American neurologist and psychologist. He was born in Boston, graduated at Harvard in 1875 and at Harvard Medical School in 1879, and settled in his native city. From 1902 until 1912 he was professor of nervous diseases at Tufts College Medical School. In 1906 he became editor of the *Journal for Abnormal Psychology*. Dr. Prince was one of the alienists connected with the Thaw case. During the European War he made a study of the psychological effect on the soldier of his life. He is the author of *The Nature of Mind and Human Automatism* (1885); *Dissociation of a Personality* (1906); *The Unconscious* (1913); *Psychology of the Kaiser* (1915).

PRINCE, THOMAS (1600–73). See PRENCE, THOMAS.

PRINCE, THOMAS (1687–1758). An American historian, antiquary, and clergyman, born in Sandwich, Mass., of an old Colonial family. He graduated at Harvard in 1707, was ordained, traveled in the West Indies and England, and from 1718 till his death was connected with the Old South Church, Boston. In 1703 he began a collection of manuscripts and books on the history of New England, which were deposited in the Old South Church tower and which were partly destroyed by the British (1775–76). What remained forms the Prince collection in the Boston Public Library. A catalogue of the books was prepared by that institution in 1868, reëdited in 1870. Prince's chief work is *The Chronological History of New England* (1736–55, one volume and a portion of the second; new ed., 1826), which he was not sufficiently encouraged to complete. Thus it does not come beyond the year 1633, for a large portion was devoted to an abridged annalistic history of the world before the landing of the Pilgrims. Prince was so accurate, however, that what he wrote was of great value. Noteworthy, too, are his *Account of the English Ministers at Martha's Vineyard*, appended to Mayhew's *Indian Converts* (1727), and his *Earthquakes of New England* (1755). Some of his sermons also were published. As a scholar he probably surpassed all Colonial Americans save Cotton Mather.

PRINCE ALBERT. A city and the capital of the Prince Albert electoral district, Saskatchewan, Canada, on the North Saskatchewan River and on the Grand Trunk Pacific and Canadian Northern railways, 542 miles by rail northeast of Winnipeg (Map: Saskatchewan, E 4). The city is the seat of Anglican and Roman Catholic bishops, has a business college, a ladies' college, a Roman Catholic convent, an armory, a labor temple, two hospitals, Dominion lands office, a permanent land show building, a collegiate institute, a customs office, and is the headquarters of the Royal Northwest Mounted Police for central and north Saskatchewan. Industrial establishments include lumber companies, brickyards, flour mills, cold-storage plants, planing mills, saddlery works, marble and granite works, and manufactories of boats, culinary articles, etc. Pop., 1901, 1785; 1911, 6254; 1914 (police census), 13,450.

PRINCE ALBERT LAND. A large island of unknown area lying to the north of the Mackenzie district of Canada and constituting a part of the Canadian district of Franklin (Map: Canada, H 2). It is typically Arctic in its character and has been but little explored. Its southern portions are known as Victoria Land and Wollaston Land.

PRINCE EDWARD ISLAND. The smallest province of the Dominion of Canada. It is

situated in the southern part of the Gulf of St. Lawrence, being separated from New Brunswick and Nova Scotia by the Strait of Northumberland (Map: New Brunswick, G 3). Length, 130 miles; breadth, 4 to 30 miles; area, 2184 square miles. The island is composed of a soft red sandstone of Permo-Carboniferous and Triassic age, which wears easily, and on this account the surface is without strongly marked prominences and nowhere rises more than 500 feet above the sea. The coasts are generally low and sandy, but in some places there are bold cliffs, varying in height from 10 to 100 feet, composed of sandstone. The island is indented with numerous bays and inlets, several of which, as Cardigan Bay on the east, the approach to Georgetown, and Hillsborough Bay on the south, the approach to Charlottetown, are deep and spacious and afford safe anchorage for large vessels. The rivers are short tidal streams. The climate is very healthful, being milder than that of the continental regions in the vicinity and free from the fogs which prevail on Cape Breton and Nova Scotia.

Forests originally covered the entire island. About three-fourths of the area is now cleared. Aside from some of the boggy and swampy lands, the whole of the island is cultivable. The soil, which is well watered with numerous springs and rivers, rests upon red sandstone. It consists for the most part of a layer of vegetable matter above a light loam, which rests upon stiff clay above sandstone.

The agricultural products are more than the quantity required for local consumption. The natural fertility of the soil was injured by too great a succession of cereal crops, but it has been renewed through the application of mussel mud (a natural fertilizer dredged from the bays and rivers). In 1914 there were 32,000 acres of wheat, with a yield of 809,000 bushels; 183,000 acres of oats, with 7,596,000 bushels; 192,000 acres of hay, with 334,000 tons; 8000 acres of turnips, with 4,024,000 bushels; 32,000 acres of potatoes, with 6,806,000 bushels; 3800 acres of barley, with 119,000 bushels. Fruit does not flourish so well as in Nova Scotia. The island has long been noted for its large production of eggs; about 2,500,000 dozen were exported in 1913. Dairy farming is growing in prominence. Stock, especially cattle, are increasing in numbers. In 1913 the province possessed 35,952 horses, 48,565 milch cows, 64,261 other cattle, 85,660 sheep, and 43,762 swine. The total value of the live stock was $6,977,782, of which horses were valued at $4,272,536. The total trade of the island in 1913 was $1,548,761, of which imports were $975,683. The total revenue for 1913 was $511,000; total expenditure, $490,000. Prince Edward Island is extremely poor in minerals. Coal exists, but under conditions which have not made mining profitable. The neighboring waters abound in fish of many varieties, and the location of the island is most favorable for fishing, yet the people have not engaged so extensively in the industry as have the populations in the sister provinces. In 1913, however, the catch was valued at $1,379,905, with 5703 persons employed.

The fox-farming industry has been developed in Prince Edward Island to a remarkable extent. The breeding of seals, mink, skunk, and beaver has also begun. (See FUR FARMING.) Manufactures are not yet important and are principally for domestic wants. According to the Dominion Census of 1910 there were 442 industrial establishments, with a capital of $2,013,365, employing 3762 wage earners and with an output valued at $3,136,470. In 1913 there were 47 butter and cheese factories.

The Prince Edward Island Railway, which runs the length of the island, was built by the Dominion government, by whom it is still owned and operated. All parts of the island are traversed by coach roads. Regular water communication is maintained with the maritime provinces and with Boston. The question of continuous communication, winter and summer, with the other provinces of the Dominion and with the United States has been vital to the progress of the island as regards population, manufactures, and commerce, and in 1914 the Dominion government completed a government car-ferry service 10 miles long between Carleton Point, Prince Edward Island, and Cape Tormentine, New Brunswick.

The provincial government is vested in a Lieutenant Governor, an Executive Council of nine members appointed by the Lieutenant Governor, and a Legislative Assembly consisting of a single house whose 30 members are elected by the people. The province receives an annual subsidy from the Dominion, which constitutes about two-thirds of the total government revenue. In 1913 the amount was $372,000. The island is divided into three counties — Prince, Queens, and Kings—of which the chief towns are respectively Summerside, Charlottetown, and Souris. The island lacks a developed system of municipal government, and most of the local affairs are in the hands of the provincial Assembly.

The population decreased between 1901 and 1911 from 103,259 to 93,728. The density per square mile (42.91) is the highest for any Canadian province. Charlottetown, the capital, had a population of 11,198 in 1911. The religious denominations in 1911 were the Roman Catholic (41,994), Presbyterian (27,509), Methodist (12,209), Baptist (5372), and Anglican (4939). Anglican episcopal authority over the province is exercised by the Lord Bishop of Nova Scotia, and Roman Catholic by the Bishop of Charlottetown. The free school system was established in 1851, and the schools are supported by government grants and district assessments. The system is administered by a superintendent and council appointed by the government. In 1913 the total enrollment of pupils was 17,078, the average attendance 10,916, the number of teachers 590, and the expenditure $261,641, of which $165,155 was a government grant. There are two colleges, Prince of Wales College, head of the provincial school system, and St. Dunstan's, a Roman Catholic college, both in Charlottetown.

The island is supposed to have been seen by Cabot in 1497. From 1534 to 1798 it was known as Isle St. Jean. It came with Canada into English hands in 1763. The Legislature of Prince Edward Island at first declined to agree to plan for a union of the British North American colonies which resulted from the negotiations begun in 1864; but at last, in 1873, the colony entered the Confederation and became one of the provinces of the Dominion. Great discontent had resulted from the proprietorship of large landholders, but the grievances of the tenantry were remedied by the Prince Edward Island Commission (1875–76). The course of local politics

followed the traditional Liberal and Conservative lines, but the main issues were the securing of better terms for the island as a member of the Confederation and the improvement of the means of communication with the mainland. Consult: D. Campbell, *History of Prince Edward Island* (Charlottetown, 1875); Sir J. W. Dawson, *Acadian Geology* (Ottawa, 1891); W. H. Crosskill, *Prince Edward Island: Its History, Interests, and Resources* (Charlottetown, 1899); *Canadian Annual Review* (Toronto, 1903 et seq.); C. D. McAlpine, *Gazetteer of Nova Scotia, New Brunswick, Prince Edward Island, and Newfoundland* (Halifax, 1911); Reports of Government Departments (Charlottetown, annually). See CANADA.

PRINCE IGOR, ē'gôr. An opera by Borodin (q.v.), first produced in St. Petersburg (Petrograd), Nov. 4, 1890.

PRINCEITES. See AGAPEMONE.

PRINCE OF WALES, CAPE. See CAPE PRINCE OF WALES.

PRINCE OF WALES ISLAND. See PENANG.

PRIN'CEPS, PRIN'CIPATE. See EMPEROR; EMPIRE.

PRINCE RUPERT. A seaport and the capital of the Comox-Atlin electoral district, British Columbia, Canada, the Pacific Coast terminus of the Grand Trunk Pacific Railway, on the north end of Kaien Island, adjoining the Tsimpsean Peninsula, about 550 miles northwest of the city of Vancouver (Map: British Columbia, C 3). It has a mild climate the year round. Kaien Island is 7 miles long and has an area of nearly 12,000 acres. The harbor is capable of receiving the largest vessels. The city possesses a modern marine station and quarantine hospital, and its industrial establishments include cold-storage plants, saw mills, and a sash and door factory. It owns and operates its water, hydroelectric, and telephone plants. Pop., 1907, 600; 1911, 4184; 1915 (local est.), 6500.

PRINCE RUPERT'S DROPS. See ANNEALING.

PRINCE'S FEATHER. See AMARANTH.

PRINCES ISLANDS. A group of small islands in the Sea of Marmora, 13 miles southeast of Constantinople, to which they are connected by ferries (Map: Balkan Peninsula, G 4). Prinkipo is the largest and most important of the group. There are several monasteries on the islands, a theological seminary of the Greek church, and a naval college. An earthquake in 1894 caused great destruction of life and property. The population is estimated at about 10,000, though but four of the islands are inhabited.

PRINCES OF THE TOWER. The name given to Edward V (q.v.) of England and his brother, Richard, Duke of York, the sons of Edward IV (q.v.). In May, 1483, Edward was seized by his uncle, Richard, Duke of Gloucester (see RICHARD III), and imprisoned in the Tower of London; in June his brother was sent to join him, while Gloucester was recognized by the Royal Council as Protector. At first it was rumored that the princes had been murdered, although later they were popularly supposed to have been exiled. After 20 years Sir James Tyrrell alleged that, on the refusal of Brackenbury, Constable of the Tower, to murder the princes at Richard's instigation, he himself with two servants had smothered them in their sleep. The testimony of Tyrrell, a notorious blackguard in the reign of Henry VII (q.v.), the enemy and successor of Richard, is by no means above suspicion. In the reign of Charles II two skeletons were found at the foot of a staircase of the White Tower and were buried in Westminster Abbey as the remains of the two princes. Consult James Gairdner, *Reign of Richard III* (London, 1879).

PRINCESS, THE. A poem by Tennyson (1847). Mediæval in setting, but modern in thought, it is a kind of epic on the question of woman.

PRINCESSE D'AUBERGE, prăn'sĕs' dō'bârzh', LA (Fr., The Princess of the Inn). An opera by Blockx (q.v.), first produced in Antwerp, Oct. 10, 1896; in the United States, March 10, 1909 (New York).

PRINCES STREET. A famous street in Edinburgh, Scotland.

PRINCETON, prĭns'ton. A city and the county seat of Bureau Co., Ill., 104 miles west by south of Chicago, on the Chicago, Burlington, and Quincy, and the Chicago, Ottawa, and Peoria railroads (Map: Illinois, F 3). It has the Matson Public Library and the library of the township high school, a picturesque park, and fine Federal, courthouse, and city-hall buildings. The surrounding district is fertile and is engaged in farming and cattle raising and coal mining. Princeton was settled in 1830, incorporated in 1838, and chartered as a city in 1884. It adopted the commission form of government in 1915. Pop., 1900, 4023; 1910, 4131.

PRINCETON. A city and the county seat of Gibson Co., Ind., 27 miles north of Evansville, on the Chicago and Eastern Illinois and the Southern railroads (Map: Indiana, B 8). Rich oil and gas fields were discovered in 1903. Among the industries are coal mining and the manufacturing of flour, carriages, and brick. Shops of the Southern Railroad also are here. The city contains a Carnegie library, a sanitarium, and a courthouse. Princeton was settled in 1814. Pop., 1900, 6041; 1910, 6448.

PRINCETON. A city and the county seat of Caldwell Co., Ky., 180 miles southwest of Louisville, on the Illinois Central Railroad, at the junction of the Nashville and Louisville branches (Map: Kentucky, C 5). It is a commercial centre of a tobacco-growing country and a point for rehandling and stemming tobacco. There are also a flour mill, brickyards, a creamery, an ice plant, a handle factory, and repair shops of the Illinois Central. Pop., 1900, 2556; 1910, 3015.

PRINCETON. A borough in Mercer Co., N. J., 10 miles north by east of Trenton, on the Pennsylvania Railroad and on the Delaware and Raritan Canal (Map: New Jersey, C 3). Princeton is a very picturesque town. It has an elevated site of great natural beauty, enhanced by wide avenues and fine shade trees. Its handsome residences, too, many of which are in the Colonial style, add to its attractiveness. Princeton University (q.v.) is the chief feature. Other educational institutions are the Princeton Theological Seminary (q.v.), the Rockefeller Institute for Medical Research, St. Joseph's College, and the Princeton Preparatory School. Pop., 1900, 3899; 1910, 5136; 1915 (State census), 5678.

Princeton was first settled about 1696 and received its present name in 1724. It was of little importance, however, until the removal here from Newark of the College of New Jersey in 1756. On Aug. 27, 1776, the first State Legis-

lature of New Jersey assembled here and on August 31 chose William Livingston as Governor. Washington here surprised and defeated a body of British on Jan. 3, 1777. (See PRINCETON, BATTLE OF.) Congress, driven from Philadelphia by mutinous soldiers, met in Nassau Hall, Princeton, in June, 1783, and was in session until November 4. It was here that news reached it on October 31 of the final signing of the definite treaty of peace with England. Consult Hageman, *History of Princeton and its Institutions* (Philadelphia, 1870), and W. M. Sloane, "Princeton," in L. P. Powell (ed.), *Historic Towns of the Middle States* (New York, 1899).

PRINCETON. A city and the county seat of Mercer Co., W. Va., 72 miles southeast of Charleston, on the Virginian Railway (Map: West Virginia, C 4). Pop., 1910, 3027. Princeton was the scene of an engagement in the spring of 1862 between the Union forces under General Cox and the Confederate forces under General Marshall. Cox was obliged to retreat with a loss of about 115 men in killed, wounded, and missing. The losses on the Confederate side were much smaller.

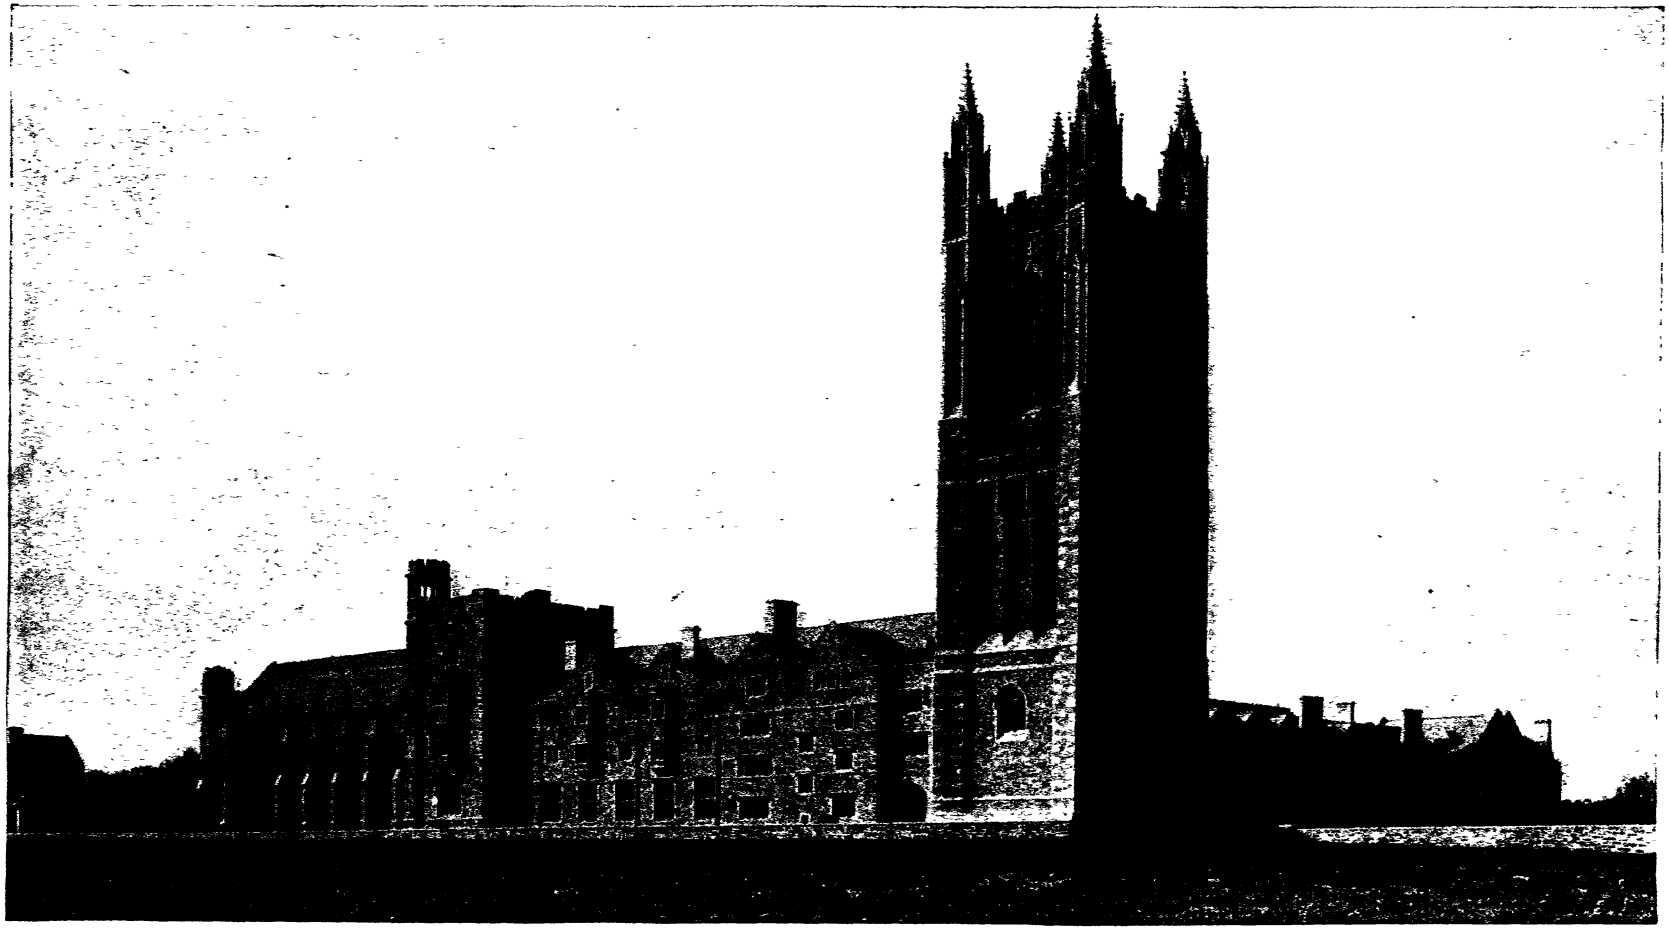
PRINCETON, BATTLE OF. A battle of the American Revolution, fought Jan. 3, 1777, at Princeton, N. J., between an American force under General Washington and an inferior British force under Colonel Mawhood and General Leslie. On January 2 Cornwallis with about 8000 men took up a position on the west bank of the Assunpink at Trenton opposite the American army, which was inferior in every way to his own. Washington, unable on account of the floating ice to retreat across the Delaware, immediately resolved to attack the British detachments at Princeton and New Brunswick and, leaving his camp fires burning, marched around the British left during the night. Reaching the Stony Brook Bridge, about 2 miles from Princeton, at sunrise, he sent General Mercer with about 400 men to destroy the bridge on the main road to Princeton and went himself by a shorter way. The British force at Princeton, on its way to Trenton, encountered Mercer's brigade at the bridge. The Americans, occupying a piece of rising ground, began a vigorous fire upon the British, who soon made a bayonet charge and drove them from their position. During the fight General Mercer was mortally wounded, and his troops slowly retreated. The British pursued, but were soon stopped by a force of regulars and militia under Washington, who displayed the greatest personal gallantry. After a short but fierce engagement the British retreated rapidly, some towards Trenton and some towards New Brunswick, while Washington entered Princeton and seized the military stores left there by the enemy. On the approach of Cornwallis he withdrew and took up a strong position at Morristown. The British loss was more than 100 killed and wounded and about 230 prisoners. The American loss was about 100. Strategically the battle was very important, as it forced Cornwallis to fall back to New York and left New Jersey in the possession of the Americans, besides inspiring the hitherto discouraged people to renewed efforts against the enemy. Consult: W. S. Stryker, *Battles of Trenton and Princeton* (Boston, 1898); V. L. Collins (ed.), *Brief Narrative of the Ravages of the British and Hessians at Princeton in 1776–77* (Princeton, 1906); A. A. Woodhull, *Battle of Princeton* (ib., 1913).

PRINCETON THEOLOGICAL SEMINARY. The oldest Presbyterian school of theology in the United States. The movement which led to its foundation took definite form in 1809; a "Plan for a Theological Seminary" was adopted by the General Assembly of the Presbyterian church in 1811, and the seminary was established at Princeton in 1812 and duly began its work on August 12 of that year with three students in attendance, to whom 11 were added in the course of the session. Rev. Archibald Alexander, its first professor, was appointed to the chair of didactic and polemic divinity in 1812. During the 103 years of its existence up to 1915, the seminary has matriculated about 6150 students. Its teaching force consists of a president and 11 active professors, with two additional instructors. It possesses grounds and buildings valued at $664,000 and invested funds aggregating about $3,200,000, with a gross income of about $144,000. Its library contained, in 1915, 100,253 volumes and 33,123 pamphlets. The attendance of students for the session of 1914–15 was 177, including 6 fellows and 33 graduate students. The curriculum of the seminary includes the whole circle of the recognized theological discipline. The degree of bachelor of divinity is conferred for advanced work under certain stringent conditions which give it especial value. Six fellowships supporting graduate students for an additional year of research work are granted annually. The teaching in the seminary is regulated by a special subscription required of all the professors to the Confession of Faith of the Presbyterian Church in the United States of America. The type of teaching prevalent at Princeton began in 1831 or 1832 to be called "Princeton theology." The seminary maintains a quarterly journal, published under the name of the *Princeton Theological Review.* The president in 1915 was Rev. J. Ross Stevenson, LL.D.

PRINCETON UNIVERSITY. An institution for higher education at Princeton, N. J., founded in 1746. About 1726 William Tennent, a graduate of the University of Edinburgh, had established in Bucks Co., Pa., a school known as the Log College, the success of which led in 1739 to a movement by the Synod of Philadelphia towards the establishment of a larger college for the Middle Colonies. The plan was abandoned owing to the unsettled condition of the times. In 1742 internal conflicts led to the division of the synod, and members of the newly formed Synod of New York determined on independent action. They sought a charter for the founding of a college in New Jersey, without assistance from either of the old synods, and secured it on Oct. 22, 1746, from John Hamilton, acting Governor of New Jersey. The institution was called the College of New Jersey and was situated at Elizabethtown. The first president was Rev. Jonathan Dickinson. A second charter was granted in 1748 by Jonathan Belcher, royal Governor of New Jersey, owing to doubts as to the validity of the first charter, and in order to give other religious communions a share in the administration of the institution. President Dickinson died in 1747 and was succeeded by Rev. Aaron Burr, to whom belongs the credit for the organization of the curriculum, the procedure, and the discipline of the college. The institution was soon removed to Newark, where the first commencement was celebrated in 1748. In 1752 it was voted that the college be fixed at

Princeton on condition that the inhabitants secure to the trustees 10 acres of cleared land, 200 acres of woodland, and the sum of £1000. In 1754 the corner stone was laid for the first building, which was named Nassau Hall. The college was completed and the students removed from Newark to Princeton in the fall of 1756. President Burr died in 1757 and was succeeded by Rev. Jonathan Edwards, who died a month after assuming office. He was followed by Rev. Samuel Davies, who devoted much time to building up a college library. Davies was succeeded by Rev. Samuel Finley (1761–66) and in 1768 John Witherspoon, D.D., a Scottish clergyman, was inaugurated as president. He was a bold and active advocate of American independence. Among the students of this period were many later conspicuous as leading spirits, among them James Madison, Aaron Burr (son of the early president), William Bradford, Philip Freneau, and Henry Lee. The college suffered heavily during the war. The course of instruction was interrupted by the presence of both armies; Nassau Hall was wrecked, the library scattered, and the philosophical apparatus ruined. Yet only one commencement, that of 1777, was omitted, and the seven members of the graduating class for that year received their degrees a few months after the regular time.

President Witherspoon was succeeded in 1795 by Samuel Stanhope Smith, under whose administration the curriculum was broadened and the first provision was made for regular instruction in chemistry in an American college. On March 6, 1802, the interior of Nassau Hall was destroyed by fire, but was rebuilt in 1804. During the administrations of Presidents Ashbel Green (1812–22) and James Carnahan (1823–54) the institution had a rapid development. A department of law was established in 1846, but was abandoned in 1852 from lack of funds. Under President John Maclean (1854–68) four new professorships were established, with an endowment of $195,000. On March 10, 1855, the interior of Nassau Hall was again burned and was rebuilt in 1860. James McCosh of Queen's College, Belfast, was elected president in 1868 and resigned the office in 1888. During his term the attendance increased from 281 to 603, and the faculty from 10 professors and 7 tutors to 31 professors, 4 assistant professors, and 5 instructors. Gifts amounting to upward of $3,000,000 were received, of which $1,000,000 was expended in the erection of 14 buildings. Among the more important changes in the curriculum were the introduction of the system of elective studies (1870), the founding of the John C. Green School of Science (1873), and the establishment of the Graduate Department (1877). Francis Landey Patton (q.v.) was president from 1888 to 1902. During the 14 years of his administration the college increased from 603 to 1354 students, and the faculty from 40 to 100 instructors, while 17 new buildings were added to the equipment. On Oct. 22, 1896, the corporate title was changed to Princeton University.



Dr. Patton resigned the presidency in June, 1902, but retained his professorship in the university and was president of the Princeton Theological Seminary until 1913. He was succeeded in the presidency of the university by Woodrow Wilson, the first lay president, who held the office until Oct. 20, 1910, when he resigned to accept the Democratic nomination for Governor of New Jersey.

During President Wilson's administratio undergraduate course of study was thoro revised and coördinated; the preceptorial sy of instruction was introduced, thereby addi the faculty about 50 preceptors with the of assistant professor; the faculty was fu strengthened by the addition of a conside number of professors distinguished in their eral departments of study, notably in cla mathematics, physics, and biology; the f ties of the university for both classroom laboratory work were greatly increased by building and equipment of a handsome recit and lecture hall and of large and complete ratories for physics, biology, and geology; new dormitories were erected; and larg dowments were received for the developme the Graduate School.

From October, 1910, to January, 1912, Aikman Stewart, senior trustee, acted as p dent pro tempore, by resolution of the boa trustees. John Grier Hibben (q.v.) was el president on Jan. 11, 1912. Since his ina ration the Graduate College of Residence been completed and put into successful opera the course of civil engineering has been reo ized and strengthened, and the university maintained a steady growth both in endow and material equipment and in the numb students, particularly in the Graduate Sc The government of the university is in the h of a self-perpetuating board of trustees u the presidency (ex officio) of the Governo New Jersey. In 1900 five alumni trustees added to the board, holding office for five y The requirements for admission to the col since June, 1903, conform to the recomm tions of the National Education Association the College Entrance Examination Board, w conducts the entrance examinations. The versity is organized in three departments, Academic, the School of Science, and the Gr ate School, together with the technical de ments of Civil and Electrical Engineering. undergraduate curriculum offers instructio the following divisions: (1) philosophy, art and archæology, (3) language and litera (4) mathematics and science. Candidates the bachelor's degree enter either the Acad Department or the School of Science. The demic curriculum leads to the degrees of b lor of arts (A.B.) and bachelor of le (Litt.B.), while the curriculum of the Sc of Science leads to the degrees of bachelo science (B.S.) and civil engineer (C.E.). C dates for the A.B. degree offer Greek at entr and fulfill the full classical requirements d their freshman and sophomore years, which they are free to choose their studies, must elect about half of their courses in one department. The degree of Litt.B. is ferred on those who, having substituted for G at entrance either two modern languages o modern language and a science, concentrate ing the junior and senior years in one of philosophical, literary, political, or other manistic departments. The degree of B.S conferred on those who enter with a similar stitution for Greek, but who concentrate d the two upper years in one of the mathema or scientific departments. The degrees of and E.E. are conferred on completion of th quirements of the departments of Civil Engi ing and Electrical Engineering respectively

The Graduate School offers more than

THE GRADUATE COLLEGE AND CLEVELAND MEMORIAL TOWER

courses of study leading to the master's and doctor's degree in arts and science. About 40 fellowships, ranging in value from $600 to $1000, are offered for advanced work. The distinguishing feature of the Graduate School is the Graduate College of Residence, where graduate students may have the full advantage of a common life in scholarly surroundings at a minimum cost. The Graduate College has dormitory accommodations for more than 100 men, and the graduate students rooming elsewhere may board at the college.

The University Campus consists of 632 acres. Nassau Hall (1756) contains the administrative offices of the university, the Laboratory of Experimental Psychology, and the Faculty or "Congress" room. The dormitories include West College (1836), Reunion Hall (1870, named to commemorate the reunion of the Old and New schools of the Presbyterian church), Witherspoon Hall (1877), Edwards Hall (1880), Albert B. Dod Hall (1890), David Brown Hall (1891), Upper and Lower Pyne buildings (1896), Blair Hall (1897), Stafford Little Hall (1899, which is joined by an extension erected in 1902), Seventy-nine Hall (1904), Patton Hall (1906), Campbell Hall (1909), Holder Hall (1910), Hamilton Hall (1911), and Cuyler Hall (1912). The Library in 1915 contained 320,701 volumes and 80,000 unbound periodicals and manuscripts. The Literary Society libraries and the library of Princeton Theological Seminary raise the number of volumes to a total exceeding 430,000. Other important university buildings are the Isabella McCosh Infirmary (1892 and 1899), Dickinson Hall (1870), Marquand Chapel (1881), Alexander Hall (1892), McCosh Recitation Hall (1906), the Gymnasium (1903), the Graduate College and the Cleveland Memorial Tower (1912), the Palmer Memorial Stadium (1914), and the University Dining Halls (which were being constructed in 1915). In 1906 an artificial lake, formed by flooding lowlands near the Campus, was presented to the university by Andrew Carnegie.

The museums comprise the Natural Science Museum, established in Guyot Hall, and the Museum of Historic Art, in the Art Building. The laboratories include the Halsted Observatory and the Observatory of Instruction, the Psychological Laboratory, the Palmer Physical Laboratory (for the departments of Physics and Electrical Engineering), the Chemical laboratories, the laboratories of the departments of Biology and Geology in Guyot Hall, the Vivarium, and the Civil Engineering Laboratory.

In 1915 the total students' attendance was 1643, and the faculty numbered 207; trustees and officers, 48. The endowment is about $5,400,000 and the annual income about $660,000 exclusive of gifts for current and special expenses. Consult: J. R. Williams, *Handbook of Princeton* (New York, 1905); E. E. Slosson, in *Great American Universities* (ib., 1910); V. L. Collins, *Princeton* (ib., 1914).

PRINCE WILLIAM SOUND. The largest and most important extension of the Gulf of Alaska. It lies principally between long. 145° and 148° W. and lat. 60° to 61° N. Shut in by the Chugach Mountains to the east and by the Kenai to the west, these ranges are intersected by numerous bays and by glacial fiords from 12 to 30 miles in length. The Sound has the most northerly ice-free harbors of America, especially important, as for 175 continuous miles this coast has no practicable harbors. Since 1900 this region has developed rapidly through mining and railroad construction. On its eastern shores are large copper deposits in the Ellemar and Port Fidalgo region, as well as on Knight and Latouche islands. In the fiords are the most numerous and active glaciers of Alaska. The Columbia Glacier, descending between cliffs 2500 to 3000 feet high, presents in Columbia Bay a face about 4 miles broad and from 100 to 250 feet high. Cordova, on Orca Sound, is a railway town of importance, whose imports amount to nearly $1,000,000 annually. It is the coast terminus of the Copper River and Northwestern Railroad, a standard line of 198 miles, which reaches the Bonanza copper mine in the Nizina valley. The population of Cordova in 1915 was about 1000. Consult A. W. Greely, *Hand-Book of Alaska* (New York, 1914), and Tarr and Martin, "Alaskan Glacier Studies," in *National Geographic Society, Bulletin* (Washington, 1914).

PRINCIPAL (Lat. *principalis*, chief, from *princeps*, first, chief, prince). A legal term having several distinct applications. In criminal law all actually participating in the commission of a crime or who are present aiding and abetting in its commission are principals, while those who aid or abet before or after its commission are termed accessories. Actual physical presence is not necessary to constitute one a principal. One may be a principal who is only constructively present at the commission of the crime by aiding in its commission at the time. See ACCESSORY.

In the law of agency one who appoints an agent is called a principal. (See AGENT; MASTER AND SERVANT.) In the law of suretyship the principal debtor for whom another becomes surety is known as a principal. See FRAUDS, STATUTE OF; SURETYSHIP.

PRINCIPAL AND AGENT. The parties to the relation commonly known as an agency, the principal being the employing party, the agent the party employed. The law of the subject is usually, in legal literature, comprehended under this title. In this work it will be found under the title AGENT. See also CONTRACT; PRINCIPAL.

PRINCIPAL AND SURETY. A phrase descriptive of two persons who are indebted to a third, but whose relations are such as to make it the duty of the one, who is the principal debtor, to discharge the debt and save the other, who is his surety, harmless therefrom. See GUARANTY; SURETYSHIP; and the authorities there cited.

PRÍNCIPE, prēn'thē-pā. A district on the east coast of Luzon, Philippine Islands, belonging to the Province of Tayabas (q.v.).

PRINCIPE, prēn'chē-pe, IL (It., the Prince). A celebrated short political treatise by Niccolò Machiavelli (1513) showing how a ruler might gain and extend absolute power. Cesare Borgia was presumably the model for the prince, and the dissimulation and treachery advocated to attain success made Machiavelli's principles synonymous with political infamy. A modern view has credited him with an ardent longing for Italian unity and with the purpose of portraying merely the methods of his own time.

PRINCIPIA (Lat., principles). A famous mathematical treatise in Latin by Sir Isaac Newton (1687). It contains the full develop-

ment of Newton's great discovery, the principle of universal gravitation.

PRIN'DLE, CYRUS (1800–85). An American Abolitionist and one of the founders of the Wesleyan church of America. He was born in Canaan, Conn. and entered the New York conference in 1821. An Abolitionist in principle, he was removed from important appointments to the poorest, and in 1843 with others he seceded from the Methodist Episcopal church and founded the Wesleyan church. When the movement had accomplished its purpose, with about 100 others of his ministerial associates, he returned to the Methodist church.

PRINGLE, prĭŋ'g'l, SIR JOHN (1707–82). An English physician, born at Stitchel, Roxburghshire and educated at St. Andrews, at Edinburgh, at Leyden, and in Paris. In 1734 he was appointed professor of metaphysics and moral philosophy in Edinburgh University. He settled in London in 1748, where he became physician to the Queen in 1761 and to the King in 1774. Sir John may be called the founder of modern military surgery. To him we owe the first proposal that military hospitals should be regarded as neutral and immune from attack. His most important work was done as an army sanitarian in Flanders, Germany, and Scotland. In this field his *Observations on the Diseases of the Army* (1752) is regarded as a classic. He made special observations of typhus. His life by Kippis is prefixed to *Six Discourses Delivered at the Royal Society* (London, 1783).

PRINGLE-PAT'TISON, ANDREW SETH (1856–). A British philosopher. He was born at Edinburgh and was educated at the university there and in Germany. He returned to Edinburgh to be an assistant and lecturer for three years, in 1883 went to University College, Cardiff, to be professor of logic and philosophy, and in 1887 accepted a similar chair at St. Andrews. From 1891 he served as professor of logic and metaphysics at Edinburgh. In 1911–13 he delivered the Gifford lectures at Aberdeen. In 1898 he assumed the name Pringle-Pattison on succeeding to the Haining estate, but he is sometimes referred to as Andrew Seth. His publications include: *The Development from Kant to Hegel* (1882); *Essays in Philosophical Criticism* (1883), edited in conjunction with R. B. Haldane; *Scottish Philosophy* (1885; 3d ed., 1899); *Hegelianism and Personality* (1887); *Man's Place in the Cosmos* (1897); *Two Lectures on Theism* (1897; enlarged ed., 1902); *The Philosophical Radicals* (1907).

PRINGSHEIM, prĭŋks'hīm, ALFRED (1850–). A German mathematician, born at Ohlau in Silesia. Educated at the universities of Berlin and Heidelberg, he became docent in 1877 and professor in 1882 at Munich. He wrote many important papers in mathematical periodicals, especially on infinitesimal calculus, and published in 1896 a German version with commentary of Daniel Bernoulli's Latin treatise on probabilities.

PRINGSHEIM, ERNST (1859–). A German physicist, a kinsman of Nathanael Pringsheim. He was born at Breslau and studied at the university there, at Heidelberg, and at Berlin, where he became docent in 1886 and professor in 1896. In 1905 he accepted a chair of theoretical physics at Berlin. His more famous experiments were on radiation and on the relation between full radiation and temperature, on measuring the ratio of the specific heats of gases, and experiments on which he based the theory (later modified) that reduction of metallic oxide accompanied the emission of line spectra of alkali metals. The variety of his activities may be suggested by his collaboration with Schwan in a study on the nature of French accent and by his work with Gradenwitz to secure photographic reconstructions of palimpsest manuscripts. He wrote *Vorlesungen über die Physik der Sonne* (1910).

PRINGSHEIM, NATHANAEL (1823–94). A German botanist, born at Wziesko, near Landsberg, Silesia. For a time he studied medicine, associated himself with the Liberal political movement, and then turned definitely to natural science. In 1851 he became a lecturer at the University of Berlin. As a result of his essays *Grundlinien einer Theorie der Pflanzenzelle* (1854) and *Ueber die Befruchtung und Keimung der Algen und das Wesen des Zeugungsaktes* (1855–57) he was chosen in 1858 a member of the Royal Academy of Scientists. In 1857 he founded the *Jahrbuch für wissenschaftliche Botanik*, which he edited up to the time of his death. He was professor of botany at Jena from 1864 to 1868, and then returned to Berlin, devoting himself almost entirely to research. In 1882 he founded and became the first president of the German Botanical Society. He was one of the foremost cryptogamic botanists of the nineteenth century. Among his works, which were published in four volumes at Jena in 1895–96, are the following: *Beiträge zur Morphologie der Meeresalgen* (1862); *Ueber die Embryobildung der Gefasskryptogamen und das Wachstum von Salvinia natans* (1863); *Ueber Paarung von Schwarmsporen* (1869); *Weitere Nachtrage zur Morphologie und Systematik der Saprolegniazeen* (1873); *Untersuchungen über das Chlorophyll* (1874).

PRIN'SEP, JAMES (1799–1840). An English architect and Orientalist, who studied under Pugin, the celebrated architect. Owing to impaired eyesight he gave up his studies for a time and went out to India (1819), where he became in turn assistant assay master in the Calcutta mint, assay master in the Benares mint, and eventually assay master in the Calcutta mint (1832). At Benares he designed the mint, built a bridge over the Karamasa, and took down and restored the minarets of the Mosque of Aurungzebe. At Calcutta he constructed a canal between the Hugli and the Sundarbans. In numismatics he won distinction by "Useful Tables Illustrative of Indian History," included in his collected works (London, 1858). At Calcutta he edited *Gleanings in Science*, afterward the journal of the Asiatic Society, of which he became secretary. He also succeeded in deciphering inscriptions that hitherto had baffled scholars. Weakened in health, he returned in 1838 to England, where he died. Consult *Essays on Indian Antiquities . . .* with memoir by Henry Thoby Prinsep, edited by Thomas (London, 1858).

PRINSEP, VALENTINE CAMERON (1838–1904). An English figure, historical, and portrait painter, also an author. He was born in Calcutta, India, was a pupil of Watts in London, and of Gleyre in Paris, and was later influenced by Rossetti. A follower of the classical school, his favorite subjects were pseudo-Oriental girls, beautiful, but without temperament, such as

"Ayesha," in the Tate Gallery. He went to India to paint the "Declaration of Queen Victoria as Empress" in 1876, a large canvas with many portraits, now in St. James's Palace. He was elected to the Royal Academy in 1894. His publications include *Imperial India: An Artist's Journal* (1879), several novels and plays, and some writings on art.

PRIN'STERER, GUILLAUME GROEN VAN. See GROEN VAN PRINSTERER.

PRINT (by aphæresis, from ME. *emprinten, enprinten,* to imprint, from OF., Fr. *empreinte,* imprint, p.p. of *empreindre,* It. *imprimere,* to impress, imprint, from Lat. *imprimere, inprimere,* to impress, from *in,* in + *premere,* to press). In the fine arts, an impression from an engraved metal plate, wood block, or lithographic stone, of a design or picture, in ink or color, upon paper or other suitable material. The custom of calling such impressions engravings is erroneous, and the term "print" is the one which should be used in such cases. The art of printing from an engraved plate is not wholly mechanical, because there are many cases in which the impression taken is not merely a flat transfer from the unmodified, hard surface. Thus, in printing woodcuts, it is customary to use what are called overlays, which are pieces of thin paper cut in peculiar shapes, accommodated to the design engraved upon the block: and these overlays are placed where needed behind the paper upon which the transfer is to be made in such a fashion as to cause certain parts of the printing to be stronger and blacker than others. So in the printing from dry point (q.v.) plates in which that process has been used for the completion of an etching (q.v.) it is quite usual to leave a certain amount of ink upon the surface of the copper plate, thus completing the line work of the draftsman by the surface work or gradation made by the printer. The word "print" is also used as meaning one of the more ordinary impressions from the block or plate in contradistinction to the proofs of different kinds. Consult: Frank Weitenkampf, *How to Appreciate Prints* (New York, 1908); Fitz Roy Carrington, *Prints and their Makers* (ib., 1912); E. H. Richter, *Prints: A Brief Review of their Technique and History* (Boston, 1915); and the bibliography of ENGRAVING. See AQUATINT; DRY POINT; ETCHING; LINE ENGRAVING; MEZZOTINT; PROOF; WOOD ENGRAVING.

PRINTERS BIBLE. See BIBLE, CURIOUS EDITIONS OF.

PRINTING. The process of taking impressions, generally on paper in ink, of printing types or of designs, drawings, or photographic prints, which have been previously cut, etched, drawn, or engraved on some solid surface. Printing with ink is done by three methods: (1) from a raised surface in high relief, as in type or woodcuts; (2) from a sunk or incised surface, as in copperplate engraving; (3) from a flat surface on stone made repellent to ink in portions by dampening the stone, as in lithography (q.v.). As the raised surface is most easily inked and impressed, typography is found most generally useful.

The Chinese methods of printing were practiced at a very ancient date. As early as 50 B.C. the Chinese had originated a method of printing in ink on paper by means of engraved blocks, although it was not until nearly 1000 years later that printing in this manner was extensively practiced. In 925 A.D. the principal Chinese classics were printed for the Imperial College of Peking from blocks of wood engraved in relief. By this process a separate engraved block had to be prepared for each printed sheet or page. The Chinese are also credited with having used movable type as early as the twelfth and thirteenth centuries, and such types are now used extensively by the European missions in China for printing Chinese books and papers. The chief difficulty in using movable types for printing Chinese is due to the fact that each Chinese word requires a separate character instead, as in the European languages, of being composed of letters or characters which are resolvable into an alphabet. Movable copper types are said to have been used also by the Koreans as early as the first part of the fifteenth century.

In Europe in classical and mediæval times books were made by transcribing them in manuscript (q.v.). About the thirteenth century, in Italy and Spain, these manuscripts began to be produced with the initial letters stamped in ink from engraved blocks of wood. This practice was gradually developed until printing blocks were quite commonly employed in printing images and text, generally of a religious character, on paper sheets which were bound together in book form. In short, the gradual development of printing in relief was as follows: (1) initial letters, autographs, and trademarks; (2) playing cards; (3) figured or ornamental textile fabrics; (4) religious pictures with and without lettering; (5) engraved words without pictures; (6) types of single letters founded in a mold.

The question as to the inventor of typography, i.e., the one who was really the first to employ movable printing types, has been a subject for discussion for several hundred years. This dispute, which has been rather national in character, has now narrowed itself down to the two names of Laurens Janszoon Coster (q.v.), of Haarlem, Holland, and John Gutenberg (q.v.), of Mainz, Germany. Coster is said to have invented types of wood about 1420 and movable types of metal, with which he printed several small books, between 1440 and 1446. It is also claimed that his types were stolen by one of his workmen and carried to Mainz, where this workman introduced typography. The facts in Gutenberg's career as a printer are meagre. There is an unsatisfactory record that he experimented with printing at Strassburg in 1439. In 1448 he had a printing office at Mainz; in 1455 he was sued by John Fust (q.v.), who was associated with him in the enterprise, for the recovery of money lent, and judgment being secured against him, Fust seized his printing-house equipment. Another printing establishment was started by Gutenberg, who operated it until his death, about 1468. Meanwhile Fust, in partnership with Peter Schöffer, is said to have continued the operation of the printing establishment founded by Gutenberg. Upon the sacking of Mainz in 1462 and the suspension of printing for three years, the pupils and workmen of these printers were scattered and the art, which had been carefully guarded as a secret, became widely known. Printing was practiced in Rome in 1467, in Paris in 1470, in Spain in 1474, and in England in 1477, the first press in this last country being set up at Westminster Abbey by

William Caxton (q.v.). The first press in the New World was established at the city of Mexico in 1544, and this was followed by one in Peru at Lima in 1585. The first press in the British colonies of North America was set up at Harvard College in 1639, and this press still continues under the name of The University Press.

In a brief review of the development of printing it is impossible more than to allude to the work of such famous printers as Aldus Manutius (q.v.), who, with other members of the same family, published the famous Aldine editions (q.v.), the Elzevirs (q.v.), whose activities extended from 1583 to 1712, and the Stephens of Paris, famous for their editions of the Scriptures and the classics.

Modern Printing Types. Types of metal are manufactured by a process of founding, using an alloy made chiefly of lead, with smaller amounts of tin and antimony. (See TYPE FOUNDING.) The earliest types used were of the style known as Gothic or black letter, which was afterward superseded, except in Germany, Russia, and Greece, by the Roman letter. (See BLACK LETTER.) Printers formerly had a distinct name for each size of type, and used about 16 sizes in different descriptions of bookwork; by the older terminology the smallest was called *excelsior*, the next *brilliant*, and then follow in gradation upward, *diamond*, *pearl*, *agate*, *nonpareil*, *minion*, *brevier*, *bourgeois*, *long primer*, *small pica*, *pica*, *English*, *great primer*, and *double pica*. The larger sizes generally took their names thus: *two-line pica*, *two-line English*, *four*, *six*, *eight*, or *ten line pica*, etc. Some of these names were given from the first maker; others from the books first printed with the particular letter. Thus, in France and Germany *Cicero* was the name of a type with which Cicero's letters were first printed (Rome, 1467); *pica* is from the ritual book, termed *pica* or *pic; primer*, from *Primarius*, the book of prayers to the Virgin; *brevier*, from *breviary; canon*, from the *canons* of the Church; etc. The following illustrates the size of the various types:

1—Brilliant, International.
2—Diamond, International.
3—Pearl, International.
4—Agate, International.
5—Nonpareil, International.
6—Minion, International.
7—Brevier, International.
8—Bourgeois, International.
9—Long Primer, International.
10—Small Pica, International.
11—Pica, International.
12—English, International.
13—Great Primer, International.

At present in Europe and America, generally, printers use a numerical nomenclature instead of the old nomenclature given above and commonly used by the layman. This nomenclature, as adopted by the United States Typefounders' Association in 1886, is as shown in the following table, a point being equivalent to 0.0138 inch.

A complete and proportioned assortment of all the letters and signs of any one particular body and face of type is called a font, which may be regulated to any extent. American founders assort characters by weight and not by count. As types of the same body vary in width (some thin and some wide), a specification by count of single types would be misleading as to weight. The following table shows the relative frequency of the letters in composition:

OLD NAME	Square of "body" in inches	New name
		Point
Excelsior	0.0415	3
	0.0484	3½
Brilliant	0.0553	4
Diamond	0.0622	4½
Pearl	0.0692	5
Agate	0.0761	5½
Nonpareil	0.0830	6
Minion	0.0968	7
Brevier	0.1107	8
Bourgeois	0.1245	9
Long Primer	0.1383	10
Small Pica	0.1522	11
Pica	0.1660	12

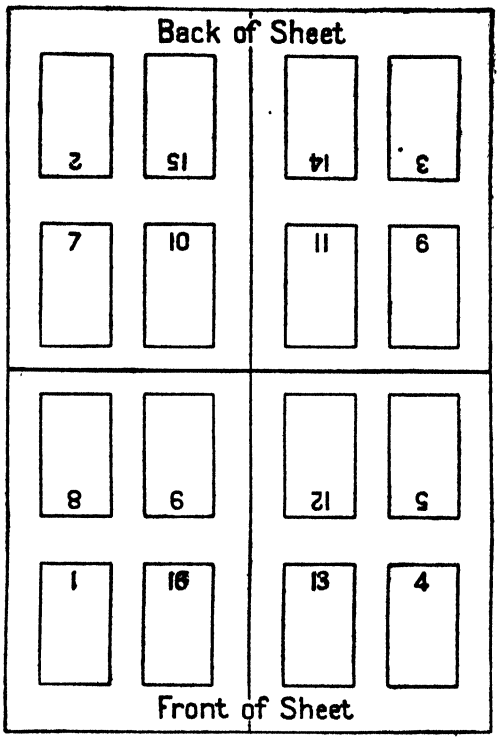
The types used in printing offices are sorted in different boxes of two shallow trays known as upper and lower case, the latter lying nearest the compositor upon the frame for their support. The lower case is placed immediately under his hand, the upper case directly above in a slanting position, and the under part of the frame is stocked with cases of different fonts. In the upper case are placed all the capitals, small capitals, and a few of the characters used as references to notes. In the lower case are all the small letters, figures, most of the points, and the spaces for blanks between the words. In the lower case alphabetical arrangement is not preserved; each letter has a larger or a smaller box allotted to it, according as it is more or less frequently required; the letters in most request are placed at the nearest convenient distance to the compositor. See article CASE for illustration.

Type-Setting or Composing. The setting of printing types in proper order for printing is termed composing, and may be performed either by hand or by machine. In hand composition the compositor places the copy before him on the upper case, and standing in front holds in his left hand a short tray of iron or steel, known as a composing stick. The stick has a movable slide, which may be regulated to any width of line. One by one the compositor picks up and puts together the letters of each word and sentence, and the appropriate points, into his stick, securing each with the thumb of his left hand, and placing them side by side from left to right along the line. When he arrives at the end of his line the compositor must *justify*, or separate, the words so that they will fill the width of the measure. Spaces of varying thickness are inserted as evenly as possible between the words. When the compositor has

set up as many lines as his composing stick will hold conveniently, they are lifted by grasping them with the fingers of each hand as if they were a solid piece of metal. He then places the mass upon a shallow tray termed a galley, which has a ledge on two or three sides.



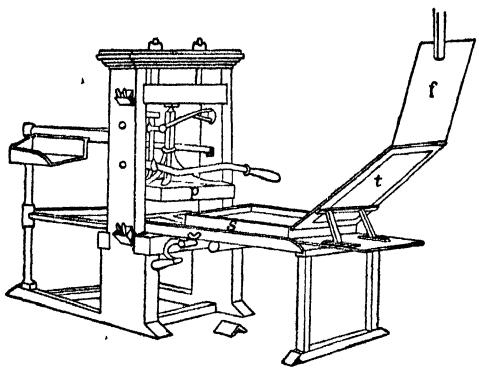
On account of the improvements and the adaptability of typesetting machines, such as the linotype and the monotype, a very large part of the composition of books, magazines, and newspapers is now produced by these machines instead of by hand. See TYPESETTING MACHINES.

The printer's unit of measurement by which the compositor is paid is the em in America and the en in Great Britain. An em is the square of the body of the type selected; the number of ems that fill a line multiplied by the number of ems in the height of a page gives the total number of ems of type in the page. One thousand ens English equal 500 ems American. The piece compositor is paid an agreed rate per 1000 ems, but the rate varies with different kinds of composition. Tabular matter, mathematical formulas, etc., are usually paid for on a time basis.

Composed type that has served the purpose for which it was set is known as dead matter, and its separate letters have to be distributed into the case for re-use, in new work. The compositor first wets the composition so that the separate types will slightly cling together. He then places a number of lines upon his composing rule, picks up a few types between thumb and forefinger, and drops them one at a time into their proper compartments in the case.

Make-Up is done by taking composed type from the galley in sufficient quantity to make a page of the prescribed size after adding the running titles and the folios, or page numbers. It is then tied up so that it can be safely handled and is put upon an imposing stone or iron-topped table. When the page consists of several columns, as in newspapers, the type of one column is placed after another upon the stone. The pages are separated by suitable blanks, and the whole mass of type is locked up by filling the angular space around the type and inside the iron frame, or chase, with strips of wood or metal, called furniture, and by wedging them with screw clamps, or quoins, so tightly that none of the type can fall out. Proofs are taken from the type in galley and in page form, which are read for errors, so that corrections may be made before the type is sent to press. At least two proofs of the type—a galley proof and a page proof—are always taken and read for errors, and very often in careful work several proofs of each kind are pulled and read by different persons. See PROOF READING.

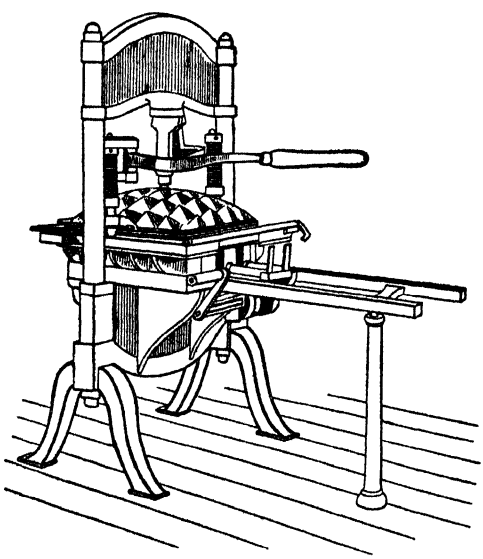
The printer's form may consist of any number of pages from 2 to 128. Imposition is a method of arranging pages so that they will follow one another upon the printed paper in the proper consecutive order. The method of imposition, or the order of arrangement, differs according to the number of pages in the form, but the general principle of the process may be understood from the following diagram of a 16-page form, in which the numeral in each case indicates the number of the page in that form and its location the top of the page. To guide the binder in arranging the printed sheets in their proper order, letters or numerals known as signature marks are placed at the foot of the first page of each section. The letters J, V, and W, are not used for this purpose.



Stereotyping is a process by which the composed types of a page are cast in one piece. The object is to make resetting unnecessary for subsequent editions and save wear of type. Many methods have been invented, but only two are now in use—stereotyping by the papier-maché process and electrotyping. The papier-maché process is preferred for its speed by daily newspapers; electrotyping by printers generally for its greater accuracy and its applicability to fine engravings in relief. Crude experiments at soldering composed types together and at making duplicates by the pressure of pages on type metal softened by heat were made in the eighteenth century, but the first practical work was done by William Ged, a goldsmith of Edinburgh, in 1725. His invention was not kindly received by the printers and publishers of England and soon fell into disuse, but it was revived and improved by Earl Stanhope, of London, about the year 1802. For nearly 50 years afterward it was preferred for bookwork, and was generally known as the plaster process. The page of type to be stereotyped was put in an iron pan and a preparation of plaster of Paris poured over it, which was afterward baked dry in an oven. The dried mold so made was then submerged in melted type metal that penetrated every crevice. When properly cooled the mold was broken, and a duplicate of the composed type appeared on one side of the plate. The rough side of the plate was planed down, its edges were beveled, and faulty letters corrected, until it became a presentable duplicate of the type work. Stereotyping by plaster was brought to Newark by David Bruce in 1813. Stereotypes have been made also by pressing the

types upon prepared dampened china clay, but the clay process is rarely used. The papier-maché process, invented by Genoux of France, in 1829, was neglected for many years, but is now in favor with most daily newspapers. Sheets of thin tissue paper pasted together and backed with damp unsized thicker paper constitute the mold or matrix for the papier-maché process. They are firmly and evenly impressed on the page of type and are then dried upon the page. When dry the matrix is removed and adjusted to an iron mold on which melted type metal is poured from several openings. The plate so made is then cooled, planed, and beveled, and curved, if necessary, to fit the press. Newspaper stereotyping is now generally done by the autoplate machine, whose operation is entirely automatic. It is the invention of Henry A. Wise Wood, and was first used in 1900 by the New York *Herald*.

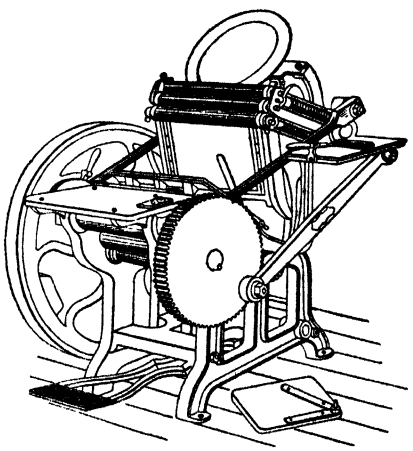
Electrotyping. For fine bookwork and for duplicating engraved illustrations, electrotyping is the process preferred. By this process the type page is impressed in a thin sheet of wax which is first dusted with a coating of powdered graphite and then with a coating of iron filings. The wax mold so prepared is immersed in a bath containing a solution of sulphate of copper through which passes an electric current from a dynamo. This deposits a thin film of copper on the wax mold. (See ELECTROCHEMISTRY, INDUSTRIAL.) When thick enough to be stable the film or shell of copper is backed with a solder of tin and afterward with a firmer basis of type metal applied in a melted state. This type-metal base is then planed and beveled, so that it can be neatly fitted to a thicker base of hard wood or of iron that makes it type-high. Electrotype plates may be curved by passing them through shapers or suitable bending rolls. Electrotype plates for printing were made by Joseph A. Adams, a wood engraver of New York City, in 1839–41, but they did not supplement stereotype before 1850.



Inking Rollers. Printing ink is a trituration (not a chemical union) of boiled oil, smoke black, coloring matter, and other ingredients. By the old process for inking types stuffed leather balls were made use of, but they were difficult to keep in proper order and were inapplicable to cylinder printing. The first improvement on the stuffed balls consisted in covering them with the elastic composition of glue and treacle then employed in the Staffordshire potteries. Catching at this idea, the inventors of cylinder printing machines made inking rollers by casting them in a cylindrical mold. This invention came generally into use between 1814 and 1818, everywhere superseding balls and rendering printing machinery practicable. Inking rollers for type work now made of a mixture of glue, glucose, sugar, and glycerin are found more durable than those made from glue and molasses only. The quantities of each constituent must be varied to suit the speed of the machine, the nature of the presswork, and the temperature of the pressroom.

Printing Presses. The earliest engraving of a printing press shows a stout framework of wood posts, firmly braced against the ceiling to resist upward pressure, a bedplate of stone as a rest for the form of type, which could be exposed to receive ink and then be slid upon ways under the platen or pressing surface. Impression was given by a large screw of wood over this platen, and this screw was moved by a long bar of wood and iron. The sheet of paper to be printed (about 16 × 20 inches was a common size) was laid upon an inclined framework of wood covered with blanket or parchment, which was hinged to slide on the ways

OLD COMMON PRESS.
p, platen; *s*, sole or bed; *t*, tympan, *f*, frisket.



and to be placed under the platen. This platen impressed only one-half of one side of the paper; to print the sheet 16 × 20 on both sides the pressman had to give four pulls on the bar. To print with uniform margin and in accurate register, the sheet on its first impression was pierced with small perforations on the front side and afterward suspended from holes so made on properly placed points when the second side was printed. Although the mechanism of the press was rude and even petty, good printing was done upon it by a competent pressman. The first improvement in construction was made

WASHINGTON HAND PRESS.

in 1601 by Blaew, of Amsterdam, who in addition to other devices attached springs to the platen moved by the screw, so that it could have a quick return movement without special exertion from the pressman. In 1786 M. Pierres, of Paris, invented a printing press entirely of iron and strong enough to print one side of the

sheet by one pull of the bar, but it did not meet with favor. About 1804 Earl Stanhope, of London, made great improvements on the large iron press of Pierres, adding many clever devices of his own for the lightening of labor. In 1806 Koenig, of Saxony, went to London with the model of an improved platen press, which he failed to introduce. His associates were more successful in reviving a patent issued to William Nicholson, of London, in 1790 for printing on a flat surface with cylindrical pressure. The new method was fairly tested upon a book form in 1811, and the new machine began to do the regular edition of the London *Times* in 1814—the first cylinder press driven by steam power. Soon after this newspapers adopted cylinder presses, for their greater speed and economy were advantages not to be neglected, but bookwork of all kinds continued to be done on platen presses of new construction. The Columbian press, invented by George Clymer, of Philadelphia (1816), the Adams power press, made in 1830 by Isaac Adams, of Boston, and the Washington press, of Rust, of New York, in 1827, were for many years the favorites. Cylinder printing machines, the first made, although indispensable to early newspapers, were damaging to type, and for that reason were rejected after fair trial by all book printers. The old publishing house of Harper and Brothers used hand presses only in 1835, but soon after introduced the Adams press. A prominent firm of law-book publishers in New York had all their work done on hand presses as late as 1849. The preference for hand-press work has been more marked in Great Britain. The fine books of Pickering and Whitingham

GORDON PRESS.

and more recently those of William Morris and his disciples were printed on a hand press. The hand press was found too slow and the cylinder press too cumbrous and costly for the small forms of commercial printing required before 1850. To supply this demand many small and inexpensive platen printing presses were devised for cards and circulars. In 1840 S. P. Ruggles, of Boston, invented a platen machine that printed a sheet of letter size at the speed of 1000 an hour, power being furnished by the foot of the pressman moving a treadle and attached crank. In 1850 George P. Gordon, of New York, patented a form of small platen press in which the platen vibrated to the bed of type and printed small sheets with great speed and accuracy. This Gordon press, with some modifications as to parts and under various names, is still preferred in all printing countries for small jobs.

Cylinder presses impressing types upon a flat bed with a reciprocating movement are made of many different constructions: (1) the drum cylinder, that makes one revolution and one impression to the forward and backward movement of the bed of type; (2) the two-revolution cylinder, that rotates at greater speed and gives impression at every other rotation; (3) the stop cylinder, that stops its rotation after each impression; (4) the double cylinder, that produces two prints from the same form on each reciprocating movement of the bed; (5) the perfecting cylinder, that prints both sides of the sheet at the same operation; (6) the two-color press, that prints two colors on the paper as each sheet passes through. Other constructions, some of value, could be named, but those here specified are in most favor. The perfecting cylinder is the only construction of flat-bed press that attempts to print both sides at once, but its movement is relatively slow. The high speed required by daily newspapers can be had only by the full use of the rotary principle for the pressed and the pressing surfaces. In 1835 Rowland Hill, of England, devised a press on this plan purposed to print upon an endless roll of paper, but his scheme was never put to practical use. In 1850 Thomas Nelson, of Edinburgh, exhibited at the World's Fair a little cylinder which did print a handbill on both sides at great speed from this endless roll. It was not favorably regarded as a practicable apparatus. In 1865 William Bullock, of New York, constructed a rotary press which printed from an endless roll 10,000 copies in an hour. R. Hoe & Co., of New York, had produced in 1846 a type-revolving printing machine. In this construction a large central cylinder contained the form of type on a small portion of its circumference, the rest of that circumference being used for the movement of inking rollers. The types were held in place by grooved and rabbeted column rules and screw clamps. Around this large cylinder were placed at graduated distances 4, 6, 8, or 10 impression cylinders, for each of which separate piles of paper and separate feeders had to be provided. Every revolution of the central cylinder produced from 4 to 10 copies, but these copies were printed on one side only, and this fact limited its value as a newspaper machine. In 1871 R. Hoe & Co. invented a rotary press which printed on both sides from curved stereotype plates at the rate of 12,000 an hour. This machine, a favorite at the start, has been reconstructed on new lines with many improvements for the different requirements of 8-page to 48-page newspapers. Two or more distinct machines are geared together in one construction and are known as the quadruple, sextuple, octuple, double-sextuple, and double-octuple machines.

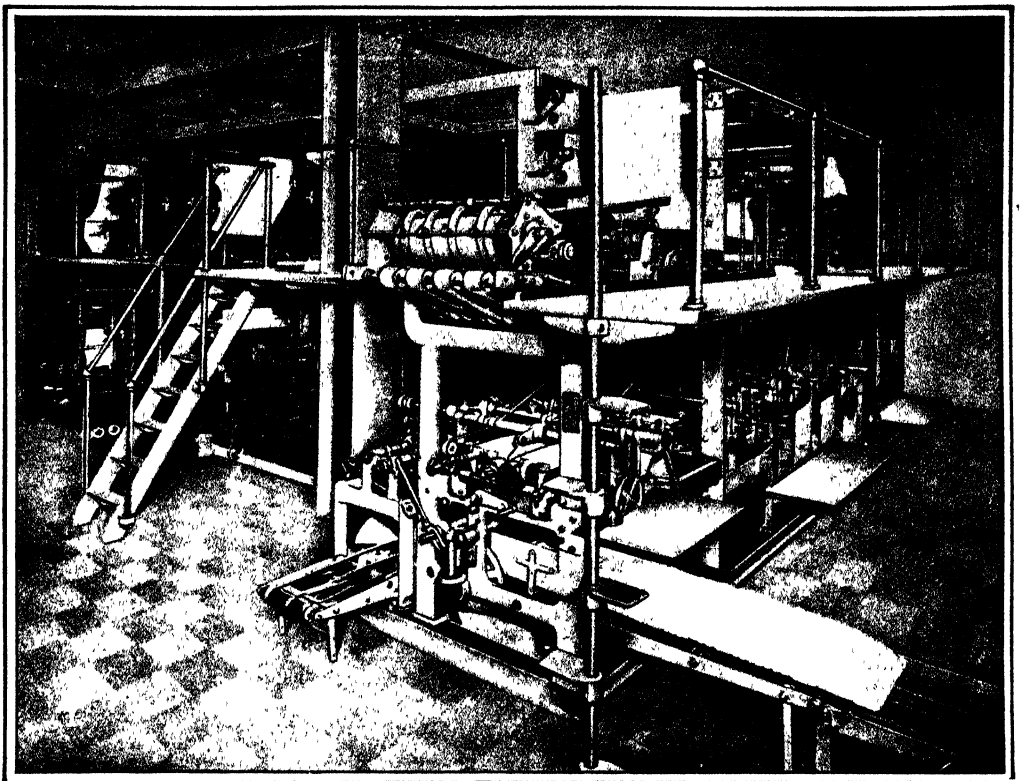
A sextuple press built for the New York *Herald* in 1889 was composed of about 16,000 pieces and weighed 116,000 pounds. This press was fed from three rolls of paper, and could print, cut, paste, fold, and count 24,000 papers of 14, 20, or 24 pages each, 36,000 papers of 16 pages each, 48,000 of 10 or 12 pages each, or 72,000 of 8 pages each during every hour of its daily operation. In 1900 three octuple

presses were installed for the New York *Journal*, each press weighing, when in running order, about 200,000 pounds and having 11 pairs of printing cylinders, 40 ink-distributing cylinders, 100 composition rollers, 22 ink fountains, 5 sets of oil fountains, and 850 gear wheels.

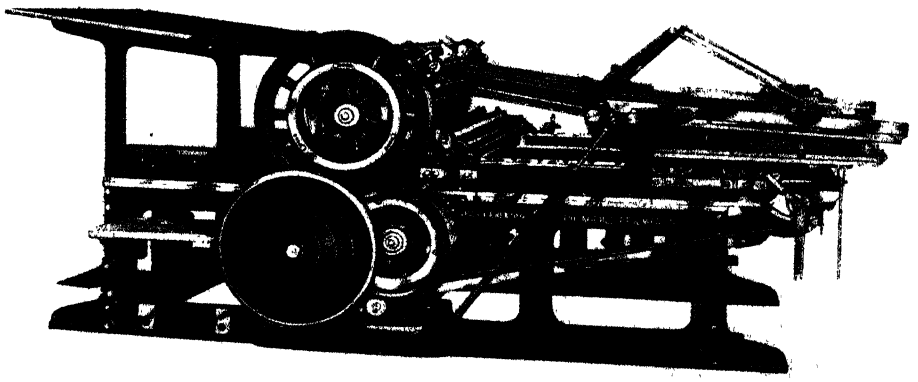
These presses, which were operated by electricity, were 35 feet long, 10 feet wide, and 15 feet high. An 80-horse-power electric motor was required to start one of them from a state of rest until it attained its proper speed, after which it performed its work at a considerably less expense of power.

In these machines five-cylinder color presses were combined with a full black press, which also had extra facilities for turning out fine newspaper work from electrotype plates; consequently half-tone plates and colored illustrations could be printed in connection with the text.

The largest printing machine that was made up to 1915 was the Hoe double octuple with eight folders and eight deliveries. It was fed from eight rolls of paper, each roll the width of four newspaper pages, and when equipped with the improved Hoe high-speed internal-gear rotating-blade folding mechanism, introduced in 1908, was capable of turning out full-sized newspapers at the rate per hour of 300,000 copies of 8 pages, 150,000 copies of 16 pages, 75,000 copies of 32 pages, or a larger number of pages in proportion, all delivered folded, cut at the top, bottom, and side, pasted if desired, and counted in lots. A press of this character was composed of approximately 65,000 separate pieces, was 48 feet in length, 8 feet in width, 19½ feet in height, weighed about 350,000 pounds, and running at capacity consumed paper at the rate of 108 miles an hour of a web 6 feet in width. When desired, additional cylinders and ink fountains could be added to print in colors as well as black. Other rotary presses of merit are made in the United States and in France and Germany, but they contain no distinctive principle that calls for minute description.

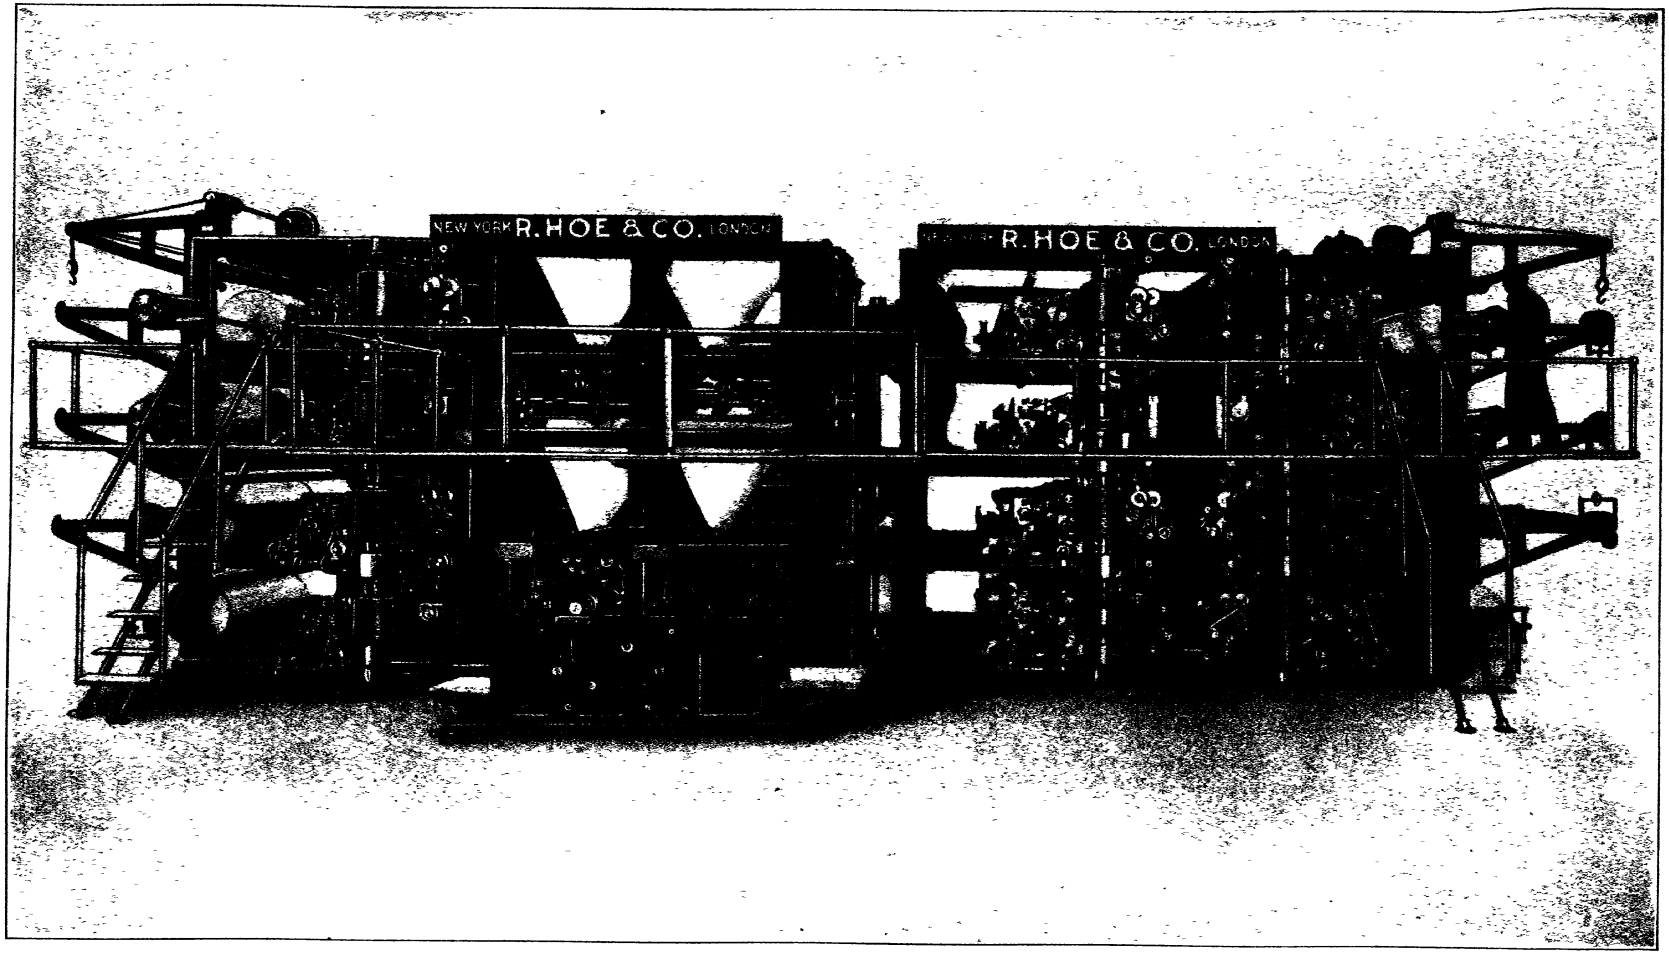


Early in the twentieth century two ideas which present great possibilities were developed and put into use. These are the offset and rotogravure processes. The principle of the former, the offset, is allied to the principle of lithography, a rubber blanket receiving the impression and that in turn offsetting it on the paper. A rotary press which is capable of a speed of 4000 to 5000 impressions per hour is used for this work. The rotogravure process, introduced into the United States in 1912, is a mechanical adaptation of intaglio printing, the printing surface being sunk on engraved copper cylinders. The result is of the nature of a photogravure print, but run at a high speed instead of printed by hand. The rotogravure press is also a rotary press, and its greatest use at present, in the United States at least, is in the printing of illustrated supplements for the Sunday issues of metropolitan newspapers.



Paper. Improvements in paper-making have been great aids in the development of printing. In 1827 the Fourdrinier paper machine, that produced paper in the so-called endless roll needed for rapid newspaper printing, was introduced in the United States. It made paper of more uniform thickness, of larger size, and at lower price. Cotton rags were used until the supply diminished. In 1860 Henry Voeltner invented a method for grinding soft woods for conversion into paper pulp. His method has been improved by chipping the wood and treating it with suitable chemical agents which have largely reduced its cost. Book papers that sold for 16 cents in 1850 are now sold for 5 cents or less, but the quality is not so good. See PAPER.

The methods of book and news presswork have been seriously changed. Before 1870 the rough paper then in use had to be dampened before it was thought fit for press, and type work was impressed upon it against a thick woolen or rubber blanket, which produced thick and strong print. This elastic impression was fatal to engravings with close and shallow lines, which were choked with ink, to the damage of proper light and shade. Then paper makers began to provide paper with a smoother surface, and printers undertook to print this paper in its dry state. Soon after the newly discovered art of photo-engraving, which became common in books and magazines, compelled the making of still smoother paper. To supply this demand a thin fabric of paper was coated with whiting, which, after proper smoothing or calendering, had a surface as smooth as polished metal. To print photo-engravings on this paper the elastic impression resistance had to be abandoned and an inelastic resistance of hard cardboard substituted. Under this treatment the delicacy of fine lines in an illustration could be properly preserved; the inelastic resistance improved the appearance of the illustration, but it did not improve the readability of the type work, and it did add to the cost of presswork.



The increasing circulation of magazines that were filled with illustrations compelled the abandonment of the flat-bed cylinder press about 1884. The rotary principle then and now employed in newspaper work had to be adopted, but with finer mechanism nicely adjusted. In 1886 R. Hoe & Co. made for the printing of the *Century Magazine* a rotary press that took on 64 large octavo pages and printed them in a satisfactory manner and with a speed not possible by any form of flat-bed cylinder. Since then steady progress has been made in the development of rotary presses for printing and folding magazines, books, and periodicals, until now the great bulk of publications of that class are turned out on fast-running machines. These are sometimes equipped with automatic feeding mechanism for inserting and adding covers or insert sheets.

PRINTING, Textile. See Textile Printing.

PRINTING-HOUSE SQUARE. 1. A London court, so called from the former office of the King's printer, which occupied the site. On it stands the office of the *Times*. 2. The open square fronting on City Hall Park, New York, near which are the buildings of most of the daily newspapers.

PRINTZ, Johan (1592–1663). Governor of New Sweden. He was born in Bottnaryd, Småland, Sweden. He served as a cavalry officer in the Thirty Years' War and for having surrendered the Saxon town of Chemnitz was dismissed from the service, but in 1641 was restored to royal favor, was ennobled, and was appointed Governor of New Sweden. He reached Fort Christina in 1643 and, desiring to control the trade of the river and be as close as possible to the Dutch at Fort Nassau, he established a settlement on the island of Tinicum, a few miles below the site of Philadelphia, and built Fort New Göteborg and also a mansion called Printz Hall. His administration was a vigorous one, and during it the colony increased in numbers and in prosperity. He caused other forts to be built at various places, as Fort Elsingborg, for the protection of the colony, carried on a large trade with the Indians, and successfully maintained himself against the English and the Dutch. He quitted the colony in 1653, and two years later it was conquered by the Dutch under Stuyvesant. When Printz reached Sweden he was made a general (1654), and in 1658 he became Governor of the Province of Jönköping. Consult: J. R. Brodhead, *History of the State of New York* (2 vols., New York, 1853–71); Justin Winsor, *Narrative and Critical History of America* (8 vols., Boston, 1889); Herman Hofberg, *Svenskt Biografiskt Handlexikon* (2 vols., Stockholm, 1906).

PRINZIP, prĭn-tsēp', Gavrio. A Bosnian student who shot and killed Archduke Francis Ferdinand of Austria and his wife, the Countess of Hohenburg, on June 28, 1914, at Serajevo, Bosnia. He was tried and on October 28 of the same year was sentenced to 20 years' imprisonment. Austria regarded Prinzip's act as evidence of a Servian plot and subsequently sent an ultimatum to Servia, the refusal to comply with which brought on the Great European War. See War in Europe.

PRI'OR. See Monastery.

PRIOR, Matthew (1664–1721). An English poet and diplomatist, born July 21, 1664, probably in Wimborne, Dorsetshire, where his father was a joiner. The family moved to London, and the young Prior was placed in Westminster School, where he formed a lifelong friendship with Charles Montagu, afterward Earl of Halifax. He graduated B.A. from St. John's College, Cambridge (1686), and was elected fellow (1688); through the influence of the Earl of Dorset he was made Secretary to Lord Dursley, Ambassador to The Hague, where he remained several years, enjoying the friendship of King William III; Secretary in the negotiations at the Treaty of Ryswick (1697); Secretary to the Embassy at Paris (1698); Undersecretary of State (1699); sat in Parliament (1701), and soon after forsook the Whigs for the Tories. He had a hand in the negotiations preliminary to the Peace of Utrecht and was for a short period Ambassador at Paris; on the advent of the Whigs to power he was impeached and imprisoned for two years (1715–17). His last years were passed at Down Hall in Essex. He died Sept. 18, 1721, and was buried in Westminster Abbey.

Prior gained recognition among the wits by *The Country-Mouse and the City-Mouse* (1686), written, nominally, in conjunction with Charles Montagu. It is a readable travesty on Dryden's *Hind and Panther*. In 1700 he published a panegyric on King William, called *Carmen Seculare*. While in prison he amused himself with a long whimsical poem, entitled *Alma; or the Progress of the Mind*. A collection of his poems appeared in 1709 and another in 1718. Prior's short poems, comprising odes, epistles, and epigrams, are among the choicest specimens of English occasional verse. Consult the *Selected Poems*, ed. by Dobson, Parchment Library (London, 1889); the edition by Johnson in the "Aldine Series" (ib., 1892); W. M. Thackeray, *English Humorists of the Eighteenth Century*, in "Standard English Classics" (Boston, 1911); Francis Bickley, *Life* (New York, 1914).

PRIPET, prĭp'ĕt (Russ. *Pripyat*, prĭ'pyăt-y'). A river of West Russia, the largest right tributary of the Dnieper. It rises in a group of lakes and marshes in the Government of Volhynia, near the boundary of Poland, and flows eastward through Volhynia and Minsk, then southeast into the Government of Kiev, where it joins the Dnieper some distance above the town of Kiev (Map: Russia, C 4). For the greater part of its course of 500 miles it flows through immense marshes and forests now in large measure drained and converted into meadows, which are almost uninhabited and through which the river and its branches form a network of side channels and backwaters. The Pripet is navigable to Pinsk and is connected by canals with the Vistula and the Niemen. See Poliessie.

PRISCA. See Priscilla and Aquila.

PRISCIAN, prĭsh'an (Lat. *Priscianus Cæsariensis*). In point of reputation the first of Latin grammarians, though one of the last in time. He belongs probably to about the early part of the sixth century, for he is mentioned by Paulus Diaconus (q.v.) as a contemporary of Cassiodorus. He taught Latin at Constantinople, probably at the Imperial court, for he enjoyed a government salary. The work which has mainly preserved his name is his *Commentariorum Grammaticorum Libri XVIII*, dedi-

cated to his patron, the Consul Julianus. The first 16 books treat of the different parts of speech as conceived by the ancients; the remaining two are devoted to syntax and in one manuscript bear the separate title *De Constructione Libri Duo*. Priscian's Commentary is, for the time, a solid and comprehensive work, the production of a man of great learning and good sense, and is enriched with quotations from many Greek and Latin authors no longer extant. The epitome executed by the German Bishop, Rabanus Maurus, in the ninth century, was very popular in the Middle Ages. Besides the Commentary, Priscian wrote six smaller grammatical treatises, and two didactic poems in hexameter, *De Laude Imperatoris Anastasii*, and a free translation of the *Periegesis* of Dionysius. The first edition of the grammar appeared at Venice (1470); the best is that by M. Hertz, in vols. ii and iii of H. Keil, *Grammatici Latini* (Leipzig, 1855–59). The two poems will be found in vol. v of Baehrens's *Poetæ Latini Minores* (ib., 1883). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., Cambridge, 1906), and W. S. Teuffel, *Geschichte der römischen Litteratur*, vol. iii (6th ed., Leipzig, 1913).

PRISCIL'LA. The heroine of Longfellow's *Courtship of Miles Standish*, wooed by John Alden for his friend Standish, but won for himself.

PRISCIL'LA AND AQ'UILA. Two New Testament characters, wife and husband, intimate associates and helpers of the Apostle Paul. The name Priscilla is a diminutive of Prisca, the form found in the best texts in the three references to her in Paul's Epistles. The husband, Aquila, is described in Acts xviii. 2 as "a man of Pontus by race, lately come [to Corinth] from Italy, with his wife Priscilla, because Claudius had commanded all the Jews to depart from Rome." This decree was promulgated about 50 A.D. Like Paul, they were tent makers by trade (Acts xviii. 3). It is possible that Aquila and Priscilla had accepted the Christian faith before leaving Rome. They continued with Paul during his stay in Corinth, and went thence with him to Ephesus, but tarried there while he went on to Jerusalem (Acts xviii. 18, 19). At Ephesus they were instrumental in bringing the gifted Apollos to a fuller knowledge of the faith (Acts xviii. 21 ff.), and their home became one of the centres of Christian activity in that city (1 Cor. xvi. 19). From there they returned later to Rome (Rom. xvi. 3), where they may have been instrumental in securing for Paul's letter to the church of Rome a favorable reception. After Paul's second imprisonment they were again at Ephesus (2 Tim. iv. 19). These changes are quite consistent with the shifting character of Jewish life at the time and with their function as missionaries of the new faith. There are no reliable sources of information concerning the close of their lives. The name of Priscilla (Prisca) figures quite largely in later tradition. There is a church in Rome bearing her name, a volume of *Acts of Saint Prisca* goes back at least to the tenth century, and one of the oldest catacombs in Rome is called *Cœmeterium Priscillæ*. Why the wife's name is usually placed first in the New Testament is not clear. The interesting hypothesis, put forward by Prof. Adolf Harnack of Berlin in 1900, that the authors of the Epistle to the Hebrews were Aquila and Priscilla is ingenious, but not convincing. Consult Sanday and Headlam, *Epistle to the Romans*, in *International Critical Commentary* (New York, 1899), and Hastings, *Dictionary of the Bible*, vol. iv (ib., 1904).

PRISCILL'IAN (Lat. *Priscillianus* (?–385). A Spanish Christian, who, while still a layman, started a reform movement with the view of deepening religious life and encouraging asceticism. He afterward entered holy orders and was made Bishop of Avila in central Spain. His theology diverged from orthodoxy at some points, and in the end he was charged with holding Gnostic, Manichæan, and other heresies, although he himself disavowed the opinions of Manes. He seems, however, to have held peculiar views respecting the influence of the heavenly bodies upon men. He believed that the Church still possessed the gift of prophecy, and he gathered his followers into private assemblies, which lent color to the charge of sectarianism, later brought against him. A council at Saragossa (380) reproved the ascetic and separatist tendencies of the day and excommunicated Priscillian and three other leaders. This only intensified the controversy. His views were soon carried over into the Gallic church, and within 8 or 10 years of its first appearance the party included several bishops and a large number of the clergy. In the course of the controversy Priscillian appealed to Pope Damasus (c.382), and further appeals to the Emperor were made by both parties. After Priscillian had protested against the jurisdiction of a synod convened at Bordeaux (384), he was tried before a civil tribunal, condemned for sorcery, and put to death, along with six others, by the Emperor's command. The Priscillianists continued for some time longer in a state of schism and are found even as late as the sixth century. The literary remains of Priscillian are published in the *Corpus Scriptorum Ecclesiasticorum Latimorum*, vol. xviii (Vienna, 1889). Consult: H. L. Mansel, *Gnostic Heresies* (London, 1875); F. Paret, *Priscillian* (Würtzburg, 1891); K. Künstle, *Antipriscilliana* (Freiburg, 1905); E. C. Babut, *Priscillian et le Priscillianisme* (Paris, 1909).

PRISHTINA, prĕsh'tĕ-nà. A town of European Turkey. See PRISTINA.

PRISM (Lat. *prisma*, from Gk. *πρισμα*, prism, something sawed, from *πριειν, priein, πριζειν, prizein*, to saw). A polyhedron (q.v.) two of whose faces (the bases) are equal polygons and whose lateral faces are parallelograms. When the lateral edges are perpendicular to its bases, the prism is called a *right* prism; otherwise it is said to be *oblique*. A *regular* prism is a right prism whose bases are regular polygons. A prism whose bases are parallelograms is called a *parallelepiped* (q.v.). The volume of any prism equals the product of the base and the altitude. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1902).

PRISM, DISPERSIVE EFFECT OF. See DISPERSION; LIGHT.

PRISMATIC EMERALD. See EUCLASE.

PRIS'MATOID (from Gk. *πρισμα, prisma*, prism + *εἶδος, eidos*, form). A polyhedron (q.v.) which has for bases any two polygons in parallel planes and for lateral faces triangles or trapezoids which have one side in common with one base and the opposite vertex or side in common with the other base. The formula for the volume of a prismatoid is $\frac{1}{6} h(b + b' + 4m)$, where h = height, b and b' are the bases, and

m is a mid-cross-section. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1902).

PRISON. See PRISONS.

PRISON ASSOCIATION, AMERICAN. An organization formed under the leadership of Dr. E. C. Wines, composed of State officials, well-known philanthropists, and students interested in the betterment of criminal laws, the improvement of penal and correctional institutions, and the care of discharged prisoners. The association was founded in 1870 at Cincinnati, incorporated in 1871 under the laws of New York, and reports of its proceedings were published in 1872, 1874, and 1877. With the death of Dr. Wines, the association became virtually inoperative, but a new organization was effected in 1883, and meetings have been held annually since, with an executive committee. The other standing committees are on criminal-law reform, prevention, probation, parole, prison discipline, discharged prisoners, statistics. Associated with the American Prison Association are five other national organizations composed of prison wardens, prison physicians, prison chaplains, women in prison work, and clinical criminologists.

PRISON BREACH, or PRISON BREAKING. The crime of escaping by force and violence from a place where one is confined in lawful custody. The act is a misdemeanor, and to constitute it there must be a lawful commitment, an actual breaking of the prison by force and violence by the prisoner or by others in his behalf and by his procurement, and he must fully escape, although, of course, subsequent recapture does not affect his act of breach. Similar escape by the violence of others without his procurement is a *rescue*. See CRIMINAL LAW.

PRISON BUILDINGS. In the article PRISONS (q.v.) brief reference is made to early prison buildings at Ghent and at Philadelphia. Since their construction much study has been bestowed upon the problem of prison architecture, and considerable progress has been made. This problem is, however, so intimately involved with that of prison administration, and the whole science of penology is now in such a state of transition, that entirely new developments may be looked for in the near future.

Prison buildings comprise not merely the blocks of cells and the necessary adjuncts—refectory, baths, etc.—but also workshops, inclosures for exercise, chapel, hospital, lodgings for wardens and guards, and other accessories. The architect's problem consists in so relating these to one another as to provide perfect supervision, security, and correct sanitation. The cells are usually arranged in blocks of three to five tiers, opening on galleries or balconies, in a corridor of the full height of the building. In one type the cells in two rows, back to back, face the outer walls, which light the two corridors adjoining them and also the galleries. In the other the cells are built against the outer walls and face on both sides of the high corridor, which is between the galleries. When several blocks of cells are required, they usually radiate from a central rotunda. The size, lighting, and equipment of the cells vary greatly; likewise the provisions for insuring supervision (as by open-barred doors) on the one hand and preventing conversation and noise on the other. There is also considerable difference in the character of different prisons with relation to the isolation of the prisoners; in some cases large cells are provided, in which prisoners of a certain class or grade may be confined in pairs or in small groups.

The modern tendency towards prison farms and colonies may in time do away with the present systems of huge, gloomy, stone cell blocks, substituting groups of smaller buildings in which, by a more normal mode of life, the prisoners may be better brought under reformative influences. For the details of prison design and distinctions between reformatories, state prisons, workhouses, penitentiaries, etc., also bibliography, see PRISONS.

PRISON CONGRESS, INTERNATIONAL. See INTERNATIONAL PRISON CONGRESS.

PRISONER. A person who is confined, or restrained in his liberty, either with or without legal authority, against his will; a person subjected to imprisonment. The term is ordinarily used to designate persons who have been taken into custody and confined in criminal or quasi-criminal proceedings and persons who are captured in war. The status of prisoners of the former class is treated elsewhere in this work. See CONVICT; IMPRISONMENT; PRISONS; PENOLOGY.

Prisoners of War. Among the ancient Greeks and Romans, and for centuries before and since, prisoners taken in war were the property of those by whom they were captured and might be slain, kept as slaves, or sold, at the caprice of their captors. This is still the case among savage races and among some of the semicivilized races of the Orient. The custom of ransoming, together with the use of mercenaries and professional soldiers, mitigated the hardships of prisoners of war, and these have in modern times been further alleviated under the influence of humane feeling and considerations of policy. Under the rules laid down by the Brussels Conference in 1874, which have been generally accepted, a prisoner of war is a lawful combatant who is captured or surrenders in war, and such noncombatants as guides, telegraph operators, and others who are identified with the army and rendering it direct service, and important public officials. Surgeons and chaplains and, now, the hospital attendants of the Red Cross Society are exempt as such from capture as prisoners of war. A prisoner of war has no protection from the laws of the state and no civil remedy, but he is protected by the rules of international law against unlawful acts against his person. See INTERNATIONAL LAW, *Land Warfare;* GENEVA CONVENTION; WAR, *Prisoners of War;* and consult the authorities there referred to.

PRISONER OF CHILLON, shĭ-lŏn' *or* shĭl'on, THE. A poem by Byron (1816), founded on the history of François de Bonnivard.

PRISONERS, CALENDAR OF. See CALENDAR, IN LAW.

PRISON LABOR. See CONVICT LABOR.

PRISONS (OF., Fr. *prison*, from Lat. *prensio*, seizure, from *prendere*, *prehendere*, to seize, take, from *præ-*, before + *-hendere*, Gk. χανδάνειν, *chandanein*, to seize; connected with Goth. *bi-gitan*, to find, OHG. *firgezzan*, Ger. *vergessen*, to forget, AS. *gitan*, Eng. *get*). Prisons have been used from antiquity as places of detention or seclusion, but only in modern times as places of punishment for crime. Of the former class were the famous Tower of London, the Bastille of Paris, the Bicêtre, the Seven Towers of Constantinople, and the castle of Spielberg in Austria. In the sixteenth century workhouses were erected

in England and also on the Continent to which vagrants were committed: London (1550), Amsterdam (1588), Nuremberg (1588). There was at first little classification, and conditions were bad. Gradually, however, improvements were introduced. The rules and regulations necessary to the sheltering and employment of vagrants developed into prison discipline, while the necessity for classification led to the development of prison architecture. Imprisonment under the new conditions came to be viewed in a different light and thus became a recognized punishment for crime.

Prisons were first looked upon as a possible means of reformation in 1704, when Pope Clement XI established the Hospital of St. Michael at Rome. This was not strictly a prison, but in the criminal wards the plan was introduced of having separate cells at night with work in common by day, silence being maintained. This plan is the basis of what is now known in America as the Auburn plan. A prison which became the architectural prison model for western Europe and America was constructed at Ghent in 1773. The cells were in blocks, tier upon tier, radiating from a central octagon. The corridors were thus against the outer walls. This probably suggested the form of the Eastern Penitentiary at Philadelphia, in which, however, the corridors were placed in the centre of the blocks of cells, as at St. Michael's. These plans, which make the entrance to each cell visible from the central room, have been adopted in many later prisons. Beccaria (q.v.), in his great *Treatise on Crimes and Punishments* (1764), protested effectively against barbarous punishments, and John Howard (q.v.), who spent 16 years in visiting the prisons of Europe, was able to effect radical changes in the prison régime of England. Two plans were henceforth followed. In one the prisoners are separated. They eat, work, and sleep in their cells apart from all other inmates. This is theoretically the policy of the Eastern Penitentiary of Pennsylvania and that adopted in Europe. By the other plan the men have separate cells, but work and often dine together. This is the common plan in America. In either case much of the corrupting influence attendant upon the intermingling of prisoners is to a large extent avoided. Early prison conditions in America were exceedingly bad. At Simsbury, Conn., an abandoned copper mine was used as a State prison from 1773 to 1827. Reform began with the building of the Eastern Penitentiary at Philadelphia in 1817 and the Auburn State Prison of New York (1816), which became the models for American prisons. Between the two systems fierce rivalry arose, but after many trials the Auburn plan has been generally adopted. With the introduction of steam heat, electric lights, and modern sanitary conveniences, prisons have been greatly improved. About the prisons are usually high walls on which guards are stationed, while the electric lights make undetected escape over the walls by night extremely difficult.

Prison management and discipline have not kept pace with mechanical improvements. The old forms of torture and barbarous punishment have, however, disappeared, while escapes are relatively infrequent. In the larger institutions there is great reluctance to tolerate idleness, which is always found to be demoralizing in the extreme. The question as to the proper occupation of the convict, however, is difficult of solution. (See CONVICT LABOR.) Inefficient management often destroys many of the good influences which modern penology demands shall surround the prisoner. Trained men are more and more needed both for efficient financial management and for wise discipline.

Places of imprisonment in the United States include lock-ups, jails, and prisons proper. In each town or city are local lock-ups, calabooses, or police stations for the detention of arrested persons pending immediate trial before the magistrates. Persons convicted of misdemeanors are confined in the county jails or houses of correction. Presumptive felons, bound over to the grand jury, are kept in the county jails pending trial, and then, if sentenced, are confined in the State penitentiaries. United States prisoners are usually kept in State institutions, as the general government maintains only a few prisons. As a rule, county jails are breeding places of crime. The houses of correction are better managed. Few county jails provide work for prisoners. In some of the States the prison system is not yet well worked out. These institutions are for adults. There are also reformatories (q.v.) for younger delinquents. There is a general feeling that local jails should be given up, and that all prisoners should be under State control, as in England, where the general government assumed control of all prisons in 1878.

The question of prison reform has received much attention in America as well as in Europe. The National Prison Congress, the National Conference of Charities and Correction, as well as local organizations, have had great influence in the past in bringing about improvements. The meetings of the International Prison Congress (q.v.) have been of great value.

PRISREND, prĕz'rĕnd. The capital of the department of the same name in the Kingdom of Servia, situated on a small affluent of the Drin, 75 miles east of Scutari (Map: Balkan Peninsula, C 3). It is one of the most beautiful towns in Servia, ranking next in population to Belgrade, Nish, and Uskub. It has a citadel (situated 1100 feet above sea level) and a large

number of bazars and carries on an active trade in flints, saddlery, glass, and copper and steel wares. Among its edifices are 24 mosques. The town is the seat of a Roman Catholic archbishop, an Orthodox metropolitan, and a Servian theological school. Long the capital city of the Ottoman Vilayet of Kossovo, it was captured by Servian troops in the course of the Balkan War (q.v.) of 1912 and confirmed to Servia by the Treaty of Bucharest (Aug. 6, 1913). It was captured by the Bulgarians in the European War which began in 1914 (see WAR IN EUROPE). Pop., 1911, 21,244.

PRISTINA, prĕsh'tē-nȧ, or **PRISHTINA.** A town in the department of the same name in the Kingdom of Servia, 30 miles north-northeast of Prisrend (Map: Balkan Peninsula, C 3). It has several mosques and churches. After remaining for a long time under Turkish rule, it was captured by Servian troops on Oct. 22, 1912, in the course of the Balkan War (q.v.), and was confirmed to Servia by the Treaty of Bucharest (Aug. 6, 1913). Pristina was captured by the Teutonic allies in the war which began in 1914. Pop., 1911, about 10,000.

PRITCH'ARD, CHARLES (1808–93). An English astronomer, born in Alberbury, Shropshire. He was educated at Christ's Hospital and at St. John's College, Cambridge. From 1834 to 1862 he was head of Clapham Grammar School and in that period became a prominent member of the Royal Astronomical Society. Elected Savilian professor of astronomy at Oxford in 1870, he planned the new observatory, invented the wedge photometer about 1881, and in 1885 published *Uranometria Nova Oxoniensis,* a photometric catalogue for which in 1886 he received half of the Astronomical Society's medal. The measurement of stellar parallax by photography seems original with Pritchard. He died very soon after undertaking a share in the international stellar chart. He contributed to the *Encyclopædia Britannica* and wrote *Occasional Thoughts of an Astronomer on Nature and Revelation* (1889). Consult Ada Pritchard, *Memoirs of the Life of Charles Pritchard, D.D.* (London, 1897).

PRITCHARD, MRS. HANNAH (1711–68). An English actress. She was found in 1733 singing in a booth at a public fair; from that time she appeared at the Haymarket and other London playhouses till, for the last 20 years of her life, she became a member of Garrick's company at Drury Lane. Though lacking in cultivation, she was an actress of great gifts in both comedy and tragedy. She played Cleopatra in *All for Love,* Zara in *The Mourning Bride,* and many other noted characters of the time. Her last appearance was in Lady Macbeth, her most famous rôle, in which only Mrs. Siddons could surpass her. A few months after her retirement, in 1768, she died at Bath, wealthy and universally respected. Consult Doran, *Annals of the Stage* (ed. Lowe, London, 1888).

PRITCHARD, JETER CONNELLY (1857–). An American legislator and jurist, born at Jonesboro, Tenn. He was early apprenticed to a printer. In 1873 he removed to Bakersville, N. C., where he became editor of the *Roan Mountain Republican.* He was several times a member of the State Legislature and was admitted to the bar in 1887. Pritchard served as a Republican member of the United States Senate in 1894–1903. He was a leader in the attempt to build up a white Republican party in the South, the so-called Lily-White movement, claiming that, as the negro had been deprived of his vote in many of the States, it was unfair that he should control conventions and keep away desirable recruits from the ranks of business men. In 1903 Pritchard was appointed associate justice of the Supreme Court of the District of Columbia, in 1904 justice of the United States Circuit Court, and in 1912 a judge of the newly created United States Circuit Court of Appeals.

PRITCH'ETT, HENRY SMITH (1857–). An American astronomer and educator, born at Fayette, Mo. After his graduation from Pritchett College, Glasgow, Mo., in 1875, he went to Washington to study practical and theoretical astronomy under Prof. Asaph Hall in the United States Naval Observatory, where he became assistant astronomer in 1878. Two years afterward he was appointed to the same position in the Morrison Observatory, Glasgow, Mo. He was sent to New Zealand in 1882 to observe the transit of Venus, and in 1883–97 was professor of astronomy at Washington University, St. Louis, Mo., and director of the observatory there. In 1889 he went to California in charge of the government expedition for viewing the solar eclipse. He was superintendent of the United States Coast and Geodetic Survey, with headquarters at Washington, in 1897–1900, and was president of the Massachusetts Institute of Technology, Boston, from 1900 to 1906, when he became administrative head of the Carnegie Foundation for the Advancement of Teaching.

PRITHU, prĭt'hōō. The name of several legendary kings of ancient India, especially one who is a hero in the Puranas. See PURANA.

PRIVAS, prē'vȧ'. The capital of the Department of Ardèche, France, 95 miles south by west of Lyons by rail (Map: France, S., J 4). The town is built upon a ridge overlooking the valley of the Ouvèze, at the foot of Mont Toulon (1400 feet), and has a fine esplanade shaded with plane trees, opening upon a panorama of great extent and beauty. It has important iron mines, the ore of which is exported, and it manufactures silks, woolens, leather, and brandy. Its buildings are unimportant. It was a Huguenot stronghold and was destroyed in 1629 by order of Louis XIII and Richelieu. Pop., 1901, 7561; 1911, 7290.

PRIVATDOCENT, prē-vät'dō-tsĕnt' (Ger., private teacher). A private instructor in German and some other European universities. The privilege to give instruction thus is acquired by promising scholars, holding the doctorate, after going through the process technically known as habilitation. This process consists in publicly defending a scientific dissertation embodying the results of the candidate's original research. Usually the privatdocent draws his fees from the students.

PRIVATE (Lat. *privatus,* individual, p.p. of *privare,* to separate, from *privus,* one's own, from *præ,* OLat. *prai,* before). In the United States army all enlisted men, except the noncommissioned officers, are termed privates and are so carried on the muster and pay rolls except where enlisted for a special duty, as in the case of firemen, cooks, farriers, horseshoers, saddlers, wagoners, trumpeters, musicians, artificers, mechanics, etc. See ARMY ORGANIZATION; and for pay, see PAY AND ALLOWANCES.

PRIVATE BILL. In English parliamentary procedure, a bill whose object is to alter the law relating to some particular locality or to con-

fer rights on or to release from liability some particular person or persons, whereas a general bill is one whose object is to alter the general law of the land. The distinction exists in all legislative systems, but the scope of private-bill legislation is wider than that of the corresponding special, or private, act in most American legislatures. It deals largely with the grant and regulation of franchises, including the incorporation of companies and even the grant of municipal charters. A private bill in Parliament is initiated by petition and is usually an expensive matter. Being regarded as a privilege, heavy fees are required of the promoters at the several stages of its passage through Parliament.

A private bill is to be distinguished from a private member's bill, which is a bill (i.e., any bill, whether private or general in character) which is introduced by a private member of Parliament as distinguished from a member of the government. Consult Sir C. P. Ilbert, *The Mechanics of Law Making* (New York, 1914). See BILL; LEGISLATION; PARLIAMENT; STATUTE.

PRI'VATEER'ING. One of the usages of war according to which private individuals are authorized by the government of one belligerent to fit out at their own expense vessels of war designed to prey upon the commerce of another belligerent. A privateer is an armed vessel fitted out for this purpose, owned and officered by a person or persons acting under a commission usually called a letter of marque. (See MARQUE, LETTERS OF.) Citizens of the United States are forbidden to accept letters of marque from powers at peace with the United States, and this is a general rule among nations. The commission is revocable upon proof of abuse, and according to English law the holder is liable in damages. As a further safeguard, a privateer is always subject to visitation and search by public vessels of war with a view to the verification of the genuineness of the commission under which it sails.

The practice of privateering is an old one among nations. In Europe it runs back to the time when public navies had not come into existence. During the Middle Ages European states having few or no ships of war hired merchant vessels for the uses of war, and eventually the practice of issuing commissions to persons who owned ships or could procure them, authorizing them to prey upon the commerce of the enemy, came into general use. By way of compensation the person so commissioned was allowed a share of the booty which he might capture. Such means enabled an inferior maritime power to call into existence on brief notice and at little or no expense a temporary force sufficient to enable it to cope with a more powerful rival. It was by this means that the Southern Confederacy during the Civil War drove the merchant marine of the United States from the high seas and seriously crippled its commercial interests. The practice is still sanctioned by international law, but it is rapidly falling into disfavor and is not likely to be again extensively resorted to by any civilized nation. Consult E. S. Maclay, *History of American Privateers* (New York, 1902), and E. P. Statham, *Privateers and Privateering* (Philadelphia, 1910). See DECLARATION OF PARIS.

PRIVATE INTERNATIONAL LAW. See CONFLICT OF LAWS.

PRIV'ET (probably a corruption of *primet*, apparently from *prim*, privet, from Lat. *primus*, first, so called in allusion to its early bloom), *Ligustrum*. A genus of shrubs and small trees of the family Oleaceæ. Common privet (*Ligustrum vulgare*), a shrub growing about the borders of woods in the middle and south of Europe, is naturalized in some parts of North America. It has half-evergreen, smooth, lanceolate leaves, and black, rarely white, yellow, or green berries about the size of peas. The flowers have a strong and sweetish smell. The berries, which persist during winter, have a disagreeable taste, but serve as food for birds. Privet, though spineless, is much used for hedges, since it bears clipping well and withstands the smoke and shade of towns. It is not fully hardy in Iowa and adjoining States, though introduced Russian forms seem able to withstand the winters. The so-called California privet (*Ligustrum ovalifolium*), a native of Japan, is one of the best varieties for hedges. All species grow readily from cuttings.

PRIVET WEBWORM. The larva of a pyralid moth (*Diaphania quadristigmalis*), which feeds upon privet hedges in the United States. The soft, light-green eggs are fastened to the leaf near its midrib in clusters of 50 or more. The light-green caterpillars hatch in early summer and feed upon the young leaves, hiding themselves in silken webs either between the upper leaves when still quite small or lower down on the older leaves when fully grown. After three weeks they transform to the chrysalis condition within silken cocoons in folded leaves. The best remedy consists in trimming the hedge at the proper time and afterward applying an arsenical spray.

PRIV'ILEGE (Lat. *privilegium*, prerogative, from *privus*, one's own + *lex*, law). In law, a benefit or immunity growing out of some special rule of law or statute by virtue of which an individual or a class enjoys certain immunities or rights distinct from or beyond those enjoyed by the community in general. It differs from a *dispensation* inasmuch as the latter merely relaxes the existing law in a particular case, while the privilege is a permanent and general right. Of ancient and mediæval legislation the law of privilege formed an important branch, the so-called privileged classes being governed by a substantially different body of law from the other classes of society. In early law there were two privileges enjoyed by the clergy which deserve special notice from the frequency of the historical allusions to them—the "privilege of the canon" (*privilegium canonis*) and the "privilege of the forum" (*privilegium fori*). By the former the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication against the offender; by the latter—known in England as "benefit of clergy"—the clergyman upon claiming his privilege was exempted from trial by the ordinary civil tribunals and could only be tried in the ecclesiastical court. Early English statutes placed limitations upon this latter privilege, and it was finally completely abolished. (See BENEFIT OF CLERGY.) In modern law there is scarcely any trace of the various forms of class legislation which characterized the Middle Ages, and in all of the United States class legislation is forbidden or restricted by their respective constitutions. Privileges in the legal sense so far as they exist at all in modern law rest upon grounds of public policy and in certain cases in

the United States are sanctioned by provisions of the State and Federal constitutions.

Some forms of privilege have been considered in connection with other topics, in the law of which they constitute an essential part. Thus, for a discussion of *privileges of witnesses*, i.e., the circumstances under which witnesses are privileged from giving testimony, see EVIDENCE; WITNESS. For a discussion of the privilege which exempts one from liability for libel and slander, see LIBEL. See also MONOPOLY, and for the special privileges accorded to ambassadors and diplomatic agents by international law, see those topics respectively.

Privileges of Legislators. It is essential to the maintenance of free government that members of legislative bodies should be privileged from arrest, both civil and criminal, during the term or session of the Legislature, and for a reasonable time before the beginning and after the end of the session, and that they should not be called to account for any language uttered by them in the course of legislative business. Such is the common law relating to members of Parliament. The United States Constitution provides (Art. I, Sec. 6) that the Senators and Representatives "shall in all cases, except treason, felony, and breach of peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same, and for any speech or debate in either House they shall not be questioned in any other place." This provision has been substantially incorporated into the constitutions of the several States as applicable to the members of State Legislatures.

Privileges and Immunities of Citizens. The Constitution of the United States nowhere undertakes to enumerate the privileges and immunities of citizens of the United States, although the Fourteenth Amendment assumes that there are such, and expressly prohibits the States from making or enforcing any law which shall abridge them. The Civil Rights Act declares that they include, among other things, the right to make and enforce contracts, to bring suit in the courts, to give evidence, to inherit, purchase, lease, hold, and convey real and personal property, and to enjoy the full and equal benefit of all laws and proceedings for the security of person and property. The Supreme Court of the United States, in the noted Slaughter House cases, decided in 1872 (16 Wallace's U. S. Reports, p. 36), undertook to enumerate some of the more important of the privileges and immunities of United States citizens. According to the opinion of the court they include a citizen's right of free access to the seat of government of the United States in order to assert any claim he may have upon that government, to transact any business he may have with it, to seek its protection, to share its offices, to engage in its administrative functions; free access to the seaports, the subtreasuries, land offices, and courts of justice; protection of life, liberty, and property when on the high seas or within the jurisdiction of a foreign government; the right to assemble peaceably and petition for redress of grievances; the privilege of the writ of habeas corpus; the right to use the navigable waters of the United States; all rights secured to its citizens by treaties with foreign nations; the right to become a citizen of any State of the Union by a bona-fide residence therein, with the same rights as other citizens of that State, etc. In the decision above cited the Supreme Court declared that there is a citizenship of the United States distinct from that of the State, and that only the privileges and immunities appertaining to United States citizenship are under the guardianship of the national authority, and that those appertaining to State citizenship must rest for their security and protection upon the law of the several States. With regard to the latter the Constitution provides that the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States. No complete enumeration of these has ever been attempted. See T. M. Cooley, *General Principles of Constitutional Law in the United States* (3d ed., Boston, 1898).

PRIVILEGED COMMUNICATION. A term applied to two distinct classes of statements. First, communications between parties occupying a confidential relation to one another, which the law does not force the recipient to disclose as a witness. Examples of this class are statements made by a client to his lawyer, by a patient to his physician, those between husband and wife, those between a party and a witness in preparation of a case for trial, and state secrets. They are frequently called confidential communications. The extent to which they are privileged is generally regulated by statute in the United States.

Second, statements which are defamatory, but which do not give to the injured party a right of action. Statements of this sort are of two kinds, absolutely privileged and conditionally privileged. Members of Parliament, of Congress, and of the State Legislatures are not to be questioned in any other place than their respective Houses for any speech or debate made therein. (See United States Constitution, Art. I, Sec. 6.) Judges also enjoy an absolute privilege from civil action for anything said or written by them as judges. This rule is not made for the protection or benefit of a malicious or abusive judge, but for the benefit of the public, whose interest it is that judicial officers should be at liberty to exercise their functions with independence and without fear of consequences. Similar considerations of public policy have led the English courts to accord the same absolute privilege to the pleadings of litigant parties, to the remarks of counsel, and the statements of witnesses, in the course of judicial proceedings. In the United States, however, the courts have generally held the privilege of such persons to be conditional and not absolute. That is, they are not liable in a civil action unless their defamatory statements are not pertinent or material to the case at issue, but are made in bad faith and for a malicious purpose.

A conditionally privileged communication is a defamatory statement made by a person in the discharge of some public or private duty, whether legal or moral, or in the conduct of his own affairs in a matter where his interests are concerned. The publication of legislative and judicial proceedings by newspapers belongs to this class. So do statements made by a lawyer to a client about the solvency of a third person with whom the client is about to engage in business transactions. Communications by a parent to a daughter of full age about the reputation of a suitor are also in this category, as are the warnings by a master to his servants about the character of a fellow servant, or the

statements of an employer about those who have been in his service. In all of these, and in similar cases, the plaintiff must show that the defendant uttered the defamation in bad faith and for a malicious purpose, or he will fail in his action. Consult Hageman, *Privileged Communications* (Somerville, N. J., 1889). See DEFAMATION; LIBEL; SLANDER.

PRIVILEGED DEBTS. In Scots law, those debts which must be paid first out of bankrupt's, insolvent's, and decedent's estates, corresponding to the class of debts called preferred claims or debts in the United States.

PRIVILEGED DEED. In the law of Scotland, a holograph deed, which is exempted from the statute requiring deeds to be signed before witnesses.

PRIVILEGES. See STOCK EXCHANGE, *Stock Exchange Terms.*

PRIVILEGIUM CLERICALE. See BENEFIT OF CLERGY.

PRIVY (priv'i) **COUNCIL.** In England, the assembly appointed by the sovereign to give advice on matters of state. In Anglo-Saxon times the kings had been advised by the Witenagemot, and in Norman times this became the Great Council. Naturally the kings had more intimate counselors, and they separated in time from the larger body to form the Privy Council. There are traces of such a body as early as the minority of Henry III, but the institution did not become definitely fixed until the minority of Richard II. During the reign of Henry V the name Privy Council first appears, and in the time of Henry VI this became the official designation.

The period of the greatest power of the Privy Council was during the infancy of Henry VI. It came into frequent collision with Parliament, which was jealous of its power. Its sphere of action was very wide. As a deliberative body it gave advice to the crown on political questions. It exercised legislative, judicial, and executive functions. Originally its judicial powers were very great. It frequently assumed cognizance of questions of private right, but in 1640 it was enacted that neither King nor Council should have any jurisdiction in matters regarding the estates and liberties of the subject, which should be tried in the ordinary tribunals of the land. Under the Tudors the Privy Council became largely a tool of the crown. The Star Chamber (q.v.), as it was constituted under Henry VII, was practically identical with the Council, except that the two chief justices were included among its members.

After the Restoration the executive and consultative powers of the Council began to decline. Vain attempts were made by Clarendon and later by Sir William Temple to give it new vigor. Since the reign of William III the cabinet has gradually appropriated all of the political functions of the larger body of which it is legally a part. The Privy Council has ceased to advise the crown regarding the government of the realm.

Since 1870 a privy councilor may be either a native or a naturalized subject of Great Britain. The honor is conferred by the sovereign's nomination, without any patent or grant, and is completed by taking the oath of office. Among the large number of members of the Council are now included the princes of the royal family, the two archbishops, the Bishop of London, the judges of the House of Lords, the Judicial Committee, and the Court of Appeals, all the cabinet ministers of the home government, and the premiers of the self-governing colonies. The office of Privy Councilor formerly fell by the demise of the crown; but by an Act of 1708 the Council continues to exist for six months longer unless sooner determined by the successor. Immediately on the decease of the sovereign the Council assembles and proclaims his successor, the Lord Chancellor affixing the great seal to the proclamation. The body is styled collectively "His Majesty's most honorable Privy Council." The councilors are entitled to the designation "right honorable" prefixed to their names, and they take precedence next after Knights of the Garter. A council can be held only under the presidency of the sovereign. Every other assembly of the members, though they should all attend, is merely a "committee."

The functions of the Council as a whole have become altogether ceremonial, requiring the presence of only three members, and they following the direction of some member of the cabinet. Its real work is now done by committees, and legally the cabinet (q.v.) is but a committee of the Privy Council. Other standing committees are the Judicial Committee, the Board of Trade, the Local Government Board, the Educational Committee, the Agricultural Committee, and the Committee for the Consideration of Charters of Incorporation under the Municipal Corporation Act of 1882.

Ireland has a Privy Council of her own, but the Privy Council of Scotland was merged in that of England in 1708.

Judicial Committee. A high tribunal, created by the Act of 3 and 4 Wm. IV, c. 41, in 1833. It has jurisdiction over appeals from ecclesiastical courts, from the colonies, from the Channel Islands and the Isle of Man, and from such English courts in foreign countries as are maintained there in conformity with treaty stipulations. The members of the committee are the judicial members of the House of Lords together with a few colonial judges. When it is considered that appeals from the highest courts of the colonies may involve important constitutional questions as to the powers and limitations of their legislative bodies, matters which to an important extent determine the very nature of the Empire itself, the dignity and importance of this Judicial Committee will be appreciated.

The forms of a secret council or committee have always been observed by the Judicial Committee, and no publication is made of the views or vote of any member. The judgments or decisions of the committee are transmitted to the sovereign in the form of advice, but that advice is almost invariably followed.

Educational Committee. The committee on Education was established in 1839 by an Order in Council for the purpose of promoting educational legislation and administering moneys voted by the Commons for school buildings and teachers' training colleges. The funds thus voted were turned over by the committee to two societies for the encouragement of elementary education among the poor, and provision was made for the inspection of schools by crown officers. The encouragement of pupil teachers by scholarships in training colleges and the offer of salaries, made possible by the grants of 1846, and the administration of special funds for the increase in the salaries of trained teachers,

also devolved upon this committee. The importance of the committee was greatly increased when in 1862 the distribution of moneys in aid of schools was made dependent on the character of their work. The committee of the Privy Council has charge mainly of the disposition of government grants for public elementary education, the curricula, and the certification of teachers engaged in subsidized schools. The Act of 1870 has increased its importance by investing it with the additional power of appointing school boards in cases where existing boards neglect their duties. In 1900 the Education Department, including the Department of Science and Art, was placed under the Board of Education for England and Wales, consisting of the Lord President of the Council, the principal Secretaries of State, and the Chancellor of the Exchequer.

PRIVY PURSE, KEEPER OF THE. An officer of the royal household in Great Britain, charged with the payment of the private expenses and charities of the sovereign.

PRIVY SEAL. A seal of the British government, which formerly was affixed to documents that were afterward to be authenticated by the great seal, or that were of such minor importance as not to require the great seal. The officer who has custody of the privy seal is called the Lord Privy Seal. As early as the reign of Edward III he was a member of the King's Council and a responsible minister of the crown. The affixing of the privy seal was for centuries by the authority of the Lord Chancellor. Until the reign of Victoria all letters patent, patents of inventions, charters, naturalizations, pensions, creations of honors, pardons, and so on, were required to pass from the signet office to the privy-seal office, the signet seal being the warrant for the privy seal, as the latter was for the great seal. By the Great Seal Act, 1884 (47 and 48 Vict., c. 30, § 3), it was provided that all instruments required to pass the great seal need only have a warrant under the sign manual, countersigned by the Lord Chancellor, Secretary of State, or a high official of the Treasury, and that thereafter no instrument need be passed under the privy seal. The Lord Privy Seal still ranks as fifth great officer of state, usually with a seat in the cabinet, but there is no salary, and no definite functions are now attached to the office. A peer above the rank of a baron is usually appointed, but a commoner is eligible. See GREAT SEAL.

PRIX DE PARIS, GRAND. See GRAND PRIX DE PARIS.

PRIX DE ROME, prē de rōm (Fr., prize of Rome). The Grand Prix de Rome is a prize given by the French government to a certain number of painters, sculptors, architects, musicians, and engravers who have passed a rigid examination in their respective departments of art. The winner of the Prix has four years at the Villa Medici, the Académie de France à Rome, and the annual sum of about 4000 francs for his expenses; he is also exempt from military service. The competition for the Prix is open to any Frenchman, between the ages of 15 and 30, who has fulfilled certain conditions in the Ecole des Beaux-Arts (q.v.) or elsewhere. A scheduled length of time is allowed the student in which to make drawings or models of a given subject for the completed design, and 10 pupils from each section are selected to enter the final competition. They have three months in which to prepare their work. The awards are made every year to painters, sculptors, musicians, and architects, every two years to line engravers, and every three years to engravers on fine stones and medalists. The Académie des Beaux-Arts, a section of the French Institute, has charge of the school at Rome and the "concours" for the Grand Prix. The director of the Academy at Rome is always a French painter chosen from among the members of the Académie des Beaux-Arts. A series of "envois," or specimens of work, are sent each year from Rome to the Salon, to show the pupils' progress. In the case of a musician the envoi goes to the Conservatory, which possesses autographs of all the prize cantatas since the establishment of the Prix.

The Prix de Rome was founded by Louis XIV in 1666. Its purpose was to educate promising young painters and sculptors, at the cost of the state, by study of the antique in Rome. The first director of the school was Charles Errard (q.v.). In 1720 architects were also allowed to compete for the Prix. During the Revolution the school was inactive, but Napoleon enlarged it, and after 1803 musicians, medalists, line engravers, and engravers of precious stones were added to the list of "pensionnaires." At this date also the school was removed to the Villa Medici, the present site of the Académie de France à Rome. Consult Baltard, *La Villa Médicis à Rome* (Paris, 1847).

PRIZE (OF., Fr. *prise*, fem. sing. of *pris*, p.p. of *prendre*, from Lat. *prendere, prehendere*, to seize, take). In international law, a term applied to all captures of property made during the course of war upon the high seas or in the territorial waters of a belligerent. The right to capture both the public property of an enemy on the sea and even the private property of his subjects is recognized by the rules of international law, although the right to capture private property on land has been generally abandoned. The capture of enemy's property cannot be lawfully made in neutral waters, and prizes thus taken must be restored to their owners with such reparation as the neutral government may demand for the violation of its neutrality. Without authority the act of capture must be regarded as piracy and punishable as such. Since the authority to capture enemy's property is derived from the belligerent government, it follows that the title of the captor to the prize which he has taken is subject to

the disposition of his government according to law. The government may therefore vest the title in the captor, or it may appropriate the prize to its own use, or destroy it, or sell it, distributing the proceeds among the captors in such manner as the laws of the state may prescribe.

A question of some importance in the law of prizes is the determination of the exact date when the title passes from the original owner to the captor. The right of the captor to that which undoubtedly belongs to his enemy is complete as between him and his enemy so soon as the capture is complete; but as between him and a neutral state which may lay claim to a whole or part of the prize, further evidence of the lawfulness of the capture must be forthcoming. According to one view, the title passes at the moment at which the capture is definitely effected and all resistance has ceased, as is evidenced by striking the flag or voluntarily surrendering. Others claim that the title vests in the captor after 24 hours of secure possession. Still others insist that the capture is complete only when the prize has been carried *infra præsidia* and is thus secure against the possibility of recapture. Whatever may be the correct rule, it would seem that the government to which the captor belongs has an inchoate title at least from the moment the act of seizure has been accomplished. This title may be contested by a neutral government on the ground that the capture was made in its waters or by its subjects, or for other reasons. The inchoate title, therefore, is made complete by having the prize sent into a port of the captor and the question of the lawfulness of the capture authoritatively determined by a judicial tribunal. (See PRIZE COURT.) To this end it is the first duty of the captor to bring in his prize for adjudication if it is capable of making the voyage, otherwise he should destroy it as enemy's property if there be no doubt as to its character, or sell it and turn over the proceeds to the jurisdiction of the proper court for distribution. Formerly the usages of war permitted the captor to take his prize into a neutral port, but neutrals may forbid the use of their ports for this purpose if they see fit, and this is almost the invariable practice except in case of distress or other emergency, and then only for as short a time as circumstances will allow.

A prize intended to be sent into port for adjudication is put in charge of a prize master who is aided by a prize crew. They are charged with taking care that the vessel is not despoiled or damaged and that it is duly delivered to the custody of the court with the ship's papers, register, etc. In order to avoid depletion of the fighting strength resulting from the necessity of supplying prize crews where a number of captures are made, or where for other reasons it may be inconvenient to send a prize into port, it is frequently provided by municipal law and is recognized by the law of nations that a captor may destroy his prize, subject, of course, to the liability of the captor's government for any loss or injury occasioned to neutrals thereby. The right of the captor to accept a ransom for his prize is also recognized. This is an arrangement between the captor and the master of the captured vessel by which the vessel is allowed to continue its voyage upon the promise of the master to pay a specified sum to the captor. The ransom contract serves as a safe-conduct for the vessel during the remainder of the voyage and is a guarantee against capture by another vessel of the captor's government or that of his ally, but not against the perils of the sea. Ransom contracts are valid instruments under international law, and it is customary to allow either party to bring suit on it in the courts of the other. As a means of encouraging the capture of an enemy's vessels, the laws of many states provide for the offering of special rewards to those taking part in operations leading to the capture of vessels belonging to an enemy. Such is the prize money heretofore allowed by the government of the United States, which consisted of the proceeds of the sale of captured vessels and cargoes lawfully captured and regularly condemned, and distributed among officers and crew. This provision for prize money, which had been a law of the United States from the establishment of the government, was abolished by an Act of March 3, 1899. By this act all laws authorizing the distribution of prize money as well as for the payment of bounties and head money were repealed. Consult Thomas Barclay, *Law and Usage of War* (Boston, 1914), and Huberich and King, *Prize Code of the German Empire as in Force July, 1915* (New York, 1915). See ADMIRALTY LAW; CONTRABAND OF WAR; COURT, *English and American*, I, 4 (*f*); DECLARATION OF PARIS; PRIVATEERING; PRIZE COURT; RECAPTURE; WAR.

PRIZE COURT. A special tribunal for the adjudication of questions of prize (q.v.). The submission of the question of the legality of a capture in war to the determination of a court is not a right which an enemy may claim, since it is assumed that all captures are enemy's property. But the fact that frequently property captured is claimed to be owned by neutrals makes a judicial inquiry in such cases necessary in order to determine the responsibility of a belligerent to neutrals. As the determination of questions of this character involves the exercise of admiralty jurisdiction, it is customary to confer jurisdiction in cases of maritime capture upon the admiralty courts. In Great Britain this is done by special commission; in the United States it is a regular branch of the admiralty jurisdiction, which is exercised in the first instance by the district courts. Prize courts differ from other municipal courts in that jurisdiction over the property of a foreigner is acquired, not by his consent expressed or implied, but by force. A prize court usually sits within the territorial jurisdiction of the belligerent under whose authority the capture is made, although it may sit within the territory of an ally. It may not, however, sit in the territory of a neutral even with the consent of the latter. The question to be decided by the court is whether, according to the law of nations, the ship and cargo in question were liable to capture, and if so whether the capture was lawfully made. If the decision be in the affirmative, the prize is pronounced good, is then sold, and the proceeds placed in the hands of an officer of the government for distribution among the officers and men who made the capture, according to the provisions of the law governing captures. If the decision be in the negative, the vessel is restored to its owners. If in the latter case it has suffered damage from the hands of the captors, the government

of which the captors are subjects is held responsible only for failure to use reasonable care and skill.

PRIZE FIGHTING. In law, fighting with the fists, either with or without gloves, in public, and for a reward or prize. It is sometimes said that there must be an intention to fight "to a finish" in order to constitute a prize fight, but the practice of fixing a limited number of rounds, in order ostensibly to make a fight a sparring exhibition, has necessitated the adoption of a different rule. The question of the intention of the parties and the promoters of the fight is important. If the intention is that one of the contestants shall "knock out" the other or disable him, and the fight is a public exhibition for money or a prize, it will be considered a prize fight. The manner of distribution of the prize money between the contestants is immaterial. A prize fight differs from a sparring match in that the latter is not held for a prize and there is no intention on the part of the contestants to do each other bodily harm. With very few exceptions, the American States define and prohibit prize fighting by statute. See BOXING.

PRJEVALSKY, przhă-väl'skĕ, NIKOLAI. See PRZHEVALSKI.

PRO'A. See CATAMARAN.

PROB'ABILISM (from Lat. *probabilis*, probable, from *probare*, to test, examine, from *probus*, good, Skt. *prabhu*, preëminent, from *pra*, before + *bhū*, to be). In theology and philosophy the doctrine that "probable opinions" may be used as a guide to conduct. (See CASUISTRY.) The word came prominently into discussion in the seventeenth century.

The doctrine of probabilism arose in the Middle Ages from the wide play given in penitential books to the idea of the morally indifferent and was further promoted by the discussions of the scholastics upon conflict of authorities, and thus upon apparent or real conflict of duties, in the moral sphere. Vasquez introduced (1598) probabilism into the moral theology of the Jesuits, and it soon gained a large place, being developed with great subtlety.

The great modern master on the subject is St. Alfonso Liguori (q.v.). He was at first a probabiliorist, later he upheld probabilism, then æquiprobabilism. It is reported that towards the end he declared more than once that he was *not* a probabilist.

Luthardt, *Geschichte der christlichen Ethik* (Leipzig, 1892); H. C. Lea, *History of Confession and Indulgences*, vol. ii (New York, 1896); A. Schmidt, *Zur Geschichte des Probabilismus* (Innsbruck, 1904); Augustino Lehmkuhl, *Probabilismus Vindicatus* (Freiburg, 1906); Thomas Slater, *Short History of Moral Theology* (New York, 1909).

PROB'ABILIORISM. See CASUISTRY.

PROB'ABILITY (Lat. *probabilitas*, from *probabilis*, probable). Expressions like the following are in common use: "It will probably rain to-day," "The chance of finding the article is very small," "He is more likely to succeed than to fail," "A is almost sure to be elected." These expressions all imply a lack of knowledge, an uncertainty as to the actual condition of affairs. But they signify different degrees of uncertainty. The first and third are indefinite, the second and fourth are quite definite. In order to answer in mathematical terms the question, "What is the chance of an event happening?" it is necessary to have some standard of measure or of comparison. Suppose we know only one of 10 candidates on examination for a degree and hear that one passed. What is the chance or probability that our acquaintance is that one? If, according to our knowledge of the case, one candidate is as likely to pass as any other, we may say that the chance of our acquaintance having passed is 1 to 10. If, however, only six of the candidates are men, and our acquaintance is a man, and we hear that it is a man who passed, the chance is now 1 to 6. But if we hear the name of the successful candidate, this name corresponding to that of our acquaintance, and observe that the names on the list are all different, the chance is now 1 to 1, or it is a *certainty*. Certainty is called the *unit of probability*. It is the standard which all estimate alike. All other degrees of probability will be expressed as fractions of certainty. For instance, in the above case of the candidate, on the first evidence the chance is 1:10, on the second evidence it is 1:6, on the third 1, or certainty.

If an event can occur in only one of a number of different ways, equally likely to occur, the probability of its happening at all is the sum of the several probabilities of its happening in the several ways. This proposition, the result of common experience, is generally accepted as axiomatic. Thus, a coin can fall either head or tail, therefore the chance of its falling head is $\frac{1}{2}$ and of its falling tail is $\frac{1}{2}$, the sum of these chances being 1. This is as it should be, for the coin must certainly fall in order to produce head or tail. The probability of an event not happening is found by subtracting from unity the fraction representing the probability that it will happen. For instance, if the chance of an event happening is $\frac{2}{3}$, the chance of its not happening is $1 - \frac{2}{3} = \frac{1}{3}$. Or, if A's chance of hitting a target is $\frac{1}{4}$, his chance of missing is $\frac{3}{4}$; if his chance of hitting is p, his chance of missing is $1 - p$. Two probabilities whose sum is unity are called *complementary* probabilities. For instance, the probability of drawing at one trial a white ball from a bag containing 2 white and 3 black balls is $\frac{2}{5}$. The probability of drawing a black ball is $\frac{3}{5}$. Their sum is 1, hence they are complementary probabilities. In general, if an event can happen in a ways and fail in b ways, all of which are equally likely to occur, the probability of its happening is defined to be $\frac{a}{a+b}$, and the probability of its failing is defined to be $\frac{b}{a+b}$, the two being complementary. In this case the odds in favor of the event are said to be a to b, and the odds against the event are said to be b to a. For instance, there are five ways of drawing one black ball from five black balls and three ways of drawing a white one from three white balls. Hence the probability of drawing a black ball from the whole eight on the first trial is $\frac{5}{8}$, and of not drawing a black ball, or (what is the same thing) of drawing a white one, is $\frac{3}{8}$. The odds in favor of drawing a black ball are 5 to 3; the odds against this are 3 to 5. Likewise, the odds in favor of drawing a white ball are 3 to 5, and the odds against it are 5 to 3.

If the probability of two independent events taking place is respectively $\frac{a}{(a+b)}$ and $\frac{a'}{(a'+b')}$, the probability that both will happen is $\frac{aa'}{(a+b)(a'+b')}$. The probability of both events failing is $\frac{bb'}{(a+b)(a'+b')}$. When *fail* is substituted for *happen*, bb' must be substituted for aa'. Similarly the probability that the first event happens and the second event fails is $\frac{ab'}{(a+b)(a'+b')}$, and the probability that the first event fails and the second event happens is $\frac{a'b}{(a+b)(a'+b')}$. For instance, if p and p' are the respective probabilities that each of two events happens, then pp' is the probability that both happen. In like manner, if there are any number of independent events, the probability that they will all happen is the product of their respective probabilities of happening.

If p represents the probability of the happening of an event in one trial and q the probability of its failing, the probability that it will happen exactly r times in n trials is

$$\frac{n(n-1)\ldots.(n-r+1)}{r!}p^r q^{n-r}.$$

The probability that an event will fail exactly r times in n trials is

$$\frac{n(n-1)\ldots.(n-r+1)}{r!}p^{n-2}q^r.$$

In the expansion of $(p+q)^n$, viz.,

$$p^n + np^{n-1}q + \frac{n(n-1)}{2!}p^{n-2}q^2 + \ldots.,$$

the terms represent respectively the probabilities of the happening of the event exactly n times, $n-1$ times, $n-2$ times, and so on, in n trials. Hence the most probable number of successes and failures in n trials is given by the greatest term in the corresponding series. For instance, the probability of throwing an ace in one trial with a die is $\frac{1}{6}$ and of failing to do so is $\frac{5}{6}$. Also

$$(\tfrac{1}{6}+\tfrac{5}{6})^4 = \tfrac{1}{1296} + \tfrac{5}{324} + \tfrac{25}{216} + \tfrac{125}{324} + \tfrac{625}{1296};$$

hence the probability of throwing an ace 4 times in 4 throws is $\frac{1}{1296}$, the probability of throwing an ace 3 times in 4 throws is $\frac{5}{324}$, the probability of throwing an ace 2 times in 4 throws is $\frac{25}{216}$, the probability of throwing an ace 1 time in 4 throws is $\frac{125}{324}$, the probability of throwing an ace no time in 4 throws is $\frac{625}{1296}$. Since the last fraction is the largest, the case of no ace in 4 throws of a die is more probable than that of 1, 2, 3, or 4 aces.

A problem in life insurance, a subject to which the theory of probability has been of indispensable service, will serve to show the applications of the subject. A table of mortality gives the numbers alive at each successive year of their age, out of a given number of children born. If l_n and l_{n+1} are the numbers in the table corresponding to the nth and $(n+1)$the years of age, the inference from the table is that of l_n individuals now alive and of n years of age, l_{n+1} will live one additional year at least. Hence the chance that any one of them die during the year is $\frac{l_n - l_{n+1}}{l_n}$. Calling this $1-p$, p is the chance that any one of them will survive the year. Of two individuals, one n years old, and the other n', what are the chances that (a) only one lives a year? (b) one, at least, lives a year? (c) both do not live a year? Calling the individuals A and B, the chance of A living out the year is p, and the chance of his dying within the year is $1-p$. For B these are p' and $1-p'$. Hence that A lives and B dies the chance is $p(1-p')$. That B lives and A dies the chance is $p'(1-p)$. Hence the answer to (a) is $p+p'-2pp'$. The second case includes, in addition to the conditions of (a), the chance that *both* survive, which is pp'. Hence the answer to (b) is $p+p'-pp'$. In the third case the chance that both live a year is pp'. Hence the chance that both will not live, i.e., that at least one will die, is $1-pp'$. See INSURANCE, *Degree of Probability*.

The theory of probability also furnishes a measure of expectation. The law of expectation in its simplest form may be stated thus: The value of a contingent gain is the product of the sum to be gained into the chance of winning it. Suppose A, B, and C have made a pool, each subscribing $1, and that a game of pure chance (i.e., not dependent on skill) is to be played by them for the $3. What is the value of the expectation of each? By the conditions all are equally likely to win the pool, hence its contingent value must be the same to each, and obviously the sum of these values must represent the whole amount in question. The worth of the expectation of each is therefore $1. That is, if A wishes to retire from the game before it is played out, the fair price which B or C ought to pay him for his share is simply $1. But this is obviously ⅓ of $3, i.e., the value of the pool multiplied by his chance of getting it.

Another very important application of the theory of probability is to the deduction of the *most probable* value from a number of observations, each of which is liable to certain accidental errors. In a set of such observations the probable error is a quantity such that there is the same probability of the true error being greater or less than it, and this probable error has been shown to be least when the sum of the squares of the errors is a minimum. The method for obtaining this least error is called the method of least squares. See LEAST SQUARES, METHOD OF.

The doctrine of probabilities dates as far back as Fermat and Pascal (1654). Huygens (1657) gave the first scientific treatment of the subject, and Jakob Bernoulli's *Ars Conjectandi* (posthumous, 1713) and De Moivre's *Doctrine of Chances* (1718) raised the subject to the plane of a branch of mathematics. The theory of errors may be traced back to Cotes's *Opera Miscellanea* (posthumous, 1722), but a memoir prepared by Simpson in 1755 (printed 1756) first applied the theory to the discussion of errors of observation. Laplace (1774) made the first attempt to deduce a rule for the combination of observations from the principles of the theory of probabilities. He represented the law of probability of errors by a curve $y=\theta(x)$, x being any error and y its probability, and laid down three properties of this curve: (1) it is symmetric as to the Y-axis; (2) the X-axis is an asymptote, the probability of the error ∞ being 0; (3) the area inclosed is 1, it being certain that an error exists. He deduced also a formula for the mean of three

observations. Among the contributors to the general theory of probabilities in the nineteenth century have been, besides Laplace, Lacroix (1816), Littrow (1833), Quetelet (1853), Dedekind (1860), Helmert (1872), and Laurent (1873). On the geometric side the influence of Miller and *The Educational Times* has been marked.

PRO'BATE COURT (Lat. *probatus*, p.p. of *probare*, to test, examine, from *probus*, good). A court whose original functions consist in the probate of wills and the administration of decedents' estates. In 1857 by Act of Parliament (Court of Probate Act, 20–21 Vict., c. 77) an independent Court of Probate was created. To this were transferred from the ecclesiastical courts (q.v.) all powers and duties in probate matters. By the Judicature Act of 1873 (36–37 Vict., c. 66) it became a part of the Supreme Court of Judicature, under the title of the Probate Division. Besides the judges of this division of the High Court of Justice, there are various registrars, record keepers, and minor officials assigned to the registry districts into which the Kingdom is divided. Each district registrar has power to grant probate of wills or letters of administration upon estates of persons having a fixed abode within the district at the time of death, provided no opposition is made thereto. In case of litigation, however, the proceedings for probate must be taken in the first instance in the proper county court or in the Probate Division of the High Court.

In the United States probate courts have been temporal tribunals from the first. The various Colonies conferred the powers of proving and registering wills, of granting letters of administration and the like, upon some minor civil tribunal. In many of the States at present probate tribunals are distinct courts, with original and extensive jurisdiction not only over the probate of wills and the administration of decedents' estates, but over the appointment of guardians to minor and other legally incompetent persons, over petitions for the adoption of children and the change of names. In other States these functions are imposed by statute upon different local tribunals, such as district and county courts. Even in States of the former class the tribunals are variously designated, as courts of probate, surrogates' courts, ordinary's courts, or orphans' courts. They are always inferior courts from whose decisions appeals may be taken to higher tribunals. For their jurisdiction and powers, the statutes in each State must be consulted.

PROBATE DUTIES. See DEATH DUTIES.

PROBA'TION (Lat. *probatio*, from *probare*, to test, examine). In criminal law, a method of exercising judicial supervision over a person who has been convicted of crime without subjecting him to the penalty of imprisonment. As usually employed it is resorted to only in the case of misdemeanants and not of persons guilty of grave offenses and rarely of any but first offenders. In practice a probation officer is usually employed to exercise the needed supervision, the period of which is fixed by the court or sometimes by statute. This method of dealing with certain grades of offenders is growing in favor as a wise and humane modification of the criminal law. See IMPRISONMENT; PUNISHMENT; PAROLE.

PROBATION AFTER DEATH. A theological doctrine according to which man's future destiny is not unalterably fixed at death, but either all men or a certain class of men will be placed on trial in another life for a definite period or until they shall have yielded to God's redeeming love. In one form or another this doctrine has been held by many Jews and Christians since, under the influence of Persian and Greek thought, the idea of future punishment developed among them. (See HELL.) Scriptural support for the doctrine has generally been sought in 1 Peter iii. 19–20, iv. 6, in which a critical exegesis unquestionably is obliged to find the belief expressed that Jesus, after his death, went to Hades to proclaim the gospel to one class of the dead, viz., those who had been disobedient in the days of Noah. While the advocates of future probation have emphasized the necessity of actual knowledge of the life, teachings, death, and resurrection of Jesus, many defenders of the officially recognized system of eschatology have regarded such knowledge as of less importance than the moral and religious disposition that under favorable circumstances may find expression in a free and intelligent acceptance of Christ. Consult: I. A. Dorner, *System der christlichen Glaubenslehre* (Berlin, 1879–81; Eng. trans., Edinburgh, 1880–84); *Dorner on the Future State*, translation of the eschatological section of the preceding work by Newman Smyth (New York, 1883); S. M. Vernon, *Probation and Punishment* (ib., 1890). See ESCHATOLOGY; HEAVEN; HELL; IMMORTALITY; JUDGMENT, FINAL; UNIVERSALISM.

PROB'LEM (OF. *probleme*, Fr. *problème*, from Lat. *problema*, from Gk. *πρόβλημα*, problem, from *προβάλλειν*, *proballein*, to place before, from *πρό*, *pro*, before + *βάλλειν*, *ballein*, to throw). In

geometry, a proposition in which some operation or construction is required; e.g., the proposition "To construct an equilateral triangle" would be a problem. This is the common usage of the term at present, but it has not always been such. For the historical view, consult T. L. Heath, *The Thirteen Books of Euclid's Elements*, vol. i (Cambridge, 1908). See CONSTRUCTION.

PROBLEM OF THE THREE BODIES. An astronomical problem demanding the motion of three bodies attracting one another according to the law of gravitation. A complete solution of this problem has so far defied the mathematicians, although the general differential equations of the motion were given by Laplace. See CLAIRAUT.

PRO'BOSCID'EA (Neo-Lat., from Lat. *proboscis*, from Gk. *προβοσκίς*, *proboskis*, proboscis, from *πρό*, *pro*, before + *βόσκειν*, *boskein*, to feed). An order of mammals embracing the elephants (see ELEPHANT), living and extinct. The nearest relatives of the Proboscidea are the extinct Toxodontia on one hand and on the other the Hyracoidea. Consult Beddard, *Mammalia* (London, 1902).

PROBOS'CIS MONKEY, or NOSE-APE. A large, yellowish monkey with the head and long hair of the neck and shoulders chestnut. It is closely allied to the langurs, but is distinguished by having in the adult male a comically long nose, for which reason mainly it has been set apart in a separate genus and given the name *Nasalis larvatus*. This monkey is a native of Borneo, where it goes about in large bands, the habits of which are little known. It seems to be merely an aberrant form of the genus *Semnopithecus*. Consult D. G. Elliot, *A Review of the Primates* (New York, 1913). See Plate of MONKEYS OF THE OLD WORLD.

PRO'BUS, MARCUS AURELIUS. Roman Emperor 276–282 A.D. He was born at Sirmium in Pannonia about 232 A.D. Probus early entered the army, and had the fortune to receive favorable notice from the Emperor, Valerian, who raised him before the legal period to the rank of tribune. He distinguished himself against the Sarmatians on the Danube, and subsequently in Africa, Egypt, Asia, Germany, and Gaul, winning golden opinions from Valerian's successors, Gallienus, Claudius II, Aurelian, and Tacitus. By the last-named Emperor he was appointed governor of the whole of Rome's Asiatic possessions. Such was the zealous attachment evinced for him by his soldiers, that, on the death of Tacitus, they forced him to assume the purple; and his rival, Florianus, having been removed, Probus was enthusiastically hailed Emperor by all classes (276 A.D.). His brief reign was signalized by important successes. The Germans were driven out of Gaul with enormous slaughter, pursued into the heart of their own country, compelled to restore their plunder and to furnish a contingent to the Roman armies. Probus swept the barbarians from the Rhætian, Pannonian, and Thracian frontiers, and forced Persia to agree to a humiliating peace. On his return to Rome Probus devoted himself to the development of the internal resources of the Empire; but, as the Romans had now no enemies, the Emperor employed the soldiers as laborers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited the utmost irritation, and a body of them murdered him (October, 282 A.D.). Consult: Champigny, *Les Césars* (Paris, 1843); Hermann Schiller, *Geschichte der römischen Kaiserzeit*, vol. i (Gotha, 1883), and the article "Aurelius, 27," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. i (8th ed., Leipzig, 1914).

PROBUS, MARCUS VALERIUS. A Roman critic and grammarian, born at Berytus in Syria in the second half of the first century A.D. He devoted his attention chiefly to the archaic and classic literature of Rome, and made annotated editions of Horace, Vergil, Lucretius, Terence, and Persius, after the manner of the Alexandrian scholars. His biography of Persius is extant, but the extant commentary to Vergil's *Eclogues* and *Georgics*, and several grammatical treatises bearing his name, are probably the works of a grammarian of the fourth century. Probus is usually ranked among the greatest Roman philologists. Consult: Steub, *De Probis Grammaticis* (Jena, 1871); Henry Nettleship, *Lectures and Essays*, 2d series (Oxford, 1895); W. S. Teuffel, *Geschichte der römischen Litcratur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part ii (3d ed., Munich, 1913).

PROCE'DURE (OF. *procedure*, Fr. *procédure*, from Lat. *procedere*, to go forward, from *pro*, before, for + *cedere*, to go). In law, the successive steps or proceedings in the initiation and conduct of a judicial proceeding and the rules of law governing them. In its broadest sense the term includes evidence and pleading. In a narrower sense the term is used as synonymous with practice, which embraces the rules governing the form and manner of conducting the various steps in a legal proceeding other than the rules of evidence (q.v.) and the rules of pleading (q.v.).

The judicial proceeding may be directed towards the person, when it is said to be in personam; or it may be directed towards the property, when it is said to be in rem. See IN PERSONAM; IN REM; LAW.

In English jurisprudence three distinct systems of procedure corresponding and adapted to distinct systems of jurisprudence were developed respectively by the courts of common law, the courts of chancery, and the courts of admiralty.

Common-Law Procedure. The common-law procedure is much older than the procedure in either equity or admiralty as practiced by the English courts, the Curia Regis which was the forerunner of the English courts of Exchequer, Common Pleas, and King's Bench, in which the common-law procedure was developed, having been established during the reign of Henry I (1100–1135). The common-law procedure was early marked by extreme formality and by an increasing complexity, and ultimately it became necessary to simplify the system by means of legislation, which has resulted in the various forms of reformed common-law procedure in modern use in England and in most of the United States. See CODE.

The first step in an action at common law was the issuing of the original writ on application of the plaintiff, which commanded the sheriff to summon the defendant to give to the plaintiff the relief demanded by him or to appear before the next term of court and show cause why such relief should not be granted. The effect of the original writ was twofold. It gave the

court jurisdiction over the subject matter by authorizing it to proceed with all subsequent steps in the litigation. It also gave the court jurisdiction over the person of the defendant when the sheriff had executed the writ by serving it personally upon him. It could then issue its process or mandate compelling the attendance of the parties and witnesses, direct the filing of pleadings, summon and impanel a jury, and after trial and verdict enter judgment for the successful party and issue its execution or other mandate to the sheriff for the purpose of satisfying the judgment. Historically the original writ is also important, as from it the action took its form, since the plaintiff's pleading was required to conform to the allegations and demand for relief contained in the original writ. See FORMS OF ACTION.

The original writ having been issued and served upon the defendant, it then became his duty to appear in the proceeding and plead, and if necessary the court could compel his appearance by issuance of its process (q.v.) known as a judicial writ as distinguished from the original writ. The method of pleading and of trying the issues raised by the pleadings is fully considered under such titles as EVIDENCE; JURY; PLEADING; TRIAL.

During the course of the proceeding and after verdict the parties to the action might apply to the court for various forms of relief incidental to the proper conduct of the proceeding. Thus, upon application the court might use the subpœna to command the attendance of witnesses and punish for contempt; and after verdict the unsuccessful party might make motions for a direction of the court, in effect reversing or setting aside the verdict of the jury. Thus, the unsuccessful party might move: (*a*) for a new trial on the ground that the judge had not properly instructed the jury or that he had admitted or excluded evidence contrary to law or because of newly discovered evidence; or (*b*) he might move in arrest of judgment on the ground that some error on the face of the record vitiated all the proceedings; or (*c*) if the verdict was for the defendant, the plaintiff might move for judgment *non obstante veredicto*—without regard to the verdict—on the ground that he was entitled to judgment on the face of the pleadings; or (*d*) for a repleader, i.e., allowing the parties to plead anew because they had framed issues upon some immaterial matter; or (*e*) for a *venire facias de novo*, i.e., a judicial writ summoning a new jury because the jury at the trial in the action was guilty of some misconduct invalidating its verdict.

Upon the denial of these motions judgment was entered by the court, usually by signing of the judgment by a proper officer of the court, for the plaintiff (*quod recuperet*) or for the defendant (*nil capiat*) in accordance with the verdict. The successful party was then entitled to enforce the judgment by the writ of execution. (See ATTACHMENT; EXECUTION; JUDGMENT.) If, however, the unsuccessful party deemed the judgment erroneous in law, he was at liberty to remove the entire record of the case to a higher court for review upon suing out a writ of error, which, like the original writ, was issued out of chancery. See ERROR, WRIT OF.

Such in its barest outline was the method of procedure developed by the common-law courts. The material elements of the system, except possibly those of the system of pleading, remain unchanged, although there has been great modification of the minor details, chiefly in the direction of greater simplicity. The first of these changes was in the use of the original writ. By the use of a series of fictions the common-law courts came ultimately to dispense with the original writ as a means of acquiring jurisdiction, and the action was regularly begun by the issuance by the courts of law of their judicial process, the summons directly, instead of the original writ. In each of the United States there are now courts established by statute having general jurisdiction over actions and authorized to acquire jurisdiction over the person of litigants upon service of its summons or writ. The summons is still issued in the name of the court, but usually attorneys as officers of the court are authorized to issue the summons directly without application to the court. This is true also of many other forms of process, as, e.g., subpœnas to appear and testify and the writ of execution.

The various changes in the system of pleading, which are more substantial than any which have taken place in procedure proper, have been noted under that title, but the system of pleading has been indirectly modified by changes in procedure.

Common-law courts also exercised jurisdiction in personam by what were known as the extraordinary writs—certiorari (q.v.), habeas corpus (q.v.), quo warranto (q.v.), and mandamus (q.v.).

For the procedure in criminal actions, see GRAND JURY; INDICTMENT; JURY; PROSECUTION; PROSECUTOR; PUNISHMENT; ETC.

Equity Procedure. Procedure in equity is much simpler than the procedure at common law. Its essential characteristics are based on the fact that the jurisdiction of equity is in personam and that the sole power of that court is to command things to be done and not directly to transfer or otherwise affect the rights of litigants. The first step in a proceeding in equity was to file in the office of the clerk of the court the bill, which is the plaintiff's first pleading. Inasmuch as a court of equity acts in personam only, it can deal adequately with a many-sided controversy. There was consequently no limit to the number of parties to the proceeding, whose interests might be as diverse as their number, provided they were all interested in the controversy, and they might be brought into the proceeding by a proper bill. Upon service of the subpœna the plaintiff then became entitled to an answer, failing which he was entitled upon the default of the defendant to the relief asked by the bill, or he could apply to have an attachment issued compelling the defendant to answer. Upon a determination of the questions raised by the pleadings and at the trial, the court might then make its decree adjusting the rights of all parties and commanding them to carry out its directions. If a party refused to obey the decree or order and was willing to accept the punishment for contempt, the court of equity was powerless to execute its decrees; but in modern practice this contingency is avoided by statutes authorizing the court to appoint an officer of the court to do the act required by the decree to be performed by a party and with the same legal effect. See EQUITY.

At any stage of the proceeding, or even before service of process, the court may grant interlocutory or intermediate relief to prevent injury to the parties or the subject of the suit pending the litigation. This is usually in the form of a temporary injunction (q.v.) or the appointment of a receiver (q.v.). Equity procedure, when it has been maintained as a distinct system, as in the United States courts and in a few States, notably New Jersey, has undergone no substantial change; and when modification has been adopted it has been usually accomplished by rules of court.

Admiralty Procedure. Procedure in admiralty was founded upon the civil law, and corresponds in many particulars to the equity system. It was much more simple and expeditious than the procedure of the common-law courts. It was adapted to proceedings either in rem or in personam, and, indeed, both forms of remedy might be had in a single proceeding.

The first step in an Admiralty proceeding was the filing of the libel, which, like the bill in equity, was both the plaintiff's or libellant's first pleading and a petition to the Admiralty Court to issue its writ or process, which was executed by an officer of the court by personally serving it upon the respondent in case the proceeding was in personam or by taking possession of the property in case the proceeding was in rem. As in equity practice the libellant might compel the defendant to give discovery (see PLEADING) by annexing interrogatories to his libel. If the respondent failed to appear the libel was taken *pro confesso* upon the default, and an appropriate decree was rendered. Upon the appearance of the respondent he might either except to the libel or file his answer. The exception might be peremptory, when it was in substance like a demurrer to the substance of the libel; or it might be dilatory, when it was in effect like a demurrer to the form of the libel or a motion to strike out irrelevant or scandalous matter. The effect of the peremptory exception, if sustained, was the dismissal of the bill; otherwise the respondent was required to answer. In the case of a dilatory exception, if sustained, the libellant was required to correct his libel by amendment so as to make it formally correct, otherwise the respondent was required to answer. The answer might set up any matter of defense or an independent claim against the libellant, when the answer was called a cross libel. No attempt was made to reduce the matter in dispute to a single issue as in the pleadings at common law. As in equity all evidence was usually taken before a commissioner or corresponding officer of the court and then submitted to the court, and as in equity the judgment of the court might be embodied in an interlocutory decree followed by a final decree.

Incidental relief might be granted during the progress of the litigation upon petition, if the application was *ex parte*, or by motion, when notice was given to the other litigants. Thus, the court might authorize the sale of perishable goods and the appropriation of the proceeds as directed by the final decree, or it might authorize the return of property from the litigation upon the filing of a proper bond.

Admiralty procedure has undergone but slight modification, and that, as in equity, has been effected for the most part by rules of court.

Codes of Procedure. The embarrassment experienced as a consequence of the technical character of the common-law procedure led to various attempts at reform by legislation. The earliest of these was directed towards a simplification of the system of pleading, and has been referred to under that title. In 1848 the Legislature of New York adopted a civil code which was intended to be a complete codification of procedure both in law and in equity. The New York code served as a model for similar legislation in many other States, while most of the remaining States, though nominally not code States, have so far revised their systems of procedure as to have systems substantially like the codes of procedure. Owing to the inherent difficulties in acceptably codifying a system so complex as the law of procedure, the codes have required frequent amendment and revision, despite which they are still found to have perpetuated many of the faults of the common-law system.

The following are some of the more important changes effected both by the codes and the various statutes enacted for the purpose of reforming procedure. All formal distinctions between the procedure at law and in equity have been abolished, and while the methods of trial in the one case by a jury and in the other by the court have been preserved, the same court sits both as a court of law and a court of equity. Interlocutory or provisional remedies have been created by which in certain cases the plaintiff is enabled to procure a preliminary writ of attachment directed against the property or person of the defendant pending the litigation. Provision is also made for various motions to correct or amend the pleadings and for examination of witnesses and parties before trial; and the law relating to injunction and receivers is frequently regulated wholly by statute. Various provisions are also made to aid in the enforcement of judgments, usually by way of supplementary proceedings for examination of the judgment debtor and the appointment of receivers to collect sums due to him and apply them in satisfaction of the judgment.

PROCEEDINGS, LEGAL. See LEGAL PROCEEDINGS.

PROCEEDINGS, SUMMARY. See SUMMARY PROCEEDINGS.

PROCEEDINGS, SUPPLEMENTARY. See SUPPLEMENTARY PROCEEDINGS.

PROCESS, prŏs'ĕs *or* prō'sĕs (OF. *proces*, Fr. *procès*, from Lat. *processus*, a going forward,

from *procedere*, to go forward). In law, a comprehensive term, including all mandates of a court, in either civil or criminal actions or proceedings, whether directed to an officer thereof or to an individual. The term is also sometimes rather loosely employed to designate all the proceedings in an action or legal proceeding, and it is in this sense that it is used in the familiar phrase "due process of law." However, the word "procedure" is a much better term for that purpose, as it includes many steps in an action which could not strictly be termed process, e.g., the argument of a case. Process is usually issued in the name of and under the seal of a court by an officer thereof, but in some States where code practice prevails certain processes, such as civil summons and subpœnas, may be issued in the name of the proper court by an attorney in his capacity as an officer of the court. Under the common-law practice original process was the original writ by which the action was commenced, and mesne process (q.v.) was that which was issued afterward and during the progress of the action. Disobedience of process is contempt (q.v.) of court. See ACTION; PROCEDURE; SUMMONS; SUBPŒNA.

In patent law a process is a mode or manner of accomplishing a particular result by the application or combination of elements or natural forces. See DUE PROCESS OF LAW; PATENT.

PROCES'SIONAL (ML. *processionale*, from Lat. *processio*, procession, from *procedere*, to go forward). The service book which contains the prayers, hymns, and general ceremonial of the different processions in the Roman Catholic church. Many forms of the ritual for this part of the service exist, but the processional approved for common use is that of Rome, of which many editions have been published.

PROCESSION OF THE HOLY GHOST. A theological term used to describe the origin or proceeding of the third person of the blessed Trinity. In the early Church controversies were concerned chiefly with the second person, and the question as to the origin of the Holy Spirit was not raised. In the form of the Niceno-Constantinopolitan creed used by the Greek church it is said simply that the Holy Ghost "proceedeth from the Father." This was understood in the Latin church to mean that, as the Son proceeds from the Father, so the Holy Ghost proceeds from both the Father and the Son, and in the course of time the words "and from the Son" (*filioque*) were added in the churches of the West. This furnished the occasion for the formal separation of Eastern and Western Christianity, and has always been one of the chief contentions between the Latin and Greek churches. See CREEDS AND CONFESSIONS; FILIOQUE; GREEK CHURCH.

PROCHEIN AMI, prō-shān' ā-mē'. The old Norman-French law phrase for "next friend." See NEXT FRIEND.

PROCHLO'RITE. A prominent mineral in the group of chlorites (q.v.), containing iron, magnesium, and aluminium. It is monoclinic in crystallization, but the crystals are small and distorted, the massive foliated and granular varieties being more common. The color varies from grass green to blackish green and the lustre from feebly pearly to dull. Prochlorite is frequently found in chloritic and talcose rocks and in serpentine.

PROCIDA, prō'chē-dà. A small island off the west coast of Italy, situated between the island of Ischia and the mainland, north of the entrance to the Bay of Naples (Map: Italy, D 4). It is about 1 mile wide and 2 miles long, and of volcanic origin, but low and flat. Two semicircular bays on the south coast are the remains of submerged craters. The island is fertile and populous, having in 1911 a population of 14,440, engaged in vine and fruit culture and tunny fishery. The town of Procida on the east coast lies at the foot of a precipitous rock crowned by a castle. Its population is 4603.

PROCIDA, JOHN OF. A tragedy by James Sheridan Knowles (1840).

PROCLAMATION OF EMANCIPATION. See EMANCIPATION, PROCLAMATION OF.

PRO'CLUS, or PROC'ULUS (Lat., from Gk. Πρόκλος, *Proklos*) (410–485 A.D.). The last important teacher among the Greek Neoplatonists. (See NEOPLATONISM.) He was born at Constantinople, brought up at Xanthus in Lycia, and first trained in philosophy at Alexandria by the Aristotelian Olympiodorus. In Athens he was a disciple of the Neoplatonists Plutarch and Syrianus, and about 450 he succeeded the latter in the chair of philosophy. Hence he received the name Diadochos (the successor); others think of him as successor to Plato. He is said to have had the greatest influence among his contemporaries because of his learning and piety. He is sometimes known as "the Scholastic among Greek philosophers," because he labored to collate, arrange, and reduce to a rigidly scientific system the mass of older philosophy which had come down to him. His teaching was a development of that of his master, Plotinus (q.v.), but is still more mystical and difficult to understand, combining the most transcendental speculation with the common superstitions of his age. Certain features remind us strongly of Gnosticism, and his teaching on evil seems to have been the source of the doctrine of Dionysius the Areopagite. Among his works, of which there is as yet no complete edition, the most important are his commentaries to certain of Plato's dialogues and also his work on *Platonic Theology*. His *Philosophical and Theological Institutions* in 211 chapters is a compendium of the principles of Neoplatonism. Important are his treatises on *Providence and Fate, Doubts about Providence, the Nature of Evil*, etc. His work in 18 books against the Christians, mentioned by Suidas, has been lost. He also produced certain encyclopædic works, including a commentary on Hesiod, Euclid, and Ptolemy and a book *On the Sphere*. Certain hymns by him have also been preserved. Some of these writings are known to us only in translation. Among the partial editions of his works may be named: *Procli Opera*, edited by Cousin (6 vols., Paris, 1820–27; 2d ed., 1864); a commentary on Plato's *Parmenides*, edited by Stallbaum (Leipzig, 1839, 1848); on Plato's *Timæus*, edited by Schneider (Breslau, 1847); on Plato's *Republic*, edited by Schöll (Berlin, 1886), edited by Kroll (2 vols., Leipzig, 1899–1901). There are English translations of the *Philosophical and Mathematical Commentaries*, by Taylor (2 vols., London, 1792); of the *Platonic Theology* and minor philosophical and theological treatises by the same (2 vols., ib., 1816); and of the *Commentary on the Timæus* (2 vols., ib., 1820). Consult: Eduard Zeller, *Philosophie der Griechen* (3d ed., Leipzig, 1881); J. E. Sandys,

A History of Classical Scholarship, vol. i (2d ed., Cambridge, 1906); T. Whittaker, *The Neo-Platonists* (ib., 1901); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

PROCNE, prŏk'nē (Lat., from Gk. Πρόκνη, *Prokne*). In Greek legend, the wife of Tereus and the sister of Philomela (q.v.).

PROCONSUL (Lat., deputy consul). Originally a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul (q.v.), not, however, including Rome and its immediate vicinity. In early times the proconsul was an ex-consul who, on completing his term of office, received a continuation of the *imperium* in order to enable him to bring an unfinished campaign to a close. The duration of the office was one year. In the later period, when conquests had added foreign provinces to the Roman rule, the consuls, on giving up their position, received, as proconsuls, either the conduct of a war or the administration of a province. Occasionally the office of proconsul, with the government of a province, was conferred on a person who had never held the consulship. In the reorganization of the Roman Empire the administration of the provinces was divided between the Emperor and the senate, and the title "proconsul" was confined to the governors of senatorial provinces. Under Constantine parts of certain dioceses came to be governed by proconsuls.

PROCOPE, prō'kŏp', Café. The first and most famous of Parisian cafés, situated opposite the Comédie Française when that theatre was opened in 1689, and still existing. Among its frequenters were Voltaire, Rousseau, Robespierre, Gambetta, and other famous men. A journal, *Le Procope*, published by the proprietor of the café, was founded in the seventeenth century to record the history of the café and its frequenters.

PROCO'PIUS (Lat., from Gk. Προκόπιος, *Prokopios*). The best known of the 16 Byzantine historians. He was born at Cæsarea in Palestine about 500 A.D., went to Constantinople when still a young man, and acquired there so high a reputation as a professor of rhetoric that Belisarius (q.v.) appointed him his private secretary (527). Procopius accompanied the great warrior in all his important campaigns in Asia, Africa, and Italy, and appears to have displayed remarkable practical as well as literary talent, for we find him placed at the head both of the commissariat department and of the Byzantine navy. He returned to Constantinople shortly before 542, and was highly honored by Justinian; some scholars identify him with the Procopius who is known to have been appointed prefect of the metropolis in 562. His death occurred, it is thought, about three years later. Procopius' principal works (all in Greek) are his *Historiæ*, in eight books (two on the Persian wars, from 408 to 553; two on the wars with the Vandals, from 395 to 545; four on the Gothic wars, going down to 553); *Ctismata*, or six books on the buildings erected or restored by Justinian; and *Anecdota*, or *Historia Arcana* (which some have been unwilling to attribute to Procopius), a sort of *Chronique scandaleuse* of the court of Justinian, most of whose piquant passages were transferred by Gibbon to the footnotes of his *Decline and Fall of the Roman Empire*. They remained one of the French memoirs of the court under the old régime. The most valuable of his productions is the first. Procopius is the principal authority for the reign of Justinian. His style is pure, vigorous, and flexible. The best complete edition of his works is that by J. Hawry (3 vols., Leipzig, 1905). There is an early English translation of the *Historiæ* by H. Holcroft (London, 1653), and one of the *Ctismata* by A. Stewart (ib., 1888). The section on the Gothic wars has been edited with an Italian translation by Comparetti (3 vols., Rome, 1895–98). Consult: Marrast, *Esquisses Byzantines* (Paris, 1874); Hernerden, *Ad Procopium* (Leipzig, 1906); J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., ib., 1906); H. T. Peck, *A History of Classical Philology* (New York, 1911); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

PROCOPIUS, or **PROKOP**, Andrew (c.1380–1434). A Hussite leader, known as Procopius the Great. He is also sometimes called the Holy, or the Shaven, in allusion to his having received the tonsure in early life. He studied in Prague, and after traveling for several years in foreign countries he returned to Bohemia and entered the ranks of the insurgent Hussites. His military genius soon raised him to the rank of an influential commander, although he did not fight in the battle which he directed. On the death of Ziska (q.v.), in 1424, Procopius was elected by the Taborites, who formed the radical section of the Hussites, as their leader. In the ensuing years he ravaged Austria, and in 1426 vanquished the crusading armies of central Germany at Aussig. In the meanwhile another body of Taborites, who called themselves Orphans, had overrun Lusatia and burned Lauban, under the leadership of Procopius the Lesser, or Younger, who now, in concert with the more distinguished Procopius, attacked Silesia and took part in those internal feuds of the Hussite factions by which Bohemia was almost wholly ruined. From 1428 to 1430 Procopius directed raids against Hungary, Silesia, Saxony, Franconia, and other neighboring lands, which were successful and caused the Hussites to be dreaded. The Emperor Sigismund attempted to treat with him, but was unsuccessful, and in 1431 Procopius decisively defeated a German army at Tauss. In 1433 the moderate Hussites, or Calixtines, accepted the terms offered by the Catholic party. The Taborites and Orphans, under the leadership of Procopius the Great and Procopius the Lesser, refused, however, to have anything to do with the Pope, and hence dissensions arose between them and the more moderate of the Hussites. After many lesser encounters between these factions, a decisive battle was fought near Böhmisch-Brod on May 30, 1434, in which both Procopius the Great and Procopius the Lesser were slain. Consult Mandell Creighton, *History of the Papacy*, vol. ii (London, 1902). See Hussites.

PRO'CRIS. See Cephalus.

PROCRUSTES, prō-krŭs'tēz (Lat., from Gk. Προκρούστης, *Prokroustēs*, the stretcher, from προκρούειν, *prokrouein*, to beat out, stretch). The surname of a celebrated Greek robber who lived near Eleusis in Attica, named Damastes, or Polypemon. According to the ancient legend he had two beds, one short, the other long. If a short traveler came to him, he placed him

on the long bed and hammered or stretched him out to fit; tall visitors he placed on the short bed and cut down to the proper length. Other writers speak of but one bed. On his journey from Troezen to Attica Theseus killed Procrustes in the same way the latter had slain his victims. Consult Plutarch, *Theseus*, 11.

PROC'TER, ADELAIDE ANNE (1825–64). An English poet, the eldest daughter of Bryan Waller Procter. She was born in London. In 1853 she became a contributor of verses to *Household Words*, under the nom de plume of Mary Berwick, and attracted the attention of Charles Dickens, who did much in the way of introducing her contributions to the public. In 1858 her collected poems were published in two volumes under the title of *Legends and Lyrics: A Book of Verse*. A number of editions were subsequently published, new verses being supplied to several of them, and for the edition of 1866, the tenth, Charles Dickens supplied a memoir. Far from being a great poet, she still expressed herself with sincerity and charm. Her verses include several hymns that have retained their popularity. She was a cousin of Archbishop E. W. Benson (q.v.).

PROCTER, BRYAN WALLER (1787–1874). An English poet, better known as BARRY CORNWALL. He was born at Leeds and was educated at Harrow, where he met Peel and Byron. He settled in London, where he was called to the bar and practiced as conveyancer. Shortly after the death of his father (1816) Procter joined the circle of Leigh Hunt and Charles Lamb and married (1824) a stepdaughter of Basil Montagu. He was commissioner in lunacy from 1832 to 1861. Procter's principal publications were: *Dramatic Scenes and Other Poems* (1819); *Marcian Colonna and Other Poems* (1820); *A Sicilian Story and Other Poems* (1820); *Mirandola*, a tragedy (1821); *The Flood of Thessaly* (1823); *English Songs* (1832). To the last half of his life belongs his delightful *Charles Lamb*, a memoir (1866–68). His *Essays and Tales in Prose* were collected in 1853. Procter wrote nearly 300 songs on a wide range of theme. It may fairly be said that he restored to the English lyric the melody that it had among the Elizabethans. Consult Coventry Patmore, *Life of B. W. Procter* (London, 1877), containing the fragment of an autobiography, and E. T. Mason, in *Personal Traits of British Authors*, vol. iii (Boston, 1885).

PROC'TOR. A town and village in Rutland Co., Vt., 6 miles north of Rutland, on the Clarendon and Pittsford and the Rutland railroads (Map: Vermont, A 5). It has a hospital and a public library. The quarrying and finishing of marble are the chief industries. Pop. (town), 1900, 2136; 1910, 2871.

PROCTOR (abbrev. from OF. *procurator*, from Lat. *procurator*, manager, from *procurare*, to manage, from *pro*, before, for + *curare*, to care, from *cura*, care). In its legal sense, originally one of the body of men who had the exclusive privilege of appearing in the ecclesiastical and admiralty courts of England; now any attorney who practices in either of these courts or in a probate court. The former proctors were admitted to practice only by a commission issued in the name of the Archbishop of Canterbury. A proctor might have an advocate do the actual pleading or trial work for him, but he alone could bring and conduct the proceedings in his own name.

On the transfer of the jurisdiction of the ecclesiastical courts over the probate of wills, the administration of estates, and matrimonial causes, to the probate and divorce divisions, the proctors practicing in the former courts were empowered to appear in all the courts of equity and common law in England. In 1877 the Solicitors Act provided that all solicitors should have power to practice as proctors on their admission without further examination. Upon the abolition of the old judicial system of England by the Judicature Acts (q.v.), the authority to practice in both the new courts was given to both proctors and solicitors. Therefore, in England to-day, the old legal distinction between proctors and other members of the bar has been abolished.

However, in both England and, to some extent, the United States the title "proctor" is still applied to practitioners in the surrogates, probate, and admiralty courts, merely as a matter of description and without any special legal signification. See ATTORNEY; LAWYER; SOLICITOR.

By other uses of the term in England it is applied to the representatives of the parochial clergy in convocation (q.v.) and to officers charged with the maintenance of discipline among undergraduates in Oxford, Cambridge, and other universities.

PROCTOR, A(LEXANDER) PHIMISTER (1862–). An American sculptor and painter. He was born at Bozanquit, Ontario, but early removed to the United States. As a boy he began to sketch wild animals in the Rocky Mountains. Later he studied at the National Academy of Design and the Art Students' League, New York, and in Paris under Puech and Injalbert. His studies of animals, which first attracted attention at the Chicago World's Fair, are novel, personal, and powerful. Among his best-known statues and groups are the quadriga for the United States pavilion at the Paris Exposition (1900); the "Panthers" (Prospect Park, Brooklyn); the "Lions" (McKinley Monument, Buffalo); and the statuettes "Puma," "Dog with Bone," "Fawn," and "Fate" (Metropolitan Museum, New York). Proctor received gold medals at Paris (1900), St. Louis (1904), and San Francisco (1915), and was elected a National Academician in 1904.

PROCTOR, REDFIELD (1831–1908). An American political leader and cabinet officer. He was born in Proctorsville, Vt., and graduated at Dartmouth College in 1851 and from the Albany Law School in 1859. He served throughout the Civil War, rising from a lieutenancy in the Third Vermont Volunteer Infantry to be colonel of the Fifteenth Vermont, taking part in the battle of Gettysburg. After some practice of law he devoted himself to his extensive quarry interests, in which he accumulated a large fortune. After several terms in the State Legislature, during which period he was author of the law authorizing formation of corporations, he served from 1876 to 1878 as Lieutenant Governor, and from 1878 to 1880 as Governor. In 1889 he entered the cabinet of President Harrison as Secretary of War, resigning in 1891 to accept an appointment as United States Senator, succeeding George F. Edmunds. He was elected for a full term of six years in 1893 and was reëlected in 1899 and in 1905. Early in 1898 he visited Cuba to inform himself as to conditions in the island, and on the information obtained by him, especially regarding

Weyler's reconcentrado system, the McKinley administration's decision to adopt a policy of intervention is said to have been largely based.

PROCTOR, RICHARD ANTHONY (1837–88). An English astronomer, born at Chelsea, London. He was educated at King's College, London, and at Cambridge, where he was twenty-third wrangler. He devoted himself for some time to literary pursuits and wrote articles for the *Popular Science Review* and other magazines. He edited the *Proceedings* of the Royal Astronomical Society in 1872–73, constructed star charts and made researches into the transits of Venus in 1874. He visited America and lectured in 1873–74, 1875–76, 1881, and 1884, when he settled in Missouri. He removed to Florida in 1887, but was summoned on business to England in 1888. He died in New York on his way to England. He was one of the greatest popularizers of science and founded *Knowledge,* a popular scientific magazine, in 1881. Among his works are: *Saturn and his System* (1865); *Half Hours with the Telescope* (1868); *Other Worlds than Ours* (1870); *The Sun* (1871); *The Orbs around Us* (1872); *Transits of Venus* (1874); *Our Place among the Infinities* (1875); *A Treatise on the Cycloid, etc.* (1878); *The Romance of Astronomy* (1880); *Hereditary Traits* (1882); *The Great Pyramid* (1883); *Nature Studies* (1883); *The Universe of Suns* (1884); *Other Suns than Ours* (1885). His *Old and New Astronomy,* upon which he was engaged at the time of his death, was completed by A. C. Ranyard and published in 1892.

PROCU'LIANS. A school or sect of Roman jurists during the first two centuries of the Christian era. Its origin was ascribed to Labeo, the most distinguished jurist of the Augustan age and head of one of the Roman law schools, as the origin of the rival Sabinian sect was ascribed to Capito, head of another law school. Each sect, however, took its name from a successor of its founder: the Proculians from Proculus, who was head, after the elder Nerva, of the law school established by Labeo. Among the noted Proculians were the younger Nerva and Pegasus in the first century, the younger Celsus and Neratius in the second. Consult James Muirhead, *Historical Introduction to the Private Law of Rome* (2d ed., New York, 1899). See CIVIL LAW; SABINIANS.

PROC'URATOR-FIS'CAL. In Scotland, a public prosecutor in criminal cases, corresponding somewhat to the district or prosecuting attorneys in the United States.

PROCURER, prō-kūr'ẽr. One who by enticement, force, or other means procures a woman for defilement by another or for prostitution. At common law a procurer was punishable only if he resorted to some act in itself unlawful to accomplish his purpose, as abduction, assault, false imprisonment, drugging, or seduction under promise of marriage. By statute, however, in most civilized countries, including all the American States, the act of procuring a woman for immoral purposes has been made a criminal offense, punishable by fine and imprisonment. See PROSTITUTION; WHITE-SLAVE TRAFFIC.

PROD'ICUS OF CEOS (Lat., from Gk. Πρόδικος, *Prodikos*) (c.460–c.395 B.C.). One of the Greek Sophists (q.v.), long famous at Athens as public speaker and as teacher of rhetoric and ethics. The titles of two of his treatises, *On Nature* and *On the Nature of Man,* are known. He won especial fame by his effort to give precision to the use of words; in this connection his discourse *On Propriety in Language* enjoyed a high reputation. Famous, too, was his apologue, *The Choice of Heracles,* of which we have a version in Xenophon, *Memorabilia,* ii, 1, 21 ff. Consult W. C. Wright, *A Short History of Greek Literature* (New York, 1907), and Christ-Schmid, *Geschichte der griechischen Litteratur,* vol. i, part i (5th ed., Munich, 1908).

PRODUCE EXCHANGE. See EXCHANGE.

PRODUCER GAS ENGINES. See GAS ENGINE; INTERNAL-COMBUSTION ENGINE

PRODUC'TION (Lat. *productio,* a lengthening, from *producere,* to lead forth, from *pro,* before, for + *ducere,* to lead). One of the traditional divisions of political economy, devoted mainly to the consideration of the factors which affect the amount of wealth produced. Among the subjects included under production the chief are: labor and the conditions determining its efficiency; land, and the law of diminishing returns; capital, its origin and productive relations; and the organization of industry. In some of the later works on political economy the treatment of production is merged with that of distribution. See CONSUMPTION; COÖPERATION; DISTRIBUTION; EXCHANGE; POLITICAL ECONOMY.

PRODUC'TUS (Lat. *productus,* prolonged, led forward, p.p. of *producere,* to lead forward, produce). An important genus of fossil brachiopods found in Upper Devonian and especially in Carboniferous rocks. The shells are usually semicircular in outline, with straight hinge line, concave or flat dorsal and very convex ventral valve, both of which are often much produced anteriorly. The beak of the dorsal valve is depressed, while that of the ventral valve is very prominent and often projects far behind the hinge line. The outer surface has radial or concentric wrinkles, and the ventral valve has generally a number of long curved hollow spines by which the shell was anchored to the muddy or sandy bottom. The genus *Productus* is a well-known index fossil of the Carboniferous system. Consult Hall and Clarke, "Introduction to the Study of the Genera of Palæozoic Brachiopoda," in *Palæontology of New York,* vol. viii, part i (Albany, 1892).

PRO ECCLESIA ET PONTIFICE, prō ĕk-klē'shĭ-ȧ ĕt pŏn-tĭf'ĭ-sē (Lat., For Church and Pope). A papal order instituted in 1888 by Pope Leo XIII on the occasion of the jubilee commemorating the fiftieth anniversary of his entrance into the priesthood. The silver cross of the order bears the papal arms surrounded by the motto *Pro Ecclesia et Pontifice,* with the date of foundation on the arms of the cross. On the reverse is a bust of Leo XIII with comets on the arms of the cross. The order is conferred in recognition of devotion to the papacy.

PRŒTUS, prē'tŭs (Lat., from Gk. Προῖτος, *Proitos*). The son of Abas. He was expelled from Argos by his twin brother Acrisius (see DANAË), but with the assistance of Iobates of Lycia was restored to his Kingdom. His three daughters were made mad by Dionysus or Here, and the contagion spread among the other women of Argos. They were cured by Melampus and Bias, between whom Prœtus agreed to divide his Kingdom. Bellerophon (q.v.) was charged by the wife of Prœtus with improper proposals, and Prœtus attempted to put him to death by means of a letter to Iobates. Perseus turned Prœtus into stone through the sight of

the Medusa head in revenge for his having expelled Acrisius from his Kingdom.

PRŒTUS. A genus of trilobites, the species of which range through Ordovician to Carboniferous rocks and are particularly common in the Devonian. They were small animals with a convex elliptical carapace, semicircular head, with prominent rounded glabella and large eyes and distinct thickened margin. The thorax is made up of 10 segments, and its elevated axis is continued on to the semicircular marginate pygidium. See TRILOBITA.

PROFANITY. Judicially defined in an American case as the act of "irreverently, disrespectfully, or contemptuously taking the name of God in vain." Profanity was punishable as blasphemy by the ecclesiastical law in England and in the Puritan Commonwealths in the Colonial history of the United States. It is now a common-law offense and in many of the United States a statutory offense to use profanity in public; but it is not a crime to swear profanely to oneself or "in a proper place." See BLASPHEMY.

PROFERT (Lat., he produces). See OYER.

PROFESSIONAL EDUCATION. The training that fits men for the special vocations in which science is applied to the practical purposes of life. It supposes as its basis the knowledge and discipline which general culture affords. The leading professional schools in the United States, following the example set by European universities, require a liberal education as a prerequisite for matriculation.

Professional education in Europe conforms to two general types—the centralized systems of France and Germany and the more independent institutions of the British Isles. The French system since the Revolution has displayed at certain periods an extensive governmental control. This was confirmed by the Ferry legislation of 1879 and 1880 dealing with secondary and higher instruction and was relaxed somewhat by the Act of 1896, which enlarges the powers of the universities and the responsibility of the communities in which they are situated. The *baccalauréat*, or graduation from a secondary school, is now required for entrance to state professional courses. Preparation for the professions is afforded by the faculties and schools of the state universities and by the free (independent) faculties whose graduates must take the state examinations. There are 12 preparatory schools and 8 schools of full functions (*écoles de plein exercise*) teaching medical and pharmaceutical science, their students being examined for the doctorate by university faculties. The study of theology has been abolished in the state universities. In 1913 there were in the state institutions 16,763 students in law, 9744 in medicine, 1565 in pharmacy. There are, in addition to the state institutions, a number of private universities or free faculties (e.g., five in law and one in medicine and pharmacy), attended by about 1200 students. The course in law covers three years, certain requirements being added in each for a doctorate; in medicine four, after which two years must be spent in hospital practice. Midwives are obliged to study for a year in an institution of medical instruction and undergo an examination. Diplomas are granted to foreign students, which confer the doctor's degree without conveying the right to follow a specified profession in France. The government alone bestows degrees, with the exception of a few universities which grant their own degrees or diplomas to foreigners, but these have neither the standing nor the validity of government degrees. With a few exceptions the departments of France and Algiers maintain elementary primary normal schools for men and for women; some maintain superior primary normal schools; and Paris has two superior normal schools for men and for women teachers of secondary schools.

Professional training in Germany shows less than in France the influence of legislation and to a greater degree is built on the foundation of the early universities. The certificate of a Gymnasium admits to professional courses. The 21 universities maintain faculties of theology, jurisprudence, and medicine, with the exception of Münster, which has no medical school. In 1914 the students of theology numbered 6393; of law, 10,577; of medicine, pharmacy, and dentistry, 17,331. The numerous pedagogic systems which German thought has produced have profoundly influenced the special preparation of the teacher and stimulated the development of teachers' training schools.

Professional education in Great Britain and Ireland is supplied by the universities of Oxford, Cambridge, Scotland's four university foundations, the University of Dublin, Belfast University, and by a number of newer institutions, including London, Durham, Manchester, Liverpool, and Leeds National universities and the University of Wales. A joint board appointed by the four Inns of Court in London examines candidates for admission to legal study in the Inns, and the Council of Legal Education, nominated by the Inns, superintends studies and examines students for the bar. There are numerous provincial medical schools. The preparation of teachers has enlisted much effort, denominational and undenominational; and many training colleges, for women as well as for men, have been established.

In the United States only two professional schools existed in 1776—the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) and the medical department of King's (now Columbia) College, the former established in 1765, the latter in 1768. Harvard University Medical School was established in 1782 and the Dartmouth Medical College in 1797. Theological instruction was obtained in the few colleges then existing, which were usually provided with chairs in Hebrew and theology. Private schools of divinity were not unknown; but the theological seminary proper was the product of a somewhat later day. The Seminary of the Reformed Dutch Church was established in 1784; St. Mary's, in Baltimore, under the direction of the Society of St. Sulpice, in 1791; and the Theological Seminary of the Associate Presbyterian Church of North America, at Service, Beaver Co., Pa., 1794. The earliest law school in America was established at Litchfield, Conn., in 1784. The growth since the eighteenth century in the number, teaching force, equipment, endowment, and attendance of American professional schools has been remarkable. In 1913 there were 179 schools of theology, with 10,965 students, 1269 instructors, grounds and buildings worth $23,296,518, endowments amounting to $38,514,924, and libraries containing 2,933,587 volumes. The law schools numbered 124, having 20,878 students, 1460 instructors, grounds and buildings

valued at $5,458,822, endowment funds equal to $2,315,245, and 988,893 volumes in their libraries. Schools of medicine numbered 108, having 17,238 students, 7290 instructors, grounds and buildings worth $27,585,874, funds of the value of $12,679,436, and 626,307 volumes. The 48 dental schools were attended by 8015 students, instruction was given by 1441 instructors, the value of grounds and buildings was $2,785,237, and books numbered 108,118. There were 75 schools of pharmacy, with 6165 students and 784 instructors. There were 22 veterinary schools, with 2324 students, 350 instructors. Not fewer than 1094 schools, connected with hospitals, with courses of two or three years, were engaged in the training of nurses, the number of whom under instruction was 34,417. In 1833 the first teachers' classes were formed in New York academies. The first American normal school was established at Lexington, Mass., in 1839. The number of public normal schools in 1912–13 was 230, with an attendance of 87,172. There were also 54 private normal schools, with an attendance of 7283, while normal schools and high schools, aggregating 1480 institutions, were giving normal instruction to 121,506 students. That year 20,872 students graduated from normal schools. Delaware and Nevada are the only States without normal schools, and these make provision for the training of teachers. Engineering keeps step in development with the sciences of which it is an application and the material expansion which has called it forth. Provisions for instruction in the sciences which lead to the engineer's diploma have multiplied in an extraordinary degree in the last 50 years. The establishment of State colleges of agriculture and the mechanic arts in all the Commonwealths under the Federal Act of 1862 gave an impulse to education in husbandry and engineering, particularly the latter. In 1913 the departments of engineering and architecture in land-grant colleges and universities reported students as follows: mechanical engineering, 3830; civil engineering, 3392; electrical engineering, 3027; chemical engineering, 598; mining engineering, 796; textile engineering, 69; architecture, 713.

The following table shows the respective ratios at three different periods between the numbers engaged in seven of the professions and the total population:

	Clergymen	Lawyers	Physicians	Dentists	Veterinarians	Engineers	Teachers
1860	837	947	576	5,608	8,212	1,145	284
1890	710	699	598	3,579	9,643	1,448	183
1900	680	663	575	2,563	9,303	808	173
1910	679	752	582	2,299	7,910	452	148

The history of professional education is distinguished by the development of new professions, which for the most part have sprung out of the older professions by differentiation. Dentistry is an offshoot from the surgeon's art. Modern veterinary medicine may be said to have originated in attempts to apply the principles of pathology and therapeutics to treating the diseases of animals. In 1873 systematic training for nurses began in the Philadelphia Lying-in, Charity, and Nurse School, which opened in 1828. Medical practice has developed numerous specialties, such as the oculist's, the aurist's, the obstetrician's, besides the major division into physic and surgery. A comparatively recent division of medical practice is State medicine, which has to do with public restrictions for the protection of the general health. It should be noted that the profession of teaching is constantly subdividing; and in this movement a new educational function has been evolved, that of supervision and inspection, not yet recognized generally in special teaching courses, but accepted in all successful school systems. The decreasing proportion of men in the secondary schools of the United States is a fact which educators regard with interest and some concern.

Closely related to teaching is the new profession, librarianship, represented by 11 prominent schools, including the departments of library science maintained in several universities. The New York State Library School and the University of Illinois Library School admit only college graduates to the courses in library training. The course in these two institutions is two years and leads to the degree of B.L.S. Accountancy is taking rank as a profession and is so recognized by statute in New York, Pennsylvania, Maryland, and California. The last few years have recorded the appearance of commercial courses in universities and academies, leading to diplomas and certificates as well as a title, certified public accountant (C.P.A.), which is protected by law.

Some of the States have exercised a potent influence by assisting in the rapid extension of the high-school system, thus affording the means of a thorough preparation for the professional school. State universities maintaining professional and technical departments present still another form of State assistance. The United States government has no jurisdiction over the practice of professions in the several States, but, owing to the efforts of the organizations in the several professions within the last 30 years, much has been done by State Legislatures towards protecting the public against incompetency. The important work done by the American Medical Association and the Carnegie Foundation in raising the standards of medical education as well as the preliminary requirements may be mentioned. The latter institution is at present also coöperating with several engineering societies and with the American Bar Association in a study of the preparation for these respective professions. State supervision now extends to preliminary education, length of courses, degrees and the power to confer them, and entrance to practice, and is effected by means of registration, examination, and license. By registration the status of schools and colleges and the value of their credentials receive State approval, and their graduates are admitted to examination for license. The tendency of special schools to become connected with some recognized university has also had a very salutary effect on professional education.

PROFESSIONAL WOMEN'S LEAGUE, THE. An organization in New York City, incorporated in February, 1893. The aims of the league are to bring together women engaged in dramatic, musical, literary, artistic, and scientific pursuits for mutual help and encouragement, to offer pecuniary assistance when in need, to provide class instruction in literature, art, language, music, and other studies at lowest possible rates, and to assist members to obtain outfits necessary to securing employment. Active membership in the league is confined to women engaged in dramatic, musical, or literary pursuits. The dues for active and associate members alike are $7.50 a year, and in addition each member, upon being admitted to membership, pledges herself to contribute two articles yearly which can either be sold in the bazar or utilized in the costume department.

PROFESSOR, THE. A novel by Charlotte Brontë (1856), written in 1846.

PROFESSOR AT THE BREAKFAST TABLE, THE. A series of sketches and verses by Oliver Wendell Holmes, contributed to the *Atlantic Monthly* and published in 1860. The plan is the same as in *The Autocrat of the Breakfast Table*, but the tone is more serious.

PROFIT (OF., Fr. *profit*, from Lat. *profectus*, progress, increase, profit, from *proficere*, to advance, make progress, be advantageous, from *pro*, before, for + *facere*, to make). The excess in the selling price of goods above their cost of production. The term has been variously used, both in common speech and in economic writings, according to the conception of the elements entering into cost. Many of the earlier economists did not regard interest as a "cost" and hence included it under the term "profit." The rent of land, however, though not regarded as an element in cost, has not usually been classed with profit, although the term "agricultural profit" is not infrequently applied to it in popular writings.

Modern economists usually exclude from profit the normal or average return to capital, which is classed as interest (q.v.). Whatever an enterprise earns above interest, rent, and wages (including normal wages of management) is profit. If this net income is due to an artificial raising of prices through manipulation of supply, it is known as monopoly profit, or monopoly return. Various theories have been advanced to explain the nature and causes of nonmonopolistic profit. The oldest of these is the "risk theory," defended by Von Thünen and many later German and some American writers. A business undertaker necessarily incurs a large number of risks which are of too indefinite a nature to be covered by insurance. Since the chance of losing a certain sum is not compensated for by an equal chance of gaining the same sum, no one would undertake the management of business unless it normally afforded a greater volume of gains than of losses. The net gain, in this view, constitutes profit.

A second view, represented by Francis A. Walker, regards profit as a differential gain, imputable to superior management. Prices, it is held, are fixed in the long run by the cost to the least efficient managers who are able to continue production. All managers of greater efficiency produce at lower cost, thus securing a surplus analogous to rent (q.v.). A third theory, not differing from this in essence, ascribes profit to the scarcity of managers of the better grades. This theory sometimes confuses simple profit with monopoly return, through failure to distinguish between scarcity and monopoly values.

Finally, profit has been explained with reference to the dynamic elements that prevent industry from reaching an equilibrium. In this view, which is in the main that of J. B. Clark, labor and capital tend towards a state of uniform productivity, but, owing to friction and to technical improvements, may at any moment vary considerably in productive power. Since the pay of each unit of labor or of capital tends to equal the product of the unit least advantageously situated, those units which happen to be in the more productive situations yield a surplus or profit which the entrepreneur secures for himself. It would appear that the theories given are not mutually exclusive, but merely describe different elements in a composite form of income now commonly termed profit. See INTEREST; MONOPOLY.

PROFIT A PREN'DRE. A right to take profit, i.e., something produced or yielded by the land, from the land of another, as the right to take coal, minerals, gravel, seaweed, grass, game, etc. Profits, as they are shortly termed, are of three kinds: profits appendant, which are of common right and are apparently survivals of ancient common rights of pasturage; profits appurtenant, which may be exercised in another's land by the owner of and solely for the benefit of other land, known as the dominant tenement; and profits in gross, which are held by an individual as a personal right irrespective of any land that he may own. No new profits appendant can be set up, but profits appurtenant and in gross may be gained either by grant or by prescription, and may be alienated, the former as a general rule only as an incident of the land to which it is appurtenant, the latter to any one, but only as a single, entire right which may not, for fear of surcharging or overburdening the servient estate, be distributed among several owners. For the same reason a profit cannot be acquired by a community, as such, by custom. As late as Blackstone the term "common" was used in place of profit, as common of pasture, etc. See EASEMENT, and consult authorities referred to there and under PROPERTY.

PROFIT SHARING. A modified form of

the wages system by which wage earners receive a part of the surplus of the industry according to some understood plan. Overseers receive salaries, capitalists interest, wage earners wages, and what remains is divided among these classes, who all are responsible for success or failure. A part or all of the wage earner's share may be given in cash; or it may be held in trust, invested in capital stock as savings to be used by them in cases of emergency; or it may be used as a social, educational, or amusement fund.

Profit sharing is based upon the principle that work done varies with the degree of interest felt by those who perform it. Profits may be increased by the wage earner by increasing the quantity of the product, by improving its quality, by better care of implements, by a decreased loss of materials, by lessening superintendence, and by avoiding quarrels with employers. The extent to which profits may be increased varies also with the extent to which the wage earner is made a sharer in profits, the form in which his share is increased, his intelligence, and the character of the industry. Profit sharing has been successful in many industries, and has sometimes failed where the methods employed were copied from those which had met with success. Upon the whole profit sharing has been most successful in handicrafts where there is a stable market for the products and where the price paid for labor is a large part of the cost of production.

The origin of profit sharing is unknown. It is said that the American financier Albert Gallatin made a trial of it in his glassworks, established at New Geneva, Pa., in 1794. John S. Vandeleur, a disciple of Robert Owen, in 1831 tried an extensive experiment in profit sharing on an estate in the County of Clare, Ireland. It was successful in stimulating the interests of the laborers to the great improvement of the estate and of their condition, until it was unfortunately terminated through the loss of Vandeleur's entire property in consequence of his passion for gambling.

The first notably successful profit-sharing enterprise was begun by Le Claire, a French house painter, in 1842. At the time of his death, in 1872, $220,000 had been distributed to workmen as their share of the profits. According to his plan capitalists received 5 per cent on capital invested, managers were paid salaries, wage earners wages, and then from the profits remaining one-fourth went to the capitalist class, one-fourth to a Mutual Aid Association of Workmen, and one-half went to wage earners directly. Since Le Claire's death his business has been conducted on similar lines. At the present time the Association of Workmen receives 5 per cent of interest on its capital as a half owner of the business and also about 20 per cent additional to its wages, which are about as high as those paid for similar lines of work in Paris. Laroche Joubert, a paper manufacturer, adopted the system in 1843 and the Orléans Railroad Company in 1844. In 1847 J. H. von Thünen introduced the system on his estate near Zellow in Mecklenburg-Schwerin, where his son and grandson, succeeding in turn to the proprietorship, continued it in force. In 1875 there were about 75 profit-sharing establishments in France, and in 1878 a society of the proprietors and directors of these was formed in Paris for a comparative study of methods.

In the Bon Marché, one of the largest retail stores in the world, a scheme of profit sharing and industrial coöperation prevails. Of the capital to the amount of 20,000,000 francs, 7,500,000 is held by employees; 6 per cent is paid on capital. The profits shared assume four forms: the heads of departments to over 100, whether they have capital invested or not, participate in the profits according to the percentage of sales; the retiring fund draws about 5 per cent of the profits; the provident fund takes another share; and what remains is then divided pro rata. Another successful experiment in profit sharing was begun by Godin, a stove manufacturer, at Guise, about 1872. In the first 15 years $650,000 were distributed to the workmen in dividends, and a considerable amount besides was invested in capital stock. In France more than 100 such enterprises are managed with success at present. Elsewhere on the Continent there are comparatively few instances. According to a report of the Labor Department of the Board of Trade (1913) there were in the United Kingdom 133 instances of profit sharing in existence, with 106,189 employees. The report also enumerates 163 instances of abandoned schemes of profit sharing.

Conspicuous examples of successful profit sharing in the United States are those of the Proctor and Gamble Company, of Cincinnati, Ohio, and the N. O. Nelson Manufacturing Company, of St. Louis, Mo. The former company employs largely unskilled wage earners, who receive comparatively low wages. During the year 1886 the work of the company was interfered with by many strikes, and in the following year profit sharing was introduced to establish harmonious relations with the employees. Reasonable salaries were allowed the active members of the firm, interest was allowed on the capital, and the net profits were divided between the firm and "the employees, in the proportion that the wages paid bore to the whole cost of production." Although the profits received by the wage earners increased their income considerably, they were indifferent to the success of the enterprise until the company divided them into four groups based upon their interest in the work, its excellence, and the prevention of waste. The best group received twice the regular dividend, the second the regular, the third one-half the regular dividend, while the careless and indifferent received none at all. The wholesome influence of this discrimination was at once seen in larger dividends. The stockholders did not profit directly by this scheme, but the better profited at the expense of the poorer workmen. When the firm became a stock company, in 1890, wage earners were to receive a dividend of 12 per cent on wages, which was the same as the profits on common stock. The number of employees receiving profits increased from 225 in 1887 to 550 in 1899, the latter number being 92 per cent of the total number of wage earners. Employees are encouraged to become owners of stock, and 80 of them own 191 shares. Beginning with 1894, $500 is set aside semiannually as a pension fund, of which one-half is contributed by the company and the other half comes from the bonuses of the employees. Since the beginning of the experiment no strikes or labor difficulties have arisen. In 1894 the labor cost, including the 12 per cent bonus to wage earners, was only 63 per cent of what it had been in 1886.

The N. O. Nelson Company, brass manufacturers, of St. Louis, Mo., began a profit-sharing enterprise in 1886. The company pays out all sums needed in cases of sickness and disability as they occur, as a part of the costs of the business. Allowances are made for funeral expenses, and upon the death of an employee his family is supported to the extent of two-thirds of his wages until it is able to support itself. The crucial test of profit-sharing enterprises is given in periods of crises, when extra efforts of wage earners are not rewarded by dividends. It is then that wage earners lose interest in them, and the mortality rate of profit-sharing enterprises is high. For the first 10 years, 1887–97, the dividends to employees were large. In two years, 1893 and 1896, there were no dividends for employees. That no labor difficulties arose and that wage earners did not lose interest in profit sharing, even though wages were reduced one-fourth, was due largely to the wisdom of the company. Salaries and interest were reduced to the same extent as wages, but the one-fourth thus deducted from these shares was to be paid out of future profits before any bonuses were to be paid. In each instance it was not long before the company was on a dividend-paying basis, and profit sharing weathered the storm in safety. One other feature of the management of the N. O. Nelson Company shows how profit sharing may pave the way to industrial coöperation. In 1896 the company made a proposal to employees in the cabinetmaking shop which provided for the gradual purchase and management of the enterprise by the employees. The proposal, at first rejected, with a few changes was soon after accepted, and at present this department is owned and managed exclusively by employees.

On Jan. 1, 1903, the United States Steel Corporation announced a plan of profit sharing. Only those employees who hold positions of responsibility share directly in the profits of the corporation. If the net earnings for the year exceed $80,000,000, but are less than $90,000,000, 1 per cent of such earnings is to be distributed among the employees, the share to be determined by the finance committee, so as to permit the fullest recognition of merit. With every $10,000,000 increase in net earnings the share to be distributed increases by ⅛ per cent of such increase of earnings. Employees of lower classes are given favorable opportunities for becoming owners of the corporation stocks. Further to encourage the holding of stocks, those who buy such stocks and remain in the service of the company are to receive at the end of five years a bonus of 5 per cent annually on the face value of the stock held over and above the regular dividends, and the promise of a bonus at the end of another five years is given. The plan appears to have worked well. It has increased stability of employment and the loyalty to the company of the classes affected by it.

The most widely discussed plan of profit sharing in recent years is that instituted by Henry Ford in the Ford Motor Works of Detroit in 1914. According to this plan, of the estimated $20,000,000 net profits for the year, one-half was to be added in the form of a bonus to the wages of some 15,000 workers, thus creating three grades with wages of $5, $6, and $7 respectively, for an eight-hour day. The plan is not strictly a profit-sharing plan, since there is no prearranged division of profits, and is subject at any time to change at the will of the employer. Other features that differentiate it are the strict control over the private life of the employees—requirements as to thrift, standard of living, etc., and the more rigid discipline in the shops.

PROFLUVIUM. See FLUX.

PROGNO'SIS (Lat., from Gk. *πρόγνωσις*, foreknowledge, from *προγιγνώσκειν*, *prognōskein*, to know beforehand, from *πρό*, *pro*, before + *γιγνώσκειν*, *gignōskein*, to know). The opinion or decision of the physician as to the probable course and termination of a disease. As the case proceeds the rapidity or severity of the symptoms, the condition of the circulation, ability to take food, the integrity of the nervous system, are points which influence the prognosis. The usual questions to be answered by a skillful prognosis are as to whether the disease will terminate in death or recovery; if in recovery, whether permanent damage to any organ will result; if in death, the probable duration of the disease.

PRO'GRAMME MUSIC (Lat. *programma*, from Gk. *πρόγραμμα*, edict, from *προγράφειν*, *prographein*, to write before, from *πρό*, *pro*, before + *γράφειν*, *graphein*, to write). A term in music applied to purely instrumental works which are intended to reproduce by musical tones a series of definite ideas or events. The idea of reproducing characteristic sounds of nature by means of music is very old. We have a composition by Jannequin, *Cris de Paris*, published in 1529, in which are imitated the cries of Parisian fishmongers and venders of various commodities. In another, *La bataille*, the same composer imitates the rattling of musketry, trumpet signals, etc. In his "Pastoral Symphony" Beethoven reproduces the murmuring of the brook and the calls of various birds. Schubert in his famous song *Gretchen am Spinnrad* imitates admirably the hum and buzz of the spinning wheel by the figure in the accompaniment. But Schumann went further; he gave some purely instrumental works (Carneval) suggestive titles. These instances do not in reality constitute programme music. Some regard Berlioz (q.v.) as the founder of modern programme music. Although much of his music belongs to this category, he cannot be regarded as the real originator, because he constantly clung to the form of the classic symphony. The credit of establishing modern programme music as something new and independent of classic forms belongs to Liszt (q.v.), who wrote long orchestral works

(symphonic poems) in a free and very elastic form, where every measure is meant to depict some definite emotion or event. He found his inspiration in works of poetry or the plastic arts. Thus, *Die Hunnenschlacht* is intended to reproduce in musical tones the impression aroused by Kaulbach's famous picture. In his Dante and Faust symphonies Liszt has taken certain episodes from Dante and Goethe, and he intends to say in music what the two poets have said in words. The unifying principle is the leading motive (see LEITMOTIV), which is treated and developed as in the Wagnerian music drama. Wagner occupies a distinct position. In one sense his music is programme music, but it is dramatic, and always accompanies and illustrates the spoken word. And even in the purely instrumental passages, such as the Preludes, Siegfried's Rhine Journey, Funeral March (*Götterdämmerung*), his method of leading motives enables the hearer to follow every measure in detail. In spite of opposition progressive composers took up the new art, which gradually won favor. And when finally the greatest master of programme music, Richard Strauss (q.v.), gave to the world his wonderful tone poems (*Death and Apotheosis, Till Eulenspiegel, Ein Heldenleben*, etc.), all opposition was silenced. Another type of programme music, which dispenses with thematic development, confining itself rather to the delineation of moods and impressions, was inaugurated by Debussy (q.v.), and also found numerous followers. Consult W. Klatte, *Zur Geschichte der Programmusik* (Berlin, 1905), and O. Klauwell, *Geschichte der Programmusik* (Leipzig, 1910). See ABSOLUTE MUSIC; INSTRUMENTAL MUSIC.

PROGRESO, prō-grā'sō. A seaport of Mexico, situated on the north coast of the Yucatan peninsula, 25 miles north of Mérida (Map: Mexico, O 7). It is the port of that city, and is connected with it by railroad. It is the principal port of the State of Yucatan. Steamship lines connect the town with Vera Cruz and various ports of the United States. In 1911–12 it ranked third in importance among the Mexican seaports, with exports valued at $10,445,557 and imports $4,242,618. A United States consulate is located here. The chief export is sisal grass. Pop., 1900, 5175.

PROGRESS AND POVERTY. See GEORGE, HENRY.

PROGRES'SION (Lat. *progressio*, from *progredi*, to go forward, from *pro*, before, for + *gredi*, to go), or PROGRESSIVE EVOLUTION. Naegeli's principle of progression, or the transformation of species from internal causes. Long before Naegeli Van Baer vaguely wrote of the striving towards an ideal in development. Naegeli and his commentator, R. Hertwig, claimed that it cannot be denied that each species is compelled, by some peculiar internal cause, to develop into new forms independently of the environment and up to a certain degree independently of the struggle for existence. In all the branches of the animal kingdom, says Hertwig, we observe a progress going on from lower to higher, very often in a quite similar way, in spite of the fact that the species live under very different conditions of development. To a certain extent, then, an organism is independent of the external world, but the independence is never complete, and Naegeli has not so contended.

PROGRESSION. In music, a term applied to the succession of entire chords or of the individual tones composing any part. The former is called harmonic, the latter melodic, progression. See LEADING OF VOICES.

PROGRESSIONS, IN MATHEMATICS. See SERIES.

PROGRESSIVE BRETHREN. See CHURCH OF THE BRETHREN.

PROGRESSIVE PARTY. A national political party formally organized in a convention held at Chicago, Aug. 5–7, 1912. It is an offshoot of the Republican party, and its formal organization was the outcome of a radical movement within the Republican party dating from the late eighties. This movement was largely agrarian, having its seat in the Middle West, and aimed at the control of corporations, especially railway corporations, the abolition of trusts and other forms of monopoly, and the expulsion of representatives of the corporations from governmental positions of influence. The earliest active progressive Republican campaign was inaugurated in Wisconsin under the leadership of Robert La Follette in the early nineties. The campaign attained success in 1900 with the election of La Follette to the governorship. In 1902 La Follette succeeded in carrying through laws increasing the taxation of railways and instituting direct primaries. Later achievements of the La Follette régime were the organization of a railway commission with power to prescribe rates, an industrial commission with extensive powers over producing corporations, and the enactment of a workmen's compensation act. Other prominent leaders of the progressive movement were Governor Pingree of Michigan, who tried ineffectually to introduce direct primary legislation (1897–1900), Governor Albert Cummins of Iowa, Governor Hughes of New York, and Governor Hiram Johnson of California. The movement in Oregon reached a high development at the opening of the century, resulting in 1902 in a law introducing the initiative and referendum. In national affairs Progressive Republicanism appeared dominant in the second Roosevelt administration. In the reactionary Taft administration the progressive movement in Congress became clearly marked in 1909 in the fight against the Payne-Aldrich Tariff Bill, led by Beveridge, Bristow, Clapp, Cummins, Dolliver, and La Follette, and in 1910 in the fight on the House rules. The President threw his influence against the Progressives, and the latter organized a movement in the party against his renomination. La Follette was at first regarded as the logical candidate to oppose Taft, but, as he appeared not to develop sufficient strength, the majority of the Progressive Republicans went over to Roosevelt. In the Republican Convention held at Chicago, June 18–22, 1912, the Taft supporters, through their control of the National Committee and consequent power of determining all contests for seats in the convention, were able to assure a majority for Taft on the first ballot. It was not claimed that Roosevelt had enough uncontested delegates to nominate; but the Roosevelt supporters asserted that but for the "steam-roller" methods of the National Committee Taft would not have had sufficient delegates to nominate, certainly not on the first ballot. Roosevelt and many of his supporters withdrew from the convention and made arrangements to meet in an independent convention later. This convention, assembled August 5, unanimously nominated Roosevelt for

the presidency and Hiram Johnson of California for the vice presidency. The platform adopted, described as a "contract with the people," proposed a wide range of reforms, political and social economic. Under the first head were planks proposing the adoption of a constitutional amendment making the process of amending the Federal Constitution simpler, favoring direct primaries, including the presidential preference primary, the initiative, referendum, and recall. Under the latter head were planks favoring legislation to prevent industrial accidents, workmen's compensation laws, prohibition of child labor, establishment of minimum wages, relief of unemployment, etc. Strong planks were also adopted regarding conservation of national resources, the regulation of corporations through a commission analogous to the Interstate Commerce Commission, income and inheritance taxes, etc. In the campaign that followed, while many of the leaders of the progressive movement in the Republican party held aloof from the new party, a very large proportion of the rank and file of the Republican party joined the Progressives. Roosevelt received 4,126,020 votes, as compared with 3,483,922 for Taft, and 88 electors, as compared with 8 for Taft. Roosevelt carried the States of California, Michigan, Minnesota, Pennsylvania, South Dakota, and Washington, while Taft carried only Utah and Vermont. That the Progressive strength was drawn almost entirely from the Republicans is indicated by the extremely close relation between the popular vote for Wilson and that for Bryan in the preceding election.

In the gubernatorial elections of 1914 there appeared a manifest drift of Progressives back to the Republican party. Only in California was there any very marked increase in Progressive votes. It was a question widely discussed among Progressive leaders in 1915 whether the party as an independent organization had not fulfilled its purpose in effecting the defeat of Taft and the reactionaries in the Republican party in 1912. Consult: Munsey, *The New Progressive Party* (New York, 1912); Payne, *The Birth of a New Party* (ib., 1912); Roosevelt, *Progressive Principles* (ib., 1913); Duncan Clark, *The Progressive Movement* (ib., 1913); De Witt, *The Progressive Movement* (ib., 1915). See REPUBLICAN PARTY.

PROHIBITED DEGREES. The degrees of kinship and affinity within which persons are forbidden to intermarry. By the English Book of Common Prayer 30 such relations are stated as "forbidden in Scripture and our laws to marry together." The list there given comprehends all ascendants and descendants in the direct line as well as all those of a deceased wife or husband, and collaterals to the second degree. First cousins are not within the prohibited degrees by the English law, but in a few of the American States the intermarriage of persons so related has been forbidden by statute. By Act of Parliament (1907, 7 Edw. VII, c. 47) it was provided that a man might lawfully marry his deceased wife's sister, but marriage to a deceased husband's brother is still under the ban in Great Britain, though everywhere in the United States it is allowed. See AFFINITY; CONSANGUINITY; MARRIAGE.

PROHIBITION, prō'hi-bish'ŭn (Lat. *prohibitio*, prevention, from *prohibere*, to forbid, prevent, from *pro*, before, for + *habere*, to have). to abolish the manufacture and sale of alcoholic liquors. Until after the Civil War the movement towards prohibitive legislation in America was merely local. By that time, however, a marked change was observed in the liquor business. German beer was introduced, great breweries were built, attractive saloons were fitted up, and other efforts were made to increase sales. One of the earliest State and national forms of prohibition forbade the sale of liquor to Indians. Some of the early laws enacted local option—which may be local prohibition—following Connecticut's (1839) example. Maine was the first State to establish prohibition. The West Indian trade brought large quantities of rum into the State, and in 1846 an educational campaign was carried on, which resulted in Neal Dow's law. This law was made effective in 1851 and was finally incorporated into the State constitution. In 1852 Massachusetts, Rhode Island, and Vermont passed laws prohibiting the sale of liquor, which were subsequently repealed by the two former States. In the period 1880–1900 a strong movement for prohibition developed in the Middle West, resulting in prohibitory laws in Kansas, Iowa, and the Dakotas. Towards the end of this period the movement subsided sufficiently in effect to withdraw Iowa from the prohibition column through the enactment in 1894 of the Mulct Law (repealed, 1915), by which liquor dealers, though operating in violation of the law, could be prosecuted only at a certain frequency and fined only up to a certain limit—a method intended to transform the prohibition system into a high-license system. Prohibition was later repealed in the Dakotas to be reinstituted in North Dakota in 1914. Oklahoma (1907) and Idaho (1915) also "went dry."

A notable development of prohibition early in the twentieth century occurred in the South. Here the animus was partly political, opposition to the influence of the liquor trade in politics; partly a measure for reducing disorders among the black population; partly economic, as liquor consumption was felt to be a handicap to efficiency. The moral and sumptuary motives played a part, but not a major part. The result of the movement was State-wide prohibition in Georgia (1907); Alabama (1907; virtually repealed, 1911—see ALABAMA, *History;* reënacted, 1915); Mississippi and North Carolina (1908); West Virginia (1912); Virginia (1914); Arkansas and South Carolina (1915). As part of the general movement may be included the success of the prohibition forces in Arizona, Colorado, Oregon, and Washington (all 1914). The dates here given are those of the popular vote or legislative enactment which decided the question. It was certain, in November, 1915, that by the next year, when certain State laws would go into effect, 19 States would be wholly under prohibition.

In addition to the State-wide prohibitory areas, there should be included the local-option prohibitory areas, which are many. In some cases the unit of local option is the county, as in Delaware, Alabama, Kentucky. In other cases the unit is the township, or even the incorporated town or city, or ward thereof. As a rule, the narrower the unit, the less effective is this means of suppressing the use of liquor. Prohibitionists assign a high value to local option as a means of preparing the way for State-

only as an end in itself, but as a means of attaining national prohibition. An agitation for a national constitutional amendment has achieved notable strategic success in forcing a vote in Congress (1914). In the House it received a majority, but not the necessary two-thirds. In 1915 there were only three States that had neither State-wide prohibition nor some form of local option—Pennsylvania, New Jersey, and Nevada. It was estimated that by 1916 (when laws earlier enacted would be in effect) at least 50,000,000 persons in the United States would be living in "dry" territory, and that this territory would constitute at least 75 per cent of that of the nation. In the work of securing State-wide and local prohibition and in the movement for a national amendment, many agencies have been active, none more so than the Anti-Saloon League (q.v.), whose *Year Book* should be consulted. These various agencies discovered, after much rivalry and bitterness, that coöperation would sooner accomplish their common purpose.

In a treaty of 1889 between the United States, Great Britain, and Germany prohibition for the Samoan Islands was established. Canada took a plebiscite on prohibition, Sept. 29, 1898, on which occasion 278,487 votes were yeas and 264,571 nays. Since the majority vote was only 23 per cent of the electorate, the government has not felt called upon to initiate legislation. In England the United Kingdom Alliance to procure total and immediate legislation for the suppression of traffic in intoxicating liquors and beverages has worked actively for prohibition. The question of compensation forms a financial barrier to the enactment of a law. In the United States the Supreme Court (Dec. 5, 1887) decided that the Kansas law making no provision for compensation does not violate the Fourteenth Amendment. The "original package" case (Bowman *v.* Chicago and Northwestern R. R., 125 U. S. 465) stated that no prohibition States could prevent interstate railroads and express companies from carrying liquors to any point within the State. While the Wilson Law of 1890 made liquors imported into a State subject to the same police regulations, including prohibition of sale, as liquors produced therein, it did not affect the right of shipment into a State not for sale but for immediate consumption. This fact has limited the efficacy of the prohibition law. A more serious limitation has been the failure of the police authorities, especially in the larger cities, to enforce such laws. The difficulties here noted disappear in proportion to the number of States that abolish the liquor traffic within their own borders.

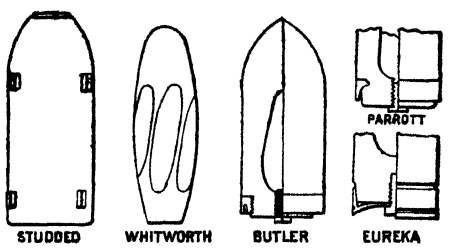
The most significant advance in prohibition outside of the United States was the abolition of the vodka trade in Russia as a war measure by ukase of 1914—a measure the more notable because it wiped out one of the most important sources of national revenue. Of only less significance were the French ban on the sale of absinthe and the British agitation against drink as a factor militating against efficiency in production of munitions.

Fernald, *Economics of Prohibition* (ib., 1890); *Cyclopædia of Temperance and Prohibition* (ib., 1891); Hugo Münsterberg, "Prohibition and Temperance," in *American Problems* (ib., 1910); Fritz Rudolf, *Das Alkoholverbot in Amerika* (Basel. 1913); Guy Hayler, *Prohibition Advance in all Lands* (London, 1913). See TEMPERANCE; LIQUOR TRAFFIC.

PROHIBITION, WRIT OF. A prerogative writ issued out of a court of superior jurisdiction and directed to the judge of an inferior court, or to a party in a suit in an inferior court, or to any other person whom it may concern, commanding that no further proceedings be had in a cause pending in such inferior court. The writ is of ancient origin, instances of its use by the common-law courts being found as far back as the twelfth century.

PROHIBITION PARTY. The failure of the advocates of temperance to force a prohibition plank upon either of the great national parties led the Pennsylvania State Temperance Convention in February, 1867, to suggest the organization of a separate party. In 1868 a Prohibition party was organized in Illinois and Michigan in response to a recommendation made on May 28 of that year by the Grand Lodge of the Good Templars in session at Richmond, Ind. In May, 1869, the Grand Lodge recommended the calling of a national convention, and in September such a convention was held at Chicago, and the National Prohibition party was there organized. In the State elections of the next three years candidates were nominated by the party, but received relatively few votes. On Feb. 22, 1872, the first National Convention met at Columbus, Ohio, nominated James Black of Pennsylvania and John Russell of Michigan as their candidates for President and Vice President respectively, and adopted a platform which besides advocating prohibition declared for woman suffrage, a direct popular vote for President and Vice President, a sound currency, the encouragement of immigration, and a reduction in transportation rates. In the ensuing election only 5607 votes were cast for the party's candidates. In 1876 Green Clay Smith of Kentucky was nominated for President and G. T. Stewart of Ohio for Vice President, but the ticket received only 9787 votes. In 1880 the candidates for President and Vice President, Neal Dow of Maine and H. A. Thompson of Ohio, received 9678 votes. In 1884 Governor St. John of Kansas was nominated on a platform which, ignoring other issues, declared only for temperance. He made an active campaign and received 150,626 votes. In 1888 the Prohibition candidates, Clinton B. Fisk of New Jersey and John A. Brooks of Missouri, received 249,954 votes, the platform in this year declaring for woman suffrage, uniform marriage and divorce laws, restriction of immigration, a tariff for revenue only, the civil-service reform. In 1892 the platform of the party, besides declaring for prohibition, advocated, among other things, woman suffrage, civil-service reform, anti-monopoly laws, currency reform, and restriction of immigration. In this year the party's candidates, John Bidwell of California and J. B. Cranfil of Texas, received 270,710 votes, the largest number so far recorded. A split in the party occurred in 1896. The party in the South was opposed to a woman's suffrage plank, and the delegates were divided on the money question. Those who wished to confine the party to a single issue were in the majority, and their opponents left to form a Liberal party, whose candidate, Bently, received only about 14,000 votes. The regular candidate (Levering) received 131,757 votes. Dr. S. C. Swallow, who represented the broad-gauge party in 1900, was defeated by John G. Woolley, the

nominee of those advocating the single issue, who in the presidential election received 207,368 votes. In 1904 the nominee of the party was Dr. S. C. Swallow, who received 258,550 votes. In 1908 the party nominee, E. W. Chafin, had 252,683 votes; in 1912 the same candidate received 207,965 votes. The organ of the Prohibition party is the *Voice*, which was started Sept. 25, 1884, and published in Chicago.



PROHIBITORY DUTIES. See TARIFF.

PROJEC'TILES (from *project*, OF. *projecter*, *projeter*, Fr. *projeter*, to project, from Lat. *projectare*, to thrust forth, frequentative of *projicere*, to throw forward, from *pro*, before, for + *jacere*, to throw; connected with Gk. *λάπτειν*, *iaptein*, to throw). Objects thrown forward by an impulse of short duration. Projectiles have been a form of offensive weapon from the earliest days of warfare, when a stone or similar missile was thrown from the hand or from some simple device. The development of guns (see ARTILLERY; GUNS, NAVAL) necessitated suitable forms of projectiles. The earliest were of stone, sometimes merely bags of round pebbles. The larger stone projectiles were made to fit the gun loosely and were generally, though not always, spherical and often very neatly and smoothly cut. A few stone elongated projectiles are known to have been used, but they were not common. Iron projectiles came into general use in Europe in the fifteenth century, though stone was used more or less for some centuries after this. The difficulty of tightly closing the breech caused the disuse of breech-loading cannon and prevented the early development of the heavy rifled gun. Rifled small arms (q.v.) using a spherical bullet have been in more or less use for three centuries. Smoothbore guns almost invariably used spherical projectiles very slightly smaller than the bore of the gun, the difference being termed the *windage*.

The resistance to the movement of a projectile through the air is proportional to the cross section perpendicular to the line of flight, and the power of the projectile to overcome the resistance is proportional to its weight multiplied by the square of the velocity. For a given velocity, therefore, we may say that the ratio of power of resistance varies roughly as $\frac{W}{D^2}$, where W is the weight and D the diameter expressed in the usual units. This is not strictly correct, for there are other factors (shape, density of atmosphere, etc.) which enter into a precise calculation, but the statement is approximately true and the expression $\frac{W}{D^2}$ is called the *ballistic coefficient*. It is apparent by inspection that if we have means of increasing the weight without increasing the diameter (i.e., the area of cross section) we shall increase the power of the projectile to overcome the resistance of the air and thereby add to its range and accuracy. The elongated projectile evidently fills the desired conditions, and the advantages of its use are at once apparent. Robins published his treatise on ordnance in 1742, and in it he stated very clearly the advantages of rifled guns and elongated projectiles (see GUNS, NAVAL), but his work was far beyond the comprehension of his contemporaries. See BALLISTICS, *Interior Ballistics;* PROJECTILES, MOTION OF.

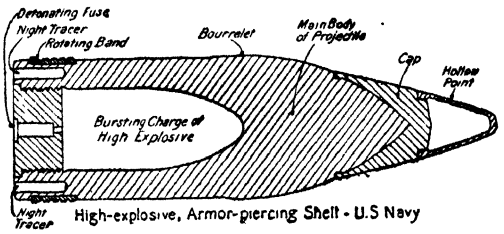
The use of smoothbore guns and spherical projectiles continued, and the next important improvement was the development of the shell gun. Incendiary shells designed to burst and scatter balls and fragments of the case had been in use for a long time, but up to 1820 these had very thin walls and were fired solely from mortars. In 1821 the Paixhans shell gun was designed in France, and thereafter explosive shells have formed the greater part of projectiles above a pound in weight.

About the middle of the nineteenth century the rifled gun established itself firmly. Difficulties in the breech mechanism caused some nations to develop muzzle-loading systems of construction, but this false step lasted nowhere more than 25 years. The projectiles for muzzle-loaders necessarily did not fit closely, and this decreased their accuracy. The revolution of an elongated projectile about its axis is necessary to keep the axis steady and prevent the projectile from tumbling or pitching end over end, which would be fatal to power and accuracy. This was effected in muzzle-loaders by means of

MUZZLE-LOADING PROJECTILES.

various rotating devices such as studs, ridges, expanding-base rings or bands, or a bore of special cross section such as that of a polygon or ellipse.

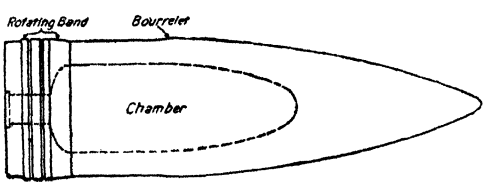
The difficulties connected with developing an effective breech mechanism were soon surmounted, and modern projectiles quickly took on very nearly their present oblong shape. With breechloaders the rotating band could be made larger than the bore (being inserted from the rear) and forced in, the lands or grooves of the rifling cutting shallow channels through the soft metal band. Projectiles for breech-loading rifles were first made of plain cast iron and wrought iron, but the advances in armor brought forth the chilled cast-iron armor-piercing shot and shell, and then the steel shell.



In the days of smoothbore guns projectiles of many kinds were used—solid shot, hot shot (solid shot heated in special ovens), bar shot, chain shot, grape shot, shell, shrapnel, and canister. Bar shot consisted of balls joined by a bar; chain shot, of similar balls joined by a chain; grape shot, of 15 to 25 balls piled on a circular wooden base around a bar or tube and held in place by iron rings and a canvas wrapping; canister, or case shot, of a tin or zinc cylinder with wooden ends and filled with balls packed in wood or sawdust.

At present projectiles are of three general types—armor-piercing shell, common shell, and shrapnel. Special projectiles for use against air craft are employed to some extent, and hand grenades and bombs—which are not really projectiles—are used by troops and air craft. Canister (q.v.) is also coming into service again for use under special conditions; also illuminating shell and bombs.

Armor-piercing shell are made of tough dense steel, specially hardened. The walls are thick,

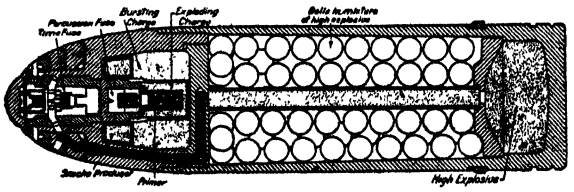


to enable them to penetrate armor without breaking up, and the chamber for the bursting charge is therefore comparatively small. The bursting charge is usually of high explosive, but in the United States navy black powder is used in projectiles of 6-inch and lesser calibres, as a high explosive, in shells of that size, breaks them into pieces too small to cause the desired damage to the structure and machinery of a vessel.

Armor-piercing shell are usually fitted with delayed-action fuses, which will not detonate the bursting charge until it has passed through armor or had its velocity instantaneously lowered 300 or 400 feet by passing through a ship's side plating or by striking the water or some resisting object. When the bursting charge consists of black powder, no fuse is necessary, the shock and heat generated by passing through armor, even if very thin, being sufficient to insure the explosion. In the United States navy all armor-piercing projectiles are fitted with caps of the general type of that shown in the accompanying illustrations. The hollow part of the cap is added to reduce the air resistance. The solid part, which consists of soft steel, serves to

High-explosive, Armor-piercing Shell - U.S Navy

support the metal of the point during the shock of entering the armor. It also slightly depresses and strains the surface it strikes; while thus strained, the surface gives way more easily



5-inch Common Shell - U S Navy.

to penetration. A capped projectile will penetrate hard-faced armor 10 to 25 per cent thicker than will an uncapped one.

Common shell of the old type are no longer used in the United States navy in guns larger than the 5-inch, but large capacity shell are supplied with these calibres. These have bursting charges of "explosive D" and are fitted with suitable fuses. Shell of this type are useful against personnel and the unarmored parts of ships and for bombardment. For target practice, "blind" projectiles are usually employed, that is, shell where, instead of the bursting charge of high explosive, sand is used to bring the projectile to exact weight. This term is employed for unloaded projectiles.

Shrapnel shell are of forged steel and contain a large number of balls of about ½-inch diameter, or larger. The space between the balls is filled with rosin, sulphur, or a high explosive like picric acid (lyddite, melinite, etc.) or trinitrotoluol. Small charges of explosive are placed in each end of the shrapnel for the purpose of bursting it, and the tube connecting the ends also contains the same material. The rear charge assists to drive the balls forward when the projectile explodes. After explosion the balls spread out like the charge of shot from a shot-gun, but the angle of the cone of dispersion is considerably greater. Time fuses (see FUSE) are fitted, and these are so constructed as to make it possible to effect explosion at any time after leaving the gun up to about 20 seconds.

BRIZANZ SHRAPNEL.

The time adjustment can be made in a few seconds, just before the projectile is placed in the gun. Time fuses work best in small calibres and with moderate velocities and chamber pressures (in the gun). Shrapnel is used with great effect against exposed bodies of men, light cruisers, and torpedo vessels. In the United States navy shrapnel is supplied for all guns up to and including the 4-inch, and a limited amount is furnished for the 5-inch. The normal projectile supply for field guns consists chiefly of shrapnel. See SHRAPNEL and accompanying illustration.

Nearly all projectiles of recent design are fitted with night tracers and some with day tracers. The night tracer consists of a burning composition held in a recess in the rear of the projectile. When the gun is fired this composition ignites and discharges a small stream of fire which enables the observer to follow the flight of the projectile exactly, so that he can see whether it hits or not. Day tracers discharge smoke. Combination tracers discharge sufficient smoke by day and fire by night to effect the desired result.

When it explodes, the contents of an illuminating shell burst into bright flame and illuminate a considerable area for a few seconds. The lighting up of the object to be attacked is thus effected without necessarily disclosing the position of the gun or ship, whereas a searchlight gives constant indication of its position. Illuminating bombs are used by troops. They are usually small and fired from the ordinary musket or rifle, the bombs being attached to a stick or rod which is placed in the muzzle of the gun. Larger types are fired from small field howitzers.

Projectile fuses are of three types—time, percussion, and combination. Nearly all time fuses are fitted with percussion mechanism to cause explosion on impact, so the term "combination fuse" is tending to disappear. Time fuses are used in naval shrapnel and in field and siege guns and are fully described in the article on FUSE. Fuses for naval projectiles other than shrapnel are all of the percussion type. They are of the *ignition* class if the bursting charge is black powder and of the *detonating* class if the charge is a high explosive. The details of the new naval fuses cannot be published. They are developments of the older percussion designs in which a sliding cylinder is held in the fuse stock by a soft wire until the gun is fired. The

shock of discharge breaks the wire, and the cylinder drops back to the rear of the chamber containing it. When the projectile strikes an object sufficiently resistant to stop it or instantly reduce its velocity 300 or 400 feet per second (e.g., thin plating of a ship's side), the cylinder flies forward and strikes a cap which ignites or detonates a fuse composition that in turn ignites or detonates the bursting charge. Consult: O. M. Lissak, *Ordnance and Gunnery* (New York, 1907); *Fuses* (Washington, 1914); *Naval Ordnance* (textbook at the United States Naval Academy, Annapolis, 1915); "Shrapnel and Other War Material," in *American Machinist* (New York, 1915). See AMMUNITION; BALLISTICS; EXPLOSIVES; FUSE; GUNS, NAVAL; ORDNANCE; SHRAPNEL.

PROJECTILES, MOTION OF. By this is understood the path followed by a particle of matter projected either obliquely upward or horizontally from a height above the earth's surface. The problem of predicting this path was solved by Galileo, the solution depending upon the assumption that the horizontal velocity of projection of the particle is unaffected by the vertical force of gravity which produces a constant vertical acceleration g (approximately 980 on the C.G.S. system). If the particle is projected in an oblique direction upward, which makes the angle θ with the horizon, with a velocity V, it will have a horizontal component $V\cos\theta$, and a vertical one $V\sin\theta$. The former remains unaltered; the latter is subject to a *negative* acceleration g. The particle will continue to rise until the initial vertical velocity is decreased to zero. If t is the time of ascent $gt = V\sin\theta$ or $t = V\sin\theta/g$. In this time the particle will have gone horizontally a distance $V\cos\theta \times t$ or $\frac{V^2\cos\theta\sin\theta}{g} = \frac{1}{2}\frac{V^2\sin 2\theta}{g}$. After the particle reaches its highest point, it will fall and will take the same time to reach the horizontal plane through its point of projection as it did to rise to the summit of its path. In the entire time, therefore, of rising and falling, the particle will move horizontally a distance $\frac{V^2\sin 2\theta}{g}$. Since the time taken to rise to its highest point was $\frac{V\sin\theta}{g}$ against an acceleration g, the height of this point is $\frac{1}{2}gt^2$, or $\frac{1}{2}\frac{V^2\sin^2\theta}{g}$. For a given value of V, the greatest distance of horizontal motion, $\frac{V^2\sin 2\theta}{g}$, is when $\sin 2\theta$ has its greatest value, viz., 1; for this $2\theta = 90°$, and hence $\theta = 45°$. (This conclusion is seriously modified in practice by the resisting action of the air.)

The path of the particle may be deduced: if horizontal distances are called x, and vertical ones y, then at a time t after projection

$$x = tV\cos\theta$$
$$y = tV\sin\theta - \tfrac{1}{2}gt^2.$$

If t is eliminated from these equations,

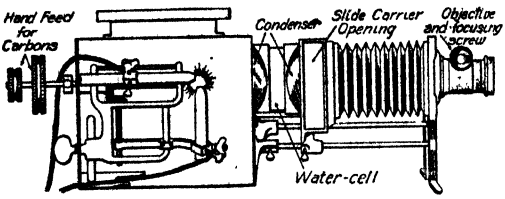
$$2y^2V\cos^2\theta = xV^2\sin 2\theta - gx^2,$$

which is the equation of a parabola.

In the simplest case, when the point of projection is at a height above the surface of the earth, and the particle is projected horizontally with a velocity V, $x = Vt$, $y = \frac{1}{2}gt^2$ where y is vertically down. Eliminating t, these equations give $y = \frac{g}{2V^2}x^2$.

As a solid moves through the air, it meets opposition of various kinds due to the air. There is an opposing force which diminishes the linear speed. For speeds less than 100 feet per second the resistance of the air varies directly as the square of the velocity, as stated by Newton. According to Duchemin (1842), this resistance $= av^2 + bv^5$ for speeds below 1370 feet per second and $= ov^5$ for higher speeds. In these expressions v is the speed of the projectile and a, b, c are factors of proportionality. The first formula has been verified by the recent work of Dr. A. F. Zahm.

If the projectile is rotating on an axis, the angular speed is decreased, owing to friction; and owing to the inequalities on the various sides, there is a sidewise *force* producing the "curves" of a baseball and the "drift" of a bullet. If the projectile is elongated or broad, the centre of pressure of the air against it and its centre of inertia are not in general in the line of motion; so there is a moment tending to make the projectile turn around an axis at right angles to the plane including the line of motion, the centre of pressure, and the centre of inertia. If the projectile is not rotating, it will turn so as to move with its broadest face front; e.g., a penny falling in water falls face down, not edge down; a sheet of cardboard falling through the air tries to fall face down. If, however, the projectile is rotating around an axis, e.g., an elongated bullet, the effect is to maintain the direction of the axis. There are other disturbing actions, also, which tend to make the axis of the rotating projectile place itself tangent to the trajectory. See BALLISTICS; DRIFT OF A PERSPECTIVE.



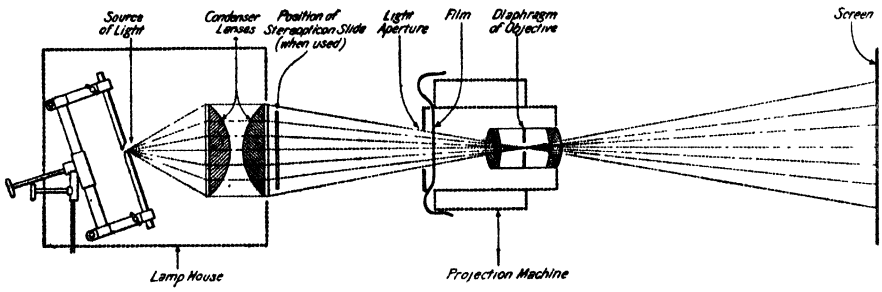
PROJECTION (Lat. *projectio*, from *projicere*, to throw forward). The act or result of constructing a figure upon a given surface, usually by means of a pencil of rays, so that it corresponds point by point to another given figure. It thus includes perspective (q.v.) and is most simply illustrated by the shadow of an object thrown by a light on a wall, the shadow being the projection, and the light being the vertex of the pencil or sheaf of rays. If the centre of projection is infinitely distant, the projection is called *parallel* projection; if also the projection rays are perpendicular to the plans of projection, we have *orthogonal* projection. The theory of projections is of great importance, both in mathematics and in geography, being in the former case general in its application, while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, all of which are treated under MAP.

In mathematics the theory of projections has reached a high degree of perfection, serving to generalize the ancient geometry. (See GEOMETRY.) Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the *magnitude*, but on the *position* of the lines and angles belonging to the figure. These properties are generally called *projective* properties. For instance, the three conic sections (q.v.), the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all *positional* properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The introduction of coördinates has extended the applications of the subject, and it is now employed in solving the problems of applied mathematics.

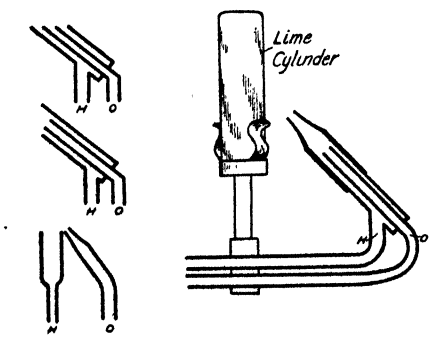
For the use of projection in mechanics, consult: S. D. Poisson, *Traité de mécanique* (2d ed., 2 vols., Paris, 1833); S. E. Warren, *Elementary Projection Drawing* (10th ed., New York, 1887); Stade and Seidel, *Das Wichtigste aus dem geometrischen Zeichnen und der Projektionslehre* (Leipzig, 1894); Church and Bartlett, in *Elements of Descriptive Geometry*, part i (New York, 1911).

PROJECTION, ISOMETRIC. See ISOMETRIC PERSPECTIVE.

PROJECTION APPARATUS. A device or apparatus for exhibiting enlarged images of transparent or opaque objects so as to render them visible in a darkened room or hall to a large number of persons. It comprises a source of light, usually an electric arc, two sets of lenses, and one or more mirrors. The most familiar projection apparatus is the magic lantern or stereopticon for showing stationary pictures called slides and moving films for motion pictures. In addition arrangements for concentrating an intense light, either white or colored, on the stage of a theatre and for projecting light to a great distance, as in military or naval service, will fall in the same category. The great variety of purposes for which projection apparatus is employed has given rise to many special names descriptive of the particular use to which any device is put. In general the terms "stereopticon," "projectoscope," "reflectoscope," "balopticon," and "delineascope" refer to a lantern device which projects the image of transparent or opaque objects.



LANTERN OR STEREOPTICON, SHOWING PRINCIPAL PARTS.



General Description. As shown in the illustration the rays from the illuminant fall upon a lens combination called a condenser, which is either a single, thick, convex lens or, as commonly made, comprises two plano-convex lenses with their curved faces placed closely adjacent. The purpose of the condenser is to collect the luminous rays and transmit them as a parallel or slightly convergent beam to illuminate the slide or film, an enlarged image of which is to be formed on a white wall or screen facing the apparatus. To produce this image another set of lenses termed the objective is placed in front of the slide or film. This lens system must be achromatic (see ACHROMATISM) and free from distortion, so as to form a perfectly flat field. By varying the distance between the slide or film and the objective, or, in other words, one of the conjugate foci, the image on the screen is made to appear sharp and distinct as the appropriate focal distance is obtained. Lenses now obtainable are so carefully ground and corrected as to combine great sharpness of detail with a high degree of magnification.

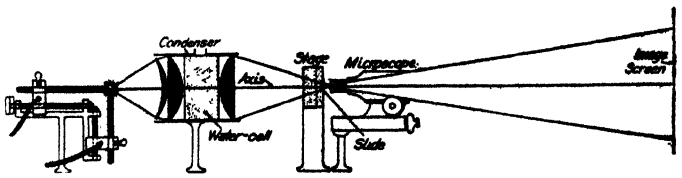
In order to prevent cracking of the glass lantern slides by heat concentrated by the condenser, a glass cell or container with parallel sides and filled with water is placed between the two elements of the condenser, as shown. Projection lanterns usually have the arc-lamp carbons arranged at right angles to each other, as shown in the diagram, for the reason that the positive crater, which is the area of greatest brightness, is more readily centred in the optic axis of the lens system. A rheostat for regulating the amount of current in the arc-lamp circuit is an integral part of an electric lantern outfit.

Illuminants. While for lecture purposes on certain topics it is advantageous to employ sunlight, its irregularity and the necessity of installing a heliostat (q.v.) make it an inconvenient and troublesome illuminant. In small rooms where the degree of magnification need not be great, a double-flame or triple-flame kerosene lantern may be used, although a Welsbach mantle or an acetylene-gas flame furnishes a brighter radiant. In localities where electricity is not available, the limelight or oxyhydrogen flame directed upon a piece of lime is an excellent substitute for the electric arc. If it were necessary it might be employed even for moving-picture projection. The electric arc is the most

PRINCIPLE OF OPTICAL PROJECTION.

TYPES OF BLOW-THROUGH NOZZLES FOR USE WITH OXY-HYDROGEN BURNER.

Position of burner in front of lime also shown.



powerful, convenient, and satisfactory radiant for projection purposes. The gas-filled incandescent lamp is often used, but is not bright enough for a large hall, involving large magnification. Either alternating or direct current may be employed for arc lamps, but the latter gives better results for picture projection because of the great brilliancy of the crater of the positive electrode and the facility with which it may be kept in the optic axis of the lenses. Where direct current is not available an alternating-current arc may be employed with a fair degree of satisfaction, but it is usually noisy, emitting a humming sound, and consumes more energy than the direct-current arc for the same degree of illumination.

Slides. The transparent glass pictures used in modern stereopticons and similar projection devices are called slides. Formerly pictures painted or drawn on glass were used in magic lanterns. The present-day slides are photographic positives, which may or may not be colored by hand. In the United States the size adopted is 3¼ inches high and 4 inches wide, while in England the standard is a square, 3¼ × 3¼ inches. Since the image of any object placed in front of the condensing lens is inverted as well as reversed in a horizontal direction, lantern slides must be marked with an unmistakable label to insure that the operator will put them in the slide carrier so as to project the picture in its proper position. This mark is located by looking at the slide when holding it so that the picture on it appears correct and just as its magnified image must appear on the screen. It is affixed to the lower left-hand corner. When the slide is put in the carrier the mark must occupy the upper right-hand corner of that side facing the condenser. Colored slides were formerly extensively employed in lectures, and required considerable skill on the part of the artist. For motion pictures the Kinemacolor (q.v.) process gives quite satisfactory results, but has not become widely popular.

Screen. For distinct and satisfactory picture projection a screen must be used that can be stretched flat without wrinkles. A smooth plastered wall, dead white or tinted, is even better, and this is to be found in the best-arranged lecture halls, as in large museums. The size of the exhibition hall or room determines the distance between lantern and screen and consequently the degree of magnification to be secured; but as the size of the projected image is increased corresponding attention must be paid to the focusing of the details of the picture.

Stereopticon. This term is often applied to a pair of magic lanterns so arranged as to focus their pictures on the same portion of the screen so as to cause the picture projected by one to merge or dissolve into the other. This may be accomplished by mechanically connecting the iris-diaphragm shutters of the two lanterns or some similar intercepting device so that one picture comes gradually into view simultaneously with the fading away of the other. The illusion of rain, snow, or lightning may be produced in a picture by employing two lanterns. Two lanterns may be used for the projection, and this device can be employed in the back drop of a stage setting of stereoscopic pictures. See DISSOLVING VIEWS; STEREOSCOPE.

Microscopic Projection. Specimens or slides prepared for the microscope (q.v.) may be well

ARRANGEMENT OF LANTERN FOR PROJECTION OF MICROSCOPE SLIDES.

shown for lecture purposes by a lantern whose objective-lens system is replaced by a microscope objective of moderate magnifying power. Photographs of such objects are made by using a low-power objective and a camera provided with a suitable extension-bellows arrangement.

Moving Pictures. For the projection of moving pictures the optical arrangement is essentially the same as for ordinary lantern slides, but as the aperture of the moving-picture machine is so much smaller than the slide, the moving film must be arranged farther away from the condenser to intercept the same quantity of light. See MOVING PICTURES.

Opaque Objects. The so-called projectoscope is arranged so that it may be used either for the projection of transparent lantern slides of the usual kind, microscopic specimens, or opaque objects. In the space between the condensing and projection lenses, on the floor of the lamp house, is placed an opaque object, such as a post card, whose magnified image is to be dis-

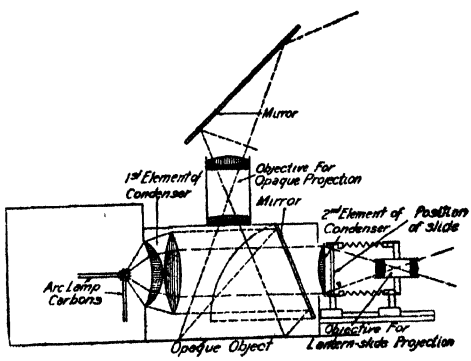


DIAGRAM OF PROJECTOSCOPE FOR PROJECTING IMAGES OF OPAQUE OBJECTS.

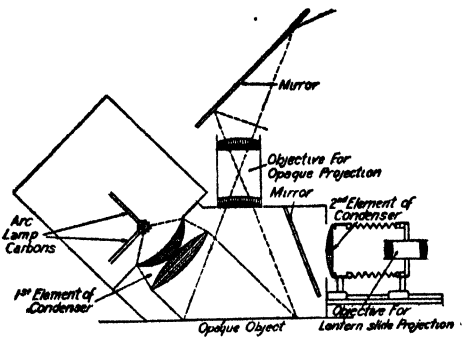
When used for lantern-slide projection the mirror shown between the two lenses of the condenser is turned down to a horizontal position.

played. For illuminating this the lamp house containing the arc lamp and the condenser is arranged so as to be inclined at an angle of 45° with the horizontal. At the top of the lamp house an additional projecting objective is arranged. This differs from the projecting objective for use with a lantern slide in that it is much larger and has a wider angle of aperture so as to permit the transmission of the maximum amount of light. Directly above this vertical objective is a plane mirror adjusted at 45° inclination, so that the light from the lantern reflected from the object on the floor of the lamp house, thence through the objec-

tive, is reflected from the plane mirror to the screen, where it is observed as a magnified image in an erect position. Several modifications of



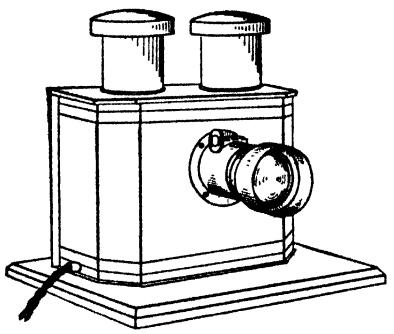


DIAGRAM OF PROJECTOSCOPE WITH LAMP HOUSE INCLINED SO AS TO ILLUMINATE THE OPAQUE OBJECT TO THE MAXIMUM DEGREE.

this form of projectoscope are made, some of them being particularly adapted for the display of microscopic specimens and having the lenses adapted therefor as regards size and focal length. A further use for devices of this kind is for

POST-CARD PROJECTOR; ALSO CALLED BALOPTICON.

making drawings of microscopic specimens on a large scale. By a suitably arranged system of mirrors the light from the object to be drawn is reflected twice, so as to be received on a horizontal surface, usually a drawing board, on which

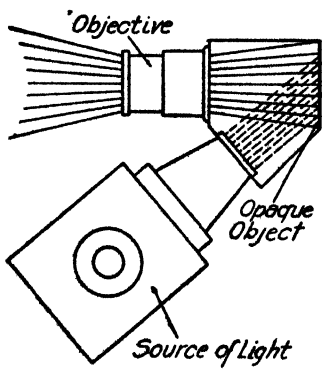

DIAGRAM OF POST-CARD PROJECTOR WITH ONE LAMP.

the artist may trace at will the outline as well as color any desired portion of the work.

For the enlarged representation of colored as well as black and white post cards and other opaque objects, a lantern is sometimes used in which the light directed from two arc or incandescent lamps is focused upon the object and reflected from it to an objective of the usual type. This gives fair results, especially in small apparatus for home demonstrations, though the brightness of the image on the screen is less than that made by transparent positives used in the ordinary magic lantern, owing to the

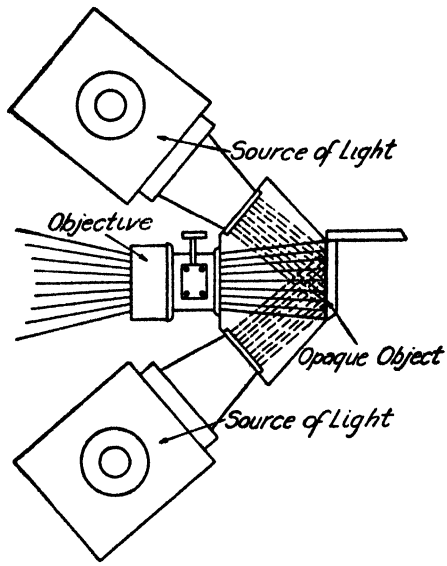

DIAGRAM OF POST-CARD PROJECTOR WITH TWO LAMPS, FOR BRIGHTER ILLUMINATION OF THE SCREEN.

fact that opaque objects can reflect so small a proportion of the light incident upon them. It is for this reason that two lanterns often are employed in devices of this kind.

Spotlights. These include arc lamps provided with hemispherical or parabolic reflectors and sets of colored glass screens that may be put in the path of the projected radiations for use in theatres for the purpose of concentrating an intense white or colored light on dancers or actors, following them in their movements about the stage. In some cases an arrangement of lenses similar to that of the magic lantern to concentrate the light is employed on a movable mounting.

Searchlights. There are several types of arc lamp in use for searchlight projection. The optical conditions to be fulfilled are somewhat different from those above described, as the maximum amount of light must be concentrated in a beam of parallel rays and projected as far as atmospheric conditions, etc., will permit; while picture projection requires the convergence of the luminous radiations to illuminate the slide or film picture, whose magnified image is then formed on the screen at a comparatively short distance. See SEARCHLIGHT.

PROKESCH-OSTEN, prō'kĕsh-ōs'ten, ANTON, COUNT (1795–1876). An Austrian diplomat and author, born at Graz. He entered the Austrian army, served in the French campaign in 1813–15, was made professor in the military school of Olmütz (1816), and, after serving as adjutant to Prince Schwarzenberg (whose memoirs he published in 1822), was sent on diplomatic missions to the East. In Greece and Syria he was very successful, and for his services in bringing about the Treaty of 1829 with the Pasha of Akka, whereby Christians were granted many privileges in Palestine, he was ennobled (1830). In 1831 Prokesch-Osten was chief of staff in the Austrian army sent to Bologna, and he was Minister to Athens (1834–49), and to Berlin (1849–52), Ambassador to the Frankfurt Parliament (1853–54), and from 1855 to 1871 represented Austria at Constantinople, with the title of Ambassador after 1867. He retired in 1871. He was made Baron in 1845 and Count in 1871. His more important works are: *Erinnerungen aus Aegypten und Kleinasien* (1829–31); *Geschichte des Abfalls der Griechen vom türkischen Reich* (1821); *Kleine Schriften* (7 vols., 1842–44).

PROKOP. See PROCOPIUS.

PROLAP'SUS A'NI (Lat., falling of the anus). An affection of the terminal portion of the intestinal canal which consists in a protrusion of the mucous membrane of the lower part of the rectum through the anal orifice. When the protrusion includes the whole thickness of the rectal wall, the condition is known as *prolapsus recti.* These conditions may depend on a naturally relaxed condition of the parts, such as exists in infancy, or they may be brought about by violent straining at stool. Whenever prolapse occurs, the parts should be washed and, if possible, replaced by careful pressure with the fingers; and if they do not easily return, the forefinger should be oiled and pushed up into the anus, when it will convey the protruded intestine with it, after which the patient should maintain the recumbent posture for some hours. If the protrusion cannot be returned by such means, surgical assistance should be at once sought. In order to obviate the tendency to prolapse the patient should regulate the bowels so as to avoid constipation and should sponge the parts, after each evacuation, with cold water. A firm pad is sometimes required to prevent recurrence. Where the trouble persists it may be necessary for the surgeon to remove part of the redundant mucous membrane by the knife or cautery, or, in severe cases, to resect a portion of the rectal wall.

PROLAP'SUS U'TERI (Lat., falling of the womb). The condition in which the womb falls below its natural position in the pelvic cavity and approaches the outlet of the vagina. If the womb appears outside, it is known as *procidentia,* or complete prolapse. Thus all degrees of prolapse are observed, from a very slight depression to a complete extrusion, and in its descent not only does the womb itself fall, but it drags with it the vaginal walls, usually a part of the bladder, and less frequently the rectum. The prolapsed portion of the bladder is known as a *cystocele,* that of the rectum as *rectocele.* Prolapse of the uterus is a very common affection, occurring most frequently in women past middle age as a consequence of lacerations of the pelvic floor during childbirth; but it is found in unmarried women also and rarely in children. The symptoms of this affection arise partly from the pressure of the womb on other organs, partly from the simultaneous displacement of adjacent parts (as the bladder, rectum, etc.), and partly from reflex action. Patients with only a slight displacement usually complain of a sensation of fullness in the pelvis, of weight and bearing down, of dragging pain in the back, these symptoms being aggravated when the upright position is assumed. The treatment varies with the degree of displacement. In cases of complete prolapse the uterus should be replaced and retained in position if possible by mechanical means, such as tampons of cotton or pessaries or rings. In extreme cases removal of the entire organ may be necessary to afford relief. In cases of moderate severity great improvement is further secured by increasing the general tone of the tissues by tonics and constitutional treatment and by douches and other forms of local applications. The improvement in the general health is of great importance. In many instances an operation is necessary for the repair of the lacerated tissues at the pelvic outlet. Where neglected, the condition has a tendency to become aggravated, and rectal and bladder symptoms make themselves evident.

PROLÉTAIRES, prō'lā'târ' (Fr. *prolétaire,* from Lat. *proletarius,* one of the lowest class of Roman citizens, regarded as of value to the state only on account of their offspring, from *proles,* progeny), or PROLETARIAT. That part of the wage-earning class who are entirely dependent on their daily labor for their livelihood. See SOCIALISM.

PRO'LOGUE (OF., Fr. *prologue,* from Lat. *prologus,* from Gk. *πρόλογος,* preface, introduction, from *πρό, pro,* before + *λόγος, logos,* speech, word, reason, ratio). In ancient Greek drama, that part of a play (whether an acted scene or an exclamatory speech) which came before the entrance of the chorus. Thus, the prologue in the *Œdipus* of Sophocles is a scene in which appear Œdipus, the high priest of Zeus, and Creon, whereas the prologue to the *Agamemnon* of Æschylus is only the monologue of the watchman on the tower. At least from the time of Euripides the prologue became a speech explanatory of the situation to be developed, and it continued to be such in Latin comedy. With Plautus and Terence the prologue was divorced from the main body of the drama. In the early English drama the duties of setting forth the theme were shared by the induction, or prologue, and the chorus. When the induction was falling into decay, the prologue or chorus supplied or assisted the argument. Their double employment is exemplified in *Hamlet* in the play scene. When the prologue enters, Hamlet says: "We shall know by this fellow; the players cannot keep counsel; they'll tell all." Hamlet explains to Ophelia the relationship of Lucianus and the King, and Ophelia responds, "You are as good as a chorus, my lord." In *Henry the Fifth* a prologue, called "chorus," precedes each

act, to prepare the audience for the shifting scenes. For other plays Shakespeare wrote no prologue, but in the first scenes he both explained and developed the situation. After the Restoration (1660) a play was hardly complete without its prologue and epilogue. Even in Dryden's time the prologue served as a subject for literary wrangling as often almost as it served any dramatic purpose. Modern plays, save for quaintness' sake, never have a prologue. On the other hand, the playwright is bound to set forth in the first scene the problem or theme to be handled in his play. Thus, we observe something like a steady degeneration of the prologue in proportion as the playwright begins more and more to make the main body of his drama a unit of thought and action. Consult G. S. B., *The Prologue and Epilogue in English Literature from Shakespeare to Dryden* (London, 1884). Taken over into oratory, the word "prologue" is also applied to the opening of a speech; and it is now loosely applied—and indeed was sometimes so applied by the Greeks—to any prefatory statement to poem, discourse, or play. See EPILOGUE.

PRÖLSS, prēls, JOHANNES (1853–1911). A German novelist, son of Robert Prölss. He was born in Dresden, studied at Jena and Leipzig, was literary editor of the *Frankfurter Zeitung* (1880–89), of the *Stuttgarter Union* (1890 et seq.), and from 1894 to 1903 also of the *Gartenlaube*. He wrote: *Emancipierte Novellen* (1880); *Modelle* (1891); *Das junge Deutschland* (1892); *Bilderstürmer!* (1895); *Die schönste Frau* (1904); and of a historical nature, *Friedrich der Stolze und Frankfurt am Main* (1905).

PRÖLSS, ROBERT (1821–1906). A German dramatist and critic of the drama, born in Dresden. After 1863 he devoted himself wholly to literature. In 1847 he wrote *Das Recht der Liebe*, a comedy. His later plays were the tragedies *Sophonisbe* (1862), *Michael Kohlhaas* (1863), and *Katharina Howard* (1865), and the comedies *Eine edle That* and *Die verdächtige Wahrheit*, after Alarcón. His critical and historical essays, of more importance, include: *Erläuterungen zu Shakespeares Dramen* (1874–89); *Das Meiningensche Hoftheater und die Bühnenreform* (1876); *Katechismus der Dramaturgie* (1877; 2d ed., 1899); *Geschichte des Hoftheaters zu Dresden* (1877); versions of Marlowe, Webster, and Massinger (1880); a life of *Heine* (1886); *Kurzgefasste Geschichte der deutschen Schauspielkunst* (1900).

PROME, prōm. The capital of a district in Burma, British India, at the confluence of the Nawin with the Irrawaddy, 113 miles northwest of Pegu (Map: Burma, C 3). On account of the flatness of the ground on which it stands the town is often inundated from the Irrawaddy. The chief native building is the Shwesandau Pagoda, 180 feet high, surrounded by 83 small gilded temples. It is visited by thousands of Buddhist pilgrims on the occasion of each annual festival in March. The European buildings include the government offices, law courts, the Jubilee Clock Tower, and the Anglican Church; the public gardens and the markets are also notable features. The town, which is the terminus of a railroad from Rangoon, has many advantages for trade. In the adjacent country are extensive gardens and rice grounds, and there are important manufactures of paper, silk, cotton, sugar, and gold lacquer ware. Pop., 1901, 27,375; 1911, 25,784. Prome dates from before the Christian era, when it was the capital of a powerful kingdom. The town was taken by the British in 1825 and in 1852. In 1862 it was almost wholly destroyed by fire.

PROMESSI SPOSI, prō-mĕ'sē spō'zē, I (It., The Betrothed). A novel by Alessandro Manzoni (1825), so admirable that it has become a classic and has been translated into many languages.

PROMETHEA (Neo-Lat., from Lat. *Prometheus*, name of a giant). One of the commonest of the large North American silkworm moths (*Callosamia promethea*). The female is reddish brown with white, black, and gray markings. The wings of the male differ both in shape and coloration from those of the female and are blackish, with the markings characteristic of the female very faint or wholly absent. The fully grown larva is 2 inches or more in length, bluish green, and armed by large black tubercles in addition to four coral-red ones in the thoracic region and one yellow one on the abdomen. The larvæ feed preferably on the wild cherry and ash, but are also found on a great variety of trees and shrubs. The cocoon is elongated and inclosed in a leaf, which is attached to a twig by strands of silk and is thus prevented from falling in the autumn. Although the cocoon resembles very closely that of the ailanthus silkworm (larva of *Philosamia cynthia*), which has some slight market value, it has never been commercially used.

PROME'THEUS (Lat., from Gk. Προμηθεύς, from *προμηθής, promēthēs*, foresighted, from *πρό*, before + *μῆτις, mētis*, wisdom; connected with *μαθεῖν, mathein*, to learn; less probably connected with Skt. *pramantha*, fire drill, from *pra*, before + *mantha*, churning, from *math*, to whirl, churn, produce fire by friction). The hero of one of the most interesting of the Greek myths. The story goes back to a very early period and in its origin may be compared with the many similar legends as to the origin of fire, usually by a theft from the sun or the gods, or as the beneficent gift of some kindly animal or great hero. In this character as the fire-bringing god (*ὁ πυρφόρος θεός, ho pyrphoros theos*) Prometheus had an altar in the Academy at Athens, where he was joined with Hephæstus and Athena, as those who had given to men the arts and crafts that brought civilization. He was honored with a special festival, of which the chief feature was a torch race from his altar in the Academy to the city. In Hesiod Prometheus is a Titan, son of Iapetus and Clymene, brother of Atlas, Menœtius, and Epimetheus. Angry at a trick played on him by Prometheus, Zeus deprived men of fire, but Prometheus stole it from the hearth of Zeus, hid it in the pith of a fennel stalk, and conveyed it to earth. In punishment Zeus sent Pandora (q.v.) to Epimetheus and bestowed thus upon men the race of women, "who dwell as a great plague among mortal men." Prometheus himself was fettered to a column and visited daily by an eagle who devoured his liver, which always grew again during the night, so that his torment was unceasing till Hercules came and by the good will of Zeus, who thus gave greater glory to his son, slew the eagle and freed Prometheus. In this version the Titan really works men harm in his efforts to overcome by trickery the high designs of Zeus. It should also be noted that

the myth of Pandora seems to be originally a separate legend of the origin of suffering and woe, only later connected with the theft of fire. This primitive myth was reworked by the Athenian tragedian Æschylus in his Promethean trilogy, of which the *Prometheus Bound* has survived, and was brought more into harmony with the Athenian cult and the conceptions of a later time. Here Prometheus is the son of Themis (whom the poet identifies with Gæa, the earth) and through her possesses the gift of foreknowledge and prophecy. He thus foresees the ultimate triumph of intelligence over brute force in the struggle between Zeus and the Titans and consequently joins the winning side. When, however, Zeus, as the establisher of a rule of law and order, plans to replace the wretched race of men by a nobler order of beings, Prometheus in pity defeats this design by stealing fire and instructing men in all the useful arts, so that there now exists no ground for Zeus to remove them from the earth. For this rebellion Hephæstus is required to nail Prometheus to a lonely cliff in Scythia near the ocean. Here the extant play, *Prometheus Bound*, shows him still defiant, execrating the ingratitude and cruelty of Zeus, who can thus punish an ally whose only fault is a desire to benefit mankind, and at the same time exulting in the secret knowledge that the violence of Zeus to his father, Cronos (see SATURN), unless atoned for, must be punished. His threats and defiance rise to such a pitch that Zeus casts him into Tartarus.

The play seems to represent Prometheus as a martyr and Zeus as a cruel tyrant, but closer examination shows that Zeus is bound to punish the rebel who has tried to overthrow the new reign of law. The later dramas of Æschylus' trilogy seem to have made this conception clear. Zeus was reconciled to Cronos and the Titans, and Prometheus was brought to yield to the now secure Zeus. Hercules by the will of the god slew the eagle and freed the prisoner, in whose stead the centaur Chiron (q.v.), suffering from an incurable wound, surrendered his immortality and descended to the regions of the dead. The closing drama seems to have related the establishment of the worship of Prometheus at Athens. In the later versions, especially on the sarcophagi, besides minor variations, we find Prometheus represented as the actual creator of men, whom he fashions out of clay, and at whose death he is sunk in sorrow and meditation. The whole myth in its origin and signification, and especially in its treatment by Æschylus, has been the subject of lengthy discussion and has produced an extensive literature, much of which is to be found in editions of the *Prometheus Bound*.

Bibliography. Welcker, *Die Aeschyläische Trilogie Prometheus*, and *Nachtrag* (Darmstadt, 1824, 1826); Hermann, "De Æschyli Prometheo Soluto," in his *Opuscula*, vol. iv (Leipzig, 1831); these two works developed a great controversy and have historical interest. Also: Wecklein, *Prometheus Bound of Æschylus*, translated by F. D. Allen (Boston, 1891), and Preller-Robert, *Griechische Mythologie I.* (Leipzig, 1887); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); the articles "Promethus," in W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. iii (Leipzig, 1897–1909), and in Fr. Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., ib., 1914). The play has been translated by Mrs. Browning. On works of art consult: Otto Jahn, "Prométhée," in *Annali dell' Istituto*, vol. xix (Rome, 1847), and "Ueber ein Sarcophagrelief im Museo Borbonico," in *Berichte der sächsischen Gesellschaft der Wissenschaften* (Leipzig, 1849); Milchhöfer, *Die Befreiung des Prometheus, Berliner Winckelmannsprogramm*, 42 (Berlin, 1882); A. Baumeister, in *Denkmäler des klassischen Altertums* (Munich, 1888); and pages 116–120 of J. E. Harry's edition of the *Prometheus Bound* (New York, 1905).

PROMETHEUS UNBOUND. A lyrical drama by Percy Bysshe Shelley (1820). Though founded on Æschylus' tragedy, it is not Greek in form or spirit. In this poem Shelley (stirred by the spirit of the French Revolution) exults in the deliverance of humanity.

PROM'ISSORY NOTE (from Lat. *promissor*, promiser, from *promittere*, to promise, send forward, from *pro*, before, for + *mittere*, to send, Skt. *miv*, to push). A written instrument containing an express and unconditional promise by the maker to pay a certain sum in money, on demand, or at a fixed or determinable future time. If it is payable to the order of the payee or to bearer, it is a negotiable instrument, i.e., not only transferable to another, with or without consideration, but, if taken in due course before maturity and without notice of defenses which the maker may have against the payee, absolutely enforceable by the transferee. The following is an ordinary form of a negotiable promissory note, payable at a bank:

"$1000.00 New York, April 1, 1907.

Three months after date I promise to pay to the order of Richard Roe One Thousand Dollars, at the First National Bank.

Value received. JOHN DOE."

If the payee is named, as in the form given above, and the note is payable to his order, his indorsement of it is necessary to its negotiation. He may sell and transfer it without an indorsement; but his transferee in that case will take it subject to any defenses available to the maker against him. The maker promises absolutely to pay the paper. Hence the holder is not bound to present it at the time and place named in the instrument, as a condition of suing the maker.

The early history of promissory notes is obscure. Their earliest appearance in the reported decisions of English courts is towards the close of the seventeenth century. For a time the judges seemed disposed to follow mercantile usage and to treat them as negotiable instruments. With the accession of Lord Holt to the chief justiceship of the King's Bench, a change of judicial attitude became noticeable. He refused to recognize their negotiable character, and in 1704 Parliament, siding with the merchants, enacted a statute (3 and 4 Anne, c. 9) which declared that promissory notes "shall have the same effect as inland bills of exchange." This has ever since been the law in England and the United States.

In some States certain forms of notes are declared negotiable by statute which are not negotiable at common law. For further discussion and for the liability of indorsers, requirements as to presentation, etc., consult M. M. Bigelow, *Cases on Law of Bills, Notes and Cheques* (2d ed., Boston, 1905), and the authorities referred to under NEGOTIABLE INSTRUMENTS.

See BILL OF EXCHANGE; DEMAND; INDORSEMENT; NEGOTIABLE INSTRUMENTS; PROTEST.

PROM'ONTO'RIUM AROM'ATUM. See GUARDAFUI, CAPE.

PROMONTORIUM BOLE'RIUM. See LAND'S END.

PROMONTORIUM LACIN'IUM. See LACINIAN PROMONTORIUM.

PROMONTORIUM LILYBÆUM. See LILYBÆUM PROMONTORIUM.

PROMONTORIUM NE'RUM. See CAPE FINISTERRE.

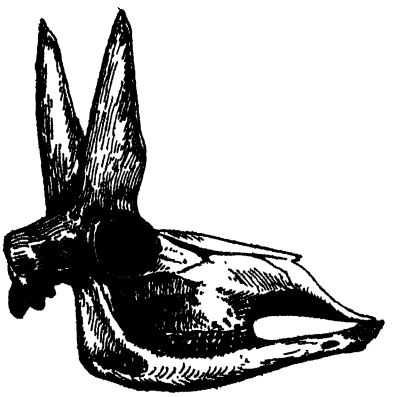
PRO'MORPHOL'OGY (from Gk. *πρό, pro,* before + *μορφή, morphē,* form + *-λογία, -logia,* account, from *λέγειν, legein,* to say). The study of the simplest of the fundamental forms of organisms. While the simplest plants and animals as well as eggs and seeds are, as the result of the action of gravity, more or less spherical, in other types we are reminded of the forms of crystals, though there is wanting the mathematical regularity and symmetry present in crystalline forms. In the most symmetrical animals certain internal organs are unsymmetrical in relation to the body. See SYMMETRY.

PROMO'TER (ML. *promoter,* from Lat. *promovere,* to promote, push forward, from *pro,* before, for + *movere,* to move, Skt. *miv,* to push). One who urges or assists in the organization of a corporation or joint-stock company. A promoter commonly makes the plans for the business operations to be carried on, estimates the probable profits, solicits subscriptions to the stock of the proposed corporation, and, in short, does all he can to bring about its organization. A promoter is held to stand in a fiduciary relation to the company formed by him. Accordingly he is held to a very strict accountability for his representations to investors. Unless he discloses to the subscribers for stock the amount of profits he intends to make by effecting the organization, or by selling the company any lands or things of value, he must account to them for what he receives. If a promoter make fraudulent misrepresentations as to the prospects of the corporation, any subscriber deceived thereby may cancel his subscription, and may recover from the promoter any damages sustained by reason thereof. If a person urges others to form a company and buy something he has to sell, and does not himself become identified with the organization, he is not a promoter in the above sense, and may lawfully obtain the best price he can induce the company to pay for his property. A promoter acting in his own behalf is not an agent of the subscribers or of the resulting corporation, and accordingly the corporation, when organized, is not liable for any contracts entered into on its behalf by the promoter prior to its organization. A promoter may, however, sometimes be held personally liable on such contracts. See Thompson, *On Liability of Directors and Other Officers and Agents of Corporations* (St. Louis, 1880); and consult the authorities referred to under AGENT; CONTRACT; CORPORATION.

PROMO'TION. See RANK AND COMMAND.

PRONA'OS (Lat., from Gk. *πρόναος,* porch before a temple, from *πρό, pro,* before + *νάος, naos,* temple). The vestibule in front of the naos or cella of a temple. It is commonly a portico or colonnade formed by prolonging the side walls of the cella. See GREEK ART, *The Temple.*

PRONG'HORN. The goat-antelope (*Antilocapra americana*) of the plains of western North America, generally known as antelope and by the Canadian French as cabree (*cabrit*). It ranged from the Missouri River to the Pacific coast and from the Saskatchewan River to the



HEAD OF A PRONGHORN.

Showing the early change from hairy skin to horn at the tips of the young horns.

interior of Mexico, most commonly on open plains or in broad valleys. It is not nearly so abundant now as formerly, but it is still plentiful in the less thickly settled parts of the West.

The pronghorn is about 4½ feet long and 3 feet high. It is yellowish brown above and white below; there are brown and white markings on the head, and the white buttocks are said to gleam in the sun at a long distance. The shape of the body is deerlike, but more robust; the head is carried erect, while the bounding gait and alert air are gazelle-like. (See Colored Plate of ANTELOPES.) The animal differs from the true antelopes and from all other ruminants in the total absence of false hoofs and in the remarkable nature of its

SKULL OF A PRONGHORN.

Showing horn cores and dentition.

horns, which are deciduous. The skull is surmounted by two spikelike horn cores, rising over the great eye orbit and leaning outward. These are covered with a skin and coat of bristly hairs which agglutinate at the tip and change into a compressed horny sheath, the change proceeding towards the base until the whole is sheathed with horn. These stand about a foot in height, are curved inward, often so as to be truly lyrate, and, unlike any other sheath horn

known, are branched, having one prong (occasionally more) on the anterior edge. Every winter these horns are pushed off by new hairy growths beneath them, comparable to the velvet of deer's antlers, which in turn harden into another pair of true horns. This distinction is deemed sufficient to justify placing the pronghorn in a separate family, the Antilocapridæ, intermediate between the giraffes and the Bovidæ. The horns of the female are rudimentary. The pronghorn is provided with several glands which secrete strong-smelling substances, especially during the rutting season. The most notable of these glands are just below the ear, one on each side. In summer the hair of the pronghorn is smooth and flexible, but as winter approaches it lengthens; each hair become thick, its interior becomes white and spongy, and it loses its flexibility, at last becoming brittle, so that its point is easily rubbed off. This singular fur forms a close and warm covering for the animal, but renders the skin useless as fur, nor does it make serviceable leather. The flesh, however, is delicious.

The pronghorn is confined to the open plains and thinly wooded parks and valleys of the Western mountains. It is suspicious and timid and liable to panic, when it will dance up and down; but when once away goes at a leaping pace which few greyhounds can outstrip. Early in spring the does separate from the winter herd and in some retired spot bring forth usually two kids. The does and kids soon gather into bands for mutual assistance in resisting their foes, and in the early autumn they are joined by the bucks, whose horns are new and who engage in fierce contests for the possession of the does. In former days these bands numbered thousands, and those in the northern districts regularly migrated to the southward when snow came. At the beginning of the present century the pronghorns had been so reduced and scattered that no herds of great number could gather.

T. Seton, *Life-Histories of Northern Animals* (New York, 1909); and books on sport in the western United States and Canada.

PRO'NOUN (Fr. *pronom*, Lat. *pronomen*, word standing in place of a noun, from *pro*, for, before + *nomen*, noun). In grammar (q.v.), a word which stands for or instead of a noun (q.v.) in order to avoid the repetition of it. While the noun is at first concrete, the pronoun is abstract and thus represents psychologically a much higher concept than the noun. That it is of later development than the noun seems clear from its composite or suppletive inflection, being made up of a number of stems, still seen, e.g., in *I*, *me*, *we*, *us*. It had originally no connection with the noun, from which it differed in inflection and in usage. At a later period, however, the nominal and pronominal systems of inflection (q.v.) influenced each other, so that the pronoun shows a number of terminations which properly belong only to the noun, and vice versa. A careful distinction must be observed between pronouns with gender and those without gender. To the latter class originally belonged only the pronouns of the first and second persons and the reflexive pronoun of the third person (represented, e.g., by German *ich*, *du*, *sich*). All other pronouns had gender, which was probably natural, not grammatical, in character. (See GENDER.) These pronouns are demonstrative (as Skt. *sa*, Gk. *ὁ*, Lat. *ille*, 'that,' later 'the'), from which the modern pronouns of the third person are derived (cf. Eng. *he*, *she*, *it* with AS. *hē*, *hēo*, *hit*); relative (as Skt. *ya*, Gk. *ὅς*, Lat. *quis*, Eng. *who*), which are more intimately connected with the interrogatives than the demonstratives; and the interrogatives (as Skt. *ka*, Gk. *τίς*, Lat. *quis*, Eng. *who*). Of these classes the demonstrative, which is local in force, is probably the oldest. The relative, which introduces the relatively late sentence form of hypotaxis or subordinate clauses as contrasted with the more primitive parataxis or coördination, seems to be the youngest. Between the two, yet nearer to the demonstrative in point of age, stands the interrogative, which introduces a question. Consult: Heinrich Zimmern, *Vergleichende Grammatik der semitischen Sprachen* (Berlin, 1898); Karl Brugmann, *Vergleichende Grammatik der indogermanischen Sprachen*, vol. ii (Strassburg, 1892); Michel Bréal, *Essai de sémantique* (Paris, 1913); Leonard Bloomfield, *Introduction to the Study of Language* (New York, 1914).

PRONUNCIATION OF FOREIGN NAMES (Lat. *pronunciatio*, *pronuntiatio*, from *pronunciare*, *pronuntiare*, to pronounce, proclaim, from *pro*, before, for + *nuntiare*, to announce, from *nuntius*, messenger). The correct pronunciation of a proper name depends chiefly upon giving to the letters their correct value and to the syllables their correct degree of stress. The following rules or principles are intended to furnish only a general rule to aid in understanding the values of the letters that occur in the names of foreign languages using the Roman alphabet and to some extent transliteration from other languages, as the Russian and Greek. For the purposes of this article the best practicable method will be to explain the sounds mentioned by reference to the same sound in the English language or its nearest equivalent, the more accurate and scientific method adopted by phoneticians being too technical for this place. See DEAF MUTE; PHONETICS; VISIBLE SPEECH; and also consult the titles A, B, C, etc.

The number of syllables in foreign words is generally equal to the number of vowels, except in the case of doubled or geminate vowels, or diphthongs. In the respelling for pronunciation used in this work the syllables are separated from each other by accents (′ for primary stress and ′ for secondary) and hyphens (-), with the use of the apostrophe (') to indicate a lesser degree of separation between consonants than is made by a full vowel, as in the glides (obscured transitional sounds) and catches (certain spasmodic interruptions of the breath). Every letter in a respelled pronunciation is to be given its value as indicated in the Key to Pronunciation. In most cases in English words and names no pronunciation is indicated, because its proper pronunciation seems evident. Sometimes when the pronunciation of a word is sufficiently indicated by marking the accented syllable, the vocabulary title has been accented without respelling. When this happens in foreign words it means that the letters are to be given the values that they would naturally have in English.

Accent. In general it may be said that there

are two kinds of accent, varying in quality—the tonic, or pitch, and the dynamic, or stress. Most modern languages have a stress accent, though in few is it as strong as in English. The unaccented syllables in foreign names, therefore, are generally more distinctly pronounced than in English, the vowels retaining to a great extent the quality of the long accented vowels, but without any glide.

Only a few general rules of accentuation can be given that are not subject to numerous exceptions. The following are therefore supplied merely as an aid in determining the proper pronunciation of foreign words. See ACCENT.

In *Arabic* the accent is on the last syllable, providing it terminates in a consonant. Otherwise it falls on the first syllable. In *Bohemian (Czech)* the accent is on the first syllable. In *French* the accent falls on the last syllable of a word, unless it terminates in a mute *e*, in which case the accent is on the penult. As the French accent is slightly tonic, syllabic stress is much less decided than in English. It should be noted that the accents printed over vowels in French have no relation to the spoken accent, but serve merely to indicate the pronunciation of those vowels. In *German* the accent is practically the same as in English. In modern *Greek* the stress follows the written accent and is not governed by the quantity of the vowels. In *Hungarian* the spoken accent is always on the first syllable, graphic accents being used only to indicate long vowels. In *Italian* the accent is nearly always the same as in Latin, i.e., it falls on the penult, except where the penult is short in Latin, in which case it recedes to the antepenult. A graphic or printed accent on a word usually denotes the spoken accent, except when the acute accent occurs over the vowel *i* in the terminations *ia, io*, and the grave accent is placed on the last syllable of oxytones and on some monosyllables. In *Polish* the accent is usually on the penult. In *Portuguese* the accent is generally upon the last syllable, except in case of words ending in a vowel, when it is mostly on the penult, though at times it recedes to the antepenult. In *Russian* no rule exists that is sufficiently general to be worth stating. The accent must be determined in each case by itself. In *Spanish* the accent is generally on the penult in words ending in a vowel or in the consonants *n* or *s*, and in other cases it is usually on the last syllable. When a final syllable ending in a vowel or in *n* or *s* is accented, the best present usage is to place a graphic accent on that syllable, and in like manner when a word terminating in a consonant other than *n* or *s* has the accent on the penult, that syllable bears the graphic accent. In *Turkish* the last syllable is generally lightly accented. In *Welsh* the accent is on the penult, except in a few cases where it is on the final syllable.

Letters—Vowels and Consonants. It is impossible within the scope of this article to make any attempt at a complete statement of the values of the letters and their combinations, even in the languages of modern civilized races. The following alphabetic list is intended only to aid in answering questions of a general nature.

a generally has the value of *a* in English *bath, fast*, or sometimes one approaching the sound of *a* in *cat;* in Hungarian *a* is nearly *o* in *hot*, and *á* as *a* in *far;* short *a* in Sanskrit and in many East Indian names is as *u* in *but.* *â* in Rumanian is as *i* in *tin;* in French nearly as *a* in *far.* *ä* or *ae.* (See *æ*, below.) *ă* in Rumanian resembles *e* in *her.* *ą* in Polish is like *a* in *fall*, nasalized. (See *n*, below.) *ã* in Portuguese. (See *am*, below.) *å* in Swedish is like *a* in *all*, or sometimes resembles *o* in *obey.*

aa in Danish and Norwegian is like Swedish *å*, above. For Dutch *aa*, see *æ*, below.

æ. In German *ae* (or *ä*) is nearly as *a* in *dare* or as *e* in *set;* in Dutch *ae* (now spelt *aa*), and in Flemish, is like *a* in *far;* in Swedish *ae* (or *à*) is like *e* in *set* or in *there;* in Danish and Norwegian *ae* is often like *a* in *sat;* in Welsh *ae* is somewhat like *i* in *ice.* *ãe* in Portuguese is like *i* in *ice*, nasalized.

ai or *aj* (when *j* is a vowel) is usually a diphthong, essentially like the sound of *aye*, yes. It is generally represented by a long *ī*. In French *ai* is nearly as *e* in *met*, except when final, especially in verbs, it approximates *a* in *mated;* in modern Greek as *e* in *set* or *a* in *senate;* in Hungarian *aj* is as *oi* in *boil*, and *áj* nearly as the sound of *aye.*

ail, aill, aim, ain, in French. See *il, ill*, etc., below.

aj. See *ai*, above.

am, an, in French and Portuguese, when final or preceding a consonant other than *m* or *n*, have the sound of *a* in *far*, nasalized. (See *n*, below.) In French *em* and *en*, and in Portuguese *ã*, have the same sound.

ão in Portuguese is as *ou* in *house*, nasalized.

au generally is like *ou* in *house.* In French it is like *o* in *stone;* in modern Greek (*αυ*) it is like *av*, except before surd or mute consonants, when it is like *af.* *äu* in German is like *oi* in *boil.*

av in Danish before a consonant is like *ou* in *house.*

aw in Welsh is like *ou* in *house.*

ay is generally like *ai.* When it precedes a vowel, however, the *y* is often treated as a consonant, as in French and Spanish, and the preceding *a* given its proper value.

b at the end of a word, and generally when followed by a consonant, is pronounced like *p* in German, Dutch, and the Slavic languages. In Spanish and modern Greek its sound is like a *v* made with the lips alone and not with the lips and teeth. It is often interchanged with *v.*

bh in East Indian names. See *h*, below.

c before *e, i*, or *y* in German is like *ts* (Ger. *z*); in French, Portuguese, and Catalan, like a hissing *s*; before *e* and *i* in Italian it is like *ch* in *church;* in (Castilian) Spanish, like *th* in *thin*, but in Spanish America and parts of Spain like *s* in *sun;* in Rumanian before *î* it is like *k;* in Welsh and Gaelic it is always like *k;* in the Slavic languages it is like *ts.* *ç* is like *s* in *set.* *ć* in Bohemian, Croatian, Servian, and Bulgarian is like *ch* in *chin.* *ć* in Polish is like *ch* in *chin.*

cc in Italian is like *t-ch*, as in *chit-chat.*

ch in Spanish, and generally in Sanskrit and East Indian names, is pronounced as in *chin;* in Italian and Catalan, like *k;* in German, with the same guttural sounds as *g* (see *g*, below); in Polish, with a similar guttural sound; in French and in Portuguese, like *sh* in *shin* (except in some classical derivatives, where it equals English *k*).

cs in Hungarian is as *ch* in *chin.*

cu in Spanish when followed by a vowel is like *qu* in *quick*, unless the *u* has the diæresis (*ü*) or is accented (*ú*).

cz in Polish is like *ch* in *chin;* in Hungarian, like *ts*.

d in German, Dutch, and the Slavic languages (Russian, Polish, etc.), when final, and generally when preceding a surd in the same syllable, is pronounced as *t;* in Spanish, modern Greek, and Danish when between two vowels or final it has a softened sound, usually stated to be like *th* in *then;* in Danish and Norwegian it is silent or mute after an *l* or *n* in the same syllable.

dd in Welsh is like *th* in *then*.

dh in East Indian names. See *h*, below.

dt in German is like *t* in *bit*.

e is generally equivalent, or nearly so, to *a* in *savior*, to *e* in *set*, or to *e* in *there*. In most foreign words the long sound of *e* does not have the glide that is heard in *ā* in English, as in *day*. In indicating the pronunciation of French the character *ā* is used both for the short and the long quantity of this sound. In French final *e* unaccented is silent, and it is usually silent or is much obscured when it ends a syllable other than the last. It is also practically silent in Portuguese when final. In Russian *e* is like *ye* in *yet* when it follows *d, t, l*, or *n*, or when it is at the beginning of a syllable. In modern Greek it has the values of *e* in *pet* and of *i* in *machine*. *é* in French is like *a* in *savior*. *è* and *ê* in French have the open sound of *e* in *met*, or the more prolonged sound of *e* in *there*. *e* in Polish is like *e* in *pet*, nasalized. (See *n*, below.) *é* in Bohemian is like *ye* in *yet*.

eau in French is like *o* in *no*. See the pronunciation given *au*, above.

eeuw in Dutch is like *a* in *fate* followed closely by (Dutch) *w*. (See *w*, below.) When the *w* is followed by an obscure *e* the *w* has a more consonantal sound.

ei in French is like *e* in *met;* in German, Dutch, and Welsh, like *i* in *ride;* and elsewhere it is generally a proper diphthong like *ay* in *fay*.

ein in French = *in*, below.

em, en in French = *an*, above; in Portuguese it is like *e* in *met*, nasalized. See *n*, below.

eu in French and Dutch is remotely like *e* in *her*, and equivalent to *ö*, below; in German, like *oi* in *boil;* in modern Greek (representing *ευ*), like *ev* before a vowel or sonant consonant, and like *ef* before a surd. *eu* is otherwise generally a diphthong composed of the sounds *ā* and *o͞o*, more or less closely united.

g is as *g* in *go, get*, in all the European languages before *a, o*, or *u;* and also in German whenever initial or followed by a vowel or liquid in the same syllable; in Swedish before *ä*, or final after a vowel, or before *e* or *i* when short (except in *ge*); in Polish, before *e* and *i;* in Hungarian always, except in *gy*. (See below.) Before *e, i*, or *y* in French (see *ge*, below), Spanish, Portuguese, Rumanian, and Swedish (also in Swedish before *ä* or *ö* or after *l* or *r* at the end of a primitive word or syllable), it is equivalent to *j* (see *j*, below) in the same language; in modern Greek it is like *y* in *yes*. Before *e* or *i* in Italian it is like *j* in *jet*. In Dutch *g* regularly has the voiced sound of the German *ch* or final *g*. In German *g* also has a guttural sound, made between the back of the tongue and the soft palate, which may be voiced, as when medial after back vowels (*a, o, u*), or unvoiced, as when final after *a, o*, or *u;* and a fricative sound made between the hard palate and the tongue, which may be similarly voiced, as when medial after front vowels (*e, i, ö*, or *ü*), or unvoiced, as when final after *e, i, ö, ü*, or a consonant. (See the Key to Pronunciation.) German *ch* is pronounced like *g* in these positions.

gh is like *g* in *game* in Italian and Rumanian; in Irish it is like *h*, more or less strongly aspirated.

gli in Italian has the sound of *lli* in *million;* but in a few words borrowed from Greek or Latin it has the sound of *gl* in *English*.

gn in French and Italian is like *ni* in *union*. See *ñ* and *nh*, below.

gu before *e, i*, or *y* is like *g* in *go* in French, unless followed by a consonant or *ë*, when the *u* has its distinct value; likewise in Spanish, unless the diæresis is put upon the *u* (*ü*), when the *gu* is like separate *g* and *w*, as it is also before *a, o*, or *u;* and in Portuguese. In Italian *gu* is like *gw* in *Gwilt* before all vowels.

gy in Hungarian has the value of *d* followed by consonant *y*.

h in French, Italian, Spanish, and Portuguese is silent, or nearly so, except as it is considered in the various combinations *ch, gh, lh, nh*, etc.; in German it is silent between two vowels in the same word, except in polysyllabic words when the syllable with *h* has the principal or secondary accent, as in *Johann, Wilhelm;* in East Indian words it is generally pronounced like *h* in *hat*, distinctly heard in all situations, as after *b, d, t*, etc.; final *h* is often pronounced in Arabic and Persian names, properly with a harshly aspirated sound not heard in English; in Swedish *h* is silent before *j*.

i is usually like *i* in *pique* or *i* in *hit;* and sometimes like *e* in *set*, as in *-ling, -ding*, in Danish names.

ie is like *ie* in *field* always when final in French, and when medial in German, and before *r* in Dutch, and often when final in German.

ien in French is as *in* (see below) preceded by consonant *y*.

ij in Dutch is nearly as *i* in *ride*.

il final and *ill* medial in French have, when preceded by a consonant, the sound of English *i* in *machine* followed by that of *y* in *yet;* preceded by a vowel, the combination has merely the sound of *y* in *yet*. Formerly the *l* was also heard, as in English *million*, and this pronunciation is still adhered to by some.

im, in in French are like *a* in *rank* or *anger*. See *n*, below.

j in German, Dutch (see *ij*, above), Italian, Swedish, Norwegian, Danish, Hungarian, and Polish is like *y* in *yet;* in French, Portuguese, and Rumanian it is like *z* in *azure;* in Spanish, like a rough or strongly aspirated *h* (see *x*, below); in the Philippine Islands it is often like *sh* in *shun*.

k in Swedish before *e, i, y, ä*, or *ö* in the same primitive syllable is almost like *ch* in *church*.

kh in Oriental names is usually properly a harsh guttural aspirate; in Russian names, often like German *ch;* in East Indian names, like separate *k* and *h*. See *h*, above.

l is usually as in English (see *il, ill*, above); in Polish it is like *ll* in Spanish.

lh in Portuguese is like *ll* in Spanish.

ll in Spanish is like the *l-y* sound in Eng-

lish *million*. In colonial or dialectic Spanish *ll* is like *y* in *yet*. In Icelandic *ll* is like *dl* in *handlike;* in Welsh, as nearly as can be given in English equivalents, like *thl* or *tl*.

ly in Hungarian is like Spanish *ll*.

m and *n* are practically always as in English, except when used to indicate a nasal stop sound. (See *am, an, em, en*, etc.)

ñ in Spanish, *ń* in Polish, and *ň* in Bohemian, Bulgarian, Croatian, and Servian are like *ni* in *union*.

ng in German is always like *ng* in *singer*.

nh in Portuguese is like Spanish *ñ*.

ny in Hungarian is like Spanish *ñ*.

o is usually like *o* in *obey* or in *for*, but it frequently shades away from these sounds towards those of *o* in *not* and *a* in *cast;* but these variations may be sufficiently well represented as the *ȯ* (see Key to Pronunciation) more or less slurred or clipped in pronunciation. *o* in Swedish has the sound of *o͞o* in *boot* or *u* in *full* when final or constituting a syllable, and also in the syllables *-nord, -port* when final. Final *o* in Portuguese is like *oo* in *fool*. *ó* in Polish is as *u* in *rude* or in *full*, and in Portuguese like *o* in *not*. *ö* (or sometimes *oe*) has no equivalent in English, but resembles *e* in *her*, and is the same as French *eu*. *ô* in French and in Portuguese is as *o* in *no*. *õ* in Portuguese is *o* as in *no*, nasalized. See *m*, above.

oe is sometimes used for *ö* (above), with the same value; in Dutch it is as *u* in *rude, full;* in Low German names, like *o* in *note;* in Welsh, somewhat like *oi* in *boil*.

õe in Portuguese is like *oi* in *oil*, nasalized. See *m*, above.

œu in French is like *eu* (above).

oi is usually nearly like *oi* in *boil;* but in French is regularly nearly like *wa* in *watch;* in modern Greek, like *i* in *pique*.

oin in French is French *in* (above) preceded by English *w*.

oo is usually *o* as in *no, oh*.

ou in French and modern Greek is like *u* in *rude;* in Dutch and Norwegian, like *ou* in *mouse;* in Portuguese, nearly as *o* in *no*.

ouw in Dutch is nearly as *ou* in *mouse*.

ow in Low German names is as *o* in *no*.

p is as in English.

qu in French, Spanish, and Portuguese, before *e* or *i*, has the sound of *k;* in German it is like *kv*. Otherwise it is usually equal to *kw*, as in Spanish, Portuguese, and sometimes in French before *a, o*, or *u*, in Italian always, etc.

qv in Swedish is equal to *kv*.

r is usually pronounced with much more trill than it has in English. A gutturalized or velar *r* is also heard, as in some pronunciations of French and German, that has no equivalent in English. *ř* in Bohemian is like *r* followed by the sound of *z* in *azure*.

rz in Polish is like the sound of *z* in *azure*.

s has the sound of *z* in *zinc*, in German when initial followed by a vowel or medial, in Portuguese when medial, and in French when between two vowels or when carried over to the following word. It has the sound of *sh* in *shine* in Hungarian, in Portuguese when final or before a surd (except *s*); in German before *p* or *t*. In Italian *s* before a vowel is sometimes like *s* and sometimes like *z*, depending on usage. Otherwise than as above noted, *s* is usually like *s* in *sin*, as always in Spanish, Dutch, and Swedish. *š* in Bohemian, Bulgarian, Croatian, and Servian, and *s* in Rumanian, is like *sh* in *shun*.

ş in Rumanian is like *sh* followed by *t*, before *e* or *i*.

sc in Italian before *e* and *i* is like *sh* in *shun*.

sch in German is like *sh* in *shun;* in Italian and Rumanian, before *e* or *i*, like *sk* in *skin;* in Dutch before vowels, except obscure *e*, like *sg* (see below), otherwise like *s*.

sg in Dutch is *s* followed by the guttural *g* of Dutch, resembling *sk* in English.

sj in Dutch, Swedish, and Danish is like *sh* in *shun*.

sk is like *sh* in *shun* in Swedish and Norwegian before *e, i*, or *y*.

skj in Swedish and Norwegian is nearly as *sh* in *shun*.

ss in Hungarian is a strong *sh* in *shun;* but elsewhere usually indicates a surd *s*, single or doubled, as in German, Dutch, etc.

ssz in Hungarian is a prolonged *s* sound.

stj in Swedish is nearly as *sh* in *shun*.

sz in Hungarian is as *s* in *sin;* in Polish as *sh* in *shun*.

t after *n* in modern Greek is as *d*. *ţ* in Rumanian is as *ts* in *pits*.

th in modern Greek (*θ*), Welsh, and Icelandic is like *th* in *thin;* otherwise like *t*, or *th* in *thyme*, in all the modern European languages.

tsch in German is as *ch* in *church*.

ty in Hungarian. See *y*, below.

tz in German is as *ts* in *pits*.

u is usually as in *rule* (*o͞o*) or *put* (*u*). In French and in open syllables in Dutch it has no English analogue. The correct sound may be approximated by attempting to pronounce *ē* with the lips in the position for pronouncing *o͞o*. In Welsh *u* is like *i* in *machine;* in Rumanian it is usually silent when final. *ü* (sometimes printed *ue* in German and Turkish) is like *u* in French. See above.

ue, except when representing *ü*, usually combines the sound of *u* and *e*, more or less closely joined in pronunciation.

ui in French is much like English *we*, and is best produced by pronouncing slightingly the French *u* and accenting the following vowel (but see *gu, qu*, above); in Dutch, nearly as *oi* in *boil*.

um, un in French are nearly as *u* in *hurt*, nasalized; in Portuguese, as Portuguese *u*, nasalized. See *m*, above.

uu in Dutch is Dutch *u* prolonged.

uy in French is like *ui* (see above), except before a vowel, when it is like *ui* followed by *y* as in *you*.

v in German, Dutch, and the Slavic languages (Russian, Polish, etc.) is usually as *f* in *fin*, but sometimes as *v* in *vine*.

w in German, Swedish, Norwegian, French, and Polish is like *v* in vine; in Dutch it is like a *w* made without rounding the lips; in Welsh it is usually as *o͞o* in *food*.

x in modern Spanish is usually as *x* in *fox;* sometimes it is as *j* or *g*. (See *g*, above.) In colonial Spanish, especially Mexican, and in some dialects in Spain, it often is as *s* in *sin*. In Portuguese *x* has the sound of *sh* in English.

y is generally like *i* in *machine*. In Danish, Swedish, and Norwegian it is like French *u; ym* and *yn* in French are like *im* and *in*.

z is as *ts* in *hats* in German; in Swedish, Danish, and Norwegian, like *s* (see above); in Spanish, like *th* in *thin*, but in American Span-

ish and in some dialects in Spain like *s* in *sin;* in Italian, like *ts* or *dz* (as in English *adze*) or sometimes nearly as the English *z*. Otherwise it is usually as *z* in *zinc*, as in Dutch, Polish, Hungarian, etc. *ź* in Polish is as *z* in *azure*. *ž* in Bohemian, Bulgarian, Croatian, and Servian is like *z* in *azure*, or, when final, like *sh* in *ship*. *ź* in Polish is a softened *z*, much like *zh*. *zs* in Hungarian is like *z* in *azure*.

W. Viëtor, *Elemente der Phonetik des Deutschen, Englischen und Französischen* (6th ed., Leipzig, 1914).

PRONVILLE, ALEXANDRE DE. See TRACY, MARQUIS DE.

PRONY, prô'nē', GASPARD CLAIR FRANÇOIS MARIE RICHE, BARON DE (1755–1839). A French engineer and mathematician, born at Chamelet and educated in the Ecole des Ponts et Chaussées. In 1785 he was put in charge of the restoration of the harbor of Dunkirk, and in 1794, after the completion of his great tables of logarithms to 25 decimal places, the first made under the metric system, he was named professor of mathematics at the Polytechnique. Four years afterward he was appointed head of the Ecole des Ponts et Chaussées. He was a member of the Academy of Sciences. Prony held office through the Empire and was connected with the great sanitary measures undertaken in the Pontine Marshes and along the valley of the Po. His more important works include: *Nouvelle architecture hydraulique* (1790–96); *Leçons de mécanique analytique* (1815); *Description hydrographique et historique des marais Pontins* (1823); *Notice sur les grandes tables logarithmiques* (1824).

PRONY BRAKE. A form of absorption dynamometer applied to a revolving shaft or pulley. It consists of a lever so connected that the friction induced by the revolving shaft will tend to rotate the frame of the lever in the direction in which the shaft revolves, but by the use of weights or springs at the end of the lever this rotation is counterbalanced. With a given number of revolutions weights may be added to the end of the lever and pulleys connecting the friction surface may be screwed up so that the lever is maintained in a horizontal position. Various modifications of the apparatus are employed. The equation for determining the horse power or work of a revolving power or shaft is as follows: W = work of shaft = power observed per minute; P = unbalanced pressure or net pull in pounds acting on lever arm at distance L; L = length or radius of lever arm in feet from centre of shaft; V = velocity of a point in feet per minute at distance L if the arm were allowed to rotate at the speed of the shaft; N = number of revolutions per minute; HP = horse power.

Therefore $W = PV = 2\pi LNP$; for $HP = PV \div 33{,}000$.

Therefore $HP = 2\pi LNP \div 33{,}000$; for $L = 33 \div 2\pi$, $HP = NP \div 1000$.

Therefore $33 \div 2\pi$, or 5 feet, 3 inches, is a convenient value to be used for the length of the arm.

If an electric motor is being tested and it is desired to obtain the power output in watts, watts = $LNP \div 7.04$.

Consult J. J. Flather, *Dynamometers and the Transmission of Power* (2d ed., New York, 1900), and Kent, *Mechanical Engineer's Pocket-Book* (8th ed., New York, 1913). See DYNAMOMETER.

PRO'NYMPH (from Lat. *pro-*, before + *nympha*, Gk. *νύμφη, nymphē*, bride, nymph). A stage of development with certain dipterous insects which transform within the last larval skin. This last skin having hardened and contracted, the insect within it loses all apparent structure and becomes an accumulation of soft, creamy matter within a delicate membrane. This condition begins in the resting larva, and the surrounding membrane is probably the larval hypodermis. In this pronymph the organs gradually take shape until a true pupa, corresponding to that of a hymenopterous insect, is formed.

PROOF (OF. *prove, preuve*, Fr. *preuve*, from Lat. *proba*, proof, from *probare*, to test, examine). In art, a trial impression taken to show the state of an engraving, etching, medal, or coin die during execution. (For proof in printing books and periodicals, see PRINTING; PROOF READING.) Thus, in the art of die sinking, impressions called proofs are taken from the die from time to time in order to guide the artist. They are struck in metal of no great intrinsic value except in the case of the last state of the die, when a proof will be taken in the metal intended to be used. As, however, there is great demand with both museums and private collectors for the proof copies of coins and important medallions, it is not unusual to take a number of such impressions from the completed die. These are sometimes marked as proofs by having a peculiar characteristic. Thus, all modern coined money is saved from the attacks of coin clippers by having raised letters around the edge, such as "Dieu protège la France," on French coins of the Third Empire and the Republic, or by having the edge fluted or reeded with little bars across it. These will be omitted in the proofs.

The most important use of the word in connection with the arts is the name given to trial impressions from an engraved wood block or plate. (See PRINT.) It is customary to take these proof impressions at different times as the plate approaches completion, and such impressions are called engravers' proofs, and, in spite of their showing an incomplete state of the plate, are sure to command high prices in an engraving of any importance. The engravers' proofs, taken as the plate approaches completion, are extremely brilliant and effective, because they are taken one by one, by hand, and with great care; the same brilliancy is preserved in the earliest proofs which are printed off expressly for sale. These are often classified in some special way, as by etching upon the margin of the plate some very small design, as a head, a figure of a bird or beast, or even a sketched incident with two figures, and this little picture is printed with the large composition. Impressions so taken are called *remarque proofs* and are recognized as being the earliest, the *remarque* being planed away or the plate cut down, the proofs next taken are known as artists' proofs. All this time the intended lettering on the edge of the plate, i.e., the title of the picture and the name of the engraver, and of the artist of whose original work the

engraving is a copy in so many cases, have not been added. Proofs made from the unlettered plate are called generally *proofs before the letter*. If, now, the names of the original artist, if any, and of the engraver are added just below the edge of the picture, proofs taken at this stage are called *proofs before the title*. What is said here of the engraver's or artist's name does not refer to the appearance of any artist's signature within the boundaries of the picture itself; for in many etchings and similar works the signature is almost a part of the design. Proofs with open letters are those in which the large capital letters of the title are inserted, but left in outline. After these letters are completed, the ordinary prints are taken.

There are still to be noted the proofs of artistic engravings, which are never lettered on the margin, which are not intended to have any title, or any name of artist or publisher, or any number or letter whatever on the margin. A conscientious etcher is very careful in noting the number of editions printed from any plate thus unsigned. The plate may be changed after any given printing; new effects may be produced, worn lines strengthened.

From this it will be seen what is the real importance of first state and second state, and the like, in artistic engravings. The first state is apt to be preferred, because there is certainty that the plate has not been worn at this stage of its existence. It may be, however, that the second state is preferred for many reasons. There are some of the *Liber Studiorum* in which the second state is admittedly finer. An impression on vellum of the second state of an etching may be better than an impression on paper of the first state, because prints on vellum are carefully taken and because of the exceptional beauty of a print upon this particular material. Again, the first state may be known from the second state or other subsequent states only by some very slight and hardly noticeable modification. Consult the bibliography of ENGRAVING; ETCHING; LINE ENGRAVING; WOOD ENGRAVING.

PROOF. In law, the process of establishing an alleged fact for judicial purposes. This may be effected by the rational process of inducing persuasion by the submission of evidence or otherwise, or it may consist in the employment by the party having the burden of proof of formal acts or words or in the performance of certain acts which of themselves amount to proof of the fact alleged. In its present form proof consists in all the various means by which, under the rules governing judicial procedure, persuasion of the court or jury is brought about, and includes observation or inspection (as of a child to determine its age or parentage), general knowledge (judicial notice) —as of facts of common knowledge—brought to the attention of the court or jury, and argument as to the inferences that may properly be drawn from facts admitted or established, as well as the submission of evidence under oath. The popular use of the term "proof" as synonymous with proof by sworn testimony or other legal evidence is therefore too restricted and misleading. Consult: Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Bentham, *Rationale of Judicial Evidence* (London, 1827); Thayer, *Preliminary Treatise on Evidence at the Common Law* (Boston, 1898); Gulson, *The Philosophy of Proof* (London, 1905); Gross, *Criminal Psychology* (Boston, 1910); Arnold, *Psychology Applied to Legal Evidence* (Calcutta, 1913); Wigmore, *The Principles of Judicial Proof* (Boston, 1913). See BURDEN OF PROOF; EVIDENCE; TRIAL; and, as to earlier modes of proof, BATTLE, TRIAL BY; COMPURGATION; ORDEAL.

PROOF READING. The reading of printers' proofs, for correction of errors in the type or, by authors or editors, for final approval or alteration. Proof readers are sometimes called "correctors of the press," and their work "correction of the press," especially in Great Britain. Of course, the assembling of types, one by one, from their boxes in the printer's case, or the striking of a corresponding number of keys in machine composition, is not done by the average worker without accidents, making errors that need correction; and the work, besides the mere technical minutiæ, comprehends reproduction from handwriting that presents many points of perplexity. In fact, typographic composition is liable to error in more ways than any person not a printer could possibly imagine. Thus it may be seen that correction through proof reading is a most important feature of the production of printed matter. In fact, sometimes the work thus done is one of the largest items of expense.

Special marks are universally used by printers in correcting proofs, and authors and editors will find advantage in knowing and using these marks, mainly because of their inherent simplicity. Absolute simplicity in indicating changes, however, is the only essential desideratum. If a desired change is shown on the margin of a proof so plainly that it cannot be misunderstood, its conformity or nonconformity to technicality is of no consequence. One method of marking a proof will almost surely fail, and that method is one that suggests itself instinctively to the novice. It is that of making changes within the bounds of the text, such as a line through an extra letter or word that should be taken out, or writing a comma or other point after a word, with no mark in the margin. Proofs have been so corrected, and great disappointment felt because the final result showed neglect of the corrections. Markings for correction may be enumerated as follows:

1. In ordering the removal of anything not desired a novice might write a full direction, as "this is to be taken out," but the proof reader makes in the margin, opposite a crossed letter, word, or words, the sign ℌ, which is merely a specialized form of the initial letter of the word *dele*, meaning "take out." One way secures the result as well as the other, but the second plainly shows its economy, which exemplifies that of all marks peculiar to proof reading. Frequently a number of corrections must be made in the same line, and in this case the only really arbitrary mark is used, being a vertical stroke, placed after each marginal item, merely for separation. Some readers make such a stroke after each correction in the left-hand margin, but before those in the right-hand. It is better always to have it follow, as that practice becomes so instinctive as to free the mind from unnecessary formality and so assists towards concentration of attention, which is the key to success.

2. A wrong letter is corrected by making a

stroke through it and writing the proper letter in the margin. Exact system in the arrangement of marginal items is very desirable. Thus, a line may contain a number of errors, and it is much easier for the compositor to trace the corrections if made in regular order, exactly in line with the corresponding faults. It is well worth while to cultivate the habit of using the margin on the left for corrections in the first half of the line and that on the right for others; also to write the first one well out towards the left edge and the first on the other side near the print. Some proof readers make the first mark on the right distant from the print, and those for later positions nearer, thus undoubtedly causing loss of time to the correctors of the type, who have to trace out the correspondences.

3. Change of place, whether of a letter, a word, or many words, is called transposition. Such change within a line is indicated by a line drawn above, below, or around the first letter, word, or words, and under or above those following, to a caret indicating the new place for the matter shifted, and by "tr." written in the margin. For transposing letters merely, it is much better to cross them and write the letters themselves in proper order, especially for machine composition. To transpose paragraphs, a line is made alongside the first and a connecting line to its new place, and "tr." is written opposite the first. Many write "transfer," but "transpose" is the printers' word.

4. For change of type a line should be drawn under the text and "rom." written for substitution of roman instead of italic, "ital." for changing roman to italic, "l.c." for lower case, "s.c." or "s. caps" for small capitals, and "c." or "caps" for capitals. For a single letter or two letters together it is economical to write the letters themselves in the margin, with one line underscoring for italic, two lines for small capitals, and three for capitals. One line is sufficient in any case under the type that is to be removed. In manuscript one line of underscoring directs the use of italic; two, small capitals; and three, capitals.

5. To correct type of wrong form—too heavy, too light, etc.—"w.f.," meaning "wrong font" (type of a wrong kind), is written.

6. A direction to leave unchanged anything that has been crossed is given by making dots under it and writing "stet" (meaning "let it stand as it is") in the margin.

7. Omission of a word or words is called an "out" by printers, but that of a point or a part of a word is not so called, though the method of correcting is the same. A caret (∧) is made in the place for insertion, and the character or words (the "out") written directly opposite when possible; but otherwise it may be placed according to convenience, with a line drawn to it. When an "out" is too long to write in the margin, the proof reader writes in its place "out, see copy," marks the matter omitted on the copy, and sends it to the compositor with the proof. For insertion of a space, the sign # is written in line with the caret. A square (□) is made for insertion of an em or square of space.

8. Superior and inferior characters are indicated thus: ʾ ¹ ˌ ˌ ˆ ˆ. The first of these marks is an apostrophe, never called a "superior comma" by printers, who would hardly know it by that name.

9. The meaning "turn this character right" is indicated by the mark ⊃. Some proof readers make it ⊂ in the right-hand margin, but simplicity is gained and nothing is lost by making it always the same.

10. A mark ! indicates that a space (a low blank type) is to be pushed down so that it will not print.

11. Crookedness of lines is noted by strokes (=) above and below and repeated in margin.

12. Elimination of space between characters is directed by the use of tie marks (⁀). These should also be used above and below the dele mark (⸗) when letters from between which a hyphen is removed are to be drawn together. When a space is to be used in place of the hyphen, the marking should be the same as for changing a letter—the hyphen crossed out and a space mark written in the margin.

13. A new paragraph is ordered instead of a mere sentence by making a caret and placing the sign ¶ in the margin. Change from a paragraph to a sentence is shown by a connecting mark from the lower line to the upper and in the margin either "no ¶ " or "run in."

14. Reduction of space between words is directed by a mark (√) at the top of the letters, which is equivalent to writing "take out some of the space."

15. Marks expressive of meanings that could not be more clearly told are ⌐ ¬ ⌊ ⌋ [ ]. They are used when anything is to be raised, lowered, or drawn to left or right.

The matter of convenience in the arrangement of marginal marks is worthy of very careful consideration. The proof readers whose practice is best are those who have begun with serious determination that such convenience must be conserved and have never allowed haste or pressure of any kind to swerve them from this path of rectitude.

PROP'AGAN'DA (Lat. *de propaganda fide*, concerning the propagation of the faith). The name of the most important of the Roman congregations or committees of cardinals for the administration, under the Pope, of the Roman Catholic church. It was established in the seventeenth century, partly to work in the countries lost by the Reformation, partly to evangelize the newly opened pagan lands. Those parts of the world which are designated as "missionary countries" come under its immediate jurisdiction, even when possessing an organized hierarchy. In general, they are those which are non-Catholic in government, with some exceptions, as Russian. They include: in Europe, the British Isles, Norway, Denmark, Holland, Switzerland, Greece, the Balkan Peninsula, and parts of Germany; all of North America except Mexico; all of Asia but the Patriarchate of Goa and the Philippines; all of Africa except Algeria and certain dioceses subject to European metropolitans; Australia and Oceania. The churches of the Oriental Rite also come under the Propaganda. Consult: A. Pieper, *Gründung und erste einrichtung der Propaganda-Kongregation* (Munich, 1901); Freri, *The Society for the Propagation of the Faith and the Catholic Missions* (Baltimore, 1902); id., *The Missionary Work of the Church* (New York, 1908). See MISSIONS, CHRISTIAN.

PROPAGATION OF THE FAITH, SOCIETIES FOR THE. See MISSIONS, CHRISTIAN.

PRO'PANE (from *prop-yl*, from *prop-ionic*, from Gk. *πρῶ-τος*, *prō-tos*, first + *πίων*, *piōn*, fat

+ *meth-ane*), C_3H_8. A gaseous compound of carbon and hydrogen existing in small quantities in crude petroleum. Its illuminating power is half again as great as that of ethane (q.v.); like ethane, it is practically insoluble in water, but, under ordinary atmospheric pressure, dissolves in one-sixth of its volume of absolute alcohol. The highest temperature ("critical temperature") at which it may still be liquefied is 97.5° C. (207.5° F.). It is produced when acetone, glycerin, and certain other substances are heated with hydriodic acid to 280° C. (536° F.), but it may be best prepared in the pure state by treating isopropyl iodide, $(CH_3)_2CHI$, with dilute hydrochloric acid. See HYDROCARBONS; CARBON COMPOUNDS.

PROPANOL. See MENTHOL.

PROPELLER SHAFT, IN MOTOR VEHICLE. See MOTOR VEHICLE.

PROPENYL ALCOHOL. See GLYCERIN.

PROPER (OF., Fr. *propre*, from Lat. *proprius*, peculiar to one's self). In heraldry (q.v.), a charge borne of its natural color.

PROPER'TIUS, SEXTUS (c.49–c.15 B.C.). A Roman elegiac poet. He was an Umbrian by birth, and his native town was in all probability the city of Asisium. He was of equestrian rank, and his father, who had joined Lucius Antonius, had lost much of his estate, which was confiscated by Augustus. Concerning the poet's life there are but few data. After his father's death he came to Rome, probably about the age of 16, and studied law. This profession, however, proved but a nominal one, for his real life work lay in poetry. His first patron was Volcatius Tullus, but, after the publication of his first book, he was presented to the famous Mæcenas (q.v.), who became his lasting friend. The relations of Propertius with his fellow poets were most harmonious. He is mentioned frequently by Ovid with unmistakable affection, and he speaks of Vergil with enthusiasm. Although neither Horace nor Tibullus is named in his poems, his work contains many reminiscences of both. Of the latter part of the life of Propertius we know nothing. He speaks of himself as a valetudinarian, and he died at Rome, probably at the age of about 35. According to Pliny, he married after the death of his mistress and left a son, but this account is rightly discredited.

The work of Propertius falls into two classes: first, and by far the more important, love elegies, and, second, poems of eulogy. Indeed, the great event of the poet's life, and the only one of real importance so far as his literary activity is concerned, was his love for a mistress, somewhat his senior, whom he celebrated as Cynthia, but whose real name, if we may believe Apuleius (q.v.), was Hostia. She was probably the sister of one Hostius (q.v.), who is known only as the author of a lost epic entitled *Bellum Histricum*. In character she seems to have been light, fickle, vain, and mercenary, yet she was witty and beautiful. In his early youth the poet had had an ephemeral passion for a slave girl whom he calls Lycinna, but after his acquaintance with Cynthia he appears to have been loyal to her for several years. At last, probably after some five years, there came a break in their union, although they seem to have been reconciled before her death. In the poems addressed to her Propertius appears at his best, although the letter of Arethuse to her husband, Lycotas, foreshadowing the *Heroides* of Ovid, shows pathos rarely beautiful. The two dominant notes of his poetry are passion and erudition. As his models he took the Greek Alexandrine school of poetry, following especially Philetas and Callimachus, being himself called "the Roman Callimachus."

In comparison with his love poems his eulogistic verse is of slight interest. Urged by Mæcenas to write in epic strain, he pleaded his unsuitability to the task. The justice of this self-judgment is confirmed by his elegies on Vertumnus, Tarpeia, Hercules and Cacus, and Jupiter Feretrius, for all of which he probably drew his material chiefly from Varro (q.v.). Yet he treated also contemporary events in his poems on the battle of Actium and the deaths of Cornelia and Marcellus, and the preparations of Augustus against the Parthians.

The first book of the elegies was published by Propertius, probably about 28, under the name of *Cynthia*. Although the dates of the remaining books are somewhat uncertain, the second and third seem to have appeared about 26, the fourth about 21, and the fifth about 16. The very number of the books is a disputed question. They were supposed to be three until the edition of Lachmann (q.v.), who divided the second book into two. Despite the arguments in favor of such a division, objections may be advanced against it.

The manuscripts of Propertius are very late and extremely corrupt. His works were apparently unknown throughout the Middle Ages; the earliest mention of a manuscript of them is of one in the possession of Petrarch. The best is the *Codex Neapolitanus*, dating from the twelfth or the thirteenth century, and now in the library of Wolfenbüttel. The influence of the poet on literature has been slight, although it is noteworthy that he inspired Goethe to the composition of his *Römische Elegien*.

The first edition of Propertius was published at Venice in 1472. Other important old editions were by Scaliger (Paris, 1577), Passerat (ib., 1608), Broukhus (Amsterdam, 1727), Vulpi (Padua, 1755), and Burmann (Utrecht, 1780). The editions of Lachmann (Leipzig, 1816; Berlin, 1829) were epoch-making in Propertian criticism. Other editions have been published by Jacob (Leipzig, 1827), Hertzberg (Halle, 1843–45), Paley (London, 1872), Bährens (Leipzig, 1880), Palmer (Dublin, 1880), Postgate (London, 1894), Rothstein (1898), H. E. Butler (London, 1905); and the text only by Keil (Leipzig, 1850), Haupt (5th ed., ib., 1885), Müller (ib., 1870), J. S. Phillimore (Oxford, 1906). English translations have been made by Cranstoun (London, 1875), Moore (Oxford, 1870), J. S. Phillimore (Oxford, 1906), and H. E. Butler (London and New York, 1912). Consult also: Jacob, *Propertius* (Lübeck, 1847); Plessis, *Etudes sur Properce et ses élégies* (Paris, 1886); Davies, *Catullus, Tibullus, and Propertius* (London, 1876); W. Y. Sellar, *Horace and the Elegiac Poets* (Oxford, 1892); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1909); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911).

PROP'ERTY (OF. *properte*, from Lat. *proprietas*, property, peculiar nature or quality, from *proprius*, peculiar to one's self), LAW OF. In the broadest sense (which is also in English the ordinary sense), property includes all rights that are primarily economic in their object, all rights that constitute legally protected wealth. It thus includes all rights in corporeal things, whether immovable or movable; all rights to de-

mand from particular persons (debtors) acts or omissions that are primarily of economic value; and all monopolies, such as patent rights, copyrights, franchises, etc. Excluded in modern law are the rights of a public officer or of a citizen, and the rights of a husband or father or guardian over the person of a wife or child or ward; because, although these rights may have economic value, modern law does not regard them primarily from this point of view. Modern theory, indeed, regards all public and family relations rather from the point of view of duties than from that of rights (q.v.).

Early Law does not draw these distinctions. All early private rights are, in a broad sense, property rights. Our Aryan ancestors apparently used the same word (Ger. *mund*, Lat. *manus*, the hand) to indicate legal power over inanimate things, animals, slaves, delinquent debtors, wives, and children; and it is probable that the powers of owners, masters, creditors, husbands, and fathers were originally equally unlimited. (Cf. MARRIAGE; PARENT AND CHILD.) In early German law the same word (*mund*) was applied to the power of the King, and throughout the Middle Ages governmental powers were generally treated as property rights. Survivals of these early views are found in the English common law, e.g., in the description of a public office as an "incorporeal hereditament" and in the treatment of paternal right as a right to services.

Roman Law. The Roman law of property originally included family rights. The earliest classification of property, which appears in the Twelve Tables, is (1) *familia*, the household, which includes land and agricultural easements, beasts of draft and burden, slaves, wife and children; and (2) *pecunia*, which includes all other things. Since things of *familia* were capable of conveyance only through a formal sale before witnesses, known as mancipation, they were also termed *res mancipi*, and the things of *pecunia* were termed *res nec mancipi*. In early Roman law these two classes of property seem to have been protected by different remedies and to have been governed by different rules as regards testamentary disposition. In the later law, as modified by the prætors, the distinction lost all practical importance. In the later jurisprudence family rights were taken out of the category of property (*res*) and put under the law of persons.

The Roman law also developed a clear distinction between ownership and all other rights in things. 1. Ownership (*proprietas*) included all powers that were neither specifically withheld by the law, in the interest of the community, nor specifically granted by the owner to another person. Ownership was thus at once the general and the residuary right over things. 2. All other rights (*jura in re*) were limited either in content or in duration. These limited rights were either (*a*) rights of use, viz., servitudes (q.v.) and long leaseholds, or (*b*) rights of eventual sale, created to secure debts, viz., pledge (*pignus*, q.v.) and hypothecation. (See HYPOTHEC, HYPOTHECATION.) With rare exceptions rights in things could be freely alienated, and, unless restricted to the single life, they were subject to free testamentary disposition.

Modern European Codes. In the law of real property the disappearance of feudal tenures and the conversion of peasant holdings either into ordinary leaseholds or into freeholds has practically reëstablished the simpler Roman categories. Political power has been separated anew from property right, and there is no eminent domain except that of the state. On the other hand, the general introduction of official registration of conveyances, mortgages, etc., and the disposition to protect the honest purchaser who relies upon the public records have greatly modified the Roman rules. The registered grantee or mortgagee is always protected against the holders of unregistered titles, and in modern German law there is, properly speaking, no title without registration.

As to movable property, nearly all the European codes have accepted the old German rule that honest possession is good title except against a prior possessor by whom the thing was lost or from whom it was stolen; and even in the case of lost or stolen property, the possessor who has purchased the thing "at a fair, in a market, at a public sale, or from a merchant who deals in such articles," is not obliged to surrender it until the price which he paid for it is refunded. In the modern German code the rule is somewhat different: purchase in market overt does not protect the possessor of lost or stolen things, but purchase at a public auction gives him an unassailable title. In the German code, also, the honest possessor of money or of negotiable paper payable to bearer is always owner, and similar rules are contained in the commercial codes of several other countries. It follows from these rules regarding movable property that no hypothecation of such property is recognized, but only pledge accompanied by possession.

The principle which underlies all these modern rules is that of publicity. Rights which run against all the world must be evident to, or at least ascertainable by, all the world. This end is gained, as regards real property, by registration of titles. As regards movable property the only public evidence of title is possession.

English and American Law. The common law of property has departed widely from the conceptions of the civil law, owing mainly to the independent development of the law of land under the influence of the feudal system. That system was late in establishing itself on English soil, but once established it impressed itself rapidly and permanently on the law of property. The fundamental distinction between movables and immovables disappeared, and we have, in their place, real and personal property, based on the distinction between real and personal forms of action. The real action was available to recover the very thing (*res*) of which the person instituting it had been deprived—primarily land and its fixtures. The personal action was instituted to recover damages from the person whose detention or destruction of a chattel had rendered him amenable to legal process. The two categories thus formed were swelled by circumstances, by analogy, by considerations of convenience, resulting in a curious composite. To real property were added all the so-called incorporeal interests, whether they had to do with land or not—as easements, profits à prendre, rents, tithes, offices. So, too, as real property passed by descent to the heir of a decedent, everything which by local or general custom passed to an heir and not to an executor came to be included in the description of real property—such as the crown jewels, heirlooms, titles of honor. On the other hand, certain interests in land, as leaseholds, creditors' estates, mortgages, and shares in landholding corporations, came

upon the world and an intense concern about its future, which have also come to characterize our conception of a prophet. That the new era expected was closely bound up with strictly national ideals represents a natural limitation, the absence of which would have placed both the prophets and prophecy entirely beyond the intellectual and religious horizon of their times. As late as the advent of Jesus the Messianic period was bound up in the minds of the masses with the restoration of the Jewish kingdom, and though Yahwe long ere the days of Jesus had ceased to be a merely national deity, yet even the God recognized as supreme and single in the universe was bound by special ties to a particular people; and even when the Messiah was no longer pictured as an earthly king, the limitation of Hebrew prophecy appears in the position accorded to Jerusalem, which, as the chosen seat of the universal God, was to be the spiritual centre of mankind—the gathering place to which all nations would make pilgrimage.

The term *nabi*, prophet, is applied in the Old Testament to many persons before the eighth century B.C. That there is a marked difference between men like Samuel and Nathan, Elijah and Elisha, on the one hand, and Amos and Hosea, Isaiah and Jeremiah, on the other, cannot be denied. The former are prophets of a different character, standing far nearer to the old Semitic *kāhins*, who, more or less closely organized into a guild, differ from the ordinary representatives of the gods, the priests, only in not being attached to any particular sanctuary, but, passing from place to place, furnishing oracles to those who seek them out, and engaging in religious practices that are the outcome of primitive religious beliefs. Yet this difference must not be exaggerated. They are not far apart in their moral fervor, their political and social interests and their pessimism, and the same intensity of nature leads one group to violent action, the other to denunciation. The application of the term to Abraham and Moses is simply due to a projection of later conditions into the remote past. It is not easy to draw a line of demarcation between true and false prophets. The fulfillment of their predictions cannot be used as a criterion, since many of the prophecies of Isaiah, Jeremiah, and Ezekiel were not fulfilled. If denunciation of doom were made the test, as it was by Jeremiah in the case of Hananiah, the author of Isa. xl ff. would be a false prophet. The theory of imposture on the part of the so-called false prophets has scarcely any adherents at present among scholars. But it is generally recognized that the degree of sincerity and moral earnestness creates a distinction among prophets, whose eyes are riveted on the future, the tendencies discernible in human history, or the moral ideals, as well as among other men.

PROPHÈTE, prô'fât', LE. An opera by Meyerbeer (q.v.), first produced in Paris, April 16, 1849; in the United States, Nov. 25, 1849 (New York).

PROP'OLIS (Lat., from Gk. *πρόπολις*, bee glue, suburbs, from *πρό*, *pro*, before + *πόλις*, *polis*, city). A substance commonly known as bee glue, which is obtained by the domestic honey-bee from the buds and crevices of trees and is carried by the workers to the hive in the basket-like cavities on the tibial joints of the hind legs. It is resinous in its chemical composition, and varies with the tree from which it is collected. It is used at once to stop up crevices in the hives and to varnish the whole interior surface, as well as to glue movable portions fast; also in strengthening the attachments of combs, and if the latter are designed exclusively for honey the edges of the completed cells receive a thin coating. The flight hole is often made smaller by filling a part of it with masses of propolis, sometimes mixed with old wax. Bees of the Carniolan race gather the smallest quantities of propolis and those of the Tunisian race the greatest amount; on this account the former are better suited to the production of white-comb honey.

PROPON'TIS. The ancient name of the Sea of Marmora. See MARMORA, SEA OF.

PROPOR'TION (Lat. *proportio*, proportion, symmetry, analogy, from *pro*, before, for + *portio*, share; connected with *pars*, part). In mathematics, an equality of ratios. Thus, the ratio of 12 to 3 equals the ratio of 8 to 2; hence $12 : 3 = 8 : 2$ is a proportion. In general if $a : b = c : d$, a, b, c, d are said to be in proportion. An equality of several ratios, as $1 : 2 = 4 : 8 = 9 : 18$, is called a continued proportion. An equality between the products of ratios, as $\frac{2}{3} \cdot \frac{4}{5} = \frac{1}{7} \cdot \frac{9}{5}$, is called a compound proportion. In the proportion $a : b = c : d$, a, b, c, d are called the terms, a and d the extremes, and b and c the means. The term d is called the fourth proportional to a, b, c. In the proportion $a : b = b : c$, b is called the mean proportional between a and c, and c is called the third proportional to a and b. If one quantity varies directly as another, the two are said to be directly proportional, or simply proportional. For example, the price of a given quality of sugar varies directly as the weight; the price is then proportional to the weight. Thus, at 4 cents a pound 12 pounds cost 48 cents, and 4 cents : 48 cents = 1 pound : 12 pounds. If one quantity varies inversely as another, the two are said to be inversely proportional. For example, in general, the temperature being constant, the volume of a gas varies

inversely as the pressure, and the volume is therefore said to be inversely proportional to the pressure.

A proportion, being an equation, can be solved so as to express any term by means of the other three. Some of the fundamental properties of proportion are: (1) the product of the extremes equals the product of the means; (2) the terms are in proportion by composition, i.e., if $a : b = c : d$, $a + b : a = c + d : c$ or $a + b : b = c + d : d$; (3) the terms are in proportion by division, i.e., if $a : b = c : d$, $a - b : a = c - d : c$ or $a - b : b = c = d : d$; (4) the terms are in proportion by composition and division, i.e., if $a : b = c : d$, $a + b : a - b = c + d : c - d$; (5) in a continued proportion,

$$\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = k, \quad k = \left\{\frac{ma^n + pc^n + qe^n + \ldots .}{mb^n + pd^n + qf^n + \ldots .}\right\}^{\frac{1}{n}}.$$

The theory of proportion, often called in connection with applied problems the rule of three, or golden rule, is as old as Plato's time and was called by the Greeks *ἀναλογία*. Euclid in the fifth, eighth, and ninth books of the *Elements* gives a rigorous treatment of the subject, in which the magnitudes are regarded as either commensurable or incommensurable. At one time the word "proportionality" was used for proportion, the word "proportion" (*proportio*) being used for ratio.

Proportion in Fine Art. This has to do with the relative sizes of things represented or embodied in a design and, in a secondary sense, with the relative importance of certain passages of light and dark, or of color more or less powerful and effective. Thus, the composition (q.v.) may be marred by a disagreeable relation between the heights or the bulks of two figures, trees, rocks, buildings in a picture or in reality, or parts of a building, in which case they are said to be out of proportion. So in an ordinary house front, as on the street of a city, the proportion between the window openings and spaces between them, and between the window openings of one tier and those of other tiers, and between the cornice and the wall below, and between the stone-faced basement and the brick-faced wall between the basement and the cornice, may all be so judicious that the whole front becomes, by the combination of these different proportions, a remarkable work of art. Certain architects of great fame have had no other important claim to the consideration of posterity than a mastery of such proportions as these.

There is no fixed rule for proportion, nor even any body of rules for the government of those who would produce effective proportions in their design. It is true, however, that many attempted analyses have been made of fine designs, both in painting and in architecture, with a view of ascertaining the supposed principles which govern the designer in making admittedly beautiful compositions. For proportion in the fine arts, consult: E. E. Viollet-le-Duc, "Proportion" and "Symétrie," in *Dictionnaire raisonné de l'architecture* (10 vols., Paris, 1854–68); Robinson, *Principles of Architectural Composition* (New York, 1899); J. V. van Pelt, *A Discussion of Composition as Applied to Architecture* (ib., 1902); H. R. Poore, *Pictorial Composition and the Critical Judgment of Pictures* (ib., 1903); A. W. Dow, *Composition* (7th ed., ib., 1913).

PRO'PYLÆ'A (Lat., from Gk. *προπύλαια, propylaia*, neut. pl. of *προπύλαιος, propylaios*, before a gate, from *πρό, pro*, before + *πύλη, pylē*, gate). In classical Greek, a structure forming the architectural setting of the entrance to an important inclosure or group of buildings. The majority of those known to us by description or by their remains comprised usually a portico, a roofed hall, and one or more doorways leading into the citadel or temple inclosure. The plans and style of those at Eleusis, Epidaurus, Priene, and some other Grecian towns have been clearly ascertained. The plan of that at Athens, by far the grandest of all, has aroused much discussion by reason of its two unequal wings. Professor Dörpfeld has suggested that it is an incomplete carrying out of a design for a symmetrical edifice, and there are many indications to support this theory. Its ruins are sufficient to permit a correct restoration, and certain parts are well preserved, especially the columns of the inner and outer porticoes. The entire structure provided a stately entrance into the sacred inclosure on the top of the Acropolis rock. A solid wall with five doorways, large in proportion to the piers between them, formed the gateway proper, with a hexastyle Doric portico on the east facing the Acropolis inclosure. A hall, roofed with stone and divided into three aisles by two rows of Ionic columns, six in all, intervened between these five doors and the outer or western portico of six Doric columns. This was flanked by two smaller projecting wings facing each other, each of these with three Doric columns *in antis*. The whole propylæa is in its principal mass about 75 feet square, while the width across the wings is about 150 feet. No other Greek example rivals that of Athens in size and dignity. It was the work of Mnesicles (q.v.), and dates from about 432 B.C. The name "Propylæa" has been applied to several modern gateways, particularly to two in Germany—the Brandenburger Thor at Berlin, by Langhans (1788), and that at Munich, designed by Von Klenze. Consult: E. A. Gardner, *Ancient Athens* (new ed., New York, 1907); M. L. D'Ooge, *The Acropolis at Athens* (ib., 1908); C. H. Welles, *Athens and its Monuments* (ib., 1913).

PROSAU'RIA, PROSAU'RI (Neo-Lat. nom. pl., from Gk. *πρό, pro*, before + *σαῦρος, sauros*, lizard). A subclass and order, respectively, of reptiles, extinct except the genus *Sphenodon*, with one living species, the tuatara (q.v.). They are represented mostly by Permian and Carboniferous fossils. The subclass contains two orders, Microsauri and Prosauri; and the latter two suborders, Protorosauri and Rhynchocephali. These "seem to represent the central stem of the reptilian tree," and the latter has a survivor in *Sphenodon*. Consult Gadow, *Amphibia and Reptiles* (London, 1901).

PROSCOR'PIUS. A fossil form of scorpions, of which *Proscorpius osborni* is the earliest known in America. It occurs in the Bertie water lime of New York, but other Silurian scorpions occur in Sweden and Scotland. The legs of these ancient scorpions terminate in sharp points and are without claws. They may have been marine animals. See SCORPION.

PROSECU'TION (Lat. *prosecutio*, from *prosequi*, to follow, from *pro*, before, for + *sequi*, to follow). In its technical legal sense, the institution and conduct of legal proceedings against one who is charged with a crime. In a more general sense it is sometimes used as applicable to civil as well as criminal proceed-

ings. There are three methods of prosecution for crime: first, upon the unsworn complaint of an individual; second, upon the complaint of an officer appointed to institute prosecutions; and third, upon a sworn complaint. The first was the earliest method known to the common law, and was, in England, a permissible method of prosecution under the technical name of appeal as late as 1818. (See APPEAL.) The second method obtains in some European countries, but not in England or the United States, where the third method of prosecution, upon sworn complaint, is now used exclusively.

Prosecution by sworn complaint may be instituted on the complaint of a private individual or on that of the attorney-general or other prosecuting officer, when the complaint is said to be on information; or it may be instituted directly by the grand jury, which makes its complaint in the form of an indictment (q.v.) or presentment (q.v.). When made by a private citizen the practice is to file the complaint in the court of a justice of the peace or magistrate, whose duty it then is to issue a warrant for the arrest of the person charged with the crime. When a person has been arrested upon complaint or by a peace officer or other person having authority, he is arraigned before a magistrate, who may hold him for the action of the grand jury or for trial by the proper court upon information filed by the prosecuting officer. When, however the accused is a fugitive from justice, the information may be filed without the preliminary examination, and an indictment may be found or presentment made by the grand jury before arrest. Whether the accusation is by information or indictment, the accused when arrested is required to plead to the information or indictment and is then placed upon trial in the court having jurisdiction. For the other proceedings in a criminal prosecution, see ARREST; GRAND JURY; INDICTMENT; PLEADING; PROCEDURE; PROSECUTOR.

PROSECUTION, MALICIOUS. See MALICIOUS PROSECUTION.

PROSECUTOR (Lat. *prosecutor, prosequutor*, from *prosequi*, to follow). One who institutes and conducts a criminal prosecution in behalf of the government.

In most European countries the duty of conducting prosecutions for criminal offenses is imposed on public officers. In England it has been customary for all criminal prosecutions to be conducted by private citizens, except in rare cases of crimes directly affecting the sovereign, when the prosecution was conducted by the Attorney-General. In cases of private prosecution in England the person instituting the proceeding is usually required to give a bond conditioned upon his proceeding with the prosecution. He can be relieved from his obligation only by the court or on the entry of a *nolle prosequi* by the Attorney-General. The prosecutor is required to bear all the costs of the prosecution, but the court will usually award him a sum sufficient to cover his necessary expenses.

In 1879 an Act of Parliament (47 and 48 Vict., c. 54) "more effectually providing for the prosecution of offenses in England" was framed which enacted that the Secretary of State might from time to time appoint an officer called the Director of Public Prosecutions, whose duty it should be to institute and carry on prosecutions under the direction of the Attorney-General. The authority of this officer, however, was somewhat limited, and it is still true that under the English system there is no officer whose duty it is to prosecute for all crimes.

In the United States, while prosecutions by private individuals are permissible, they are in practice rarely resorted to. Under both the Federal government and the several State governments provision is made for the prosecution of offenders by public prosecutors usually known by the title of district attorney (q.v.).

The prosecuting officer's authority is confined to the preparation and trial of cases. He cannot stipulate for exemption from punishment or as to the amount of punishment which shall be inflicted, although his recommendations are often accepted and acted upon by the court. In most States, but not all, he may with leave of the court accept the assistance of private counsel, but he still remains the responsible instrument of the law. He may, if the evidence or facts within his knowledge justify in his judgment the step, enter a *nolle prosequi*, thus ending the present prosecution, but not barring the right to institute a new prosecution on the obtaining of further proof. In some States he must obtain the consent of the court to do this.

Besides district attorneys, there are in many States special prosecutors appointed to conduct prosecutions in police and other minor courts with more restricted power than that of district attorneys. Special prosecuting agents are also sometimes appointed to prosecute for violations of the liquor laws. See INDICTMENT; INFORMATION; JEOPARDY; NOLLE PROSEQUI; ETC.

PROSELYTE (Lat. *proselytus*, from Gk. προσήλυτος, convert, one who has come over, from προσελθεῖν, *proselthein*, to have come towards, from πρός, *pros*, towards + ἐλθεῖν, *elthein*, to have come). A convert, generally to a new religion. In the Greek version προσήλυτος is the usual translation of the Old Testament term *gēr*, i.e., one who takes up his residence in a foreign land and puts himself under the protection of a foreign people. It is applied more particularly to the foreigner residing in Palestine, but in the New Testament is the name given by the Jews to a convert to Judaism. The transition, however, from the former to the latter meaning is already foreshadowed in certain parts of the Old Testament, such as, e.g., Num. xv. 14–16, 29, 30 and Isa. xiv; but it was not until the second century B.C. that the term "proselyte" seems to have fully acquired its technical sense. According to Jewish law circumcision was an essential preliminary to admission into the synagogue as a member. The proselyte is therefore a *gēr* who has been circumcised. By the side of the proselyte in the full sense, however, there were two classes of persons to whom the term *gēr* would naturally be applied, pagans sojourning in Israel's land and sympathizers with Judaism, in Palestine and elsewhere, who had adopted some Jewish customs, such as Sabbath keeping and certain dietary laws, and had proclaimed their belief in monotheism. Of the former the *gēr toshab* (Lev. xxv. 47) was used. Theoretically these sojourning foreigners were regarded as subject to the seven Noachic commandments, but practically this demand could not, of course, be enforced. Among them some were God-fearing ones, and by virtue of the soil he had carried with him to Damascus Naaman was therefore called a *gēr toshab* (*Gittin* 57 b, *Sanhedrin*

96 b). In the time of Nachmanides (thirteenth century) they were called *gere she'ar* (proselytes of the gate). The sympathizers were called *σεβόμενοι τὸν Θεόν* (the God-fearing ones). This term is often used in Acts, and Josephus (*c. Apion*, ii, 10) calls the Empress Poppæa *Θεοσεβής*. There was an active missionary propaganda, not only in the Hellenistic world, as may be seen in Philo (*De Humanitate*, ii, 405 ff.), Josephus (*Bellum Jud.*, ii, 202), Horace (*Sat.*, i, 9, 691), Persius (*Sat.*, v, 179 ff.), and Seneca (in Augustine, *Civ. Dei*, vi, 11), but also by Palestinian rabbis, as is shown by Matt. xxiii. 15 and the story of the conversion of the royal house of Adiabene (q.v.). In the last case Ananiah is willing to forego the demand for circumcision, while Eliezer insists upon it.

The full proselyte, known in rabbinical literature as *gēr ṣedeḳ* (proselyte of righteousness), in addition to submitting to the rite of circumcision had to receive instruction in the texts of Judaism and usually was obliged to carry out the precepts strictly. He was obliged to cut loose from heathen associations altogether, and after a certain time the ceremony of baptism, or the ritualistic bath to symbolize his purification from the uncleanliness of heathenism, was also insisted upon. The testimony of Yebamoth 47b renders it extremely probable that baptism of proselytes was in vogue before the Christian era, that it was practiced in the case of women, and that it was demanded in the case of men even when circumcision was not required.

A part at least of the Hellenistic Jewish literature is distinctly intended for heathen readers, written to convince them of the falsity of their own religion and of the superiority of Judaism. To be sure, the Judaism advocated in this literature was no longer a pure product and itself shows traces of the influence of Greek thought; yet in its main lines it was in keeping with the doctrines and tendencies of Palestinian and Babylonian Judaism. As a result of these proselytizing tendencies Christianity found the way opened when the new religion felt strong enough to begin active missionary efforts; and in the measure that the Jewish Christians abandoned distinctively Jewish customs and rites, they attracted many to their ranks who had been prepared for the new faith by the dissemination of Hellenistic thought. In this manner Christianity reaped the benefits of the labors of the Jewish propagandist and became essentially a missionary religion. Judaism also continued to make converts, as the history of the Khazar Jews seems to show. But it gradually became characterized by a decided discouragement of additions to its ranks, increasing its restrictions and surrounding admission into the synagogue with difficulties that only a very limited number could overcome.

Brandt, *Die jüdischen Baptismen* (Giessen, 1910).

PROSENTERON, prŏs-ĕn'tĕr-ŏn. See ALIMENTARY SYSTEM, EVOLUTION OF THE.

PROSER'PINA (Lat., from Gk. *Περσεφόνη, Persephonē*, *Περσεφόνεια, Persephoneia*, of unknown etymology). In Greek mythology, the daughter of Zeus and Demeter. (See CERES; ENNA.) In Homer she appears as the dread consort of Hades (q.v.; see also PLUTO), the ruler of the lower world and enemy of life. With this probably belongs the genealogy that made her daughter of the Styx. This side is, however, far more prominent in literature and art than in the cult. In imprecations her name is frequently invoked along with those of Hades and the Furies, who in Orphic theology (see ORPHEUS) are even called her daughters. So she rules the dead, and death comes in obedience to her command, while it is as her servant that Hermes leads the souls to her kingdom. Not that she is always stern, for in the story of Orpheus and Eurydice and in that of Alcestis she appears as moved to pity. In art, when with her mother, she is sometimes represented as of more girlish form, but even here she carries the torch of the goddess of the lower world. When represented with Hades she is altogether the queen, commonly enthroned, and holding the sceptre, or sometimes the bunch of wheat, which conveys a reminiscence of her gentler function. Consult the bibliography under CERES, and C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

PROSKUROV, prô'skụ-rôf'. A district town in the Government of Podolia, Russia, situated near the Bug, about 60 miles north of Kamenetz-Podolsk (Map: Russia, C 5). It has an extensive sugar mill and manufactures of flour and tobacco. Pop., 1910, 40,611.

PROSODY, prŏs'ô-dĭ (Fr. *prosodie*, Lat. *prosodia*, from Gk. *προσῳδία*, from *πρός, pros*, towards + *ᾠδή, ōdē*, song, from *ἄδειν, adein*, to *sing*). A term which originally meant the tone or accent of a syllable, and later was applied to a song sung to music. At the present time it is loosely regarded as that part of grammar which treats of quantity, accent (q.v.), and the laws of versification (q.v.).

PROSPECTING. See MINING.

PROSPECT PARK. A borough in Passaic Co., N. J., adjoining the city of Paterson, on the Passaic River. It is a residential suburb of the neighboring city. Pop., 1910, 2719.

PROSPECT PARK. See BROOKLYN.

PROSPECTS. See MINING.

PROS'PERO. The banished Duke of Milan in Shakespeare's *Tempest*, a wise and noble magician living on a desert island with his daughter Miranda.

PROS'PER OF AQUITA'NIA, SAINT (c.400–c.463). A learned layman of the fifth century, born in Aquitania. Little is known of his life except that he was in Gaul from 428 until 434 and after that date probably lived in Rome. It was he who induced Pope Celestine to write a letter to the bishops of Gaul expressly confirming St. Augustine's doctrine of grace, and he was recognized as the accredited defender of the Church's teaching on the subject against the Semi-Pelagians. His *Chronicle* (called *Chronicon Consulare* to distinguish it from another called *Chronicon Imperiale*) was completed in Rome. It is a continuation of that of Jerome

and brings it up to 455, dealing especially with the history of dogma and of heresies. His works, from the Benedictine text of 1711, are in Migne, *Patrologia Latina*, li. For his teaching on grace, consult Wörter, *Prosper von Aquitanien über Gnade und Freiheit* (Freiburg, 1867).

PROS'SER, CHARLES ALLEN (1871–). An American educator, born at New Albany, Ind. He graduated at De Pauw University in 1897, took the degree of LL.B. at the University of Louisville the next year, and in 1915 the Ph.D. at Columbia University. He was superintendent of schools in New Albany from 1900 to 1908, until 1910 occupied a similar position in connection with the Children's Aid Society of New York, and thereafter, as Deputy Commissioner of Education of Massachusetts, devoted himself to the introduction and organization of vocational and industrial education in that State. From 1912 to 1915 he was secretary of the National Society for the Promotion of Industrial Education, and in the latter year was appointed director of the Dunwoody School, an institution founded in Minneapolis to provide industrial education. Prosser is the author of the *New Harmony Movement* (1903); *Organization and Administration of Vocational Education* (1913); *The Teacher and Old Age* (1913); and of many pamphlets and monographs on vocational education.

PROSSNITZ, prŏs'nĭts (Boh. *Prostějov*). A manufacturing town of the Crownland of Moravia, Austria, in the fruitful plain of Hanna, 11 miles southwest of Olmütz (Map: Austria, E 2). It manufactures woolen cloth, cashmeres, malt, sugar, brandy, agricultural implements, linen, and cotton stuffs. Pop., 1900, 24,054; 1910, 34,100, mostly Czechs.

PROS'TATE GLAND (from Gk. *προστάτης, prostatēs*, one who stands before, from *προϊστάναι, proistanai*, to stand before, from *πρό, pro*, before + *ἱστάναι, histanai*, to stand). A pale, firm, chestnut shaped, glandular body, surrounding the neck of the bladder and the beginning of the male urethra. The prostate gland secretes a milky fluid, which has an acid reaction and when examined with the microscope shows columnar epithelium with granular nuclei, and which is discharged into the urethra at the time of the emission of the semen, and acts as its vehicle. In old age it is liable to become enlarged, and it is also sometimes the seat of various diseases. Inflammation of the organ, acute or chronic, occurs most frequently as the result of gonorrhœa. Abscess may happen either as the result of acute inflammation or it may occur with comparatively little antecedent inflammation, as in pyæmia. Prostatitis is liable to produce retention of urine, either from inflammatory exudation or from the pressure of the congested organ. In such cases the urine must be drawn from the bladder by a catheter. In rare cases there is excessive growth of the glandular element, and sometimes tumors develop. The gland is sometimes the seat of cancer as well as of tubercle. Prostatic calculi may occur, usually in old people, more rarely in young subjects. Prostatorrhœa is the excessive secretion and discharge of the characteristic milky secretion of the gland and occurs in neurasthenic individuals. Prostatic hypertrophy is treated surgically by removal of the organ entirely or in part, the operation constituting prostatectomy. It is a grave operation. Consult Da Costa, *Modern Surgery* (7th ed., Philadelphia, 1914).

PROSTITU'TION (Lat. *prostitutio*, from *prostituere*, to expose publicly, to place before, from *pro*, before, for + *statuere*, to place, from *stare*, to stand). Customary and common practice of lewdness for hire. Prostitution appears to have arisen in every race upon its emergence from the semipromiscuity of barbaric life; certainly no highly civilized people has ever been free from it. While it may thus be regarded as universal, it is not, however, a constant phenomenon, since its volume has unquestionably shown great tendency to variation.

The causes of prostitution are too complex for enumeration, but its principal conditions may be briefly indicated. It is most common where large classes of men live under conditions which do not admit of the founding of families, and where numerous women exist in so degraded an environment that they are not greatly influenced by the social abhorrence for professional vice. These conditions are fulfilled in most large cities, and for this reason it is not unnatural that prostitution has increased in the last century, since the proportion of the population living in cities has greatly increased. (See POPULATION.) It may therefore be regarded as a phenomenon of social pathology, since it is closely dependent upon the social grouping of population and distribution of wealth. It may be pointed out that the use of alcoholic beverages increases the number who live by vice, not only by increasing the attractiveness of such a life, but by creating in many homes conditions of so degraded a character that young children are early familiarized with evil. Recent changes in the mode of life of a large part of the race have no doubt given rise to many forms of physical degeneracy which naturally find expression in this form of vice. Further, the fact that a great deal of money finds its way into the hands of the prostitute renders it inevitable that a class of individuals should arise who make it their business to provide opportunities for vicious indulgence and to secure new victims for prostitution; and although there is no foundation for the popular belief that systematic procuration is responsible for the greater number of prostitutes, it remains true that in many cities there have existed and still exist agencies for procuring unwilling victims for vice.

Attempts to repress prostitution by penal laws have been common in all nations which have developed a high standard of personal purity. Such attempts were frequent in Jewish history. Prostitution was intimately associated with the worship of certain pagan deities (e.g., Astarte), and was therefore more severely punished than a mere moral offense would have been. In the early Germanic tribes prostitution, like any other form of unchastity, was severely punished as an offense against social and religious institutions. The conquest of the Roman Empire by Christianity resulted in the promulgation of repressive laws against prostitution. By the capitularies of Charlemagne whipping, imprisonment, and exposure were imposed upon the prostitute and those who sheltered her. Repressive enactments appear frequently in the later Middle Ages, especially after the great epidemic of syphilis in the fifteenth and sixteenth centuries, when many states and cities adopted the harshest measures of repression, employing imprisonment, mutilation, and even capital punishment to this end. Upon her accession to the throne of Aus-

tria, Maria Theresa entered upon a systematic policy of repression, punishing severely both the prostitute and those who consorted with her. Repressive policies still appear sporadically in both Europe and America, but the inherent difficulties of police control of morals, together with the fruitlessness of past repressive policies, prevent their general adoption.

As an alternative to repressive measures many governments have adopted the policy of tolerating prostitution itself, but under such regulations as might divest it of its attendant evils. These may be classed as social and hygienic. The social effect which was earliest recognized was its tendency to lower the general standard of morals and thus to impair the integrity of the family and to undermine the whole constitution of society. Classical and mediæval regulation endeavored to meet this evil by drawing a clearly defined line between women devoted to vice and those of honorable life. The prostitute was compelled to live in special quarters and to wear a distinguishing garb. The same spirit evidently lies at the basis of modern police regulations, common in German cities and not uncommon in America, creating a reservation within which prostitutes may live unmolested. It is assumed that when scattered among the general population prostitutes act as centres of contagion of moral disease. In small cities such regulations have proved effective in centralizing vice, although grave doubts have been cast upon the social expediency of such a policy; and in large cities it has never proved satisfactory even to those who are convinced of the expediency of regulation.

A second social result of prostitution is the encouragement and opportunity it gives to crime. The prostitute and the criminal come to a large extent from the same social classes. The female members of criminal families are frequently prostitutes. Moreover, the fact that both classes are social outcasts tends to bring them into sympathy with each other. Many prostitutes form semipermanent relations with low criminals (*souteneurs*, cadets) and support them in the intervals of their criminal enterprises. The brothel furnishes easy opportunity for robbery and theft. To break up this alliance between vice and crime has been one of the constant endeavors of those who seek to regulate prostitution. In the Middle Ages it was a common practice to form quasi-guilds of the prostitutes, imposing upon them collective responsibility for all violence and disorder that might occur in the brothel. The present policy of the French police is to force prostitution, so far as possible, into brothels, the owner or tenant of which may be made responsible for crime. One of the purposes of the plan of confining prostitution in reservations is the greater ease of police supervision that may result from lessening the area in which prostitution operates.

The hygienic effects of prostitution, however, have attracted far more attention from modern students of the problem than the social effects. Prostitution has always been the source of serious contagious maladies, but in early times, owing to the backwardness of medical science, the relation between disease and vice was hardly recognized. The appearance in Europe of syphilis (q.v.) in epidemic form drew attention to this relation. In 1700 the Berlin authorities adopted the plan of periodic examination of prostitutes, with confinement in hospitals of the diseased, a policy now generally known as reglementation. A similar plan was put into systematic operation in Paris in 1802, and during the first half of the nineteenth century was widely adopted in other European cities. The great majority of the large cities of continental Europe pursue the same policy at the present time. Sanitary control of prostitution received an extended trial in England under the Contagious Diseases Acts, in operation from 1866 to 1883 in 12 stations in England and 2 in Ireland. A modification of the same plan was tried in America in St. Louis (1870–73). In parts of Japan reglementation is the accepted method of dealing with vice. The ideal of reglementists is to compel every person devoted to professional vice to submit to periodic inspection for signs of disease. In Paris, which may be selected as typical of cities in which reglementation is well established, inmates of brothels are inspected weekly at their place of residence. These form only an insignificant fraction of the total number. The great majority live in furnished rooms, and are required to report twice a week at the dispensary. Each prostitute who submits to control is given a card which frees her from molestation unless her conduct is flagrantly disorderly. A register is kept of tolerated prostitutes, and when once enrolled upon the register they cannot be freed from the obligation of periodic inspection except upon evidence of a change in their mode of life. If they are found to be diseased, they are sent to the hospital of the prison of St. Lazare, where they are detained until cured.

Registration may take place at the request of the prostitute, or by order of the official head of the Morals Police, a body of police set apart especially for this service. Inasmuch as probably the majority of prostitutes regard their state as only temporary, expecting to return to honorable life sooner or later, they usually resist strenuously the efforts of the police to place them upon the register, since they believe that the register may be employed at any time in their lives to brand them with infamy. The chance of detention for months in a prison hospital in order to be cured of a malady which causes little suffering is another deterrent to the acceptance of police toleration. For these reasons the police are forced, by frequent arrests and imprisonment, to render the position of the unregistered or clandestine prostitute as unsatisfactory as possible; and frequently the office finds it necessary to register prostitutes against their will. In spite of the incessant activity of the police, the number of those who are found on the register is only a small minority of the total number of prostitutes—not over 25 per cent and probably nearer 10 per cent. What is true of Paris is true in the main of most other cities in which reglementation is practiced. In Berlin the police act with somewhat greater freedom in registering prostitutes against their will, but succeed in subjecting no very large percentage to control. The difficulties in the way of control are less in the smaller cities, and it is claimed that in some towns, e.g., Dorpat in Livonia, clandestine prostitution has been practically eradicated. This is, however, but very rarely the case, and no supporter of reglementation is optimistic enough to hope for equal effectiveness of control in large cities.

It is almost impossible to form a just estimate of the effect of reglementation in checking

the spread of venereal maladies. Until the close of the nineteenth century it was generally believed that statistical evidence existed which demonstrated clearly the sanitary advantages of reglementation. Those statistics have since been subjected to careful analysis and have been proven to be practically worthless. Defenders and opponents of the system have practically agreed to discard statistical arguments and to rely upon common sense to defend their positions. If, as seems probable, the system increases the extent of indulgence in vicious pleasures through creating a popular impression that vice is innocuous, it is not inconceivable that reglementation, as at present practiced, increases disease instead of diminishing it. The system is attacked on the grounds, (1) that it legitimatizes vice and encourages it by the attempt to make it innocuous; (2) that it is in violation of the principles of personal liberty, since it creates a class of persons over whom the police have practically unlimited power, and permits the police, on mere suspicion, to subject individuals to arrest and an insulting inspection; (3) that it tends to render difficult or impossible the reform of those who have once fallen into vicious habits of life; and (4) that it increases instead of checking the extent of disease. Furthermore, it creates a popular impression that prostitution is a necessary evil, and thus acts as a check upon efforts to prevent its increase and to assist fallen women to rise from their dishonorable vocation.

How far the charges of the abolitionists are true it is impossible to say. A conservative view is that little good results from reglementation, possibly no more than could be gained by the now discredited policy of penalizing prostitution. Permanent amelioration of public health and morals depends upon limiting the absolute extent of vice. To this end repression may contribute in a considerable measure, though complete success is not to be expected. In the chief American cities the police technique of repression has been greatly improved since 1900. The "Injunction and Abatement" principle, first appearing in an Iowa law of 1909, makes it possible for any citizen to secure the closing of a disorderly house through appeal to the courts, thus depriving the police of power to license or segregate prostitution without warrant of law. Commercialized vice received a serious blow from the adoption in 1904 by 13 nations of a treaty for the suppression of the international white slave trade, and the adoption in 1910 of the Mann White Slave Act, penalizing the transportation of women for immoral purposes in interstate traffic, made possible restriction of procuring in the United States. Organized efforts have been made, both in Europe and the United States, to educate the public to the dangers of venereal disease. This work is undertaken in America by the Society of Sanitary and Moral Prophylaxis, organized in 1906. There can be little doubt that a greater regard for the welfare of neglected minors in the large cities would diminish the number of those who live by vice. Houses of refuge for those who desire to reform are now quite common. Such institutions have not hitherto been as successful as was expected. Investigation has shown that not more than 5 per cent of the inmates of some of these Magdalen houses were permanently reformed. This has been due in part to the fact that such homes, founded by religious organizations, assumed that the reformed prostitute was to live a life of severe penance. Institutions which have aimed merely to offer a temporary refuge, and have sought to secure the return of the prostitute to an honorable place in society, have been far more successful. Societies for the rescue of girls who have fallen into the hands of professional procurers are also becoming prominent, and have already effected much towards the suppression of this form of slave trade.

PRO'STYLE (Gk. *πρόστυλος, prostylos*, having columns in front, from *πρό, pro*, before + *στῦλος, stylos*, column). A temple with a portico in front. A temple with a portico at both ends was termed amphiprostyle. See GREEK ART, *The Temple*.

PROTAG'ORAS (Lat., from Gk. *Πρωταγόρας*) (c.485–c.411 B.C.). A famous Greek sophist of the fifth century B.C., born at Abdera, in apparently humble station. He came to Athens as early

as 445 B.C., and in that city and in Sicily won his fame as a teacher and philosopher. About 411 B.C. he was charged with impiety because of his agnostic writings and was forced to flee into exile. He met his death by drowning in the Sicilian Sea. Protagoras was the first to call himself a sophist (see SOPHISTS) and to teach for pay. His instructions were valued so highly that tradition reports that he received as much as 100 minæ ($1800) from a single pupil. He enjoyed the intimate friendship of Pericles and won great reputation by his brilliancy and skill. His chief works were entitled *Truth* (Ἀλήθεια, or Ἀντιλογικά) and *On the Gods* (Περὶ τῶν Θεῶν). His doctrine was a form of agnosticism, which declared that there was nothing absolutely good or bad—that characterizations of things and actions as good and bad are based simply on convention; hence it follows that each individual is his own final authority. This teaching is summed up in his saying "Man is the measure of all things." Protagoras further turned his attention to grammar and the explanation of difficult passages in the poets; the distinction of genders and moods is also attributed to him. Magnus (New York, 1905); W. Windelband, *Grundriss der antiken Philosophie* (3d ed., by A. Bonhöffer, Munich, 1912); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

PRO'TAN'DRY. See POLLINATION.

PRO'TEASE. See DIGESTION IN PLANTS.

PROTEC'TION (Lat. *protectio*, from *protegere*, to protect, cover over, from *pro*, before, for + *tegere*, Gk. *στέγειν*, *stegein*, Skt. *sthag*, to cover, Lith. *stógas*, roof, OIr. *teg*, house, OHG. *dah*, Ger. *Dach*, AS. *þæc*, Eng. *thatch*). The term applied to the policy of encouraging and developing home industries by means either of bounties paid to home producers or of duties imposed upon goods imported from abroad. The encouragement afforded by bounties is so direct and certain that they have been preferred to duties by many writers, including Alexander Hamilton. Nevertheless they have been little used in practice, because of their cost and of administrative difficulties connected with them. The latest examples of the use of bounties are afforded by the sugar bounty provided in the United States tariff of 1890 (the McKinley Act) and the export bounties on the same commodity paid by Germany and some other European states. The former remained in force only four years, while the latter have been abrogated except in the case of Russia by the Brussels Sugar Convention.

Import duties serve to encourage home industries under the following circumstances: they must apply to goods that may be produced within the country imposing them; they must not be offset either by reductions in the export prices of the commodities taxed or by internal-revenue duties on the same commodities produced within the country; finally, they must serve to raise the prices of the taxed articles in the home market sufficiently to make their home production profitable. Given these conditions, a duty is increasingly protective according to the completeness with which it excludes the foreign producer from the home market. Its purpose is directly opposed to the acquisition of revenue, since it becomes perfectly protective only when it prohibits all importation, i.e., ceases to afford any revenue whatever. It is for this reason that highly protective tariffs need to be supplemented by revenue schedules and even internal-revenue duties to satisfy the fiscal requirements of modern governments. See TARIFF.

The policy of protection does not differ outwardly from the restrictive policy advocated by the mercantilists (see MERCANTILISM), but is defended on grounds quite independent of their erroneous balance-of-trade theory. As pointed out elsewhere (see FREE TRADE), protection is the policy practiced by most of the governments of the world. In this article attention will be directed to protection as it has been applied in the United States. Arguments similar to those reviewed are advanced in justification of the policy in other countries, and there is therefore no occasion to repeat them.

When the American Colonies gained their independence, free exchange with the mother country was the policy advocated on all sides. The restrictive measures put in force by England herself after 1783 made the realization of this ideal impossible and fostered a sentiment in favor of protection to home industries as a means of rendering the United States industrially, as it had become politically, independent. Tariffs passed by Massachusetts and Pennsylvania in 1785–86 reflect clearly this protectionist attitude, as does the first national tariff passed in 1789. There was still some misgiving as to whether the country was adapted to manufacturing, however, and the first Secretary of the Treasury, Alexander Hamilton, was asked to submit to Congress a report on manufactures, together with recommendations to guide its future policy.

The famous *Report on Manufactures* was submitted in December, 1791, and has remained down to the present day one of the most important documents in the literature of protection. Hamilton concluded that in the light of the actual situation a moderate protective policy designed to build up within the country all the industries necessary to national independence and to the most rapid development of natural resources was advisable. In coming to this conclusion he ascribed great importance to England's restrictive policy, and said repeatedly that but for these restrictions a freer policy on the part of the United States might be desirable. He also emphasized his conviction that industrial independence is indispensable to continuous political independence and that it is the part of wisdom for a new country to foster within its borders, even at considerable sacrifice, the industries necessary to a complete national life, not forgetting those concerned with the munitions of war.

During the years immediately following the completion of Hamilton's report the situation was so favorable to the development of the shipping industry of the United States that little attention was given to the question of protection. The Napoleonic wars made shipping under the flag of a European state hazardous and gave America, as the only important neutral country, the lion's share of the world's carrying trade. While this condition continued shipping and commerce flourished in an unprecedented fashion. The situation was abruptly changed by Napoleon's Berlin Decree and the British Orders in Council of 1806–07, which set up a paper blockade of all important European ports and de-

prived American merchant vessels of the immunity which they had previously enjoyed. The United States retaliated with the Embargo (1807) and the Nonintercourse Act (1809), and finally became involved in the War of 1812. From 1807 to 1815, in consequence of these difficulties, the United States was more nearly isolated industrially than ever before or since. Foreign trade was almost entirely suspended and the country was forced to produce for itself nearly all the commodities which it required. It was during this period that manufacturing first developed to the position of an important American industry. When it ended the industrial situation was so different from that described by Hamilton that the whole question of protection assumed a new aspect.

The Tariff Act of 1816, the first out-and-out protective tariff that the country had known, was defended more on the ground of protecting industries already established than of building up new industries. In fact the highest duties provided were to remain in force only three years, since it was believed that by that time manufactures would be adjusted to the conditions of peace and able to hold their own against foreign competitors. The erroneousness of this view was soon demonstrated, and succeeding tariffs continued the protectionist policy, although with modifications, down to 1857. During this period the vested-interests argument, the home-market argument, and the infant-industry argument were those most frequently urged in support of protection. The vested-interests plea needs no explanation. It is always urged by conservative people in favor of the continuance of an established policy and does not pretend to throw any light upon the expediency or inexpediency of the policy itself. The home-market argument, as advanced by Henry Clay, the father of the American system, as protection began to be called, was designed to reconcile the interests of the agricultural South and West with those of the manufacturing North. It rested upon the proposition that the prosperity of the American farmer depends upon a regular and constant market for his products and that such a market is to be obtained only by building up manufacturing centres within the country. The experience of the years from 1816 to 1825 was cited to prove that the foreign market was not to be depended upon, and farmers were exhorted to unite with manufacturers in establishing a system which should bind different sections of the country together by furthering the interests of all. To the greater stability claimed for the home market—a quality now seriously questioned by economists—later analysis has added another merit. The home market calls not only for the stable products which will bear ocean transportation, but also for all kinds of perishable goods. Substituting it for the foreign market renders possible diversified farming and enables cultivators to substitute for one-crop systems of agriculture scientific rotation of crops, which serves to preserve and perpetuate the fertility of the soil. This advantage is believed by protectionists to outweigh the admitted losses incidental to the protectionist policy and to insure in the long run a greater degree of prosperity than will result from the free play of economic forces.

The infant-industry argument is the one to which economists generally have conceded greatest weight. It is urged in both a special and a general form. As it applies to special industries it rests on a recognition of the risks and difficulties which attend the domestication of new branches of production. In the successful prosecution of any industry three factors coöperate—the requisite natural resources, skilled and unskilled workmen of different grades, and the appropriate forms of capital. As regards each one of these the country which has practiced an industry has a marked advantage over the country which has not. The natural resources of the latter may be superior, but they are undeveloped; its labor force may be ample and adaptable, but it is untrained; its people may be competent to use tools and machines, but they have no familiarity with the special forms of capital needed. Under such circumstances the encouragement of a protective tariff may suffice to induce investors to establish the new industry when without it they would not venture on such a step. After a few years, if the industry to be domesticated has been wisely chosen, the initial difficulties will have been surmounted and the protective duty may be withdrawn without danger of crushing out the now vigorous infant. Advocates of such a policy recognize quite clearly that resort to protection entails a serious burden on consumers. They justify the temporary loss on the ground that the establishment of the new industry on a permanent footing affords in the end a more than compensating gain.

The infant-industry argument in its general form recognizes that countries must usually pass through different stages of industrial development, and advocates protection as a means of accelerating progress during the periods of transition from one stage to another. The best statement of this argument is that given by Friedrich List in his *Das nationale System der politischen Oekonomie* (1841). The conclusions at which List arrived were based on the contrast between an industrial country like England and an agricultural country such as Germany was at the time he wrote. In his opinion England's success as a manufacturing country was due chiefly to the development of certain industrial qualities among her people. Germany, he thought, might develop the same qualities among Germans by means of a protective policy which would force them to manufacture for themselves. Through protection the natural resources of the country necessary to the development of manufacturing would also be opened up to exploitation. From this point of view protection is a temporary means by which an agricultural country may transform itself into an industrial country. After the transformation is completed the new manufacturing industries, or at least a great many of them, will be quite capable of holding their own in competition with the manufacturing industries of other countries and protection will no longer be required.

The last stage in the development of protection in the United States was closely connected with the Civil War. The outbreak of that struggle caused the withdrawal from Congress of the Representatives of the Southern States, who had been the most active opponents of the protective policy. Under the guidance of Representatives from the North and West successive tariffs were passed carrying the policy of protection to the most extreme lengths which the country had known. Factors in this development were the antiforeign sentiment which resulted from the somewhat hostile attitude of Europe and espe-

cially of England to the cause of the North, and the comprehensive system of internal revenue taxation adopted during the war, which had to be offset by higher import duties if American producers were not to be placed at a disadvantage in competition with foreign producers. The change in the level of duties which resulted from this combination of circumstances is indicated by the fact that whereas under the Act of 1857 the highest duties imposed were 24 per cent ad valorem, under the Act of 1864 the average rate on dutiable articles was over 47 per cent. Down to 1894 all the important changes made in the tariff were in the direction of increased protection. The Wilson Act of the latter year was a reactionary measure, but was so garbled in its passage through Congress that the tariff-reform President of the period, Mr. Cleveland, allowed it to become a law without his signature. The victory of the Republicans in 1896, although not connected with the tariff issue, involved as an incident a return to a highly protective policy. In fact the Dingley Act of 1897 marks the extreme limit of protectionist policy in the United States.

During this last period only one new argument of importance has been advanced in support of protection, the wages argument. Before protection was the settled policy of the country one of the reasons urged in its favor was that since wages were higher in the United States, some special encouragement was necessary to the establishment there of new industries in competition with the low-wage labor of Europe. After protection became a settled fact, by an interesting inversion the high wages of American labor began to be attributed to it. The wages argument runs as follows: In protected industries higher wages are paid in the United States than in similar industries abroad. Protection, it is concluded, causes the high wages, and its withdrawal would pauperize American labor. This view overlooks several important facts. First, equally high wages are paid in unprotected industries, and these industries, which include farming, mining, transportation, and many branches of manufacturing, vastly exceed in importance and magnitude the protected industries. Second, employers, whether protected or unprotected, desire to secure their labor as cheaply as they can, and there is nothing in a protective tariff which forces them to pay higher wages than are current in the community in which the protected industries are situated. In other words, employers in protected industries pay the wages necessary to get the labor they require, and these depend not upon the protective tariff but upon general industrial conditions. Third, it is not true that high wages and protection always go together. For example, wages in protectionist Germany are distinctly lower than in free-trade England. For these reasons the wages argument, although effective for campaign purposes, has never enjoyed much repute among trained economists. It is, however, urged in a more subtle way by some writers, and in this form merits consideration.

It is argued that the wealth produced in any country is divided into wages, profits, and rent, and that the amount of the last share depends upon the poorness of the marginal land and other natural resources to which resort is made. Protection, as applied in the United States, diverts labor and capital from farming and extractive industries to manufacturing. In consequence, it is claimed, the margin of cultivation to which resort is made is somewhat higher under a protectionist than it would be under a free-trade policy and rents are lower, while wages and profits together are proportionately higher. Hence, it is concluded, protection raises wages at the expense of rent and "other monopoly incomes." In answer to this argument it need only be pointed out that the reasoning, if valid, proves merely that protection secures for labor a larger *relative* share of the total product. If, in so doing, it diverts labor and capital from investments in which they would afford larger returns, as advocates of free trade maintain, it may very well be that labor's larger share of the *smaller* product obtained under the régime of protection is actually less than would be labor's smaller share of the *larger* product that would be secured under the régime of free trade.

Present-day advocates of protection in the United States may be divided into two classes—those who defend it as a temporary and those who defend it as a permanent policy. Among the former it is beginning to be actively discussed whether protection has not done its greatest possible service for the country and whether a gradual transition to a free-trade policy would not be desirable. Writers answering these questions in the affirmative advocate the abolition of the protective duties on raw materials, trust-made manufactures, etc., and emphasize the importance of allowing foreign goods to enter the country more freely in order that American industries capable of developing an export trade may find larger foreign markets for their products. Advocates of protection as a permanent policy urge it not only on economic grounds, but as a means of fostering the sentiment of nationality and of perpetuating those characteristics which distinguish the United States from other countries. Free trade is characterized by them as a cosmopolitan policy which appeals to the foreign-hearted, while protection is extolled as the national system to the support of which all true lovers of country must rally. Strong as is the appeal which these "higher considerations" make to the patriotic citizen, there is a certain vagueness about their application to tariff problems which makes the shaping of a law by reference to them difficult. Appeals to patriotism in connection with protection are significant chiefly because they introduce a moral earnestness into discussions which would otherwise be narrowly commercial.

Since Great Britain adopted a free-trade policy in 1846, the leading protectionist country of the world, next to the United States, has been Germany. There also the application of protection was coincident with a remarkable development of manufacturing industries, which seemed to justify fully the expectations of advocates of the policy. Germany's success in domesticating manufacturing industries led France, Austria-Hungary, and later Russia to emulate her example. Europe was thus engaged in a war of hostile tariffs, in which each important country was trying to build up its own industries by discouraging importations from its neighbors. In Great Britain an Imperial federation to include all the dependencies of the country in a commercial alliance against the rest of the world is beginning to be advocated. Finally, the policy of expansion upon which the United States seems to be embarked must have as one of its incidents the admission of new areas within the American

tariff wall. As protectionist areas grow the difficulty of harmonizing divergent interests by means of protective tariffs is bound to increase, and this affords perhaps the surest ground for a belief in the eventual triumph of free trade.

PROTECTION, NEW ENGLAND ORDER OF. A secret beneficiary society paying life insurance. It was formed at Philadelphia in 1887, by men and women members of Knights and Ladies of Honor who broke from the latter over a question of separate jurisdiction for New England. Its headquarters are at Boston and membership is restricted to residents of New England. There is a supreme lodge and six grand lodges. Total membership is 54,672, and aggregate disbursements for insurance and relief since 1887 amount to about $12,819,280.

PROTECTIVE ASSOCIATION, AMERICAN. A secret organization, commonly known as the A. P. A., which was formed in the United States to combat the influence of Roman Catholicism. Its platform, as published by a supreme council held at Des Moines, Iowa, in May, 1894, stated that "subjection to and support of any ecclesiastical power not created and controlled by American citizens and which claims equal, if not greater, sovereignty than the government of the United States of America, is irreconcilable with American citizenship," that State assistance to parochial schools and Church interference with public education are undesirable, and that restrictions ought to be imposed on immigration. Candidates for admission into the order were required to take oath never to favor or aid the choice of a Roman Catholic to political office, and never to employ a Roman Catholic in any capacity if the services of a Protestant could be obtained. The order was first established at Clinton, Iowa, in 1887 by a lawyer, Henry F. Bowers. It obtained its greatest foothold in the Middle West, but it extended even to Canada, England, and Australia, and an international organization was ultimately effected. In 1896 its president, W. J. H. Traynor, claimed for it a membership of almost 2,500,000. The order soon began to interfere in politics, and forced many candidates for office to promise to act in accordance with its principles. In 1896 its president claimed that almost one hundred of the National Representatives and many of the Senators chosen in 1894 had given such pledges, although many had broken them. For a time it seemed that the order would probably run a similar course to the American Party, or Know-Nothings (q.v.), with which it was often compared. Soon, however, the denunciations of clear-sighted, influential men, and the realization that the dangers dreaded were almost if not altogether imaginary, had their effect, and the decline of the order after 1900 was even more rapid than its rise, although the national organization was maintained. Affiliated with the A. P. A. were the Junior United Order of American Mechanics, the Patriotic Order of the Sons of America, and other organizations. Consult: *Congressional Record* (Washington, Oct. 31, 1893); H. J. Desmond, *The A. P. A. Movement* (ib., 1910); also Traynor in *North American Review*, vol. clix (New York, 1887).

PROTECTIVE COLORATION AND RESEMBLANCE. All organisms are beautifully adapted to the world around them, and this adaptation in a large proportion of animals extends to their colors. Owing to this adaptive coloration, certain insects, frogs, reptiles, birds, and mammals are protected from the observation of their natural enemies.

In marine fishes the ground coloration is, according to Jordan, protective in its nature. The fish, especially if swimming near the bottom, is better protected if the olivaceous surface is marked by darker cross sheaths and blotches. These give the fish, he says, a closer resemblance to the weeds about it, or to the sand or rocks on which it lies. As a rule no fish which lies on the bottom is ever uniformly colored. At a depth of from 50 to 150 fathoms in the tropics a large proportion are red of various shades. Several of the large groupers of the West Indies are represented by two color forms; the shore form is olive green, and the deeper water form is crimson. Deep-sea pikes are black or violet black, with no markings. Desert animals are usually gray or tawny or sandy; forest animals are frequently green, marine animals olive or reddish, pelagic animals transparent, while the typical Arctic mammals and birds are white. The polar bear, hare, snowy owl, and Greenland falcon are white throughout the year, while the fox, lemming, American hare, ermine, stoat, and ptarmigan change their summer dress of dull hues to white.

There has recently been a great deal of discussion in regard to protective coloration. The supporters of one extreme see protection in almost all colors and patterns, while their opponents hold that even the dullest colored are conspicuous in their native haunts. The truth seems to lie between the two points of view. The crucial factor is that of movement. The brownest sparrow among dead leaves is conspicuous when hopping, while the most brilliant tanager among sunlit foliage is difficult to detect as long as it remains motionless.

Color Preference. Different aquatic animals exhibit a marked preference for certain colors of the spectrum in which they feel better. The little fresh-water crustacean *Daphnia* prefers to swim in orange, yellow, and especially green rays. The starfish shuns the red rays. Animals which love the light, as bees, prefer blue or green rays, while the light-shunning or lucifugous insects, such as ants, have less antipathy for red than for other colors. In such cases it has been thought by Cuénot that light doubtless acts as an excitant on respiration. As has been

repeatedly noticed, the common house fly prefers green to lavender, and black to white. On the other hand, locusts are attracted and will alight upon white or light-colored clothes, and not be attracted by dark. The preference of flies for dark cloth may be due to the fact that it absorbs more heat than white cloth, and thus favors quicker respiration and greater activity, especially in the coolness of the autumn.

Protection Due to Conspicuous Bars, Stripes, and Spots. Although the giraffe, the zebra, and the jaguar seem most conspicuously colored, we are assured that the spots upon the jaguar, e.g., harmonize with the oval patches of sunlight. Sir Samuel Baker says that the striped skin of the tiger harmonizes with dry sticks, yellowish tufts of grass, and the remains of burnt stumps of its habitat, and even the giraffe is far from conspicuous when found in its native forests. The African antelopes are strikingly marked on the body and head as well as the feet with white stripes and patches in general like those of zebras, which Pocock regards as "representing spots or streaks of sunlight passing through foliage or reflected from leaves," and that these marks are for protection rather than for recognition. He thinks that such markings come within the scope of Thayer's hypothesis of concealment by the counteraction of light and shade. Of the species of elands of Africa one lives in the forest and is reddish and conspicuously striped with white, the neck being black; on the other hand, the common eland is dun-colored with no sign of stripes and lives in deserts. So it is with the koodoos; the lesser one living in thick jungles is much more strikingly marked than the larger species which lives in hilly mountainous regions or on the open plains.

Mimicry. Many butterflies of the group Heliconidæ are associated with species of *Leptalis* belonging to another family (Pieridæ) which copy the heliconid butterflies in form and color, and which, probably owing to a bad odor secreted by glands in the end of the body, are distasteful to birds. It is supposed by Bates, Wallace, Darwin, and others that were not the mimics disguised as heliconias they would be devoured by birds and thus become extinct. These authors believe that the resemblance has been brought about by natural selection. In his "Contributions to an Insect Fauna of the Amazon Valley," Henry Walter Bates (q.v.) calls attention to the fact that a large number of the species of Heliconidæ "are accompanied in the districts they inhabit by other species which counterfeit them." According to Fritz Müller (although Bates states the same idea), the species serving as the model, being unpalatable to birds on account of its repulsive taste and odor, is therefore safe from its foes, while the mimic, which has no bad taste or odor, is protected from attack. Mr. Bates's own views are moderate compared with those of Wallace and later extreme advocates of Darwinian mimicry. In his original essay Bates shows that the majority of the species of Heliconidæ have very limited ranges, and contends that the cause of the formation of the local varieties is "the direct action of physical conditions on the individuals." Several entomologists, Elwes, Packard, and others, have not accepted the hypothesis of Bates and Müller that the mimicry is due to natural selection, but hold that the mimicry is accidental and due to convergence, or to similarities in the environment. The markings, such as similar hues in models and mimics, bars and spots, Packard believes are due to such effects of light and shade, moisture and temperature, as have produced them in birds, mammals, and reptiles. They may be perpetuated and preserved by natural selection, but the primary cause of this originally is the action of the physical agents mentioned, or at least environmental causes affecting both models and mimics. Much stress is laid on the attacks of birds in bringing about or aiding the process of natural selection of these markings. It is, however, to be observed that neither Bates, Müller, nor Wallace, all of whom lived for many years in the tropics, has ever seen a bird chase and devour butterflies. In fact, only a few insectivorous birds catch butterflies or care to chase them. After several years' special research on the habits of sparrows and other insectivorous birds, Judd states in a report to the United States Department of Agriculture that he does not know of any kind of bird "that feeds upon butterflies during any month of the year to the extent of one-tenth of one per cent of its food."

It thus appears from a comprehensive survey of the markings of animals of different classes, living both in the sea and on land, that the causes of the similarity in their markings are due to the effects of light and shade, also perhaps to moisture—at all events to the action of the surroundings. It should also be borne in mind that the range of primary colors is not very great, nor of stripes and bars; under similar physical conditions the color and spots and stripes and their location on the body are repeated in animals of different groups and species. Nature is limited in the disposal of ornamental features. Hence models and mimics may be protectively ornamented with the same hues and patterns, and it is probable that selection and the attacks of birds and lizards have had little to do with the origination of protective coloration.

PROTECTOR. An English title equivalent to that of regent, denoting a nonregal head of the government under exceptional circumstan-

ces, as during a minority or an interregnum. The title was given to Humphrey, Duke of Gloucester, during the minority of Henry VI from 1422 until the crowning of the young King in 1430. Richard, Duke of York, father of Edward IV and Richard III, acted as Protector of the Kingdom at different times during the later years of Henry VI's reign. His son, Richard, Duke of Gloucester, was Protector for about two months in 1483, prior to his accession in the same year as Richard III. The Duke of Somerset, at the head of a council during the minority of Edward VI, bore the title from 1547 to 1549, until he was deposed by his colleagues. In 1653 Cromwell was installed as Lord Protector of the Commonwealth of England, Scotland, and Ireland under the provisions of the Instrument of Government (q.v.), and in 1657 was reinstalled under the provisions of the Humble Petition and Advice. On his death, in 1658, his oldest son, Richard, succeeded to the title and authority, but resigned the office in the following year.

PROTEC'TORATE. A relation assumed by a stronger nation towards a weaker one whereby the former protects the latter from hostile invasion or dictation and interferes more or less in its internal affairs. This relation is established by treaty between the protecting and the protected State, or among a number of States in respect to another State, by which the extent and character of the protectorate are determined. Usually the foreign relations of the protected State, including the right to wage war, are controlled by the protecting State.

PROTEIDS, prō'tē-īdz. See PROTEINS.

PROTEINS, prō'tē-īnz (from Gk. *πρῶτος, prōtos,* first). A name applied to an exceedingly important group or class of highly complex chemical substances, widely distributed in nature. Like carbohydrates and fats, they contain carbon, hydrogen, and oxygen, but differ from these inasmuch as they invariably contain nitrogen in addition and in most instances also contain sulphur. In some proteins, phosphorus, iodine, and other elements may be present.

The percentage (or elementary) composition of the proteins varies with their source but only within very narrow limits. The following analyses will serve as an example:

Carbon	50–54 per cent
Hydrogen	6.5–7.3 per cent
Oxygen	21.5–23.5 per cent
Sulphur	0.3–5 per cent
Nitrogen	15–17.6 per cent

Proteins, when burned, leave behind a small amount of mineral matter or ash, but owing to the extreme difficulty of removing mineral substances from these bodies, investigators in this field are unprepared to say whether they enter into the makeup of the protein molecule or not. The protein molecule is of an enormous size and an idea can be gained of this by taking as an example the protein of the white of egg, $C_{239}H_{386}N_{58}S_2O_{78}$.

General Characteristics. Many proteins are soluble in water or saline solutions, and are rendered insoluble or are coagulated when heated. The temperature required for coagulation differs with different proteins. With few exceptions proteins are colloids and pass with difficulty through animal membranes. They are levorotatory, and nonconductors of electricity.

With strong nitric acid, the proteins when heated to boiling give yellow flakes or a yellow solution, this being known as the xanthoproteic reaction. When a protein in the solid state or in solution is boiled with a solution of mercuric nitrate in nitric acid containing some nitrous acid (Millon's reagent), a red coloration is produced.

Proteins are precipitated by a great many reagents, the peptones and albumoses being excepted in a number of cases. Thus solutions of proteins are precipitated (1) by strong acids, (2) by picric acid, (3) by acetic acid and potassium ferrocyanide, (4) by acetic acid and excess of neutral salts, (5) by salts of heavy metals, (6) by tannin, (7) by alcohol, and (8) by saturation with some neutral salts, but in the light of the newer researches, proteins have come to be regarded as structures made up of a number of amino acids (substances having both basic and acidic properties, i.e., amphoteric, by virtue of the fact that their molecules contain COOH and NH_2 groups), both monamino and diamino forms. Among the amino acids derived from proteins are glycine (glycocoll), alanine, leucine, isoleucine, phenylalanine, tyrosine, serine, cystine, aspartic acid, glutamic acid, lysine, ornithine, arginine, proline, histidine, oxyproline, tryptophane, trihydroxydodecanoic acid and glucosamine (?).

Liebig was the first one to regard proteins as combinations of amino acids. Hofmeister added to this knowledge by saying that the acid amid form of combination of amino acids is the principal form in the protein molecule. The view of Hofmeister is supported by the researches of Fischer and others, and resulted in the preparation by Fischer and others of combinations of amino acid termed polypeptids. These synthetic polypeptids have properties similar to those of peptones derived from proteins by hydrolysis with dilute acids, alkalies, or with pepsin.

A large number—more than 200 in all—of di-, tri-, tetra-, penta-, etc., peptids have been prepared. When polypeptids contain three units they give the biuret reaction and some other reactions characteristic of proteins. The higher polypeptids, e.g., are precipitated by phosphotungstic and tannic acids and some are also precipitated by ammonium sulphate. The octa- and deca- peptids possess the highest molecular weight of all compounds obtained by synthesis. If these compounds were discovered in nature they would undoubtedly be regarded as proteins. Polypeptids also resemble proteins in their behavior with enzymes. Trypsin, e.g., will hydrolyze some of the peptids. The peptids are not attacked by pepsin.

No absolutely satisfactory classification of proteins is known, the best being that proposed by a joint committee of the American Physiological Society and the American Society of Biological Chemists.

The earliest known vegetable protein was wheat gluten. This was isolated by Beccari in the eighteenth century. About the same time Braconet isolated a protein from peas and beans which is now known as legumin. Gay-Lussac was the first to point out the occurrence of proteins in seeds. Liebig and his pupils, however, must be regarded as the pioneers who led to our present conceptions of protein chemistry. Liebig distinguished between plant albumin, plant casein, and plant fibrin on the basis that the former was coagulated by heat and the second not coagulated by heat. Neither

plant fibrin nor plant casein is precipitated by acids. It is principally due to two American workers, viz., Chittenden and Osborne, that the full value of the methods of fractional salt precipitation for vegetable protein chemistry was established.

The best-known vegetable proteins are zein from maize, hordein from barley, gliadin, glutenin, and leucosin from wheat, edestin from hemp, and excelsin from the Para nut. Up to the present time about 23 seed proteins have been systematically studied. All of them on hydrolysis yield leucine, proline, phenylalanine, asparagine, glutamic acid, tyrosine, histidine, arginine, and ammonia. Two showed no glycine (glycocoll), two no alanine, four no lysine, and one no tryptophane. Zein, the protein of Indian corn, yielded neither glycine, lysine, nor tryptophane. Three gave no cystine and two others only gave evidences of traces of this amino acid. These findings have an important bearing on nutrition of animals. We are still ignorant of the state in which proteins are present in the cell and cell juice, and our knowledge of the nature of proteins present in the mature plant is limited when compared with what we know of these complexes in seeds.

Physically speaking, almost all of the vegetable proteins are present in plants in a colloidal state, and evidences of proteins in crystalline form have been found in the aleurone grains of oil-bearing seeds, as the Para nut, castor-oil seed, etc.

It should not be said, however, that some vegetable proteins soluble in alcohol lose their property of being coagulated by heat and give evidence of a diminished viscosity. This is probably distinct evidence that numerous transition stages exist between the colloidal and crystalloidal conditions.

Animal Proteins. In the animal kingdom albumins are found in milk, white of egg, and blood serum; globulin in blood serum and egg white; albuminoids (or scleroproteins) in skeletal structures and appendages—represented by collagen, gelatin? (a transformation product of collagen); keratin (from horn), elastin (from ligaments), and spongin; phosphoproteins in vitellin of egg yolk; casein (caseinogen) in milk; protamins in roe of fishes, e.g., salmine, sturine, etc.; histones in blood (globin) and thymus (thymus histone); glycoproteins (mucins, chondroproteins and mucoids, etc.) in the salivary glands, bile bronchi and in cartilages; hemoglobin in the red blood, hemocyanin in blue blood of molluscs and crustaceans; lecithoproteins, e.g., lecithans, phosphatids, in the nervous tissues, body fluids, etc.; and nucleoproteins in the nuclei of cells, i.e., blood cells, spermatozoa, thymus, pancreas, liver, etc. Vegetable proteins have many characteristics in common with animal proteins. Thus vegetable like animal globulins are insoluble in water, but soluble in salt solution, and are precipitated on dilution or removal of the salt by dialysis. Like the vegetable proteins, animal proteins are present in the animal organism in a colloidal state. Crystalline proteins are not so frequently found in the animal as in the vegetable kingdom. The coagulating temperature of edestin, the protein of hemp seed, is 90° C. (194° F.), which is much higher than has been found for any animal globulin. Vegetable proteins on hydrolysis yield more glutamic acid than do animal proteins and many yield more proline, arginine, and ammonia. Furthermore alcohol soluble proteins, viz., the protamines, are found only in the vegetable kingdom. Briefly it may be said that the greatest difference is found in the groups of albumins and globulins.

Protein has come to be regarded as one of the most, if not the most, necessary constituents of food for man and animals. On the one hand it serves as a builder of tissue and a replenisher of wasted tissue, and on the other it serves as a source of energy. Its function as a builder cannot be performed by any other food constituent.

Protein when taken into the body, whether this be in the shape of white of egg, meat, or in peas or beans, is acted upon principally by the pepsin ferment in the stomach. Our ideas regarding the nature of the products formed in the course of peptic proteolysis have been considerably modified during the past few years. The former view that the products obtained included only acid albuminates (and meta proteins), proteoses, and peptones is no longer tenable. As the result of numerous observations it has been learned that artificial gastric digestion if allowed to go on for a sufficient length of time will ultimately yield in addition to proteoses a large number of cleavage products crystalline in structure which include aspartic acid, glutamic acid, tyrosine, phenylalanine, proline, leucine, valine, and lysine. A similar group of substances is formed if proteins are subjected to the action of trypsin, the principal proteolytic ferment of the pancreatic juice. Peptic digestion differs from tryptic digestion only in so far that more amino acids are formed in the latter. The products of protein digestion are taken up by the villi, and there again in the walls of the intestine some of them undergo changes which are of the opposite kind. In this locality the proteoses, peptones, and amino acids probably recombine into albumins, globulins, etc. It must be said, however, that amino acids have been found in the circulating blood. The recombined proteins which serve to replenish tissue, or build new tissue, are fixed at the necessary locus while the excess is katabolized and its products either discharged from the body or its molecule is rearranged and deamidized, and serves as a source of fat and possibly carbohydrates.

The amount of protein taken by the individual each day must be adequate to keep the body in what is termed the nitrogen equilibrium. Voit says 118 grams of protein is necessary per day for a 150-pound man, Rubner sets the standard as 127 grams, Atwater 125 grams, while Chittenden claims 60 grams is the proper amount. Various conditions of living undoubtedly influence the amount of food required.

Recent work has shown that protein intended for maintenance must be of the right kind. While some proteins, as gelatin, when fed will tend to lower the waste of body protein they cannot by themselves wholly repair it. This is due to the fact that it lacks some of the amino acids essential for the elaboration of body protein. Experiments made on mice by Osborne and Mendel showed when zein—the protein of maize—was the only source of protein the animals under experiment died. If, however, the amino acids (lysine and tryptophane) lacking in the zein which are necessary for growth were supplied, growth went on at the normal rate. Glycocoll lacking in the zein is synthesized by the body itself. Protein when broken

down in the body of man is in a great measure discharged in the urine as urea. Proteins occur in much greater abundance in animals than in plants. Plants unlike animals cannot make use of highly complex bodies as protein and their cleavage products as food. The material necessary for the synthesis of protein is chiefly obtained from the nitrogen of the atmosphere, ammonia salts, nitrates and nitrites in the soil. In other words, plants are able to manufacture organic body tissue from inorganic substances.

It has long been known that when protein substances undergo putrefaction a number of more or less poisonous products of a basic character are found. To some of these products the name ptomaines (q.v.) has been given. As a rule these bases are closely related to the simple amino and imino compounds into which proteins are resolved by hydrolysis. The formation of simple physiologically active bases from proteins must not be regarded as being due to the agency of bacteria alone, for there is reason to believe that they are also formed by the natural processes in the tissues of animals and plants. The base B-iminazolylethyl amine, e.g., when injected into an animal produces symptoms or manifestations which are similar to those shown by another animal which has been rendered anaphylactic by repeated doses of protein.

PROTELES, prō̆t'ē-lēz. See AARD-WOLF.

PRO'TERAN'DRY. See POLLINATION.

PRO'TEROG'LYPHA (Neo-Lat. nom. pl., from Gk. *πρότερος, proteros*, fore, comp. of *πρό, pro*, before + *γλύφειν, glyphein*, to carve). A section of the great group of colubrine serpents, including those in which the anterior maxillary teeth are so deeply grooved as to appear tubular and which form enlarged fangs for the conveyance of poison into the wound made by their bite. (Cf. OPISTHOGLYPHA.) All are extremely poisonous, most are viviparous, and they are distributed throughout all the warmer parts of the world except Madagascar and New Zealand.

PRO'TEROG'YNY. See POLLINATION.

PROTEROZO'IC ERA (from Gk. *πρότερος, proteros*, fore + *ζωή, zōē*, life). In geology the period of time that followed the Archeozoic era and preceded the Paleozoic era. The records of this time interval are found in a great assemblage of strata which consist mainly of sediments more or less thoroughly metamorphosed. Fossil remains are seldom to be found, though they do occur in a few localities, but it is well established that life was abundant over the earth and of quite varied character. See GEOLOGY.

PRO'TESILA'US (Lat., from Gk. *Πρωτεσίλαος, Prōtesilaos*). A legendary king of Phylace, in Thessaly, son of Iphiclus and brother of Podarces. He married Laodamia, and soon after sailed with the other Greeks to the Trojan War. According to the story he was the first Greek to spring on shore, and also the first to fall by the hand of Hector. His young wife, Laodamia, overwhelmed with grief at the news, besought the gods that he might return, if for only three hours. Her prayer was granted; Hermes led Protesilaus back to earth, and when the allotted time had passed Laodamia slew herself that she might not again be separated from her husband. According to another version, which seems to have been followed by Euripides in a lost tragedy, Laodamia made an image of her husband and lavished affection on it. Her father, Acastus, sought to take it from her. Protesilaus, probably at his own prayer, returned for a brief space from the lower world, and Laodamia, as in the other story, accompanied him on his return. There were a tomb and a sacred precinct of Protesilaus at Elaios on the extremity of the Thracian Chersonese, and apparently an oracle connected with it. In Thessaly also a festival called the Protesilaia was celebrated with athletic contests.

PRO'TEST (from Lat. *protestari, protestare*, to declare publicly, bear witness, from *pro*, before, for + *testari*, to bear witness, from *testis*, witness), CERTIFICATE OF. A formal document by a notary public or other duly authorized person, attesting the truth of some statement of fact therein contained. It is often employed in shipping transactions in the form of a complaint by or on behalf of the master of a vessel as to accidents, or injury, or breaches of duty committed by charterers or consignees, causing delay or damage to the ship; or of a complaint by the shipper against the master for misconduct, or delay or refusal to sign customary bills of lading. It is most frequently employed, however, in connection with negotiable paper, for the purpose of affording evidence that the paper therein described has not been duly honored. The law merchant, as it has been understood in England and in this country, requires a protest only in case of a foreign bill of exchange. By modern statutes, however, the formality is authorized and the fees and expenses thereof are collectible in the case of an inland bill, check, or promissory note. The protest is to be made by a notary public under his hand and official seal, or by a reputable resident of the place where the instrument is dishonored, in the presence of two or more creditable witnesses. On the day of dishonor the notary should make a memorandum of the fact that the paper has been duly presented and dishonored. This is termed noting the dishonor. At his convenience thereafter he may extend the protest, i.e., draw up, sign, and seal the formal certificate. This document must specify: (1) the time and place of presentment; (2) the fact that presentment was made and the manner thereof; (3) the cause or reason for protesting the bill; (4) the demand made and the answer given, if any, or the fact that the drawer, or accepter, or maker could not be found.

The term "protest" is often used to designate all the proceedings which are necessary to fix the liability of a drawer or indorser, including the notice of dishonor. As a technical term of the law, however, it is limited to its original signification of a formal document prepared

to bear witness to (*protestari*) the fact of dishonor. Consult Brooke, *Treatise on the Office and Practice of a Notary of England* (6th ed., London, 1901), and J. W. Daniel, *A Treatise on the Law of Negotiable Instruments* (5th ed., 2 vols., New York, 1903). See BILL OF EXCHANGE; DISHONOR; NEGOTIABLE INSTRUMENTS.

PROT'ESTANT EPISCOPAL CHURCH. See EPISCOPAL CHURCH.

PROT'ESTANTISM. A term which has become a general designation for the system adopted by the reformers in the sixteenth century and followed by their successors in later times. The name Protestant was first applied to the adherents of Luther, from their protesting against the decree passed by the Catholic states at the second Diet of Speyer in 1529. This decree had forbidden any further innovations in religion and enjoined those states that had adopted the new principles so far to retrace their steps as to reintroduce the mass, order their ministers to avoid disputed questions, and use and explain the Scriptures only as they had hitherto been used and explained in the Church. The essential principles involved in the protest and in the arguments on which it was grounded were: (1) that the Roman Catholic church cannot be the judge of the reformed churches, which are no longer in communion with her; (2) that the authority of the Bible is supreme and above that of councils and bishops; (3) that the Bible is not to be interpreted and used according to tradition or use and wont, but to be explained by means of itself—its own language and connection. As this doctrine, that the Bible, explained independently of all external tradition, is the sole authority in all matters of faith and discipline, is really the foundation stone of the Reformation, the term Protestant was extended from those who signed the Speyer protest to all who embraced the fundamental principle involved in it. The essence of Protestantism, therefore, does not consist in holding any special system of doctrines and discipline, but in holding the Bible to be the source of religious authority and maintaining the right of private judgment as to its meaning; and thus a church might, in time, see reason to depart from special points of its hitherto received creed without thereby ceasing to be Protestant. The symbols or confessions of the Protestant churches were not intended as rules of faith for all time, but as expressions of what was then believed to be the sense of Scripture. This implies a theory of the Church. Protestantism holds that the Church is a community of believers, in which the sacraments are administered and the gospel preached, and denies that its validity depends upon its being in organized connection with the churches of other lands or, some Protestants would say, with any other churches at all. In the period after the Reformation the continental churches preferred the terms Evangelical, Lutheran, and Reformed, but the convenience of Protestant as a name uniting all the non-Catholic branches is so great that it has come into common use. The problem of its use in the Church of England (q.v.) has been more difficult. This church went through the Reformation without a break from its former organization, but with sympathy and even formal fellowship with the Lutheran and Calvinistic reformers of the Continent. The modern High Church party, emphasizing the continuity and catholicity of the Church, have repudiated the name Protestant. The Evangelical and Low Church party, emphasizing the anti-Roman elements in the church, have used the term freely, and publicly gloried in their Protestantism. The same difference of opinion has risen in the Episcopal church in America, complicated by the fact that the official name is the Protestant Episcopal Church of America (q.v.). Many have wished to drop the word Protestant as representing a local and sectarian idea. Whether appropriate in the name of a church or not, it has a historic use as the name of a particular form of the Christian religion.

Lilley, *The Principles of Protestantism* (Edinburgh, 1898); J. M. Gibson, *Protestant Principles* (London, 1901); K. Sell, *Katholizismus und Protestantismus in Geschichte, Religion, Politik, Kulture* (Leipzig, 1908); Wilhelm Bousset, *Faith of a Modern Protestant*, English translation by F. B. Low (New York, 1909); Paul Lobstein, *Introduction to Protestant Dogmatics*, translated by A. M. Smith (Chicago, 1910); E. Tröltsch, *Protestantism and Progress* (New York, 1912). For the history of Protestantism, see bibliography under REFORMATION.

PRO'TEUS (Lat., from Gk. Πρώτευς). In the Homeric poems (*Odyssey*, iv, 357 ff.), a prophetic old man of the sea (*ἅλιος γέρων, halios gerōn*) who tends the seal flocks of Poseidon (Neptune) and has the gift of endless transformation. His favorite residence was the island of Pharos, off the mouth of the Nile, according to Vergil (*Georgics*, iv, 387 ff.) the island of Carpathos (now Skarpanto), between Crete and Rhodes. Here he rose at midday from the floods and slept in the shadow of the rocky shores, surrounded by the monsters of the deep. Here he must be sought and captured by surprise, for he prophesied most unwillingly and sought to escape by his power of transformation. If, however, his captor held him firmly in every shape, he resumed his original form and revealed the future unerringly. In Herodotus Proteus has become a king of Egypt, who received Paris and Helena and retained the latter, while Paris took only a phantom with him to Troy. On the arrival of Menelaus in Egypt after the fall of Troy, Proteus restored to him his wife.

PROTEUS. A slender pennibranchiate salamander (*Proteus anguinus*), called olin by the Germans, which is closely related to the North American mud puppy (q.v.) and is found in subterranean waters in the absolutely dark limestone caverns of Carniola, Carinthia, and Dalmatia. Almost nothing is known of its habits. It is 10 or 12 inches long, seldom above ½ inch in thickness, and pinkish white with the gills carmine red. Specimens have been kept alive in confinement for several years, in a darkened aquarium, apparently without food. It lays eggs and fastens them singly to stones under water, and the larvæ nearly resemble the adults. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901), and G. A. Boulenger, *Reptiles and Amphibians* (New York, 1914).

PRO'TEVANGE'LIUM OF JAMES. See APOCRYPHA.

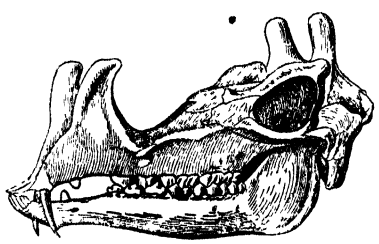
PRO'THALA'MION (Neo-Lat., from Gk. *πρό, pro*, before + *θαλάμιος, thalamios*, nuptial). A

poem by Edmund Spenser (1596), written for the double marriage of Elizabeth and Catherine Somerset, daughters of the Earl of Worcester.

PRO'THAL'LIUM, PROTHALLUS (Neo-Lat., from Lat. *pro,* before + *thallus,* from Gk. *θαλλός,* young twig). The sexual generation (gametophyte) of ferns; often extended to include the gametophytes of seed plants. See PTERIDOPHYTES.

PROTHERO, prŏTH'ĕr-ō, GEORGE WALTER (1848–). An English historian and biographer, born in Wiltshire and educated at Eton, at King's College, Cambridge, and at the University of Bonn. After holding several appointments at Cambridge he served as professor of history at Edinburgh from 1894 to 1899, and thereafter as editor of the *Quarterly Review,* succeeding his brother. (See PROTHERO, ROWLAND EDMUND.) From 1901 to 1905 he was president of the Royal Historical Society. Prothero came to America in 1910 to be Schouler lecturer at Johns Hopkins and Lowell lecturer in Boston. He received honorary degrees from Cambridge, Edinburgh, and Harvard. His work includes: *The Life and Times of Simon de Montfort* (1877); *Memoir of Henry Bradshaw* (1889); an edition of *Select Statutes* from the reigns of Elizabeth and James I (1894); and an edition of *The Growth of British Policy* (1895), by J. R. Seeley, whose life he wrote for the *Dictionary of National Biography.* He was editor of the *Cambridge Historical Series* and coeditor of the *Cambridge Modern History.*

PROTHERO, ROWLAND EDMUND (1852–). An English writer, brother of G. W. Prothero. He was born at Clifton-on-Teme, Hampshire, and was educated at Marlborough School and at Balliol College, Oxford, where he graduated with honors in classics and modern history. From 1875 to 1891 he was fellow of All Souls, Oxford; from 1894 to 1899 he edited the *Quarterly Review;* and in 1914 he was chosen (Conservative) member of Parliament for the University of Oxford. His principal publications are: *Life and Correspondence of Dean Stanley* (1893); *Letters and Verses of Dean Stanley* (1895); *Letters of Edward Gibbon* (1896); *H. R. H. Prince Henry of Battenberg* (1897); *Life of Queen Victoria* (1897); *Letters and Journals of Lord Byron* (1898–1900); *The Psalms in Human Life* (London, 1903; New York, 1915); *The Pleasant Land of France* (1908); *English Farming, Past and Present* (new ed., 1912).



PROTH'ESIS. See ETYMOLOGY, FIGURES OF.

PROTHONOTARY (prō-thŏn'ō-tā-rĭ) **WARBLER** (OF. *prothonotaire,* Fr. *protonotaire,* from ML. *protonotarius,* chief notary, from Gk. *πρῶτος, prōtos,* first + Lat. *notarius,* notary, scribe, from *nota,* mark, from *noscere,* to know; ultimately connected with Eng. *know*). A wood warbler (*Protonotaria citrea*) of the Mississippi valley from southern Illinois southward. It is rich yellow over the head and neck and lower parts and olive green upon the back, wings, and tail, with the lining of the wings and the tail coverts white. It is peculiar principally in nesting in holes in old trees.

PROTIS'TA (Neo-Lat. nom. pl., from Gk. *πρώτιστος,* very first, superlative of *πρῶτος, prōtos,* first, from *πρό, pro,* before). A group name proposed by Haeckel in 1878 for the lowest Protozoa and Protophyta; it forms a neutral kingdom containing the simplest plants and animals. Haeckel claims that the Protista show in their external form, structure, and vital phenomena such a remarkable mixture of animal and vegetable properties that they cannot justly be assigned to either the vegetable or the animal kingdom.

PROTIUM, prō'shĭ-ŭm (Neo-Lat., perhaps from a Javanese name), formerly called ICICA. A genus of pinnate-leaved trees of the family Burseraceæ, with white flowers in panicled racemes. *Protium icicariba,* a Brazilian species with fragrant resinous seeds, yields American elemi (q.v.); *Protium heptaphyllum* and *Protium guianense,* natives of Guiana, yield fragrant balsams, which harden into a gray resin, used as incense in churches; *Protium altissimum,* another Guiana tree, which attains a height of 100 feet, is used in house carpentry, canoe and furniture making. Its wood is known as white cedar, red cedar, acuyari, Samaria, Mara, and Curana wood.

PROTOC'ERAS (Neo-Lat., from Gk. *πρῶτος, prōtos,* first + *κέρας, keras,* horn). A primitive ungulate found fossil in the White River beds of South Dakota. The animal was somewhat larger than a sheep and had a long narrow skull, armed in the male with two to six pairs of horns and in the female with one pair of small protuberances. The upper incisors are absent,

PROTOCERAS SKULL.

the lower incisors well developed, and the upper canines of the male are much enlarged to form tusks. The ancestry and descendants of this animal are unknown and it constitutes a distinct isolated family remotely related to the modern chevrotains (*Tragulidæ*) of the Indo-Malayan region and west Africa. Consult Scott, "Osteology and Relationships of Protoceras," in *Journal of Morphology,* vol. xi (Chicago, 1895).

PROTOCOCCALES, prō'tō-kŏk-ā'lēz. See ALGÆ; CHLOROPHYCEÆ.

PRO'TOCOL (ML. *protocollum,* from MGk. *πρωτόκολλον, prōtokollon,* protocol, first leaf glued to a manuscript, from Gk. *πρῶτος, prōtos,* first + *κολλᾶν, kollan,* to glue, from *κόλλα, kolla,* glue). A term of diplomacy applied to the minutes or preliminary draft of an instrument or agreement between two or more states and intended to serve as the basis of negotiations for the conclusion of a definite treaty. The term is applied also to the formally authenticated minutes of the proceedings of a congress or conference, as where a number of friendly powers enter into a preliminary agreement to accomplish certain diplomatic ends by peaceful means.

PROTOCOL, THE INDUSTRIAL. In general, an instrument for the adjustment by arbitration and conciliation of differences arising between labor organizations and employers. Specifically it is the unique agreement entered into at New York by the International Ladies' Garment Workers' Union and the Manufacturers' Pro-

tective Association under which all differences in the cloak, suit, and skirt industry are settled without recourse to strikes or lockouts. It originated in 1910 after the protracted strike in the tailoring industry in the summer of that year, and was largely the work of Louis D. Brandeis, Julius Henry Cohen, and Meyer London (q.v.).

The important features of the industrial protocol are: (1) the provision for collective bargaining unlimited by time; (2) the establishment of a minimum-wage scale and a maximum working week; (3) the provision for a preferential union shop in place of the closed or open shop; and (4) the formation of a board of grievances to act as an industrial court, a board of arbitration to act as a court of appeals, and a joint board of sanitary control to regulate the sanitary conditions of factories. The two first-mentioned boards, on each of which the unions and the manufacturers are equally represented, constitute the machinery for settling industrial disputes.

The method of procedure is, in general, as follows: whenever any difference arises between an employer and his employees, it is first discussed by the former (or his representative) and the shop chairman elected by the latter. If a dispute cannot be so settled it is taken up by specially trained investigators, called clerks, who usually reach an amicable decision. Should they, too, fail, the matter is carried to the courts specially provided for such contingencies, usually very rare. In still rarer instances appeals are taken to an impartial chairman and from him to the full board of arbitration, representing the union, the manufacturers, and the general public.

So well has this method worked that many thousands of grievances have already been settled by it without recourse to the courts. In 1913–14, however, and again in 1915 controversies arose which threatened the life of this agreement. The first was over the manufacturers' demand that the union's chief clerk (Isaac A. Hourwich at the time) be changed, which was finally done. The second, which resulted in a temporary abrogation of the protocol by the Manufacturers' Association and a threatened strike on the part of the garment workers, involved the general charge of failure on the part of the workers' organization to live up to the protocol agreement. But a committee of public men, known as Mayor Mitchel's council of conciliation and presided over by Felix Adler, succeeded in extending the period of industrial peace enjoyed under the protocol.

The general effect of the protocol, now famous as the peace protocol, has been to substitute law for war in the clothing industry. Its benefits have accrued to workmen, manufacturers, and the public generally. Through it the garment workers have secured higher wages, shorter hours, and more sanitary conditions, the manufacturers better and more dependable help, and the public exemption from wasteful and often violent strikes and lockouts that periodically paralyzed not only the tailoring industry of New York but many dependent industries as well.

PRO'TO-DOR'IC, PROTO-ION'IC. Terms used to designate forms of architecture, especially of columns, which appear to have anticipated the later development of the Doric and Ionic forms of Greek architecture. The term "proto-Doric" is especially used of certain Egyptian types of column occurring in the façades of rock tombs at Beni-Hassan (twelfth dynasty) and in some early portions of the great temple at Karnak (eighteenth dynasty) which were supposed to have furnished the prototypes of the Greek Doric order. They resemble the latter in having polygonal or shallow-channeled shafts without bases, a circular echinus, and a square abacus. But the resemblance ceases here and modern archæology discredits the old theory that the Greek order was derived from the Egyptian. It is probable that the Greek type was in process of development before Greek intercourse with Egypt began in the seventh century B.C.

PRO'TOEP'IPHYTE. See EPIPHYTE.

PROTOG'ENES (Lat., from Gk. Πρωτογένης). A celebrated painter of ancient Greece who was born at Caunus in Caria and practiced his art at Rhodes. He was a contemporary of Apelles, working in the latter part of the fourth century. Pliny the Elder, to whom we owe most of our information (*Historia Naturalis*, XXXV, 83), says that when Demetrius Poliorcetes besieged Rhodes (305–304 B.C.) he took special care that the painter should be protected and undisturbed in his work. The ancient critics seem to have regarded his paintings as representing the highest art. They seem to have contained usually but few figures and to have shown but little creative power. His strength lay in execution, in minute labor and careful finish, rather than in composition.

PRO'TOGEN'ESIS. See SPONTANEOUS GENERATION.

PROTOGINE, prō'tō-jĭn (from Gk. *πρῶτος, prōtos*, first + *γίνεσθαι, ginesthai, γίγνεσθαι, gignesthai*, to become). Granite (q.v.) of gneissic structure composed of quartz, feldspar, and a greenish micaceous mineral belonging to the sericite or the chlorite family, which latter covers the lamination surfaces in a more or less continuous wavy membrane. The name "protogine" is applied chiefly to a rock mass of the Alps and is little used to describe rocks in other regions.

PROTOG'YNY. See POLLINATION.

PRO'TOHIP'PUS (Neo-Lat., from Gk. *πρῶτος, prōtos*, first + *ἵππος, hippos*, horse). An ancestor of the horse in the Miocene period. See HORSE, FOSSIL.

PROTONOTARY, prō-tŏn'ō-tā-rĭ *or* prō'tō-nō'tā-rĭ (ML. *protonotarius*, chief notary). The name properly given to each of the seven members of the Roman College of Papal Notaries, composed of prelates. They make up the first class; besides there are honorary protonotaries, who constitute a second class. The office of notary is very ancient, indeed primitive, for according to the *Liber Pontificalis* Clement I (91–100) appointed a notary for each two of the fourteen regions of Rome, making seven in all. The number was raised to 12 by Sixtus V (1585–90), but by the beginning of the nineteenth century they had lost all importance. The office was revived in 1838 and their duties were fixed by the constitution *Apostolicæ Sedis Officium* issued by Pius IX in 1872 and by the *Motu Proprio* of Pius IX in 1905. The original notaries were shorthand writers, using the *notæ*, or characters, 1100 in number, invented, it is said, by Ennius, the Latin poet. Later notaries were simply secretaries. Consult P. A. Baart, *The Roman Court* (Milwaukee, 1895),

and E. L. Taunton, *The Law of the Church* (St. Louis, 1906).

PRO'TOPLASM (ML. *protoplasma*, from MGk. *πρωτόπλασμα*, first creation, from *πρῶτος*, *prōtos*, first + *πλάσμα*, *plasma*, creation, from *πλάσσειν*, *plassein*, to form). The living substance constituting the cells of plants and animals or forming the bodies of all one-celled organisms. In appearance it is like thin syrup, filled with highly refractive microscopic granules. It forms the physical basis of life, no living being existing without it; and all the phenomena or activities of life are based on this fundamental substance.

Chemical Constitution. Protoplasm largely consists of proteins, which are compounds of carbon, hydrogen, oxygen, nitrogen, and sulphur, associated with a large proportion of water. Besides proteids protoplasm contains small proportions of mineral matters, especially phosphates and sulphates of potassium, calcium, and magnesium, as well as sodium, iron, phosphorus, and chlorine found in the ash. It is dissolved by prolonged treatment with weak acids or alkalies. Strong alcohol coagulates it, as does heat. Proteids are unstable, and protoplasm, especially that of animal cells, decomposes with more or less rapidity and gives out a fetid odor. Protoplasm readily stains by the application of neutral or slightly alkaline solutions of carmine, logwood, or acid aniline dyes (eosin and acid fuchsin). Thus by the use of a carmine stain the chromatin in cells is clearly demonstrated. Protoplasm is usually, but not always, alkaline in reaction; red litmus paper is turned blue by it. Protoplasm is evidently a highly complex substance, but it is not known whether it is a definite chemical body or whether it is a varying mixture of different chemical substances. "Protoplasm," says Hertwig, "is not a chemical but a morphological conception," and the present organization of protoplasm is "the result of an exceedingly long process of development." For remarks upon the origin of protoplasm, see SPONTANEOUS GENERATION.

General Properties. If we watch an amœba under the microscope we gather that protoplasm first of all is contractile and irritable; that it assimilates its food and is capable of excreting the waste residue; that it even respires, while it reproduces true to its species by self-division. Under a high power of the microscope the protoplasm of the egg of a starfish or sea-urchin, says Wilson, gives the appearance of a fine meshwork or framework composed of innumerable minute granules, or microsomes, suspended in a clearer, less deeply staining, continuous substance. The spaces of the meshwork (filar substance, spongioplasm, cell reticulum) are filled with a clear, homogeneous substance, not staining readily, and called the ground substance (interfilar substance, enchylema).

Movement and Irritability. This consists of the changes in the form of the body, e.g., of the amœba, or of the white blood corpuscles (leucocytes), whence such movements are called amœboid; while in the interior streams of granules are seen passing along the body and in the pseudopods. That irritability exists is proved by many facts, as that amœboid movements and the flow of granules can be induced, stopped, or modified by mechanical, chemical, and thermal stimuli.

Nutrition and Assimilation. Irritability and the power of motion are essential in bringing about assimilation, which is the change of food substance into protoplasm. Most unicellular animals, as well as the white amœboid blood corpuscles, and certain cells in sponges, cœlenterates, etc., have been observed to take in or devour solid substances. They take the particles of food into the midst of the protoplasm of their bodies by flowing around them; they extract all the assimilable and reject the indigestible portions. (See AMŒBA.) Many Protozoa (q.v.), besides taking in food for their own growth and for replacing worn-out parts, have the power of producing substances, such as lime or silica, or in rare cases cellulose, forming hard coverings or shells, often many-chambered and wonderfully complex, as well as often richly ornamented. This formative power, says Hertwig, is the starting point in the formation of tissue.

History. In the eighteenth century Corti (1772) and later Treviranus (1807) had seen that the grains of chlorophyll which cause the green color of plants flow rapidly in the interior of cells of certain plants. Mohl discovered that this apparent motion of the chlorophyll grains was due to that of the substance in which they were contained. This substance Mohl in 1846 called protoplasm, while several observers (Siebold, Kölliker, Remak, etc.) afterward discovered movements similar to those seen in vegetable protoplasm in the lymph corpuscles of animals, and therefore Remak applied the same term "protoplasm" to the fundamental substance of animal cells. Meanwhile further knowledge of protoplasm was obtained by the study of certain Protozoa, and Dujardin in 1835 applied the name "sarcode" to the gelatinous granular contractile substance forming their bodies. Ferdinand Cohn in 1850 argued for the identity of sarcode and protoplasm. Finally Max Schultze, in 1861, and De Bary, as the result of prolonged investigations, proved the identity of the protoplasm of plants and animals with the sarcode of the Protozoa. Afterward the cell membrane was found by Nägeli, Leydig, Kölliker, Cohn, etc., to be of minor importance, the protoplasm being the essential, dynamic substance of the cell.

Consult Max Verworn, *General Physiology*, translated from the second German edition by F. S. Lee (New York, 1899); E. B. Wilson, *The Cell in Development and Inheritance* (ib., 1900); C. B. Davenport, *Experimental Morphology* (new ed., ib., 1908); Oscar Hertwig, *The Cell: Outlines of General Anatomy and Physiology*, translated by M. Campbell (ib., 1909). See HISTOLOGY.

PRO'TOROHIP'PUS (Neo-Lat., from Gk. *πρῶτος*, *prōtos*, first + *ὄρος*, *oros*, mountain + *ἵππος*, *hippos*, horse). An ancestor of the horse in the Middle Eocene period. See HORSE, FOSSIL.

PRO'TOROSAU'RI. See PROSAURIA.

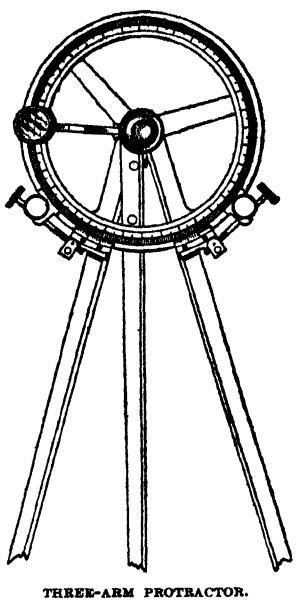
PRO'TOSPON'GIA (Neo-Lat., from Gk. *πρῶτος*, *prōtos*, first + *σπογγία*, *spongia*, sponge). One of the earliest, if not the earliest, fossil sponges known. It consisted of a spherical body which now appears as a faint disk upon the surface of the rock, with the skeleton showing as a regular network of cross-shaped spicules that form square meshes. It is found in the Cambrian formations of North America and Europe.

PRO'TOTHE'RIA (Neo-Lat. nom. pl., from Gk. *πρῶτος*, *prōtos*, first + *θηρίον*, *thērion*, dim. of *θήρ*, *thēr*, wild beast). The lesser and inferior of the two primary divisions of the

Mammalia. It embraces only the small group represented at present by the Australian and Papuan egg-laying duckbill and echidnas, which constitute the order Monotremata (or Ornithodelphia), and possibly also the doubtful and little-known fossil group termed Allotheria or Multituberculata. The mammalian affinities of these extinct forms have been denied by some paleontologists, but the weight of opinion views them as properly included in that category. Both externally and internally the monotremes show much that is distinctly mammalian, including the character of the brain, which in the echidnas at least is surprisingly large and well convoluted. The absence of a corpus callosum is the chief peculiarity differentiating it from the eutherian brain. The skeleton exhibits many archaic features, one of the most striking of which is the presence of only the capitular head to the ribs. The shoulder girdle has other reptilian features and a bone (the interclavicle) peculiar to the group. The digestive and circulatory systems differ little from the normal mammalian type, and the great distinction between the Prototheria and other mammals lies in the reproductive system and the fact that their eggs, instead of being minute and with little or no food yolk, are large, contain much yolk, and therefore develop, so far as their early stages are concerned, after the meroblastic manner of a reptile's egg. The Prototheria have a temporary ventral mammary pouch in which the young are hatched, or to which they are transferred after hatching, and into which open the ducts of the mammary glands. This pouch is formed by a deep fold of the skin periodically developed in preparation for the young, and contains no teats, but nutrition is supplied by modified sweat glands. Its homologies are fully discussed by Beddard (*Mammalia*, 1902), who refers to the work and writings of many investigators. See DUCKBILL; ECHIDNA; MAMMALIA.

PROTOXYLEM, prō'tŏ-zī'lĕm (from Gk. *πρῶτος*, *prōtos*, first + *ξύλον*, *xylon*, wood). The first vascular elements appearing in a stele, usually being spiral vessels. The position of the protoxylem strands and their relation to the xylem subsequently developed (metaxylem) have been of great use in tracing the evolution of the vascular system and of vascular plants.

PRO'TOZO'A (Neo-Lat. nom. pl., from Gk. *πρῶτος*, *prōtos*, first + *ζῷον*, *zōon*, animal). The subkingdom or phylum of one-celled animals, represented by the amœba (q.v.), infusoria, and the like. They are, as a rule, of microscopic size, and are like particles of protoplasm (q.v.), having a gliding motion and constantly changing their form. Protozoa consist of a single cell, and, with the exception of the moners (see MONER), they possess one or more nuclei, but no other organs or true tissues. As the entire body is composed of protoplasm, the simplest protozoan is contractile, absorbs and digests food, is metabolic, automatic, and reproduces by self-division. Motion is brought about not only by the general contraction of the body, but also by means of pseudopodia (see AMŒBA), cilia, and a specialized cilium called flagellum, while in the most specialized infusoria, such as *Vorticella* and *Stentor*, little muscular fibrillæ have been detected. Besides the nucleus and food vacuoles there are other cell organs called contractile vacuoles, which occur in fresh-water forms and only rarely in marine species. They apparently perform an excretory function, and may be respiratory, since they are supposed to eliminate carbon dioxide. All the vital functions appear to be under the control of the nucleus. Protozoa reproduce by self-division or budding, or they conjugate, multiplying by spores or germs. (See REPRODUCTION; SEX.) They may be naked or may secrete a calcareous shell consisting of one, two, three, or many chambers; in the latter case (the Foraminifera) the shell is remarkably complex considering the great simplicity of the animal itself. Apparently the same mechanical laws guide the mode of shell formation, the chambered shells being irregular, or straight, or twisted, or coiled in a single plane, like the chambered nautilus. While a very few forms are terrestrial (*Amœba terricola*), the vast majority are marine and fresh-water forms, the shelled forms being marine. The fresh-water forms abound most in still or stagnant water, and may become encysted when the water dries up or when food is lacking or cold approaches. Thus protected by a thin resistant outer covering, the monads and infusorians in general may dry up and be blown about by the winds, remaining suspended in the air for a long period. In this way the species have become more or less cosmopolitan. A large proportion of American forms are of the same species as those of Europe.



The discoverer of the microscope, Leeuwenhoek (q.v.), in 1764 first detected and described certain forms living in infusions, and about the same date Wrisberg (*Observationes de Animalculis Infusoriis*, Göttingen, 1765) called them infusorial animalcules. The name Protozoa was given in 1845 to the subkingdom by Siebold, who discovered that they were unicellular, disproving Ehrenberg's claim that they possessed a digestive canal, nervous system, muscles, excretory and sexual organs. The earliest traces of shelled Protozoa are those of *Globigerina* and *Orbulina* detected by Matthews in the Lower Cambrian rocks of St. John, New Brunswick.

Classification. The phylum Protozoa is divided into five classes: (1) Rhizopoda; (2) Mycetozoa; (3) Flagellata (Mastigophora); (4) Sporozoa; (5) Infusoria. Of these the Sporozoa are all parasitic, while the malarial germ is a protozoan of doubtful position, its young being provided with flagella.

Consult: E. R. Lankester, *A Treatise on Zoölogy*, part i (London, 1903), containing a bibliography; M. M. Hartog, "Protozoa," in *Cambridge Natural History*, vol. i (New York, 1909); E. A. Minchin, *Introduction to the Study of the Protozoa* (ib., 1912); also G. N. Calkins, *Protozoa* (ib., 1901). See FORAMINIFERA; RADIOLARIA.

PROTRAC'TOR (ML. *protractor*, from Lat. *protrahere*, to draw forward, from *pro*, before, for + *trahere*, to drag, draw). An instrument used for measuring and laying down angles on paper. In its simplest form it consists merely of a semicircular scale of metal or transparent material. The three-arm protractor used in marine surveying is used to solve mechanically the three-point problem. The middle arm is fixed with its reading edge at the zero of the scale; the other arms, pivoting at the centre of the instrument, are arranged to measure angles on each side of the middle arm; the movable arms carry verniers. The method of using the protractor is as follows: three objects (whose positions are marked on the chart or map)

are selected. The angle between the right and centre objects and that between the centre and left are measured with sextants or similar instruments. The angles so obtained are transferred to the protractor, which is then laid upon the chart, and, with the edge of the centre arm always kept on the marked position of the centre object, the instrument is slipped along until the side arms fall upon the positions of the other two. The centre of the protractor then indicates the position occupied by the observer when the angles were taken, and crossed wires, a hole in a glass-ended tube, or a needle point serves to fix this position, which, if the angles are simultaneously observed, can be accurately ascertained even when the vessel carrying the observers is moving at any rate of

THREE-ARM PROTRACTOR.

speed. In selecting the point of observation care should be taken that the angles exceed 30 degrees if possible and that the point occupied is not near the circumference of the circle which passes through the points observed. If the angles are small a slight error in them is likely to produce a large error in the resulting position; and if the point occupied is on the circle passing through the three observed, its position is indeterminate.

PROU, prōō, MAURICE (1861–). A French historian, born at Sens and educated in Paris, in the Ecole des Chartes and the Ecole des Hautes-Etudes. After some time at the French School at Rome, Prou entered the numismatic museum of the National Library, and he became professor of diplomatic relations at the Ecole des Chartes in 1900. In 1910 he was elected to the Academy of Inscriptions and Belles Lettres. He edited *Le moyen âge* (1893 et seq.). Besides editions of Hincmar (1884) and of Honorius' registers, his most important works are: *Raoul Glaber* (1886); *Manuel de paléographie, latine et française* (1889; plates, 1892 and 1896; 3d ed., 1910); *Catalogues des monnaies françaises* (1892 et seq.); *La Gaule mérovingienne* (n. d.); *Les monnaies carolingiennes* (1896); *Recueil des actes de Philippe Ier* (1908).

PROUD FLESH. The popular term for exuberant granulations (see GRANULATION) springing up in wounds or on ulcerated surfaces. Such granulations may be treated with silver nitrate either in the solid form or in strong solution, or they may be removed with the scissors or curette. See INFLAMMATION; LUNAR CAUSTIC.

PROUDHON, prōō'dôN', PIERRE JOSEPH (1809–65). A French Socialist and political writer, born at Besançon, July 15, 1809. He was educated at the College of Besançon, where he proved himself an able student, but on account of the poverty of his parents he was compelled to leave before receiving his degree. In 1828 he obtained employment in a large printing establishment in his native city, and after eight years he set up one of his own, which was not successful. In 1838 he published his *Essai de grammaire générale*, which secured him a triennial pension of 1500 francs from the Academy of Besançon. In the same year he removed to Paris. Here in 1840 he published *Qu'est-ce que la propriété?* (translated by Tucker, Philadelphia, 1888), in which he sums up his doctrines in the celebrated dictum, *La propriété c'est le vol.* At the moment of publication the work attracted little notice, and the sole results to its author were the withdrawal of his pension by the Academy, on the score of his noxious opinions, and the threat of prosecution. In 1842, for a repetition of the offense in his *Avertissement aux propriétaires*, he was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1844 to 1847 Proudhon was employed at Lyons in the superintendence of a scheme of water transport on the rivers Saône and Rhone, publishing during this time at Paris the two works entitled *De la création de l'ordre dans l'humanité* and *Système des contradictions économiques.* On the outbreak of the revolution of February, 1848, Proudhon repaired to Paris, and on April 1 came before the public as editor of the *Représentant du Peuple.* By his vigorous advocacy of extreme democratic and Socialistic opinions he became one of the leading figures of the hour. His paper was suppressed in August; but meantime, on June 4, he had been elected to the Constituent Assembly as representative of the Department of the Seine. In that body he had comparatively little influence; he attached himself to no political party, but attacked the radical Left and the reactionary Right with equal bitterness. His importance as a writer was much greater, and as editor of three daily journals in succession he had great influence upon the political movements. All three papers were in turn suppressed as anarchistic and obnoxious—*Le Peuple* (Nov. 23, 1848–April, 1849), *La Voix du Peuple* (October, 1849–May, 1850), *Le Peuple de 1850* (June 15–October 13). During their continuance Proudhon was repeatedly subjected to fines, which were defrayed for him by popular subscription. In January, 1849, he attempted to put his theories into practice by the institution of a people's bank. The bank was closed by the authorities, and its originator fled to Geneva to escape threatened imprisonment. In June, however, he returned, and his next three years were passed in the prison of Ste. Pélagie. While confined there he married. In June, 1852, he was set at liberty and, quitting Paris, went to Belgium, where he continued to publish from time to time on his favorite subjects. He re-

turned to Paris after the amnesty of 1860 and died at Passy, Jan. 16, 1865.

Proudhon's theories are best set forth in his works *Qu'est-ce que la propriété?* and *Système des contradictions économiques*. Property, he declared, is unjustifiable either on the ground of occupation, which can entitle the possessor only to the usufruct, or on the ground of labor, which presupposes occupation. The individual has a right only to the integral product of his labor. One service can be duly repaid only by rendering another: but the owners of land and capital exact many services while rendering none.

His political programme was equally revolutionary. He was the founder of a school of individualistic or philosophical anarchy. He declared that the state, representing unintelligent conservatism or brutal reaction, must be abolished. The revolution for the betterment of humanity must come, not from above, through the government, but from below, through the individual.

In the history of French thought and Socialism Proudhon occupies an important position. His destructive criticism was of value; but he also elaborated numerous propositions which are regarded as positive acquisitions by economists and Socialists. He gave to federalism and anarchy a doctrine; he conceived of a democratic organization of credit; he outlined the Socialistic theories of value, of rent, and of the right of the laborer to the whole product of his labor. His theories were of great influence upon three important movements—the revolution of 1848, the Commune of 1871 (many of the principal actors in which held his opinions), and the International Workingmen's Association. Moreover, many organizations of workingmen, especially in France, still look for their intellectual leadership to Proudhon. Among his works, in addition to those already mentioned, are: *Explications présentées au ministère public sur le droit de propriété* (1842); *Solution du problème social* (1848); *Banque du peuple* (1849); *Actes de la révolution: résistance* (1849); *Les confessions d'un révolutionnaire* (1849); *Intérêt et capital* (1850); *Idée générale de la révolution au XIXème siècle* (1851); *Philosophie du progrès* (1853); *La guerre et la paix* (1861); *De la capacité politique des classes ouvrières* (1865).

Consult: Putlitz, *P. J. Proudhon: sein Leben und seine positiven Ideen* (Berlin, 1881); Diehl, *P. J. Proudhon: seine Lehre und sein Leben* (3 vols., Jena, 1888–96); Desjardins, *P. J. Proudhon: sa vie, ses œuvres et sa doctrine* (2 vols., Paris, 1896); Mülberger, *P. J. Proudhon: Leben und Werke* (Stuttgart, 1899); Célestin Bouglé, *La sociologie de Proudhon* (Paris, 1911).

PROUST, prōōst, ANTONIN (1832–1905). A French politician and author, who sometimes wrote under the pseudonym of Antoine Barthélemy. He was born in Niort and, after an excellent education and travels in Greece, entered journalism and in 1864 founded at Brussels *La Semaine Universelle*, in which he bitterly opposed the Empire. Proust became Gambetta's private secretary after the fall of the Empire, and was elected deputy in 1876 and repeatedly reëlected. From November, 1881, to January, 1882, he was Minister of Fine Arts under Gambetta. The Museum of Decorative Arts was the result largely of his efforts. He was the Commissioner General of Fine Arts at the Exposition of 1889 and French Commissioner General to the World's Columbian Exposition of 1893. His chief works are: *Les beaux-arts en Angleterre* (1862); *Un philosophe en voyage* (1864); *Chants populaires de la Grèce moderne* (1866); *La democratie en Allemagne* (1872); *Le prince de Bismarck* (1876); *L'Art français* (1890); *L'Art sous la république* (1891); and critiques of the Salons of 1898 and 1899.

PROUST, JOSEPH LOUIS (1754–1826). A French chemist, born at Angers. He studied chemistry there and in Paris and became chief apothecary to the Salpêtrière. He went to Spain, becoming professor of chemistry at the artillery school at Segovia and later director of the laboratory of King Charles IV. In 1806 he returned to Paris and in 1816 was elected to the Academy of Science. Proust put on a firm basis the chemical law of definite proportions, sometimes called Proust's law; discovered glucose (1805)—*Mémoire sur le sucre de raisin* (1808); and greatly advanced the art of quantitative analysis. See PROUSTITE.

PROUSTITE, prōōs'tīt (named in honor of Joseph Louis Proust). A mineral sulpharsenite of silver that crystallizes in the hexagonal system. Its lustre is adamantine to metallic and it shows a bright-red color by transmitted light. It is found in Saxony, Bohemia, Spain, Mexico, South America, and in the United States at various localities in Colorado, Arizona, and Nevada, in association with the silver ores of these regions. Both proustite and pyrargyrite (q.v.) are known as ruby silver ores in allusion to their transmitted color.

PROUT, EBENEZER (1835–1909). An English musical theorist, born at Oundle, Northamptonshire. He taught composition at the National Training School for Music and the Royal Academy of Music. His scholarly and exhaustive treatises on the various branches of musical composition assure him a place among the great theorists. His most important books are: *Harmony* (1889); *Counterpoint* (1890); *Double Counterpoint and Canon* (1891); *Fugue* (1891); *The Orchestra* (1898–99). His numerous compositions are models of masterly writing, but lack inspiration.

PROUT, FATHER. See MAHONY, FRANCIS SYLVESTER.

PROUT, SAMUEL (1783–1852). An English landscape and architectural painter in water color, also a lithographer. He was born at Plymouth, studied under a local teacher, early contributed to Britton's *Beauties of England*, and spent two years in London with Britton. His real artistic activity began in 1818 with his travels on the Continent, which were continued throughout his career. He made sketches in Belgium, France, Germany, Italy, and Switzerland, excelling particularly in rendering northern Gothic architecture, to which his peculiar touch and broken line were especially adapted. His work possesses great charm and spontaneity, and shows a happy sense of composition, love of the picturesque, skillful handling of light and shade, and keen appreciation of values. Life and movement are added by the introduction of picturesquely clad figures. He is represented in the Tate Gallery and many of his drawings in water color, sepia, and pencil are in the South Kensington Museum. His later sketches were drawn by him on stone for lithography and published in volumes under

the titles, *Facsimiles of Sketches Made in France and Germany* (1833); *Interiors and Exteriors* (1834); *Sketches in France, Switzerland, and Italy* (1839), etc. He also published numerous elementary drawing books. Consult "Sketches by Samuel Prout," edited by Charles Holme, published as a special number of the *International Studio* (New York, 1915).

PROUTY, CHARLES AZBO (1853–). An American lawyer and transportation expert, born at Newport, Vt. He graduated from Dartmouth College in 1875, for two years assisted Prof. S. P. Langley (q.v.) in the Allegheny (Pa.) observatory, and was admitted to the Vermont bar in 1882. In 1888 he was elected to the State Legislature, and from that year to 1896 was reporter of the Vermont Supreme Court. After 1896, when President McKinley appointed him a member of the Interstate Commerce Commission, Prouty became known as one of the ablest members of the commission; in 1912–13 he served as its chairman. Besides numerous articles Prouty wrote *Transportation—Every-day Ethics* (1910) and *The Trust Problem* (1911).

PROVENÇAL (prō'vĂN'sàl') **LANGUAGE.** A term which designates either the family of Romance dialects spoken in Provence (and neighboring districts), that part of southern France which was the Roman province called Provincia, or the dialect peculiar to Provence. It was the first in rank of the literary dialects of langue d'oc, its most ancient documents going back to the tenth century. Its literary development was stopped after the Albigensian Crusade (1209–1229), which crushed its patrons, the spoken language taking the rank of a patois and French becoming the literary language; but in modern times it has been successfully applied to literary purposes again by Mistral (q.v.) and other writers. From French, its northern neighbor, Provençal may, roughly speaking, be separated by a line which, starting from the mouth of the Gironde, follows the Dordogne for a while, then ascends to the north towards Isle-Jourdain, and, bending to the east as far as Montluçon, descends again in a southerly direction, crosses the Rhone, passes through the regions of Lyonnais and Dauphiné, and reaches the Alps. This line of demarcation serves also to divide it on the northeast from a linguistic territory known as the Franco-Provençal, because it has peculiarities savoring both of French and of Provençal. In the southwest of the territory to the south of the dividing line described is found a body of Gascon dialects, which in the Middle Ages were treated as forming a speech foreign to Provençal. The number of persons speaking the modern Provençal dialects (including Gascon) may be estimated at about 8,000,000. Provençal has often been called the *langue d'oc*, as contrasted with French, called the *langue d'oïl; oc* and *oïl* were respectively the Provençal and the Old French words for "yes."

What most distinguishes Provençal from French is the fact that it keeps the Latin accented *a* of free syllables and Latin unaccented final *a*, while French has changed them respectively to *é* and slurred or mute *e* (cf. Provençal *amat* and Old French *amét*, modern French *aimé;* Provençal *bona* and French *bonne*). In modern Provençal the final unaccented *a* has become *o*, and palatalized *l* has tended to become the palatal semivowel *y* as in French. Vowels which in French have been nasalized have in Provençal stopped short of nasalization: Latin *bonum*, French *bon*, but Provençal *bo*. The *l mouillé*, which has disappeared from modern French, still survives in these dialects. The word accent has always fallen on the last or the next to the last syllable, which is probably the reason why its final explosive consonants have been better preserved than in French (cf. Provençal *cap* with French *chef*). In the older period there was a case distinction of nominative and accusative for substantives, except those coming from the Latin first declension; thus, nominative singular *sor*, sister, accusative singular *seror*, nominative plural *serors*, accusative plural *serors;* nominative singular *cavaliers*, knight, accusative singular *cavalier*, nominative plural *cavalier*, accusative plural *cavaliers;* but nominative and accusative singular *domna*, lady, nominative and accusative plural *domnas*. In the modern speech the plural sign *s* is silent except in *liaison*. The four conjugations of Latin persisted in Provençal; but only the first (infinitive in *-ar*) and the fourth (infinitive in *-ir*) remained with sufficient vitality to attract new verbs to them. As in the earliest Old French, and as occasionally even nowadays in Spanish and Portuguese, the Latin pluperfect indicative (*cantaveram*, etc.) had in early documents an indicative value (either pluperfect or aorist, usually the latter); it had oftener, however, the imperfect subjunctive or conditional force that has prevailed also in the Iberian Peninsula.

The older speech, as represented in the literary works of the twelfth century, had eight simple vowels, viz., open and close varieties of *a*, of *e*, and of *o*, the high front vowel *i*, and a rounded form of this last vowel, written *u* as in modern French. Among the more common diphthongs were *ie, uo, ue*, and *au*. The retention of the Latin diphthong *au* is a characteristic of Provençal as compared with the other Romance tongues. The consonantal sounds comprised the velar stops *k* (written *c* before *a, o*, and *u*, and at the end of a word, as in *car*, why, *cort*, court, and *qu*, as in *que*, that, and *quino*, fifth) and *g* (written *gu* or more usually *g* before *a, o*, as in *garnir, guarnir*, to furnish, *g* before *u*, as in *agur*, augury, and *gu*, before *e, i*, as in *guerra*, war); the velar nasal with a value like that of the English *ng* in ring (written *n* before the *k* and *g* sounds already described, as in *tenc*, he held); the dental stops *t* and *d*, the former voiceless, the latter voiced; the voiceless sibilant *s* (written *s* and *ss*, the latter usually between vowels, as in *baissar*, to lower); the voiced sibilant *z* (written *z* or *s*, as in *chauza* or *chausa*); the dental spirant *th* (*th* of English there; written *d*, and after the middle of the twelfth century *z*, when it probably already denoted the *z* sound, as in *espaza*, sword); the dental nasal *n;* the palatalized *n* (written *n, ign*, etc., and more commonly in later times *nh*, as in *renhar*, to reign); a well-pronounced *r;* an *l;* a palatalized *l* (written *lh* or *ill*, as in *acolhir, acoillir*, to welcome); the labial stops *p* (voiceless) and *b* (voiced); the labiodental spirants *f* (voiceless) and *v* (voiced); the labial nasal *m;* the semivowels *y, u, ü* (represented by *i*, by *ou*, and by *u*, when they stood in hiatus). More complex sounds are *ts* (the English *ch* of church, i.e., a voiceless dental sibilant, represented by *ch* in all positions, and by *g* occasionally in the final position, as in *sapcha*,

let him know, *tug* or *tuich*, all); *dž*, the voiced equivalent of the preceding sound (the English *j*, represented by *j* and, before *e* or *i*, by *g*, as in *gen*, gentle, *joglar*, minstrel; the manuscripts often have graphic *i* for *j*); a voiceless dental sibilant *ts* (written *c*, as in *marce*, and *z* or *tz*, especially in the final position, as in *faz*, *fatz*, he does); and a voiced dental sibilant *dz* (written *z*, as in *dizem*, we say); as in French the last two sounds soon lost their dental component. In the literary documents final *n* is often omitted, and, on the other hand, it is often added to words that should normally end in a vowel; this ease of addition or omission has led to its being called the movable *n*. Even in the earliest times the Provençal region was divided into a northern and a southern linguistic district, the northern marked by the change of initial Latin *ca-* to *cha-* (*chastel*, castle), the southern by the retention of the *k* sound (*castel*) of the *ca-*.

PROVENÇAL LITERATURE. The literature written in the various dialects of the south of France, and more particularly that written during the Middle Ages in the dialect of Limousin. Its earliest monument, a fragment of a moral poem called *Boëthius*, belongs to the first half of the eleventh century. The courtly lyrics, however, which constitute its main glory, were nearly all written between 1090 and 1350. The songs of over 400 poets who composed during this period have come down to us, and we know the names of almost 70 others whose works have perished. The troubadours (q.v.) wrote, not for readers, but for hearers; their pieces were sung at court festivals either by the authors themselves or by the more humble jongleurs. Music and words were usually composed by the same person. This intimate connection between words and music strongly influenced the form of these lyrics. Elaborate artificiality is a predominant trait. Every variety of rhyming scheme was attempted, the rhymes of one stanza being repeated in all the others throughout a poem. Word play, alliteration, conceits, and forced constructions abound, and difficulties of every kind were sought. There even grew up a style called the *trobar clus*, or *oscur*, the chief merit of which was that it could hardly be understood. A treatise on verse written in the fourteenth century (*Leys d'Amors*) mentions many different kinds of poems, the most important of which are the *vers* and *canso*, the *sirventes* and the *tenso*. Between *vers* and *canso* no very clear distinction has been observed, except that the *vers* was the earlier and simpler form. The *canso* was an elaborate lyric of from five to seven stanzas with complicated rhymes, and it dealt always with love and required a melody of its own. The sort of love thus treated was peculiar to the Middle Ages and seems to have been shaped by the social conditions of the period. The ladies who presided over the almost independent courts of southern France were the natural subjects of the praise and adoration of the singers, who expressed largely a feigned passion in artificial formulas. Yet, however innocent for the most part these love affairs actually were, the semblance of an illicit relationship was preserved. In general love is represented as the greatest good, the height of blessings, the source of all virtue and glory.

The *sirventes*, or service song, was written to fit some well-known and popular air. The subject was moral or religious, political or personal. The poet, with great freedom of language, scourges the vices of nobles or women or clergy, laments the decay of ancient manners and the growth of avarice, stimulates leaders and populace to war, exalts a patron for his political virtues and his generosity, avenges an injury by virulent personal invective, or exhorts laggards to the crusade. Without an intimate acquaintance with the events to which they relate, many of these pieces are now unintelligible, yet to the student of mediæval life they are most interesting, for they constitute the journalism of the age.

The *tenso*, with which may be included the *partimen*, *jocs partitz*, and *torneyamen*, was a poetical dispute, a play of wit, in which, often with biting mockery and intense personal bitterness, two or more poets debated, in alternate stanzas, some question of love casuistry, such as: Which are the greater, the benefits or the ills of love? Which contribute more to keep a lover faithful, the eyes or the heart? The decision is commonly left to some lord or lady. Such were the leading artificial forms of the Provençal lyric. There were, however, some others which retain a stronger impress of popular origin: the *alba*, or dawn song, portraying the parting of lovers; the *ballada*, *dansa*, and *ronda*, to be sung to the dance; the *pastorela*,

copied some think from the French, a dialogue between a knight or a clerk and a shepherdess.

The earliest lyrical writer whose songs have been preserved is William IX, Duke of Aquitaine and Count of Poitou, but his pieces show such sure skill in treatment, such stability of language, metrical form and artistic character, as could not have been attained without the foundation of a considerable earlier literature. After the middle of the twelfth century the poets became numerous and their art soon reached its culmination. Among the most notable singers are: Marcabrun, distinguished for his biting satire; Jaufré Rudel, Prince of Blaia, hero of a romantic tale, charmingly dramatized by Edmond Rostand in his *Princesse lointaine;* Rambaut d'Orange, who exchanged love songs with Beatrice, Countess of Die; Peire Rogier, who excelled in exaggerated devotion to Ermengarde, the masculine Countess of Narbonne; Bernart de Ventadour, the greatest singer of love; Peire d'Alverhne, who wrote largely in the difficult style; Arnaut de Mareuil, referred to by Petrarch, in comparison with Arnaut Daniel, as "the less famous Arnaut"; Guiraut de Borneil, "the master of the troubadours"; Peire Vidal, an erratic genius; Bertran de Born, often called, on account of his stirring war songs, the Tyrtæus of Provence and put by Dante into hell among the stirrers of dissension (*Inf.*, xxviii); Folquet de Marseille, who sang of love in his youth, then entered the Church, rose to be Bishop of Toulouse, and was one of the most ferocious persecutors of the Albigenses; Pons de Capdueil, Rambaut de Vaqueiras, and Peirol, all three lovers and crusaders; Arnaut Daniel, whom Dante met in the last circle of Purgatory and whom he regards as the greatest of all poets of love (*Purg.*, xxvi); Raimon de Miraval, who sang light-heartedly of amorous intrigues while his country was being devastated by a cruel war and ruin stalked through the land.

After the beginning of the thirteenth century the Provençal lyric rapidly declined. Moral poems largely took the place of songs of love and war. Among the writers worthy of mention are: Aimeric de Peguilhan, the favorite of many nobles; Peire Cardinal, master of the moral *sirventes;* Sordello, the Mantuan, made famous by Dante and Browning; and Guiraut Riquier, who may well be regarded as the last of the troubadours.

The fall of this brilliant literature began with the Albigensian Crusade of 1209, which soon turned into a savage war of conquest and ended in the absorption of the fiefs of the south by the French monarchy. The elegant and liberal life of the Provençal nobility, the fount from which this lyric drew all its vitality, was destroyed. The stream of court poetry was dried up at its source. Even the language was condemned by authority. The culture of the region became entirely French, and the *langue d'oc* declined into a mere group of dialects, with a dialectal literature. The poets took refuge in Catalonia, Aragon, and Italy, where for another century their profession flourished.

The art, abandoned by the aristocracy, was taken up by the citizens of the towns. In 1323 seven burghers of Toulouse founded the Sobregaya Companhia dels VII Trobadors de Tholoza, the purpose of which was to further their native poetry. This company developed into a formal society with many sharply defined grades of membership. Their chancellor prepared in 1355 a manual of poetic art, the *Leys d'Amors*, degrees of bachelor and doctor of the gay science were conferred, and annual competitions in song were held, called the Floral Games, from the fact that gold and silver flowers constituted the prizes. The pieces composed for these competitions celebrated the Virgin under the names *Amors* and *Clemenza*, the stereotyped love formulas of the ancient poets being employed in the service of religion. Being written according to rule, these poems are uninspired and of small literary value.

Lyric poetry, though the most important, was not the only manifestation of Provençal literature. Almost all the mediæval forms are to be found. There are epics, mostly fragmentary, the most important of which is *Girart de Rossillon;* Arthurian romances, such as *Jaufré;* short versified tales, called *novas*, which are interesting chiefly as presenting the life of the age; and one long and highly artificial love story, *Flamença*, which represents the impossible wooing and conquest of a married lady by a young knight. *Flamença* has kept for us a most valuable picture of Provençal manners before the year 1235, when it was probably composed. Some historical poems are also of importance, among which may be mentioned the *Chanso d'Antioche*, dealing with the First Crusade, and two long fragments on the Albigensian War. A few fables, hymns, prayers, allegories, epistles, and lives of saints remain; also a great mass of moral, didactic, and scientific verse, much of which is still unpublished. To this class belongs an immense work, a sort of encyclopædia, the *Breviari d'Amors* of Matfre Ermengaud, which consists of over 34,000 lines. Of the drama little has been preserved, and of that little none is earlier than the fourteenth century.

Compared with the poetry, Provençal prose is weak and poor. We have some translations of parts of the Bible and of legends of the saints, some chronicles, some quasi-scientific treatises, and works on grammar (*Donat Provensal*, of about 1243, *Las Razos de Trobar*) and poetics (*Las Leys d'Amors*, of about 1356). The most interesting bit of prose is the *Biographies of the Troubadours*, containing more than 100 lives, together with *razos*, or stories explaining the circumstances under which particular poems were composed. This work, however, is untrustworthy. Many of the notices are romantic tales, products of the imagination, built wholly upon the poems they are designed to interpret.

Provençal literature, it will be seen, is of slight value apart from its lyric poetry, but this lyric poetry is one of the most important artistic manifestations of the Middle Ages. Poor as it was in ideas and sentiments and empty in its courtly refinement, it was original. Very few outside influences were at work at its rise or in its development. It was the spontaneous outgrowth of chivalric manners and institutions acting under favorable conditions upon a race prone to melody. Its fundamental aridity is offset by variety of form, courtly refinement, and superior musical qualities. Though almost without known ancestry, it was not without known offspring. France, Germany, Spain, and Italy echoed its tones and imitated its conventional forms. In Germany, however, a native spirit soon mastered the minnesingers, and in Italy a school of thoughtful and cultivated writers developed the love theories of

Provence till they were fit for the hand of Dante.

For modern Provençal literature, see FÉLIBRIGE.

Bibliography. F. C. Diez, *Die Poesie der Troubadours* (2d ed., by Bartsch, Leipzig, 1883); id., *Leben und Werke der Troubadours* (2d ed., by Bartsch, ib., 1882); C. C. Fauriel, *Histoire littéraire des troubadours* (3 vols., Paris, 1844; Eng. trans. by Adler, New York, 1860), a work which, though brilliant, loses through hazardous theorizing; K. F. Bartsch, *Grundriss zur Geschichte der provenzalischen Litteratur* (Elberfeld, 1872); Antonio Restori, *Letteratura Provenzale* (Milan, 1891), of which there is also a French translation (Montpellier, 1894), perhaps the best brief treatment of the subject; Stimming, "Provenzalische Litteratur," in Gröber, *Grundriss der romanischen Philologie*, vol. ii (Strassburg, 1892–98); Gaston Paris, in his *Mediæval French Literature* (London, 1902), treats Provençal literature as a branch of the old French. In addition to these works collections of poems have been published by F. J. M. Raynouard, *Choix des poésies originales des troubadours* (6 vols., Paris, 1816–21), and in the first volume of his *Lexique roman* (6 vols., ib., 1844), and by K. A. F. Mahn, *Werke der Troubadours* (4 vols., Berlin, 1853–56), and id., *Gedichte der Troubadours* (ib., 1856–73). There are also editions of many individual troubadours and of several of the longer epic and didactic works. Consult: Karl Appel, *Provenzalische Chrestomathie, mit Abriss der Formenlehre und Glossar* (Leipzig, 1895), of which a third edition appeared in 1907; a treatise on the grammar of Provençal in C. H. Grandgent, *Outline of Phonology and Morphology of Old Provençal* (Boston, 1905); and also the article TROUBADOURS.

PROVENCE, prō'vāns' (Lat. *Provincia*, province). Formerly a province of southeastern France, comprising the present departments of Basses-Alpes, Var, and Bouches-du-Rhône, and parts of the departments of Vaucluse and Alpes-Maritimes. The name Gallia Provincia, or simply Provincia, was given to the country by the Romans, who, about 120 B.C., subdued the territory later constituting Provence, Dauphiné, and Languedoc. Aquæ Sextiæ (Aix) was the capital of the new province. During the movement of Germanic peoples in the fourth century the Roman power and the name Provincia were restricted to the southeastern portions of this territory lying between the Rhone, the Durance, and the Mediterranean Sea, and with the fall of Arles about 480 this portion, too, passed into the hands of the Visigothic invaders. After being held from 510 to 536 by the kings of the Ostrogoths, the region passed to the Frankish kings, in whose many partitions it was repeatedly parceled out. It was saved from the Saracens by Charles Martel (c.739). By the partition of Verdun Provence fell to Lothair; it was seized by Charles the Bald in 875, and in 879 attained the rank of a kingdom under Boso, being known as the Kingdom of Provence, or Cisjurane Burgundy. (See BURGUNDY.) This was united with Transjurane Burgundy in 933 to form the Kingdom of Arles, which existed for 100 years. Soon after the extinction of the Arletan realm the counts of Provence became hereditary feudal princes. They ruled in practical independence until 1112, when, upon the failure of male issue, the county passed to Ramon Berenguer (Raymond Berengar), Count of Barcelona, whose male line became extinct in 1245 in the person of Ramon Berenguer IV. His daughter, Beatrice, brought Provence in marriage to Charles of Anjou (q.v.), whose last direct descendant, Joanna I of Naples, made Louis of Anjou her heir (1382). Best known among the counts of the house of Anjou was René I (q.v.), the last of the troubadours, whose court became the home of a splendid culture. René left an only daughter, Margaret of Anjou, and in 1482 Provence fell to France, being formally annexed in 1486. In the life of the French nation the inhabitants of Provence have played their full share, exercising no inconsiderable influence on the development of politics, art, and literature. With the shrewd Norman, the wily Gascon, and the well-fed burgher of Touraine, the hot-blooded, poetic, eloquent Provençal ranks as one of the great national types, which has received concrete form in Alphonse Daudet's undying Tartarin.

PROVENCE, COUNT OF. The title borne previous to his accession by Louis XVIII of France.

PROV'ERB (OF., Fr. *proverbe*, from Lat. *proverbium*, adage, from *pro*, before, for + *verbum*, word). A short, sententious saying long current in common speech. The last phrase, "long current in common speech," serves to differentiate the proverb from the multitude of happy expressions in literature which never become permanently fixed in popular usage. "Patience on a monument" is a happy phrase, often quoted by literary men, but it is not a proverb. "A bird in the hand is worth two in the bush" is a proverb. Another frequent characteristic of proverbs is alliteration or rhymes or rhythmic balance. Thus, "Where there's a will there's a way" shows alliteration; "Birds of a feather flock together" shows both rhyme and rhythm; and "Out of sight out of mind" shows rhythmic balance.

Whence comes the proverb? Lord Russell suggests the apparent origin in the phrase "the wit of one." Some one gives apt expression to a general truth or to an apparent truth; taken up by others, it spreads far and wide. St. Jerome is said to have originated "To make a virtue of necessity." In Sterne's *Sentimental Journey* occurs the fine English proverb, "God tempers the wind to the shorn lamb." And it is assigned either to Sterne or to the Bible, where it does not occur. It is found in George Herbert's *Jacula Prudentum* (1640), under the form, "To a close-shorn sheep God gives wind by measure." Herbert clearly took it from the French, "Dieu mesure le froid à la brebis tondue" (sixteenth century). From this point the proverb may be followed back to Provençal and Latin; and we find, too, the Turkish "God makes a nest for the blind bird." Sterne had come across the saying, clothed it in the aptest words, and made it immortal. As in this spe-

cific case the proverb is made by many hands. Like the ballad and the fairy tale it is impersonal and, like them, it goes back to the remotest times. The golden age of proverb making may well have been the age of the folk song. Its frequent metaphor and alliteration suggest this. Later times remold what comes to them. Among nations far advanced in civilization new proverbs are rare. The press throws off phrases of a proverbial character, but they do not often become a part of our speech. They serve their purpose and then disappear. It is the old phrases that we employ, as those relative to sour grapes, the gift horse, the prophet honored elsewhere than at home, haste and waste, honesty and policy. Except in certain cases, as in the examples just given, we do not usually quote proverbs at length, but some phrase or word from them. With these remnants our speech and our very best literature are pervaded. Shakespeare, e.g., refers to two proverbs in the same scene of the *Tempest* (ii, 2): "Good liquor will make a cat speak" and "He must have a long spoon who must eat with the devil."

As we have implied all countries have their proverbs as well as their folk songs. There is a rich mine in the East—Arabic, Persian, Hindustani, Japanese, and Chinese. "Where the corpse is, there the vultures gather," e.g., is an Indian proverb. Of ancient Hebrew proverbs a whole book is extant. The language of Christ and the Evangelists is ornamented with them. They were turned to the highest spiritual uses in the Sermon on the Mount. Roman proverbs, often relating to husbandry, inculcate frugality, patience, and independence. Italian proverbs are of various import, teaching now distrust and cynicism, now subtle wisdom and plain-dealing. Attention has frequently been called to the respect shown to the Devil in the Italian proverb; whereas in the Teutonic proverb—German, Dutch, and Scandinavian—he is a ridiculous figure. The Gallic wit of French literature is curiously absent from the French proverb.

Proverbs appear in Anglo-Saxon poetry, especially in the gnomic verses. At the Renaissance this fund of native philosophy was augmented by importation. In the early part of the seventeenth century appeared two notable collections of proverbs, partly English and partly foreign—George Herbert's *Jacula Prudentum* (1640) and the volume added to James Howell's *Lexicon Tetraglotten*, published separately in 1659 under the title "Proverbs or old Sayed Saws and Adages in English or the Saxon tongue, Italian, French, and Spanish; whereunto the British [Welsh] for their great antiquity and weight are added." Of all countries Spain possesses the largest and best store of proverbs. Don Juan de Iriarte (eighteenth century) collected at least 24,000. Cervantes hardly exaggerated the employment of them among the peasants when he made them crowd thick into the mouth of Sancho Panza and come out haphazard.

There now remains the question of the origin of the similarity between proverbs in various countries. Have those resembling one another a common ancestry? "One swallow does not make a spring" is current in some form among many peoples and was a proverb some 2000 years ago. Have all the forms of this proverb a common parent? Such a question cannot be safely answered. All that can be done is to attempt to settle the date when a proverb appears in different countries. The tendency, of course, is to say that all forms derive from the oldest. In many cases the investigation leads to the East, and it is perfectly evident that the native proverbs of Europe have been enriched from that source. The media of diffusion were the Bible, the Arabs in Spain, travelers in the East, and mediæval Latin literature. Still more easy is it to understand how proverbs have been exchanged by the peoples of western Europe and how Englishmen, Welshmen, and Irishmen have freely given and taken. In spite of all this it must be remembered that men's minds work in common ways. That one swallow does not make the spring or summer is a natural observation. The thought may have been expressed by a hundred different men far apart in space and time. So, too, it is not probable that "God tempers the wind to the shorn lamb" derives from "God makes a nest for the blind bird." On the other hand, "Where the carrion is, there the eagles gather," seems to be a variant of the Eastern "Where the corpse is, there the vultures gather."

R. Burke, *Spanish Salt: Proverbs in Don Quixote, with Translations* (London, 1877); and for full information, J. M. Sbarbi, *Monografía sobre los refranes y las obras que tratan de ellos* (Madrid, 1891). Italian: Giusti, *Proverbi toscani* (Florence, 1853), revised by Capponi (1884). German: Wander, *Sprichwörter-Lexicon* (Leipzig, 1867), and Rheinsberg-Düringsfeld, *Sprichwörter der germanischen und romanischen Sprachen* (ib.,

1872–75). Dutch: Harrebomés, *Spreckwoorden boek* (Utrecht, 1858–65). Danish: Collection by Molbech (Copenhagen, 1850), Gruntvig (ib., 1875). Arabic: Freytag, *Arabum Proverbia* (Bonn, 1838–43); Burckhardt, *Arabic Proverbs* (London, 1830; new ed., 1875). Behar: J. Christian, *Behar Proverbs* (London, 1891). For general collections of proverbs: V. S. Lean, *Collection of Proverbs, English and Foreign, Folk-Lore, and Superstitions* (4 vols., Bristol, 1902–04); Robert Christy, *Proverbs, Maxims and Phrases of All Ages* (2 vols., New York, 1904). There are also collections of proverbs in Russian, Persian, Hindustani, Chinese, Japanese, and in numerous other languages.

PROVERBIAL PHILOSOPHY. Essays in blank verse, on almost every emotion and condition of life, by Martin Farquhar Tupper, in four series, 1838–76.

PROVERBS, Book of. A book of the Old Testament, containing an anthology of gnomes and sentences, forming, in the Hebrew canon, the second book of the Hagiographa. Like Job and Ecclesiastes, it belongs to the Wisdom literature of the Hebrews. The form of these proverbs is manifold; similes, enigmas, theses and antitheses, wise sayings, and comparisons vary constantly. The book falls naturally into eight distinct sections, partially marked off by special titles: 1. Chapters i–ix, forming a kind of introduction to what follows and chiefly taken up with exhortations to the reader to follow wisdom and flee folly. In chapter viii Wisdom is personified and introduced as the speaker, while in chapter ix Folly is likewise personified and the two, Wisdom and Folly, are pictured as women, offering rival invitations and inducements to men. 2. Chapters x–xxii. 16, with the heading "Proverbs of Solomon," constitute the kernel of the collection. Each verse is complete in itself and forms an independent saying. 3. Chapters xxii. 17–xxiv. 22, a small separate collection distinguished from what precedes by a series of maxims that usually extend over several verses—generally two or three, though in one case as many as seven. The address, as in the first collection, is to a "son" and the exhortations are described as "words of the wise." 4. Chapter xxiv. 23–34, forming an appendix to the preceding and distinguished by a separate heading. 5. Chapters xxv–xxix, with the heading "These also are proverbs of Solomon collected by the men of Hezekiah, King of Judah." In this collection, again, each verse, as a general thing, forms an independent saying, though this principle is not consistently carried out. Some of the proverbs in this collection duplicate those found in the second. 6. Chapter xxx, with the heading "Words of Agur ben Jakeh," a series of enigmatical sayings. 7. Chapter xxxi. 1–9, exhortations addressed to Lemuel, King of Massa, by his mother, the main theme of which is a caution against wine and women. 8. Chapter xxxi. 10–31, an alphabetical poem devoted to the praise of the virtuous housewife.

It is evident from this survey that the Book of Proverbs is a combination of several distinct collections, to which furthermore a number of fragments from other collections have been added. It is ascribed by tradition to Solomon, but as other authors are mentioned, it is probable that some part was first assigned to him and the tradition then extended to the whole work. In 1 Kings v. 12 Solomon is said to have spoken 3000 proverbs. Some of these may have been preserved in x–xxii. 16, though even in this collection they have suffered much in transmission, and many new ones have been added. The references to the King in xxv–xxix, the insistence upon monogamy, and the attitude to the law preclude Solomonic authorship for this section, and the whole character of i–ix shows that it is a late introduction.

The Book of Proverbs represents in all probability a gradual growth that extended over a long period of time. Of the separate collections comprised in the book all the internal evidence points to the second as the oldest, while the fifth comes next. The first is later. The third and fourth divisions may be regarded as fragments which were added to x–xxii. 16, and similarly the sixth and seventh divisions are fragments added to xxv–xxix. The alphabetical poem (xxxi) is an independent composition of a late date. There is no reason to doubt that the words of Agur and Lemuel actually may have come from a north Arabian state Massa, though a fictitious ascription, as in Job, is also possible. Egyptian influence on the earlier collection has been suspected, as gnomic wisdom flourished in Egypt long before Solomon. The internal evidence, however, is insufficient for fixing the dates of compilation of the various divisions of the book definitely. As the latest date for the first section, and therefore the earliest possible date for the compilation in its present shape, we may fix upon 250 B.C. Many of the sayings are no doubt of popular origin, but the great bulk bear a scholastic character which points to their rise in literary circles.

Bibliography. There are commentaries on the Book of Proverbs by H. Ewald (2d ed., Göttingen, 1867; Eng. trans., London, 1880); Franz Delitzsch (Leipzig, 1873); A. Lesètre, *Le livre des Proverbes* (Paris, 1879); Nowack (ib., 1883); H. Strack (Munich, 1888; 2d ed., 1889); G. Wildeboer (Freiburg, 1897); W. Frankenberg (Göttingen, 1898); J. J. S. Perowne, in *Cambridge Bible for Schools and Colleges* (Cambridge, 1899); C. H. Toy, in *International Critical Commentary* (New York, 1899); and G. C. Martin, in *The Century Bible* (London, 1908). Consult also: P. de Lagarde, *Anmerkungen zur griechischen Uebersetzung der Proverbien* (Göttingen, 1863); T. K. Cheyne, *Job and Solomon* (London, 1887); A. J. Baumgartner, *Etude critique sur l'état du texte du livre des Proverbes* (Leipzig, 1890); W. Baudissin, *Die alttestamentliche Spruchdichtung* (ib., 1893); T. K. Cheyne, *Jewish Religious Life after the Exile* (New York, 1898); W. T. Davidson, *The Wisdom Literature of the Old Testament* (London, 1894); J. Meinhold, *Die Weisheit Israels* (Leipzig, 1908).

PROVIDENCE (Lat. *providentia*, foresight, from *providere*, to foresee, from *pro*, before, for + *videre*, to see). A term of theology, including two elements, God's preservation and administration of the material universe and His moral government over His rational creatures. Both combine in the conviction that the universe and all its inhabitants move towards the end appointed by God, and that therefore man may trust His goodness and wisdom in the events of life. The doctrine has two aspects, religious and philosophical. The religious aspect is the earlier in history and the more important for practical life. Religion, as far back as it can be traced, included the belief that men could obtain the aid of higher powers who were able to mold the course of events to the good of

men. The Hebrew religion, especially the prophets, strongly believed that the order of nature expressed the divine will and that man's destiny was also in God's hands. The early prophets even regarded all evil in life as being the punishment for sin, an extreme against which the Book of Job was a protest. Especially does the providence of God guide the history and destinies of the Hebrew race (Ps. cv; Hos. xi. 1 ff.), and often while free will is recognized, it is held that nothing takes place outside of the divine control; and the Jewish writers did not concern themselves to solve the philosophical problems of their position. The religion of the New Testament, with its emphasis on the fatherhood of God, naturally magnified the religious aspect of providence. God controls all things for good, and men may therefore trust His love and wisdom and need fear nothing. (Matt. v. 45, vi. 31–34, x. 28–31; Luke xii. 11–12; Mark xiv. 36; Rom. viii. 28–39; Phil. ii. 12–13; 1 Pet. v. 7.) The philosophical aspect of the doctrine arises whenever philosophy enters the realm of religious thought. Thus, Socrates, Plato, and the Stoics emphasized the idea of a world order working for good. Christianity, borrowing from both Hebrew and Greek thought, early added to its religious trust in God's providence a philosophical doctrine regarding it. Clement, Origen, and the other Greek fathers held that the very existence of God implied it. Augustine held that all things, even evil, are but working out the will of God, and that nothing can thwart His purpose. This has been the general position held in all branches of the Church, and is not essentially affected by discussions of the relation of sin to the will of God (see SIN; THEODICY), since all have believed in the final triumph of the will of God. The philosophical aspect has borne fruit in religion and furnished a basis in reason for a loving trust in God. Later theology divided providence into general and special, the first governing the order of the universe, the second, particular events of the life of men; and into ordinary and extraordinary, the first operating through natural causes, the last through miracles. In modern times the emphasis on the immanence of God and the development of the theory of evolution have only increased the grounds for a belief in providence. See PREDESTINATION.

Ballard, *Why Does not God Intervene?* (2d ed., New York, 1912); G. Galloway, *The Philosophy of Religion* (ib., 1914).

PROVIDENCE. The second largest city in New England, the capital of Rhode Island and the county seat of Providence County, 44 miles southwest of Boston and 188 miles northeast of New York (Map: Rhode Island, C 2). It is situated about 35 miles from the Atlantic Ocean, at the head of the Providence River, an arm of Narragansett Bay. Steamship lines connect with New York, Norfolk, Newport News, and Baltimore; the railroad facilities comprise the New York, New Haven, and Hartford and leased roads, and one transatlantic line, the Fabre from the Mediterranean, docks at the new State Pier.

The city lies on both sides of the Providence River, its easterly limits being marked by the Seekonk River, with an area of 18.29 square miles. Its early settlement was at the mouth of two small streams, the Woonasquatucket and the Moshassuck, whose confluence forms the Providence River. Separating the valley of these streams and the Seekonk River is a ridge about 200 feet high, which offers beautiful sites for residences. The larger part of the city is an extensive glacial sand plain which extends along the west side of the Providence River. The business district is in the centre of the city, and some of the finest business houses are built on made land. There are 248 miles of paved streets, two-thirds of this distance being laid with macadam. In the older part of the city the thoroughfares are narrow and crooked. Providence has 649 acres in public parks, among which is the noteworthy Roger Williams Park. This has been improved at a considerable expense and is a beautiful pleasure ground. It has a fine system of boulevards, an extensive sheet of artificial lakes, a museum, and a statue of Roger Williams. The Soldiers and Sailors Monument stands in front of the city hall, and near by is a statue of Gen. Ambrose E. Burnside. What Cheer Rock, on the Seekonk River, is of historic interest as the landing place of Roger Williams.

The city has set aside for a civic centre land valued at $3,000,000 and has converted it into a railroad entrance unusual if not unsurpassed in America. Exchange Place is the real centre of the city, and around this area the most notable buildings are being placed. The city hall stands at one end, opposite is the beautiful post office, and City Hall Park extends along the whole length of the plaza in front of the railroad station, while to the north of the station on rising ground stand the State Normal School and the new State House. The latter, first occupied in 1900, is a massive edifice of marble and granite and has a large dome. Other prominent structures are the public library, the county courthouse, the Roman Catholic cathedral of St. Peter and St. Paul, the Young Men's Christian Association Building, and the State Armory. Among business structures the Arcade is noteworthy, and there are a number of commodious office buildings of recent construction. Brown University (q.v.), with its large buildings on the east side, is one of the principal features of the city. Providence has several noted charitable institutions, among which are the Rhode Island Hospital, Rhode Island Homœopathic Hospital, Butler Hospital for the Insane, St. Joseph's Hospital, the Dexter Asylum for the Poor, and the State Institute for the Deaf. Besides Brown University the educational institutions include the Friends' School, which dates from 1818, the State Normal School, and the Rhode Island School of Design. The public library contains about 157,200 volumes. Other important libraries are the State Law Library and those maintained by the Providence Athenæum (over 70,000 volumes), the Rhode Island Historical Society, and the Rhode Island Medical Society. The Historical Society possesses also a collection of relics and the Athenæum some valuable pictures.

Providence is a port of entry, but is noted pri-

marily for its manufacturing interests. For many years the wealth of the city was mainly derived from its commerce of the sea. About 1840 the city began to neglect its shipping interests, as the growing prosperity of its manufactures demanded attention. Large quantities of coal are handled at its docks, and the city controls extensive wholesale and jobbing interests. The relative unimportance of Providence in foreign commerce is due to the lack of sufficient depth in the harbor for ocean steamships and to inferior docking facilities. Otherwise the natural waterway through the Providence River and Narragansett Bay forms one of the best harbors on the New England coast. During 1914 an attempt to regain its former prestige in foreign commerce was instituted and a State pier capable of docking ocean steamers was opened. Providence is the first manufacturing city in Rhode Island, its products comprising nearly half of the total output of the State. The value of the products of her factories in 1909 was over $120,000,000. In the manufacture of jewelry Providence is among the leading cities of the United States; it is noted also for its extensive production of silverware, worsted and woolen goods, cotton goods, engines and boilers, machinery, including cotton milling machinery, fine tools, and files. Dyeing and finishing textiles, refining gold and silver, slaughtering and meat packing, and the manufacture of rubber and elastic goods, oleomargarine, malt liquors, etc., are other important industries.

The municipal government is vested in a mayor, elected annually, a bicameral council, consisting of a board of aldermen and a common council, and in administrative officers, the majority of whom are elected by the council. The council elects three commissioners of sinking funds, the park commissioners, and the license and fire commissioners. The commissioner of public works is appointed by the mayor. The city treasurer, harbor master, overseer of the poor, and school committee are chosen by popular vote. The personal property valuation of Providence in 1914 exceeded $132,000,000 and the real estate $212,000,000. The tax rate is $16.50 per $1000. Its largest items of expenditures were for schools, $1,038,051; for police department, $516,171. The water works, which were constructed at a cost of $7,100,000, are owned and operated by the city. Public bathhouses are maintained as a municipal activity. The bonded debt of the city in 1913 was $18,505,000, and the net debt, $12,061,000. Pop., 1800, 7614; 1850, 41,513; 1870, 68,904; 1880, 104,857; 1890, 132,146; 1900, 175,597; 1910, 224,326; 1915, 247,660. The total in 1910 included 76,303 persons of foreign birth and 5316 of negro descent.

Providence was founded and named in 1636 by Roger Williams, who, having been expelled from Massachusetts, came here and bought a tract of land from the Narraganset sachems, Canonicus and Miantonomoh. Here a distinct separation was made between spiritual and temporal affairs, complete religious toleration being unequivocally guaranteed. The first Baptist church in America was organized in 1638 under the ministry of Roger Williams. Williams secured in 1644 a parliamentary charter, under which Providence, Portsmouth, and Newport were united for governmental purposes as the "Providence Plantations in the Narragansett Bay in New England." In 1676, during King Philip's War, Providence was attacked by Indians and 29 of its 75 houses burned. Near Providence occurred in 1772 one of the first overt acts of the Revolution, the burning of the British cruiser *Gaspée*. In September, 1815, a tremendous gale forced the water back into the harbor and river, flooded part of the town, and destroyed property valued at over $1,000,000. Providence was incorporated as a city in 1832. Consult: W. A. Greene and others, *The Providence Plantations for Two Hundred and Fifty Years* (Providence, 1886); Bayles, *History of Providence County* (New York, 1891); "Providence," in L. P. Powell, ed., *Historic Towns of New England* (ib., 1898); H. K. Stokes, *Finances and Administration of Providence, 1636–1901* (Baltimore, 1903); William Kirk, ed., *A Modern City: Providence R. I., and its Activities* (Chicago, 1912). *The Early Records of the Town of Providence* have been printed in 15 volumes (Providence, 1892–99).

PROV'INCE (Lat. *provincia*, from *pro*, before, for + *vincere*, to conquer). A term used in geology to designate an area in which the deposition and succession of sediments are uniform. In paleontology it refers to a more or less well-marked district throughout which the animal or plant life was the same.

PROVINCE HOUSE. A brick mansion on Washington Street, Boston, built in 1679. It became the residence of the governors of the Province in 1715, and after many changes was burned in 1864. It is described in Hawthorne's *Twice-Told Tales*.

PROV'INCETOWN. A town in Barnstable Co., Mass., 54 miles by water and 120 miles by rail southeast of Boston, on Cape Cod Bay and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, G 4). It is situated at the extremity of Cape Cod and has a deep, spacious harbor. There are a public library, a fine town hall, and the Pilgrim Monument, 245 feet high. Provincetown has some reputation as a summer resort, but is best known for its fishing and whaling industries, the latter of which, however, has declined considerably. There are wholesale fish establishments, a number of fish-freezing and shipping plants, and manufactories of various kinds of oil. Pop., 1900, 4247; 1910, 4369. On Nov. 21, 1620, the Pilgrims in the *Mayflower* arrived in Provincetown Harbor and remained anchored there for nearly a month. It was here that the celebrated compact was signed and the first Governor, John Carver, was chosen. Permanently settled about 1680, Provincetown formed a precinct of Truro from 1714 until 1727, when it was incorporated. Its growth was very slow and in 1776 it had a population of only 205. Here during the Civil War the Confederate commissioners, Mason and Slidell, were delivered to the British gunboat *Rinaldo*. Consult Freeman, *The History of Cape Cod* (Boston, 1860–69), and H. D. Thoreau, *Cape Cod* (new ed., 2 vols., New York, 1908).

PROVING GROUND. An establishment maintained for the sighting and testing of ordnance and the testing of armor and projectiles. In the United States the army proving ground is on Sandy Hook, N. J., and the naval proving ground at Indian Head, on the Potomac River.

PROVINS, prō'văn'. The capital of an arrondissement in the Department of Seine-et-Marne, France, on the Voulzie, 59 miles by rail southeast of Paris (Map: France, N., J 4). The chief buildings are the eleventh-century Roman-

esque Gothic church of St. Ayoul; the twelfth-century Transitional church of St. Quiriace with its adjacent bell tower; the twelfth-century Grosse Tour, or keep of an ancient fortress; the church of Ste. Croix, town hall, and hospital dating from the thirteenth century; the sixteenth-century Tour de Notre Dame du Val, and several ancient dwelling houses. The town maintains a museum and public library, and has a public garden and pleasant boulevards. The culture of Provins roses is a local industry of repute; there are manufactures of confectionery and a trade in the mineral waters of its chalybeate springs. Provins was the Roman Pruvinum, and under the rule of the counts of Champagne in the Middle Ages was an industrial centre, it is recorded, of over 80,000 inhabitants. Its decay dates from the Hundred Years' War with England and the Religious wars. Pop., 1901, 8794; 1911, 8726.

PROVISIONAL ORDER (from *provision*, Lat. *provisio*, foresight, from *providere*, to foresee). In England, an order granted under powers conferred by an act of Parliament, by a department of the government, by the Secretary of State, or by some other authority, whereby certain things are authorized to be done, which could be accomplished otherwise only by an act of Parliament. The provisional order is, in fact, an ingenious device for relieving Parliament from the necessity of dealing directly with the enormous mass of local and other private legislation which modern conditions had imposed on it. The order does not become effective, however, until it has been confirmed by Parliament. Till that time it is purely provisional; and even after it has been so confirmed, and is in reality an independent act, it retains the title of a provisional order. See PARLIAMENT; PRIVATE BILL.

PROVISIONAL REMEDY. In the reformed procedure which has in the United States largely superseded the common-law procedure inherited from England, an extraordinary proceeding to prevent a dishonest defendant from disposing of his property before judgment and execution can be obtained in a civil action. The order is applied for at the time of commencing the action and as an incidental remedy. Under the New York Code and codes following it the principal provisional remedies are: order of arrest; warrant of attachment; temporary injunction; and the appointment of a receiver. See ACTION; PROCEDURE.

PROVISIONS OF OXFORD. See OXFORD, PROVISIONS OF.

PROVISIONS OF WESTMINSTER. See WESTMINSTER, PROVISIONS OF.

PROVI'SO (Lat., it being provided, abl. sing. of *provisus*, p.p. of *providere*, to foresee). In law, a clause in a legislative act, or in any legal instrument, which contains a qualification, limitation, or condition affecting or governing the preceding clauses. A common example of a proviso is the defeasance clause in a mortgage, the latter being in form an absolute conveyance, but with a proviso that if the mortgagor, or person who executes it, performs a certain obligation, then the instrument shall become null and void. A proviso is, in effect, an expressed condition. See CONDITION; DEED; MORTGAGE.

PROVI'SORS, STATUTE OF. The name of several statutes of England which were intended to prevent the Pope from presenting to benefices in England, or, as it was technically known, from using the rights of provision and reservation. Since the time of Innocent III (1198–1216) the Pope had frequently appointed foreigners to bishoprics and the like. Often these never lived in England, and merely sought to derive as much revenue as possible, leaving the ecclesiastical duties to others. Edward I in the Statute of Carlisle (1307) sought to prevent the heads of the great monastic orders from burdening the English monasteries with taxes, and by implication included the Pope in this prohibition. It was not, however, until 1351 that the first Statute of Provisors of Benefices was passed, which seriously aimed to check the various abuses. It was reënacted in 1362 and again in 1390, the last time with additional safeguards. For diplomatic reasons, however, the kings of England were compelled frequently to give way to the papal demands, and consequently the statute was in practice always suspended. Moreover, the King himself found it often convenient to override the rights of the cathedral chapters and obtain the appointment of a favorite to some benefice or other by employing the aid of the papal machinery. It was not until the breach with Rome took place in the reign of Henry VIII that the abuses which the Statute of Provisors sought to check ceased. The text of the statutes will be found in Adams and Stephens, *Select Documents of English Constitutional History* (New York, 1901). Consult also John Lingard, *History of England*, vol. iii (London, 1883), and Sir William Stubbs, *Constitutional History of England*, vols. ii and iii (6th ed., Oxford, 1897).

PRO'VO. A city and the county seat of Utah Co., Utah, 48 miles by rail southeast of Salt Lake City, on the Provo River and on the Denver and Rio Grande and the San Pedro, Los Angeles, and Salt Lake railroads (Map: Utah, C 2). It has the Brigham Young University, the largest educational institution of the Latter Day Saints, a Mormon tabernacle, Proctor Academy, a Carnegie library, county courthouse, Federal building, United States reclamation office, and the State Insane Asylum. Utah Lake, Mount Timpanogas, the Bridal Veil Falls, and the Provo Cañon are much visited for their scenic attractions. Provo is situated in an agricultural, fruit-growing, and cattle-raising region, manufactures woolen goods, flour, tin and iron roofing, etc., and has considerable trade in lumber and sugar beets. Settled in 1849, Provo was chartered as a city in 1851 and in 1910 adopted the commission form of government. Pop., 1900, 6185; 1910, 8925; 1914 (U. S. est.), 10,091.

PROVOKED HUSBAND, THE. A comedy begun by Vanbrugh as *A Journey to London* and left unfinished at his death. It was completed by Colley Cibber and published in 1728.

PROVOKED WIFE, THE. A comedy by Vanbrugh, produced in 1697. The rôle of the hero, Sir John Brute, a rough, mischievous fellow, was Garrick's favorite part.

PROVOOST, prō-vōst', SAMUEL (1742–1815). First bishop of the Protestant Episcopal church in New York. He was born in New York City, of Huguenot descent, and was educated at King's (now Columbia) College. In England he continued his studies at St. Peter's College, Cambridge, and was ordained priest in 1766. He returned to New York and became an assistant minister of Trinity parish, a post he retained until 1774, when he withdrew. He declined to serve as delegate to the Continental Congress, though his patriotic impulses led him to join his neighbors in their pursuit of the British

after the burning of the town of Esopus. He did not resume the active ministry until the close of the war, when, in 1784, he became rector of Trinity Church, New York, and in 1785 chaplain of the Continental Congress, then meeting in New York. Elected in 1786 first Bishop of New York at the Diocesan Convention, he was consecrated in England. In 1800 he resigned the rectorship of Trinity and the following year sought to relinquish his episcopal office, but the House of Bishops, declining to accept his resignation, appointed instead an Assistant Bishop. Consult W. S. Perry, *The History of the American Episcopal Church, 1587–1883* (Boston, 1885), and *The Centennial History of the Protestant Episcopal Church in the Diocese of New York, 1785–1885*, edited by J. G. Wilson (New York, 1886).

PROVOST, prŏv'ŭst (OF. *provost, prevost*, Fr. *prévôt*, from Lat. *præpositus*, principal, provost, p.p. of *præponere*, to set before, from *præ*, before + *ponere*, to place). The title of various academic, ecclesiastical, and civil officials. In England the heads of certain colleges, as of Oriel, Queen's, and Worcester at Oxford, of King's College, Cambridge, and of Eton College, are called provosts. In the United States this title is given to the heads of some institutions, as, e.g., the University of Pennsylvania. It is applied as an ecclesiastical title to the head of a cathedral or collegiate chapter, especially in Germany. The title is also given to the superiors of certain religious houses of lesser rank which bear a relation to the mother house analogous to that which a prior bears to an abbey. In the Catholic church he presides at the installation of canons, and acts of the chapter are valid only when signed by him. In the Protestant churches of Germany the title of provost is sometimes used as synonymous with that of dean or archpriest; and occasionally, where several minor churches or chapels are attached to one chief church, the minister in charge of the latter is called provost. The civil use of the title is found chiefly in Scotland, where the chief municipal magistrate of a burgh or city is styled provost. The provost presides in the civil courts together with the bailies, who are his assistants. The chief magistrates of the cities of Edinburgh and Glasgow are styled Lord Provost, and the claims of the provosts of Aberdeen and Perth to the designation of lord, although at one time contested, are now held to be fully established.

PROVOST MARSHAL. A military official in charge of the military police (q.v.) of a camp, garrison, or in the field. In the *Field Service Regulations, United States Army*, 1914, it is provided that "the defense commander of the area in and about the base of a line of communications is assigned as provost marshal." The functions of a provost marshal, in addition to those of general military police, are to receive and hold all classes of prisoners. He makes records of the prisoners of war, and collects and records the tags taken from the enemy's dead, as required by the laws and usages of war. The records of prisoners of war and of the enemy's dead are transmitted quarterly to the War Department. In the British army the provost marshal has a captain's rank, and authority to punish any offender taken *flagrante delicto* on the spot, according to the provisions and penalties laid down in the Mutiny Act.

In the navy the provost marshal is an officer attached to a naval court-martial who is responsible for the safe-keeping of prisoners under trial before the court; also for the serving of notices to witnesses and executing the processes of the court. He is usually an officer of the navy (not above the rank of lieutenant) or of the marine corps (not above the rank of captain), but in case of the trial of enlisted men a petty or noncommissioned officer may act as provost marshal.

PROXY (contraction of *procuracy*, from ML. *procuracia, procuratia*, charge, care, from *procurare*, to take care of, from *pro*, before, for + *curare*, to care, from *cura*, care). The agency of one person who acts as substitute for another, usually in public assemblies, conventions, and other bodies. It is now rarely permitted in legislative bodies, though formerly it was the privilege of English peers.

PRUDDEN, prud'en, T(HEOPHIL) MITCHELL (1849–). An American pathologist, born at Middlebury, Conn. He graduated from the Sheffield Scientific School, Yale, in 1872 (M.D., Yale, 1875), and became an assistant (1879) and was professor of pathology (1892–1909) in the College of Physicians and Surgeons, Columbia University. In 1901 he was made a director of the Rockefeller Institute for medical research. His writings include: a *Manual of Normal Histology* (1881); a *Handbook of Pathological Anatomy and Histology* (1885; 9th ed., 1911), with F. Delafield; *Story of the Bacteria* (1889); *Dust and its Dangers* (1891); *Drinking Water and Ice Supplies* (1891); *On the Great American Plateau* (1907).

PRUDENTIUS, prōō-dĕn'shĭ-ŭs (AURELIUS CLEMENS PRUDENTIUS) (348–?405). The greatest poet of the early Latin Church and one of the leading literary figures of the fourth century. He was born in Spain (in Saragossa, Tarraco, or Calaguris). He received a liberal education, was admitted to the bar, practiced as a pleader, discharged the functions of a Roman magistrate, and received appointment to a high position at court. His early life was gay and dissipated, but after his conversion he devoted himself to the service of the Church, retiring to a monastery when 57. He lived in an age of great Christian leaders, among them Ambrose, Jerome, and Augustine, and from Ambrose he derived his impulse towards poetic composition. Among his poems the *Cathemerinon* (Daily Round) includes 12 hymns, of considerable length, designed for devotional use (Eng. trans. by R. M. Pope and R. F. Davis, New York). The *Psychomachia* (Soul's Conflict) pictures the battle which virtue and vice wage over the soul of a Christian. This is the earliest type of pure religious allegory in the Western Church, and may almost be said to mark an epoch in literary history. In the *Peri Stephanon* (The Crowns) we have a collection of 14 hymns in praise of martyrs and martyrdoms, about half of them dealing with Spanish subjects. The two books *Against Symmachus* carry on the battle already begun by Ambrose, against the proposed restoration of the altar of Victory to the senate house. Two of Prudentius' poems are distinctly theological, the *Hamartigenia*, on the origin of evil, and the *Apotheosis*, a defense of the doctrine of Christ's divinity. In both these works the influence of Tertullian is unmistakable. His works are in Migne, *Patrologia Latina*, vols. lix–lx (Paris, 1847). A new edition, edited by J. Bergman, is to appear in the *Corpus* of Vienna.

PRUDHOMME, René François Armand Sully-. See Sully-Prudhomme, R. F. A.

PRUD'HOMMES, prụ'dŏm' (Fr., discreet men), Council of. Municipal tribunals which existed first in the Middle Ages at Marseilles, Lyons, and elsewhere in France, exercising an equitable jurisdiction as arbiters of trade disputes. Similar tribunals, under the same name, were reintroduced by Napoleon I in 1806 and were found to be of great practical utility. Under the present French Republic the system has been continued, the Conseils des Prud'hommes being citizens elected by the people irrespective of their connection with capital or labor.

PRUD'HON, prụ'dŏN', Pierre (1758–1823). A French historical and genre painter, one of the most eminent of the classical school. He was born in Cluny, the son of a stonecutter, and received his first instruction from the monks of the abbey of Cluny. Afterward he studied under Desvoges at Dijon, but an unfortunate marriage handicapped the painter in his youth. He worked in Paris with Wille, the engraver, and in 1784 won the Prix de Rome. In 1789 he returned to Paris, and, his genius being at first unrecognized, he supported himself by working for the booksellers, but finally was made painter in ordinary by Napoleon and given lodging in the Sorbonne. Under the influence of his friend and pupil Constance Mayer, he painted his best pictures, such as "The Rape of Psyche" (Louvre), "Venus and Adonis" (Wallace collection), and "Crime Pursued by Vengeance and Justice" (1808, Louvre) in which he displays unusual virility and grandeur of style, and for which he received the Legion of Honor. In 1816 he was elected to the Institute. After the suicide of Mademoiselle Mayer, in 1821, Prud'hon completed her picture, "The Unfortunate Family" (Louvre), and painted a few religious pieces, including "Crucifixion" and "Assumption" (both in the Louvre), but he never recovered from the shock and died two years later. Though he nearly always painted classical subjects, Prud'hon was one of the principal precursors of romanticism. In Italy he had studied Correggio and Leonardo, and his women have something of the subtlety of the latter master, as is shown in his portraits of the Empress Josephine, Constance Mayer, and Madame Jarre, all in the Louvre. Grace and charm of style, poetic invention, delicacy of coloring, and simplicity of conception make Prud'hon unique among the Classicists of his day. Consult: Clément, *Prud'hon* (2d ed., Paris, 1872); De Goncourt, *L'Art au XVIIIme siècle* (3d ed., ib., 1906); Salvator, "Prud'hon," in *French Art from Watteau to Prud'hon* (London, 1907).

PRUNE (Lat. *prunum*, plum, *prunus*, plum tree, from Gk. *προῦνον, prounon, προῦμνον, proumnon*, plum, *προῦνος, prounos, προύμνη, proumnē*, plum tree). Any variety of plum which can be successfully cured without removing the pit. Only those varieties which have a large proportion of solids, and sugar in particular, are considered good prunes. The prune industry was started in the eastern United States in 1854, but failed because the climatic conditions were not favorable for the production of the desired qualities. About 1863 the industry started in California and grew rapidly. In 1880 the output had reached 200,000 pounds annually and, in 1910, 150,000,000 pounds, of which nearly half is exported, thus developing in about 40 years an industry with an annual output greater than that of France, hitherto the chief prune-producing nation of the world. Oregon, Washington, and Idaho also grow good prunes, as do Servia, Bosnia, Germany, Spain, Australia, and South Africa. The value of prunes exported from the United States in 1914 was $4,662,000.

The prune may be cured in three ways. (1) Sun drying, the common and most economical way where climatic conditions will admit it. This is largely practiced in California, as well as in the European countries. The prunes are not picked until ready to fall, when they are gathered, graded, and dipped in hot lye or run through a pricking machine, after which they are spread on boards or wire-bottomed frames and put out to dry, an operation which takes from 8 to 12 days, depending upon the variety, the size of the plum, and the weather. (2) They are treated by evaporation, the drying being effected by fire heat. In this operation great care and skill are necessary, as too hot a fire will cause the fruits to burst, drip, and finally shrivel. If properly handled the evaporated product is superior to the sun-dried fruits. (3) The fruits in some European countries are partially cooked before being dried. Such prunes are softer than the sun-dried or evaporated ones. After being dried the fruit goes through a curing process by being thrown into bins or heaps to sweat, which takes from one to three weeks. After this they are ready for processing, which consists in dipping the fruits in boiling water and glycerin, steaming, or by rattling in a revolving cylinder. The object of this operation is to improve the color and appearance of the fruit and to destroy the eggs of any insect which may be upon them. They are then ready for packing, the best products being placed in boxes, although many are packed in bags.

PRUNE INSECTS. The insects which damage the prune are mainly those found on plums and peaches. See Peach Insects; Plum Insects.

PRUNING (from *prune*, from OF. *proignier, progner, provigner*, Fr. *provigner*, to prune, from OF., Fr. *provin*, vine, from Lat. *propago*, sucker, from *propagare*, to propagate, from *pro*, before, for + *pangere*, Gk. *πηγνύναι, pēgnynai*, to fasten). The removing of any part of a plant, either root, stem, or branch, to discourage growth in one direction and turn the energies of the plant in another. It is considered an artificial operation, but nature is a constant and very severe pruner, as is shown by the long, slender, limbless boles of many forest trees. When plants are taken from their natural environment and the forces which regulate their habits, pruning becomes a necessity. In this work the gardener must be guided by the well-known laws of plant growth governing the healing of wounds and the balance of parts. At planting time the tops of trees must be pruned in order to establish a proper relation of the top to the root, which is always unavoidably reduced in the process of digging. This pruning is necessary also because the roots have no intimate connection with the soil by which

the demands of the expanding leaves can be supplied with food and moisture; in fact, the demands of the top should be less than the root can meet in order that a too severe strain shall not be placed upon the organism. Pruning may be performed for the purpose of correcting the habit of growth. The head may be made high or low, compact or open, at will, almost regardless of the natural habits of the tree. In general, however, the peculiar nature of the tree should be taken into account and the pruning made to conform as closely as possible to that form. Where fruit is the object sought the manner of fruit production of the plant must be thoroughly understood, otherwise pruning may induce wood growth at the expense of fruit production. For instance, apples and pears bear fruits upon spurs; peaches, usually on the young branches (sometimes on spurs) of the previous season's wood; grapes, on wood of the current year produced from buds developed the year previous. In order, therefore, intelligently to prune any plant for fruit production, its fruiting habit must be carefully considered. Sometimes desired results are obtained by root pruning or by cutting away a portion of the bearing wood. In the first case fruit bearing is induced, in the second the fruits are thinned or their number decreased, the food supply distributed to a lessened number which may be correspondingly increased in size. Pruning also admits light to the tree tops by removing superfluous branches, thus making the fruits higher colored.

Besides these objects pruning is used to change the form of head (heading in). Whatever be the object the operation should be performed in the manner least injurious to the plant. This involves the method of removing the branch and the time of year the work should be done. In regard to the season for pruning little exact information can be given. As a rule apples, pears, and cherries suffer least if pruned while in full vigor of growth. The wounds heal readily and there is less liability to loss of vitality than at other seasons. The peach should be pruned early and severely for wood growth, and late and lightly for fruit production; the same is also true of the grape. All pruning of the grape and peach should be confined to the resting period.

The manner of pruning so as not to lessen the vigor or shorten the life of the plant involves systematic annual pruning, by which the removal of large branches can be avoided. All cuts should be made close to and parallel with the main branch so as to promote the healing process. Large wounds must be covered with some preservative or protective coating to prevent decay. The healing of a wound is accomplished by the formation of a callous from the growing tissues. The process continues, and by the annual deposition of new material the wound is covered. A smooth cut will heal where a jagged cut or bruise will decay. Trees grown upon walls or espaliers require great skill in pruning in order to hold them within bounds and at the same time secure the maximum production of fruit or flowers.

Consult: L. H. Bailey, *The Pruning Book* (8th ed., New York, 1907); J. C. Newsham, *Propagation and Pruning of Hardy Trees, Shrubs, and Miscellaneous Plants* (ib., 1913); also publications of the national and State experiment stations.

PRURI'GO (Lat., itch). The name of a skin disease restricted to prurigo of Hebra, not including all conditions in which there is pruritus. Formerly dermatologists distinguished prurigo mitis, prurigo formicans, and prurigo senilis, which are now relegated to the eczemata and the lichens (q.v.). True prurigo, also called prurigo agria or ferox (the milder type is called prurigo mitis), begins in infancy or in childhood or youth, persisting with recurrences for many years. It resembles *urticaria* (q.v.). The eruption is usually at first a series of white or rosy plaques and is accompanied by intense itching. Then papules appear, as pale red points, excoriated at the summit, usually on the anterior and external portions of the legs and thighs, about the pelvis and buttocks, and also upon the upper extremities. The skin hardens and becomes thicker, furrowed with folds, and covered with crusts. Vesicles may appear, exuding yellowish serum, or sanguineous, and blackened. Impetigo, furuncle, abscess, and lymphangitis, all resulting from inoculation, may complicate the attack. Indolent lymphatic glandular enlargements may appear in the groin. The prognosis is very unfavorable. The disease may last for years or for a lifetime. Many cases are incurable. Asthma, emphysema, and chronic bronchitis are very common among the victims of prurigo. Diet, cod-liver oil, pilocarpine, carbolic acid, cannabis indica, and analgesics are helpful. Bran baths, starch baths, cod-liver oil, styrax, sulphur, ichthyol, beta naphthol and resorcin are among the local applications used. Consult Stelwagon, *Treatise on Diseases of the Skin* (Philadelphia, 1914).

PRURI'TUS. A functional skin disorder, characterized by itching, without structural changes in this tissue. Pruritus is a symptom of many diseases and is classed by neurologists among the parasthesias. The sensation may be of a tingling, pricking, or tickling character, or a feeling as if ants (whence the term "formication") or other insects are crawling over the skin. Pruritus is usually worse at night. When the disorder is local the regions usually attacked are the anus (pruritus ani) or the vulva (pruritus vulvæ). Generalized pruritus is a common symptom of jaundice, diabetes, Bright's disease, hepatic affections, digestive and intestinal disturbances, as well as of nervous diseases and inflammation of the female generative organs. Pruritus is occasionally a premonitory symptom of apoplexy, and may arise from brain tumors in the parts supplied from the seat of lesion. In certain persons a dose of morphine produces itching, especially about the nose. Copaiba and ergot sometimes produce itching, and chronic lead poisoning is sometimes accompanied by it. The successful treatment of pruritus obviously rests upon the determination and removal of the causative factor.

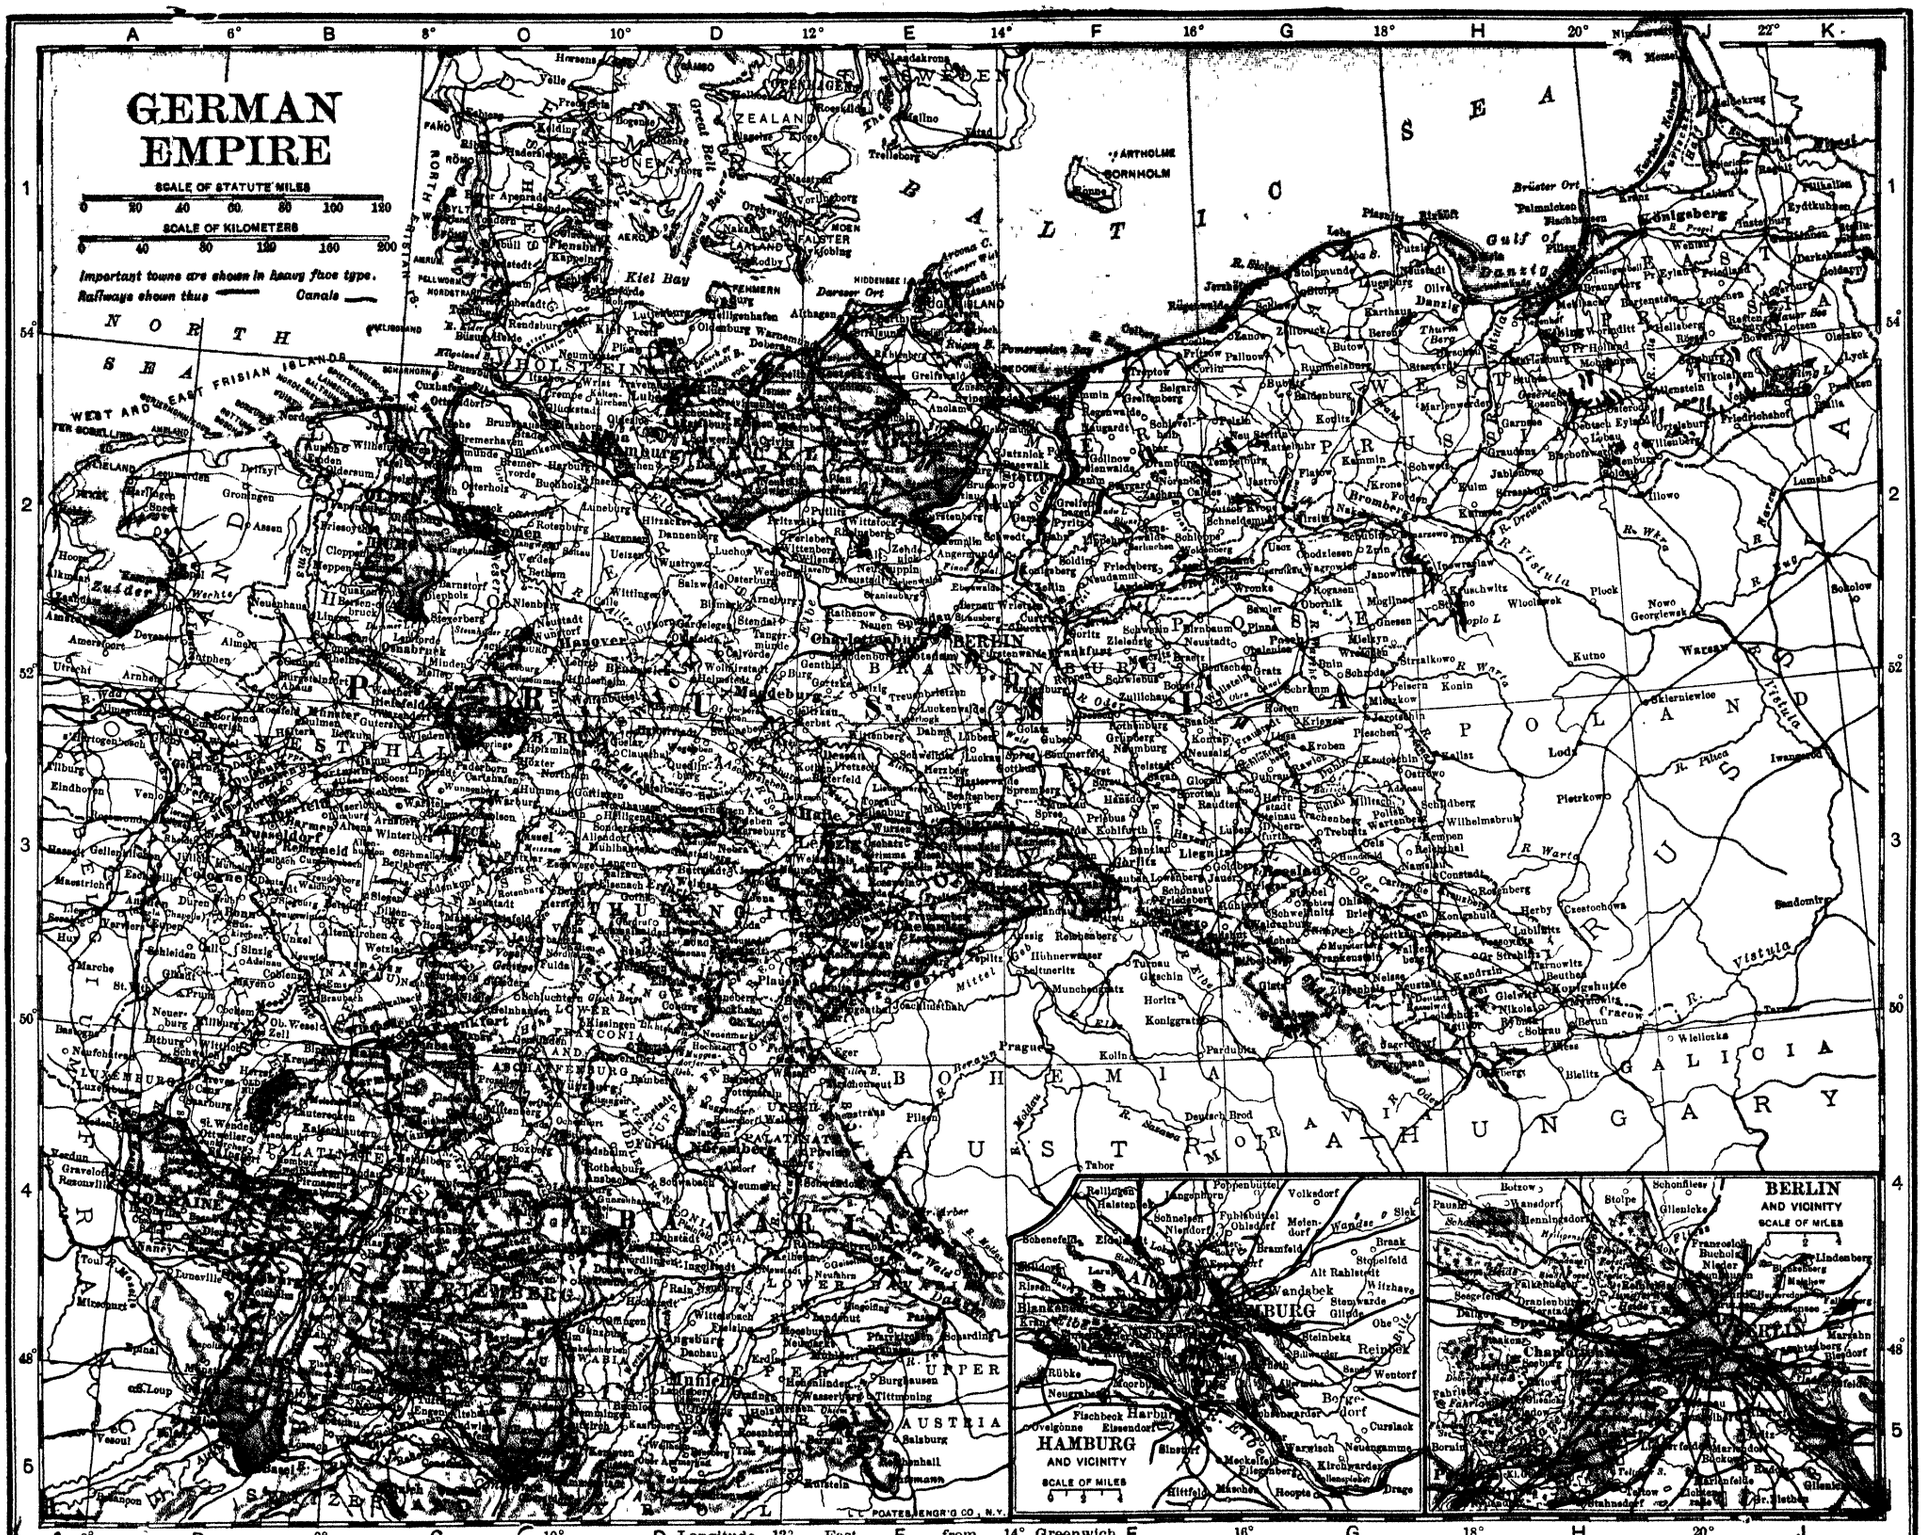
PRUS, BOLESLAV. See GLOWACKI, ALEKSANDER.

PRUSA. See BRUSA.

PRUSSIA, prŭsh'ȧ. A kingdom and the largest state of the German Empire. By the Imperial constitution of 1871 the King of Prussia bears the title of German Emperor. The Prussian territory completely or nearly surrounds that of five of the smaller states of the Empire—the grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, the duchies of Anhalt and Brunswick, and the Grand Duchy of Oldenburg; also the three free towns of Lübeck, Hamburg, and Bremen. With these exceptions the whole of north Germany and its

low plain are embraced in the Kingdom of Prussia. A small detached portion of Prussia, Hohenzollern, is in the extreme south of the Empire. Exclusive of Hohenzollern Prussia extends from lat. 49° 7′ to 55° 54′ N. and from long. 5° 52′ to 22° 54′ E. With an area of 134,650 square miles (including Hohenzollern, 441 square miles), it embraces more than three-fifths of the territory of the German Empire. It also has five-eighths of the population of Germany. The density of population was 298.2 to the square mile in 1910.

Topography. Prussia has a frontage of nearly 1100 miles on the North and Baltic seas. The tidal variations of level in the North Sea are not great, but northwest storms have wrought great destruction on the low, flat seaboard of Prussia, so that in the course of centuries a large area of coast has been destroyed by the washing away of the shores. The Frisian Islands, fronting this part of the Prussian coast, are the ruins of a former coast line, and large parts of the present coast are saved from destruction only by costly works of protection. Much of the coast is bordered by marshy land, which affords fine pasturage. The Baltic, still more shallow than the North Sea, also lacks important flood and ebb tides, but instead of marsh formations along this coast sandy and gravelly soils abound. There are fewer islands than along the North Sea, one, however, the island of Rügen, being of considerable size. The coast has several deep indentations, the most important of which are Kiel Bay, Lübeck Bay, Pomeranian Bay, and the Gulf of Danzig. Sand dunes stretching along parts of the coasts have nearly cut off the sea, and the lagoons (*haffs*) within are filled with fresh water from the rivers emptying into them, so that the *haffs* are only slightly brackish. Outside of Hamburg, Bremen, and Lübeck, Prussia has all the important seaports of Germany.



The great plain which comprises by far the larger part of Prussia is by no means flat or level, though its elevations formed of the accumulations of bowlders and ground moraine of the Ice age rarely exceed 600 feet in height. Communications in all directions meet with no obstacles on this comparatively level surface, stretching in Prussia between the river Ems and the Russian frontier and southward nearly to the southern boundary of the Kingdom. (See GERMANY.) In the south-centre (region of the Harz) and the southwest (lower Rhine plateau) the surface rises and merges with the hilly and mountainous regions of the South German states, but in the southeast the great northern plain is continued in the low plain of the Oder and only the boundary of the Kingdom lies in the northern part of the Sudetic ranges.

Hydrography. Prussia has the middle and lower courses of all the great rivers of Germany excepting the Danube. It is within its borders, therefore, that the Rhine, Weser, Elbe, and Oder attain their highest availability for navigation, as they flow over the plain gently sloping to the north and northwest. In the northeast are the Vistula, Pregel, and Memel (Niemen), the first and the last entering the country from Russia. Naturally the canal system of the Empire has its largest development on the plain of Prussia, where these artificial highways may most easily be constructed. (See GERMANY for rivers, canals, and lakes.) All the great rivers of the plain receive their large tributaries from the east, so that their courses are near the western limits of their drainage systems.

Climate and Soil. The distance from the Atlantic is the determining control of the differences of temperature of Prussia rather than distance from the equator. Increasing altitude as one goes south from the coast gives the more southern latitudes the same conditions of temperature as the coast provinces. The temperature differences are greater between the west and the east of Prussia, as the continental influences are intensified towards the east. The Rhine Province has the least and the Baltic lands the greatest extremes of temperature. There is sufficient rainfall for agriculture, the precipitation being quite evenly distributed and averaging 21 inches per annum and being as high as 30 inches or more near the North Sea. (See GERMANY, *Climate.*) The alluvial soils of the Rhine Province are the best in the Kingdom, while the glacial till of the plains to the east is poor in plant food and is made highly productive only by the most scientific methods of fertilization. Sixty-three per cent of the soil is poor or mediocre sandy loam or sand, 6 per cent is bog or marsh, and 29 per cent is good loam or clay. For flora and fauna, see GERMANY.

Geology and Mineral Resources. The whole plain is strewn with sand and clay of Quaternary age that have been spread over the surface by glacial and alluvial action from the Ice age till the present time. These deposits rest upon areas of all formations from the Primary down through the Tertiary, small parts of these harder rocks projecting here and there above the diluvium and alluvium, as, e.g., the chalk cliffs of Rügen and the limestone plateau to the east of Berlin near Rüdersdorf. In the southeast the mountains of Silesia are composed chiefly of granite, gneiss, and schists, while the highlands of the Harz and the lower Rhenish plateau are composed almost entirely of Devonian and Silurian rocks. Prussia ranks among the great mining countries and leads the German states in value of mineral product. Ninety per cent of Germany's coal comes from Prussia, chiefly from Silesia, Westphalia, and the Rhine Province. Lignite is extensively mined in the Province of Saxony. The output of coal in 1912 was 165,302,784 tons (metric) and of lignite 65,803,959 tons. Westphalia, Silesia, Hanover, and Hesse-Nassau are the sources of Prussian iron, the output of pig iron in 1911 amounting to 10,477,263 tons (metric). Upper Silesia is the world's largest source of zinc, and its output in 1912 was 643,598 tons. Copper mining in that year yielded 974,285 tons of ore, and lead ore 142,839 tons. In 1912 the number of persons employed in and about mines in Prussia was 720,230. See GERMANY, *Geology* and *Mining.*

Agriculture. Prussia is the most important agricultural state of the German Empire, containing about two-thirds of the entire cultivable area. About 50 per cent of the total area is arable land. The number of agricultural holdings was 3,400,144 in 1907, while the total farm land was 20,984,025 hectares (hectare = 2.471 acres). The number of holdings under 20 hectares in 1907 was 3,205,051, comprising 40.6 per cent of the total farm land. The percentage of farm holdings of 100 hectares and over (28.1) is larger than that of the Empire (22.2). Large estates are especially

numerous in the eastern provinces, where many of the landed gentry still live on estates of 1000 hectares and upward. In spite of Germany's development, during the last few decades, in manufacturing at the expense, in some degree, of her agricultural interests, the farmers of Prussia are in a fairly prosperous condition, owing to intensive cultivation of the land, the fostering care of every agricultural interest both by Imperial and by royal legislation, and the use of excellent farm machinery. Among the later developments of Prussian agriculture is the association of neighboring farmers for the purpose of buying machinery run by electricity, alcohol, or other artificial motive power for plowing, threshing, grinding grain, and many other purposes. Prussia leads the world in the use of alcohol as steam-producing fuel, the alcohol being produced for the most part from the potato crop.

All the common agricultural products are raised in Prussia. Prussia produced in 1913 about 75 per cent of the entire rye crop of Germany (the chief food of the peasantry and most important cereal in the Empire), in addition to 72 per cent of the potato crop (a large amount of it turned into alcohol for fuel and illumination), 63 per cent of the wheat crop, and 67 per cent of the oats crop. The greater part of Germany's beet crop is grown on the plains of Prussia from the Harz Mountains to Silesia. The vineyards of Prussia in 1913 aggregated 17,216 hectares and yielded 218,264 hectoliters of wine. Fruit culture, including all the fruits of the temperate zone, is highly developed.

The area under the principal crops in 1913 and the yield are shown in the following table:

CROPS	Hectares	Metric tons
Rye	4,935,425	9,345,155
Oats	2,943,255	6,559,911
Wheat	1,166,054	2,942,647
Barley	892,154	2,107,158
Potatoes	2,329,404	39,215,298
Hay	3,222,589	14,001,132

Prussia is the leading German state in the number and quality of live stock. The breeding of horses is extensively carried on in the provinces of East and West Prussia and Hanover; while many cattle are bred along the North Sea and in Saxony, the region of the marshes, drained and otherwise improved, being particularly favorable for cattle raising and the dairy industry. Pomerania is well known for its sheep. In 1912 the domestic animals included 3,193,279 horses, 8262 mules and asses, 11,866,079 cattle, 4,111,929 sheep, 15,475,739 swine, and 2,102,703 goats. A large part of the cavalry horses in the German army come from northeast Prussia, and the Prussian government, through the stud farms which it maintains, about 20 in number, exerts great influence on the scientific breeding of horses.

About 23.7 per cent of the area of Prussia is under forests. Only a little over one-half of the total forest area is in private hands, and private ownership is constantly declining. The remainder is held by the state and local governments, the state controlling about two-thirds of the public area. The largest forests are in Brandenburg, Silesia, and the Rhine Province, while Hohenzollern and Schleswig-Holstein are almost entirely devoid of woods. Nearly one-third of the forest area is under coniferous trees, which predominate in the north. The Prussian government derives more than $20,000,000 a year from its forests.

Manufactures. The textile industries thrive in the Rhine Province, noted for its cotton spinning and weaving and for its woolen and silk products, and in Silesia, known for both its cotton and linen manufactures. Aachen (Aix-la-Chapelle) and its district are a great seat of the woolen manufacture, and Krefeld and Elberfeld are noted centres of the silk industry. Berlin and the Rhine Province and some of the largest cities in other sections of Prussia turn out most of the machinery and metal work. The iron and steel industry is on a vast scale, and is centred chiefly in the coal field of the Ruhr. Large amounts of the pig iron and steel made in that region are sent to shops in various parts of the country for manufacture. The most famous iron and steel works are at Essen. Shipbuilding is a very important and growing industry in Kiel, Danzig, Stettin, and Elbing. Car and wagon works centre largely in the eastern cities of Breslau and Königsberg, besides Cologne, Düsseldorf, and Görlitz. Glass, porcelain, and pottery are produced in the Rhine Province, Silesia, and Saxony; the same is true of paper. The chemical industry is especially important in the Rhine cities and is prominent in Berlin also. See GERMANY, *Manufactures*, and the articles on the provinces and leading cities.

Out of the total number of persons engaged in the manufacturing establishments of Germany in 1907, 6,308,439 were employed in Prussia. They were distributed among the following industries (the figures of 1895 being also given for purposes of comparison).

INDUSTRIES	1895	1907
1. Mining and smelting	458,504	736,406
2. Quarries and potteries	314,258	447,453
3. Metal industry	383,932	573,355
4. Machine and instrument making	329,404	655,830
5. Chemical industry	66,661	105,993
6. Textile industry	441,885	445,452
7. Paper industry	72,250	111,555
8. Leather industry	86,692	111,865
9. Woodworking	322,989	411,970
10. Manufacture of food products (including beverages)	586,353	706,732
11. Clothing industry	710,635	758,000
12. Building trades	596,690	919,684
13. Printing and publishing trades	67,539	109,875
14. Artistic trades	9,503	14,470
15. Manufacture of lighting material—soaps and fat	35,038	55,964

Transportation and Communication. One of the greatest factors in the industrial development of Prussia has been the excellence of its inland water routes and railroad lines, which supplement instead of rivaling one another. An enormous tonnage is carried on the great rivers, on their canalized tributaries, and on the canals, which connect the rivers, so that the waterways as well as the railroads gridiron Prussia, serving commerce between the east and west as well as between the north and south. Steel lighters of large tonnage and small draft have replaced wooden boats on the canals. The government expends enormous sums in the improvement and maintenance of the waterways. The Kaiser

Wilhelm Canal saves two days of steam travel between Hamburg and the Baltic ports as compared with the old route around Jutland.

The Prussian railway system covers not only the entire territory of the Kingdom, but also that of several minor German states. Since 1897, when the Prussian railway system was combined with that of Hesse, Prussia has effected an entrance into the southern territory of Germany. (See GERMANY, *Railways.*) As reported for 1912, railway open to traffic amounted to 37,698.2 kilometers, of which 35,139 kilometers were classed as state and 2559.2 as private railway and 37,177.6 as broad gauge and 520.6 as narrow gauge. Government ownership and operation has proved a complete success from a financial and commercial point of view. The government derives nearly one-fourth of its entire revenue from the profits of its railway operation, and is able by the manipulation of freight rates to come to the aid of industries in need of special encouragement.

Prussia is one of the six German states possessing a merchant marine. It ranks third, being exceeded by Hamburg and Bremen. Stettin, the largest Prussian port, is far behind these cities. The Baltic ports are frozen over in winter, but that of Stettin is kept open by ice breakers. It is the nearest port to Berlin. Danzig is a large outlet for the cereals of northeast Prussia. Other important seaports are Königsberg, Memel, and Altona. The merchant marine at the end of 1913 comprised 2329 vessels, of 318,646 tons net, of which steamers numbered 687 of 251,924 tons. In 1912 there were entered at the ports 80,903 vessels, of 12,186,428 tons, and cleared 79,030, of 11,821,772 tons. In shipping Prussia is exceeded only by Hamburg.

Commerce. The commerce of Prussia is facilitated by her central position and by the network of river and canal navigation, which make her territories the connecting medium between several of the great European states and give her a free outlet to the rest of the world. Yearly markets are held in about 2700 towns.

Banking. The banking system of Prussia does not differ from that of the rest of the German Empire. (See GERMANY, *Banking.*) The Imperial Bank acts as the fiscal agent of the Kingdom. Prussia occupies a commanding position in the banking world of Germany, since Berlin is the most important financial centre of the country. The eleven great corporate banks of Berlin (not including private banks like Bleichröder, etc.) do almost as great a business as the Imperial Bank of Germany, with its 300 branches. The leading bank is the Deutsche Bank, with a capital stock of 150,000,000 marks. Each of the Berlin banks shows a larger capitalization that that of any national bank in the United States and compares very favorably with the banks of France. An important financial institution is the Prussian Maritime Association (Seehandlung), founded by Frederick the Great in the middle of the eighteenth century. It was the chief financial support of the Prussian government for more than a century, until the formation of the German Empire, and was intrusted with the investment of the enormous war contribution exacted from France. It is the prototype of the crédit mobilier institutions which found such favor during the nineteenth century in France and other countries. Its activity may be seen from the fact that with a capital stock of less than 39,000,000 marks it had assets exceeding 520,000,000 marks.

Finances. Prussia has a highly scientific and satisfactory revenue system. Taxation, though somewhat burdensome, is very equitably distributed. Direct taxes bring in nearly 10 per cent of the revenue from all sources. The principal direct tax is the progressive income tax. Persons deriving less than a fixed minimum income are exempt. Another important source of revenue in Prussia is the income obtained from government domains and industrial enterprises, railways, mines, salt works, mills, etc. The chief item of expenditure in the Prussian budget is the so-called working expense in connection with government enterprises. The next item is the contribution to the Imperial funds, which every state is required to make to complete the revenue of the Empire. (See GERMANY, *Finance.*) Next come the interest on the public debt, which in the fiscal year 1915 amounted to nearly 8½ per cent of the amount of the estimated ordinary expenditure; public instruction and worship, with over 6 per cent; justice; and finance. War expenditure is met directly from Imperial funds. Revenue and expenditure (ordinary and extraordinary) have been reported for fiscal years as follows, in marks:

YEAR	Revenue	Expenditure
1901	2,885,071,665	2,688,595,268
1905	3,268,926,617	3,046,883,134
1910	4,408,102,407	4,392,375,416
1911*	4,595,736,227	4,595,736,227
1915*	4,848,881,995	4,848,881,995

* Budget.

The public debt of Prussia has grown to enormous proportions. In 1867 it was 1,323,000,000 marks; in 1881, 1,995,000,000; in 1891, 5,205,000,000; in 1905, 7,208,953,000; in 1910, 9,421,770,789; in 1914, 10,355,537,145. A great part of the debt, however, has been incurred for productive enterprises, such as railways, mines, and domains, which have furnished their own means of liquidation. The interest on the debt amounted to about 366,345,000 marks in the fiscal year 1914.

Population. The population at several censuses is shown in the table on page 307.

The effect of industrial development on the distribution of the population may be seen in the changed proportion of urban and rural population. In 1890, 51.5 per cent lived in rural communes and 48.5 per cent in communes (towns and cities) of more than 2000 population. In 1900 the rural population comprised but 44.5 per cent of the total and in 1910 38.5 per cent. Berlin, the capital, ranks third (after London and Paris) in population among the cities of Europe. The 14 largest cities after Berlin, each with a population exceeding 200,000, are, in order, Cologne, Breslau, Frankfort-on-the-Main, Düsseldorf, Charlottenburg, Hanover, Essen, Magdeburg, Dortmund, Königsberg, Stettin, Neukölln, Duisburg, Kiel.

For religion, education, charities, see GERMANY.

For army and navy, see GERMANY; NAVIES.

Government. The present constitution of Prussia is a written instrument and one of the products of the revolutionary events of 1848. It was promulgated by the King in 1850 and

has since been modified by various royal decrees. It may be amended by the King and the Legislature according to the ordinary processes of legislation, except that the resolution for amendment must be twice passed by the chambers, an interval of three weeks intervening between the two votes.

The executive power is vested in the King, who attains his majority at 18 and whose crown is hereditary according to the principle of agnatic lineal primogenial succession. He is irresponsible and exercises his powers through ministers, who must countersign all his official acts and who thereby assume responsibility for them. Their responsibility, however, is not to the Legislature, but to the King, who appoints and dismisses. They represent the King in the chambers, and may participate in the debates. They do not resign upon an adverse vote, for the cabinet system of government does not exist in Prussia. None of them acts as Prime Minister with authority over the others, although the Minister for Foreign Affairs, as chairman of the Council of Ministers, is called the Minister President. Their responsibility is not collective, although they meet occasionally as a Staatsministerium for the consideration of matters of general concern.

The legislative power is vested in the King and a bicameral legislature (*Landtag*), the two chambers having substantial equality of powers in legislation. The House of Peers (*Herrenhaus*) consists of three hereditary groups: (1) adult princes of the royal blood; (2) princes of mediatized houses; (3) territorial nobles; and the following nonhereditary elements: (1) life peers, appointed by the King from among certain wealthy and distinguished persons; (2) eight noblemen, elected by certain Prussian landowners; (3) representatives of the universities, of evangelical bodies, and of certain cities; and (4) an unlimited number of worthies appointed by the King for any term he pleases. The total number of members in 1915 was over 300, of whom about two-thirds were representatives of large landowning classes. The House of Representatives (*Abgeordnetenhaus*) is composed of 443 members, elected for a term of five years by indirect vote. For the purpose of election the country is divided into districts, in each of which usually one member is chosen by the three-class system. Under this plan the voters (all male Prussians at least 25 years of age and qualified to vote in the municipal elections) are divided into three classes according to the amount of taxes they pay; the largest taxpayers, who together pay one-third of the taxes, constituting the first class; the next highest taxpayers, who together pay another third, forming the second class; and the remaining taxpayers forming the third class. Each class of voters then chooses an equal number of electors, who then assemble and choose the representative. Thus the moneyed class have a most decided advantage. One elector is chosen from about 250 of the population, and representatives are distributed on the basis of one for about 75,000 inhabitants. The Parliament is regularly convoked by the King each year in November and in special session at such other times as he may choose. Each chamber is the judge of the elections and qualifications of its own members and has full power over its organization, procedure, and discipline except that the sessions must be public. The budget and revenue bills must originate in the House of Representatives and cannot be amended by the Peers.

DIVISIONS	Sq. miles	Pop., 1871	Pop., 1890	Pop., 1900	Pop., 1910
East Prussia	14,286.5	1,822,934	1,958,663	1,996,626	2,064,175
West Prussia	9,866.7	1,314,611	1,433,681	1,563,658	1,703,474
Berlin (city)	24.5	826,341	1,578,794	1,888,848	2,071,257
Brandenburg	15,383.1	2,036,888	2,541,783	3,108,554	4,092,616
Pomerania	11,633.7	1,431,633	1,520,889	1,634,832	1,716,921
Posen	11,193.6	1,583,843	1,751,642	1,887,275	2,099,831
Silesia	15,573 4	3,707,167	4,224,458	4,668,857	5,225,962
Saxony	9,755.7	2,103,174	2,580,010	2,832,616	3,089,275
Schleswig-Holstein	7,343.2	1,045,419	1,219,523	1,387,968	1,621,004
Hanover	14,868.5	1,961,437	2,278,361	2,590,939	2,942,436

Hesse-Nassau	6,062.5	1,400,370	1,664,426	1,897,981	2,221,021
Rhine Province	10,424.8	3,579,347	4,710,391	5,759,798	7,121,140
Hohenzollern (ter.)	441.0	65,558	66,085	66,780	71,011
Total	134,663.9	*24,689,252	29,957,367	34,472,509	40,165,219

* Including 35,355 soldiers in France.

The organization, jurisdiction, and procedure of the judicial system, as in all the German states, is regulated by the Imperial Judicature Act of 1877. The territorial competence of the courts and the appointment and compensation of the judges, however, are matters of state regulation. The Prussian constitution requires that the judges shall be appointed by the King for life, and they can be removed, retired, or transferred to other districts only by resolution of the courts themselves. Their position is one of independence as concerns the administration. They are admitted to the judicial service only after the completion of a prescribed course of study and preparatory service and after passing two state examinations. The highest courts in Prussia are the *Oberlandesgerichte*, of which there are 15 in number, the one at Berlin being known as the *Kammergericht*. The next lower grade of courts are the *Landesgerichte*, and at the bottom of the judicial system are the *Amtsgerichte*, or magistrates' courts. For the trial of minor criminal offenses the magistrate associates with himself two laymen called *Schöffen*. For the trial of more serious offenses jury courts (*Schwurgerichte*) are constituted in connection with the *Landesgerichte*. They consist of a bench of 3 judges and 12 jurors, the latter being selected from a list of eligibles prepared before the beginning of each year. The Imperial Court at Leipzig serves as a final court of appeal from the state courts. (For a more detailed account of the judicial system, see GERMANY.) Besides the ordinary courts mentioned above there are a number of special

courts (*besondere Gerichte*), which the individual states may or may not establish. Such are the industrial courts, the communal courts, agrarian courts, etc. Moreover, as a result of the so-called separation of justice from administration in Prussia in the early part of the nineteenth century, Prussia has a system of administrative courts charged with the adjudication of administrative controversies. As a result of the legislation of 1875 there are three grades of administrative tribunals, viz., the Superior Administrative Court (*Oberverwaltungsgericht*), the Circle Committee, and the District Committee. The first mentioned is composed of an equal number of judges and trained administrators appointed by the King for life. This court has its seat at Berlin and is a tribunal of great influence.

The present system of local government in Prussia dates back to the year 1807, but has undergone numerous reforms, culminating in the noted *Kreisordnung* of Professor Gneist, which became law in 1872. As a result of this legislation the sphere of local autonomy was extended, a judicial control over the action of the administrative authorities was provided for, with a view of preventing abuses which had become quite frequent, and a large nonprofessional service, for the most part compulsory and unpaid, was introduced into the administration with the view of diminishing the influence of the bureaucracy and at the same time of increasing the political capacity of the people, for whom admission to the civil service was most difficult on account of its highly professional character. A distinctive principle of Prussian administration is the separation of local activities into two classes—those which are regarded as of general concern, such as schools, police, and worship, and those of purely local concern, such as highways, local institutions, etc. For the administration of the first class the state is divided into administrative units, in each of which are to be found central officers under control of the Ministers at Berlin. For purely local administration there are local corporations with their own property and officials.

For the purpose of administration Prussia is divided into 12 provinces, not artificial, but historical units (besides the city of Berlin and the territory of Hohenzollern). These are subdivided into government districts (*Regierungsbezirke*), from 2 to 6 in each, 35 in all. The districts are divided into circles (*Kreise*). Below the circle are the justice-of-the-peace district (*Amtsbezirk*) and the commune (*Gemeinde*). In the province there are two sets of government officials, one central and the other local. The chief central officer is the *Oberpräsident*, a purely professional official, somewhat like the French prefect, appointed by the King. He exercises supervision over the administration of affairs which concern the province as a whole, such as those relating to the police, worship, schools, public health, etc. Associated with the *Oberpräsident* in the administration of matters of central concern in the province is the provincial council (*Provinzialrat*).

The organs for the administration of matters of purely local concern in the province are the Provincial Diet (*Landtag*), the Provincial Committee, and the Director. The *Landtag* is the legislative assembly of the province and is composed of members elected for six years by the Diets of the rural circles and by the municipal councils of the urban circles (cities with over 25,000 inhabitants) within the province. The duties of the *Landtag* relate to the organization and management of provincial institutions, the election of local officers, the voting of appropriations and taxes, and the enactment of by-laws on various subjects. The Provincial Committee is the local executive authority for the province, and its chief duty is the enforcement of the measures of the *Landtag*.

The government district, unlike the province, exists only for the administration of those affairs which are regarded as being of general concern, and it has, therefore, no organs for the administration of purely local matters. In each of these areas is a board consisting exclusively of professional administrators appointed by the King, collectively known as the government (*Regierung*) and having at its head an officer called the government president (*Regierungspräsident*). The duties of the government fall chiefly within the domain of the ministries of the Interior, of Agriculture, of Public Works, of Trade and Commerce, of War, and of Education and Worship, to which the government is responsible. Another organ of the government district is the District Committee (*Bezirksausschuss*), composed of the government president, two professional members appointed by the King for life, and four laymen chosen by the Provincial Committee for six years. The chief function of this predominantly lay authority is to exercise control over the action of the professional government president.

As to the circle (*Kreis*) there is found again, as in the province, the distinction between affairs of general concern and those of purely local interest. The matter is, however, somewhat simplified by intrusting to one set of organs the administration of both spheres, but when they act as central organs they are subject to strict central control. These are the *Landrat*, the Circle Committee (*Kreisausschuss*), and the Circle Diet (*Kreistag*). The *Landrat* is the chief executive authority of the circle and the agent of the central administration. He is a highly trained professional administrator and is appointed by the King. The Circle Committee is composed of the *Landrat* and six nonprofessional members elected by the Circle Diet for six years, and acceptance of the office is compulsory. As a central organ it has supervision over the justices of the peace; as a local organ, over other officers of the circle. The Circle Diet is the representative assembly of the circle and is composed of members elected for six years. They are distributed equally between the urban and the rural circles. The Circle Diet elects the members of the Provincial Diet, votes the provincial taxes, contracts loans, enacts ordinances for the administration of various local affairs, and has power to create certain offices and establish local institutions.

The justice-of-the peace district (*Amtsbezirk*) consists of a group of rural communes with a population of about 1500 inhabitants. The justice (*Amtsmann* or *Amtsvorsteher*) is appointed by the King upon the nomination of the Circle Diet for six years, and the office is compulsory and unpaid. The duties of the justice include the control of the local police and the administration of the poor and health laws. The office is therefore one of the most important in the system.

As to the communes there is a distinction between the rural and the urban. The larger rural communes act through representative councils chosen by taxpayers, while the less populous manage their affairs through mass meetings of the voters. The chief executive officer in the commune is known as the *Schulze* or *Dorfrichter* and is elected for six years by the communal council or mass meeting. Communal affairs include the regulation of pasturage, tillage, schools, churches, etc.

In the government of the cities of Prussia the deliberative organ is the council, chosen for six years by the taxpayers according to the three-class arrangement already described in connection with the Prussian House of Representatives. Its powers comprise the general administration of city affairs. The chief executive authority in the city is vested in either a burgomaster or a board elected by the council. Where the board system prevails the burgomaster serves as chairman of the board. He is a high-salaried official with a tenure of at least 12 years, and occupies a position of great influence. In the large cities the central government may vest the control of the police in distinctively central organs, and this it has done quite generally. The executive board acts both as an organ for local administration and as an organ for central administration, and in the latter capacity it is subject to the supervision of the central government at Berlin.

Ethnology. The inhabitants of modern Prussia are, for the most part, German-speaking descendants of the old Teutonic tribes, mixed more or less with Celts in the west and southwest and with Slavs in the east. There are two important branches to be recognized which differ in customs and speech and possibly in descent. These are the Low Germans and the High Germans, occupying respectively the low-lying plains to the north and the higher regions to the south.

In addition to the German-speaking population there are a large number of Slavs in the eastern part of the Kingdom, a considerable body of Danes in Schleswig, a number of Lithuanians in the northeast, of Frisians in the northwest, and of Dutch in the West, and a few representatives of Celtic peoples (French and Walloons) in the west. Of the Slavs the most important are the Czechs, the Wends, and the Poles. The Czechs are found in Silesia and the Wends in Brandenburg and Silesia. Akin to the Wends, but speaking a Polish dialect, are the Kashoubs, or Kassubs, dwelling in the northwest part of the Province of West Prussia and in Pomerania. These form a small remnant of the old Slavic Pomeranians, who formerly occupied this region but have been largely absorbed in the surrounding Teutonic element. The Poles, some 3,000,000, form the largest body of Slavs in Prussia. They dwell in Posen, Silesia, and East and West Prussia. Related to the Poles are the Mazurians, or Mazurs, who dwell in the southeastern portion of East Prussia and still preserve some of their old customs and habits. The old Prussians, the original inhabitants of Prussia east of the Vistula, who preserved their independence until they were subdued by the Teutonic Knights in the thirteenth century, have died out or been absorbed, and their language is no longer spoken. The Jews number about 400,000, of whom about one-fourth dwell in Berlin.

History. The origins of Prussian history up to 1411 are treated under BRANDENBURG (q.v.). In that year the Emperor Sigismund placed over the Mark of Brandenburg the thrifty Frederick, Burgrave of Nuremberg, who was invested four years later with the hereditary sovereignty of the mark and the accompanying dignities of margrave, prince elector, and Imperial archtreasurer. This Frederick was the head of the house of Hohenzollern (q.v.), and with him began its steady rise to power. He was a capable administrator and brought order out of the existing chaos. The work was continued by his son, Frederick II (1440–70). Frederick was succeeded by his brother, Albert Achilles (1470–86). In the *Dispositio Achillea* of 1473 he ordained that the Franconian margraviates (Bayreuth and Ansbach) should be separated from Brandenburg. There now began those family arrangements by which lesser territories, reserved for younger sons or acquired by marriage, were to revert to the elder line in default of other heirs. Joachim II Hector (1535–71) adopted the reformed religion in 1539, thus bringing himself into sympathy with his people, who in common with all of north Germany were embracing Protestantism. He and his successors, John George (1571–98) and Joachim Frederick (1598–1608), were, however, too cautious to involve Brandenburg in the Reformation struggles. The important event in the reign of John Sigismund (1608–19) was the reversion of the Duchy of East Prussia (the region about Königsberg) to the electoral branch in 1618.
